

RTEMS - 5.0.0-m2006-2 Release Notes

17 June 2020

RTEMS 5 Series Release Notes

These notes cover the dot releases:

5.1

5.0

5.1 (open)

Statistics

Total	792
Fixed	723
Invalid	14
Works for me	8
Duplicate	12
Won't fix	33

Distribution

Summary

- #1247 RTEMS does not implement locks needed by multithreaded newlib
- #1394 scandir() fails due to MAXNAMELEN is incorrect
- #1662 termios.c: semaphore not deleted, consequently resulting in failure of rtems_termios_open
- #1747 Heap extend allows discontinuous memory regions.
- #1971 Memory leak in tmpfile()
- #2132 <rtems/score/basedefs.h> superfluously includes <limits.h>
- #2133 <rtems/score/basedefs.h> superfluously includes <string.h>
- #2135 times() and _times() are subject to integer overflows
- #2173 Potential integer overflow problem in EDF scheduler
- #2176 fishy behavior in termios tx task mode
- #2198 Automate doxygen build
- #2207 RTEMS tar does not overwrite.
- #2213 Decreased performance for whetstone benchmark using GCC >=4.5
- #2261 Add coverage report generation support to rtems-tools
- #2266 Move bsp_pretasking_hook() into files named bsppretaskinghook.c
- #2284 h8300 gets error linking dl0* tests
- #2289 rtems_ada_self is broken on SMP
- #2305 sp07 needs to be split into an user extensions and a notepad test
- #2306 powerpc/mvme5500/vectors/exceptionhandler.c uses task variables
- #2308 Change uniprocessor INIT task mode to preempt.
- #2325 Broken console driver infrastructure for SPARC
- #2344 Second argument of ualarm() is ignored
- #2350 One watchdog ticks header per scheduler instance
- #2354 Replace red-black tree implementation, change API
- #2355 SPARC: Several shared drivers are not SMP ready
- #2363 SPARC: Silent FP context corruption possible
- #2366 Create a Public API for the Atomic Operations
- #2367 Documentation of User Extensions needs more information
- #2377 rtems_waf: Tools without a version are not supported
- #2385 Warning from commit "bsps/arm: Do not use __ARM_ARCH_7A__"
- #2407 Enable function and data sections
- #2408 Linker set based initialization
- #2412 Improved priority inheritance implementation
- #2420 RSB %source file fails
- #2423 rtems_iterate_over_all_threads lacks user callback private pointer pass through
- #2428 Add 4.12 Tool Target Configurations to RSB
- #2441 lpc1768 variants fail to build with error in gpio.c
- #2442 Remove avrttest BSP
- #2443 Remove AVR Architectural Port
- #2444 Remove m68k/mvme136 BSP
- #2445 Remove m68k/sim68000 BSP
- #2446 Remove M32R Architectural Port
- #2447 Remove m32r/m32rsim
- #2448 Remove mips/mongoose BSP
- #2449 Remove arm/gba BSP
- #2450 Remove arm/nds
- #2451 Remove arm/gp32 BSP
- #2452 Remove H8300 Architectural Port
- #2453 Remove h8300/h8sim BSP
- #2454 Warning in threadqops.c
- #2455 Warning in spsimplesched02
- #2457 Remove powerpc/ep1a BSP
- #2458 Remove powerpc/score603e BSP
- #2459 Add rtems_chain_get_first_unprotected() to chain API
- #2464 RSB: Tool patches use the RTEMS version
- #2468 Add Thread Local Storage (TLS) support on x86
- #2477 Remove <rtems/debug.h>
- #2487 Should <https://devel.rtems.org/wiki/TBR/Delete/SpecBuilder> be Deleted?
- #2488 Vagrant Scripts
- #2490 RSB: Use SHA512 instead of MD5
- #2493 Remove notepads
- #2494 Remove task variables
- #2503 mvme5500 BSP: Exception Handler uses deprecated Notepads.
- #2509 Should "https://devel.rtems.org/wiki/TBR/Delete/BSP_Template" be replaced?
- #2513 Remove m68k/idp BSP
- #2514 Make POSIX API mandatory (except signals and the sporadic server)
- #2515 i386 score/libcpu API Layering Violation
- #2527 Move pc386/tools/bin2boot to rtems-tools
- #2529 BSP for the Atmel SAM V71/V70/E70/S70 chip platform
- #2536 RSB allows use of insecure hash algorithms like MD5 and SHA1

- #2537 Use Newlib exec*() variants and remove RTEMS versions
- #2542 Review cxx_iostream size change per function-section changes
- #2543 Obsolete gen68302 BSP
- #2544 Osolete m68k/ods68302
- #2545 Obsolete mbx8xx BSP
- #2546 Obsolete idp BSP
- #2553 [mvme3100] boot_card() broken by 37030e38
- #2554 New watchdog handler implementation
- #2555 Eliminate the Giant lock
- #2556 Implement the O(m) Independence-Preserving Protocol (OMIP)
- #2557 Add word splitting to print output
- #2559 Delete the EXTERN pattern
- #2560 smdk2410 is broken due to gp32 removal
- #2562 RSB Docs Quick Start version number
- #2576 arm/lpc176x: linker script update (add KEEP() sections)
- #2606 alarm() uses seconds watchdog and thus is affected by clock changes
- #2608 POSIX Condition Variables Clock Attribute Support
- #2617 rtems_heap_allocate_aligned_with_boundary() body and prototype inconsistent
- #2624 Fix the year 2038 problem
- #2625 Use one lookup tree per-thread for the POSIX keys
- #2626 Unify thread cancel/join and delete
- #2627 Fix CPU time used for threads on SMP
- #2628 Avoid home-grown condition variable implementation in the Classic Regions
- #2631 Use an ISR lock to protect the state of Classic Rate Monotonic objects
- #2632 rtems-tester failure
- #2633 waf build failed for rtems-libbsd
- #2634 New warning in pc386 VESA driver
- #2638 pc386: ld -r issue with per function sections
- #2641 configure: enable-rtemsbsp doesn't warn if bsp does not exist
- #2644 sis does not run on gdb 7.11 but does on gdb 7.9
- #2649 RSB remove 4.11, 4.10 and 4.9 from the master branch.
- #2663 pc386 BSP has complex dependencies
- #2664 spclock_err02
- #2669 Update OpenRISC toolchain in 4.12
- #2672 After latest patches with Objects_Get_by_name rtems-master not compiling without --enable-posix
- #2674 CORE spinlock implementation is next to be useless
- #2676 Obsolete clock_get() directive
- #2680 Add pthread_setconcurrency() and pthread_getconcurrency()
- #2683 Configuration table's smp_enabled conditional on RTEMS_SMP
- #2684 rtems/c/src/lib/libbsp/sparc/leon3/clock/ckinit.c:122: duplicate if
- #2685 c/src/lib/libbsp/arm/atsam/network/if_atsam.c:409: possible bad if statement
- #2689 POSIX key destructors must be called during thread restart
- #2692 User extensions execution order must be clarified
- #2693 Update doc to reflect obsoleting rtems_clock_get()
- #2694 linking issue for htonl, etc when using -std=c99
- #2695 Add libatomic for RTEMS
- #2696 Unpredictable errno value returned by sem_wait() in case of semaphore deletion
- #2698 GCC 6.1 is broken for microblaze
- #2700 cpukit/libfs/src/nfsclient/src/rpcio.c:524]: (style) Suspicious condition
- #2701 Rename asm file with .S(upper case) ext. name
- #2702 Remove descriptor objects for POSIX message queues
- #2706 Buffer allocation of capture engine is broken on SMP configurations
- #2707 Unsafe use of current processor index in capture engine
- #2714 A pthread_detach() does not lead to a resource reclamation
- #2718 Blocking _CORE_message_queue_Submit() may lead to unpredictable results
- #2722 SEM_VALUE_MAX is unusually small on RTEMS
- #2723 CPUINFO command to report per-processor information
- #2725 Classic binary semaphores without a locking protocol can be released by everyone
- #2726 grascs.c: Questionable use of binary semaphore
- #2727 FAT file systems use wrong semaphore for mutual exclusion
- #2728 Pipes use wrong semaphore for mutual exclusion
- #2729 TFTP client uses wrong semaphore for mutual exclusion
- #2732 Add clock_nanosleep()
- #2734 pthread_setschedprio() is missing
- #2735 pthread_setschedparam() sets the priority not according to POSIX
- #2736 pthread_getschedparam() returns wrong priority values
- #2737 Add CLOCK_DRIVER_USE_ONLY_BOOT_PROCESSOR
- #2740 Suboptimal type for Timestamp_Control
- #2741 New warning from printf plugin changes
- #2742 New warning in SHM driver
- #2745 Use clock from pthread_condattr in pthread_cond_timedwait
- #2748 Move RTEMS-specific socket wake-up to RTEMS-specific <rtems/rtems_bsdnet.h>
- #2749 rtems_task_set_scheduler() has insufficient parameters
- #2750 Compile Error When Multiprocessing Enabled
- #2751 Thread dispatch via interrupt is broken at least on ARM and PowerPC
- #2752 Relax execution environment for thread begin extensions
- #2754 no .strtab section
- #2765 Application level deadlocks may lead to SMP lock level deadlocks
- #2768 untar does not keep permissions correctly.
- #2769 rtems-syms does not clean up temp files.
- #2770 Missing documentation for RTEMS_LINKER_ROSET_CONTENT and RTEMS_LINKER_RWSET_CONTENT
- #2771 Empty C++ file with just <rtems.h> does not compile with HEAD.
- #2775 ARM CP15 arm_cp15_set_translation_table_entries fails if TTB in read-only memory
- #2776 SPI Framework
- #2777 Remove librtems++
- #2784 Add function to get the current priority of a task by scheduler instance
- #2788 RTEMS I2C API only defines Standard-mode (Sm) speed as a default.
- #2790 Linker sets broken with GCC 7
- #2795 Overrun Handling for general real-time models
- #2797 Add ability to add/remove processors to/from a scheduler instance
- #2798 Fix POSIX timer interval
- #2800 qoriq variants failing to build
- #2802 Test "libdl (RTL) 5" fails on SPARC targets

- #2803 Get rid of CPU_BIG_ENDIAN and CPU_LITTLE_ENDIAN
- #2805 Use SPRG0 on PowerPC for current per-CPU control (SMP only)
- #2806 Undocumented confdefs.h Configure Options
- #2807 rtems-docs repository is not known to trac
- #2808 Conditionally provide rtems_interrupt_frame
- #2809 Reduce interrupt latency on SMP configurations during thread dispatch
- #2810 Remove sparc/sis BSP variant
- #2811 More robust thread dispatching on SMP and ARM Cortex-M
- #2816 Many ARM BSPs have Static Assert
- #2817 All Blackfin BSPs do not Compile on Master
- #2818 NIOS2 Does Not Compile on Master
- #2819 powerpc-ss555 does not compile on master
- #2820 All SPARC64 BSPs do not Build on master
- #2821 No BSPs Build on Master
- #2822 m32csim does not build on master
- #2823 Nearly all m68k BSPs do not Build on Master
- #2824 arm/lpc23xx_tli800 no longer links tar01
- #2825 Improve the fatal error handling chapter of the user manual
- #2826 arm_cp15_get_translation_table_base_control_register warning.
- #2829 xz git URL in README is broken
- #2835 Ada support is broken on SMP configurations
- #2836 Add posix_devctl()
- #2838 Termios task driven mode should use mutex for device operations
- #2839 Add new interrupt server driven Termios mode
- #2840 Use self-contained mutexes for Termios framework
- #2841 Add NXP SC16IS752 serial device driver
- #2843 Use self-contained objects instead of Classic API for drivers and support libraries
- #2844 JFFS2: Add IO controls to get filesystem instance information and force a garbage collection
- #2845 Add I2C framework documentation
- #2849 ATA/IDE support in RTEMS is out-dated
- #2850 Driver manual covers non-existent Analog Driver
- #2851 Driver manual covers non-existent Discrete Driver
- #2853 Driver manual covers non-existent Non-Volatile Memory Driver
- #2858 Add user defined thread names
- #2859 Implement POSIX Shared Memory Objects
- #2862 docs.rtems.org Add support to ReST format releases.
- #2863 Update POSIX 1003.1 Compliance Guide for ReST
- #2864 docs.rtems.org Automatic update of branches content when a rtems-doc.git change is made.
- #2865 Coverpage installed when building the docs repeats catalogue.xml entries
- #2867 Fix exclude rule in rtems-test-check
- #2868 src/c/src/lib/libbsp/arm/smdk2410/smc/smc.c: 3 * pointless local variables ?
- #2873 src/c/src/lib/libbsp/arm/raspberrypi/i2c/i2c.c:320: defective error checking ?
- #2874 src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt_timer.c: 4 * pointless check ?
- #2877 DHCP client fails on complex networks
- #2878 src/c/src/lib/libbsp/sparc/shared/can/occan.c:1573: broken error checking ?
- #2879 src/cpukit/libdebugger/rtems-debugger-server.c: four problems
- #2880 src/cpukit/libfs/src/jffs2/src/readinode.c:189: faulty logic
- #2883 src/c/src/lib/libbsp/arm/tms570/console/tms570-sci.c:248: strange expression ?
- #2885 Fix rtems_rate_monotonic_postponed_job_count() prototype
- #2889 RTEMS_STACK_CHECKER_EXTENSION has incomplete definition
- #2890 _RBTree_Initialize_node generates warnings
- #2893 Remove CONFIGURE_SMP_APPLICATION
- #2894 Rename CONFIGURE_SMP_MAXIMUM_PROCESSORS to CONFIGURE_MAXIMUM_PROCESSORS
- #2895 Prefix the confdefs.h internal defines with an underscore
- #2896 RSB requirements are missing pax
- #2897 Update termios.h to match the latest FREEBSD definitions
- #2905 Merge LEON
- #2906 rtems-doc waf configure does not detect sphinxcontrib.bibtex status
- #2909 xz: Support for 64-bit CRC is build although XZ_USE_CRC64 is not defined
- #2912 libdebugger: control reaches end of non-void function
- #2916 termios: Change receive callback invocation to enable select() and poll() support
- #2917 termios: Make write POSIX compatible
- #2922 libdl unresolved externals that use more than one block or multiple entries corrupts.
- #2923 Questionable Code in resource_snapshot.c
- #2924 Warnings in SPARC BSPs
- #2925 Warnings in rtl-obj-cache.c on some targets
- #2930 Coverity Reports Out of Bounds Read in drvmgr_print.c
- #2933 Flexibleassignto is broken on new ticket page.
- #2935 Termios task driven mode not compatible with SMP
- #2941 building rsb freezes
- #2942 rtems building error
- #2943 rtems building error
- #2945 Many failures on LEON3 with SMP disabled
- #2946 Add a top level global testsuite configuration file (.tcfg) and a 'user-input' test state.
- #2949 Questionable patch organization in RTEMS tools and RSB
- #2951 Error path in rtems-gcc-6.3.0-newlib-2.5.0.20170228-1.cfg
- #2954 ARM: Optimize context switch
- #2957 Shared memory support internal locking is broken
- #2958 Add some popular benchmark programs to the testsuite
- #2959 arm/libdl: C++ exception index tables may not be ordered correctly
- #2962 Set test configurations to reflect test results.
- #2963 Add a testsuite top level configuration file that is common to all tests.
- #2965 bootstrap sort inconsistent with sb-bootstrap for acinclude
- #2967 ARM: Change ABI to not use short enums
- #2968 newlib inttypes.h is missing some methods
- #2969 qoriq BSPs depend on mkimage which is not always available
- #2976 warnings in rtems-debugger-server.c
- #2977 warnings in Dhystone Benchmark
- #2980 pc586-sse does not compile fsjffs2gc01
- #2981 testdata excludes on included tcfg files does not work
- #2982 LibBSD broken with GCC+RTEMS changes
- #2983 Create <rtems/inttypes.h> to consolidate extensions to <inttypes.h>
- #2984 Changing Trac milestone page fails.

- #2990 RTEMS Source Builder Fails on Windows Builds
- #2992 Long path crashes the RSB when listing a directory.
- #2993 SMP assert in _Thread_Executing in libdebugger
- #2994 tar01 XZ error
- #2995 Missing bsets
- #2997 Monitor config command does not handle unlimited objects.
- #2998 RTEMS User Manual Quick Start does not cover releases.
- #2999 sb-check on Cygwin
- #3000 Setting interrupt level in the mode arg on SMP returns RTEMS_UNSATISFIED
- #3001 SMP build of RTEMS Testsuite does not set CONFIGURE_MAXIMUM_PROCESSORS
- #3003 FAT does not support clusters bigger than 32K
- #3006 SPARC LEON3 BSP SMP build is broken.
- #3007 ARM caching issues
- #3008 missing pax causes install failures
- #3009 Provide invalid link handler for docs.rtems.org so old docs can be removed.
- #3010 src/cpukit/posix/src/mmap.c:189]: (style) Suspicious condition
- #3011 Error compiling xilinx_zynq_zedboard.
- #3012 Global C++ IO streams are broken (cout, cin, cerr)
- #3013 ProgrammingError: (1064, "You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'sid='nikolaykomashinskiy' AND authenticated=1 AND name='force_change_passwd' at line 1")
- #3014 interrupt vector indexing is assuming BSP_INTERRUPT_VECTOR_MIN = 0 for this code.
- #3015 Add support for IBM PPC 750 chip
- #3016 missing a couple register names + a #ifndef __ASM__ around serial.h inclusion
- #3017 improvement in pci.h
- #3018 RSB cannot compile tool chain in CentOS 7.
- #3023 Parameter of CPU_COPY() are in wrong order
- #3025 m32c/m32csim does not build linpack-pc.c
- #3027 RTEMS source builder fails when building gcc documentation with newer versions of gcc
- #3032 CPU_NAND_S() implementation is not in line with FreeBSD
- #3036 CPU_CMP() implementation is not in line with FreeBSD
- #3040 Cannot use RTEMS mailing list archive for patches
- #3043 4.11/rtems-nios2 does not build on Windows.
- #3046 4.12/rtems-moxie missing release number.
- #3047 Remove docs directory from the RSB
- #3049 Warnings in libdebugger
- #3052 RSB: powerpc GDB build broken on Apple Darwin
- #3054 gdb 7.12.1 on RSB 4.12 branch fail to build on Archlinux
- #3056 Add EDF SMP scheduler
- #3057 Add a workaround for the LEON3FT store-store errata
- #3059 Add a simple processor affinity support to the EDF SMP scheduler
- #3061 including 'unistd.h' in C++ does not build.
- #3063 Make the EDF scheduler the default SMP scheduler
- #3069 Add rtems_scheduler_ident_by_processor()
- #3070 Add rtems_scheduler_ident_by_processor_set()
- #3071 Create an interrupt server for every processor in the system
- #3072 Declaration of global functions in driver source files
- #3076 Test suite failures due to floating point usage
- #3077 SPARC: Add lazy floating point context switching
- #3079 Ada tests do not build
- #3080 Infinite loop in SPARC rtems_invalidate_multiple_instruction_lines()
- #3082 Add 64-bit support for PowerPC
- #3083 parallel make not working
- #3084 Makefile recipe override warning has returned
- #3085 Add hypervisor support for QorIQ BSPs
- #3087 RSB rtems-gdb-7.12-1.cfg MD5 value is ERROR
- #3088 shell test in testsuites\samples\fileio many COMMANDs is Lost
- #3089 Inconsistent blocking addressing in RFS
- #3090 Add BSP for i.MX 7
- #3091 Core Dump in powerpc-rtems4.12-ld
- #3096 Shell internal commands should be public.
- #3098 Add new RTEMS repos to github.
- #3099 Add RTEMS FDT wrapper and shell command to libmisc
- #3100 Add Xilinx AXI I2C driver
- #3101 Add I2C Drivers for LM25066A, TMP112, ADS1113 and ADS1115
- #3102 rtems-exeinfo does not decode ARM static constructors.
- #3103 rtems-tools on CentOS 7 Build Failure
- #3109 Add RISC-V support
- #3111 Newlib: Change time_t and clock_t integer types to 64-bit
- #3112 POSIX: Make pthread_mutex_t self-contained
- #3113 POSIX: Make pthread_cond_t self-contained
- #3114 POSIX: Make pthread_barrier_t self-contained
- #3115 POSIX: Make pthread_rwlock_t self-contained
- #3116 POSIX: Make sem_t self-contained
- #3117 score: Optimize _Thread_queue_Enqueue() timeout handling
- #3121 clock() implementation in Newlib is broken
- #3122 Simplify and unify BSP_output_char
- #3123 GDB 8.0.1 is broken on FreeBSD 11
- #3124 Ignore pshared attribute for POSIX semaphores
- #3125 Accept PTHREAD_PROCESS_SHARED for POSIX mutexes
- #3126 Accept PTHREAD_PROCESS_SHARED for POSIX barriers
- #3127 MIPS tool build on Darwin (MacOS) fails.
- #3128 RTEMS Tools corvar does not build on Windows.
- #3129 RTEMS Tools covoar build fails on Windows
- #3130 RTEMS Doxygen.in latex output does not build
- #3132 Add reference counting to file descriptors
- #3133 Remove rtems_libio_t::driver
- #3134 Remove LIBIO_FLAGS_CREATE
- #3135 Devel mailing list doesn't work and Git push impossible due to disk full
- #3136 Use FIFO for file descriptor free list
- #3137 Accept PTHREAD_PROCESS_SHARED for POSIX condition variables
- #3139 Remove old ISR parameter from Clock_driver_support_install_isr() and make it optional
- #3140 CPU Kit broken with --enable-rtems-debug
- #3141 Change the BSP Howto's name to something smaller.

- #3142 POSIX: Reduce size of pthread_once_t and make it zero-initialized
- #3148 PSXRDWRV Test failure on Beaglebone Black
- #3152 Beaglebone Black crashes on u-boot master build.
- #3153 Accept PTHREAD_PROCESS_SHARED for POSIX rwlocks
- #3157 PowerPC tools don't build on 32-bit hosts
- #3158 Examples v2 does not build
- #3159 Examples v2 trace linker ini files reference non-existing dump-on-error
- #3160 Trace linker score support is broken
- #3163 Add I2C device driver for temperature sensor LM75A
- #3166 New default ticket assignee: NeedsReview
- #3167 Internal status codes must not depend on RTEMS_POSIX_API
- #3168 Simplify POSIX_API_Control
- #3170 Use BSP_output_char via RTEMS printer or simple console driver for test output by default
- #3171 RSB GCC does not build on High Sierra and APFS
- #3172 i386 PC BSP does not reset when bsp_reset is called.
- #3173 Xilinx AXI I2C driver IP race condition causes clock glitch.
- #3174 Remove rtems_pthread_attribute_compare()
- #3175 Merge FreeBSD timecounter changes from 2015-01-20 to now
- #3176 __getreent in libc.a and generated by confdefs.h
- #3177 Replace/update POSIX Compliance Guide
- #3178 Update sh-rtems4.12 bset to use rtems-default (using old gcc)
- #3179 New warnings from Time Changes
- #3180 ar warning: `u' modifier ignored since `D' is the default (see `U')
- #3181 Various cc1plus warnings for "valid for C/ObjC but not for C++"
- #3182 CLOCK_REALTIME timeout implementation is not POSIX compliant
- #3185 Change uptime seconds to int32_t
- #3187 smptests/Makefile.am Issues
- #3188 Add C11 Threading Examples
- #3189 MUTEX_INITIALIZER missing braces warning
- #3190 RTEMS Tester covoar does not link on MacOS
- #3191 RTEMS Tester covoar dies with no arguments.
- #3198 Add lazy update of line control and baud divisor to NS16550 serial driver
- #3200 m32c tests don't build -- test_context too large
- #3201 epiphany tools checksum error
- #3202 or1k tools build error
- #3203 Upgrade trac to fix numerous problems.
- #3204 Exception in rtems-test
- #3205 Relative timespec timeouts are subject to integer overflows
- #3207 Supported Architectures Page is out of date
- #3209 RSB should fail on this error
- #3210 Improve the RSB build email message
- #3211 Fix pthread_create() with user provided stack
- #3212 Qemu Fails to Build, RSB Gives Odd Traceback
- #3213 Move erc32, leon2, leon3, psim and jmr3904 to Tier 2
- #3215 Configuring a System Still Includes Notepads and Has Wrong Heading
- #3216 Replace vprintk() implementation
- #3217 Add RTEMS version, build and tools details to tests
- #3218 Termios canonical mode (ICANON) does not return input line by line
- #3219 Zynq BSP missing linker option --gc-sections
- #3220 Change RTEMS release number scheme from 4.12 to 5
- #3221 RSB wiki page duplicates documentation
- #3224 Upgrade or1k and m32c to Binutils 2.29
- #3225 Upgrade m32c to GDB 8.0.1
- #3226 gdb: pr 16827, fix sim on Mavrick
- #3227 sb-check fails on Msys2 64-bit
- #3228 aarch64 missing from 5/rtems-all build set
- #3229 Add index to all documents.
- #3231 RTEMS Top level README needs updating.
- #3232 Use of `.. include:.` in the User Manual should be changed.
- #3234 Quick Start Instructions Inconsistent
- #3235 Fix rtems_semaphore_flush() for priority inheritance semaphores
- #3236 Fix thread queue owner priority update in _Thread_queue_Flush_critical()
- #3237 Fix priority ceiling updates
- #3238 Git push to Trac with more than one commit does not update tickets.
- #3239 Add getentropy() implementation provided by each BSP
- #3240 cpukit/libmisc/stackchk/check.c stack addresses formatted incorrectly.
- #3242 Workarounds for UT699, UT700, and GR712RC errata
- #3243 Simplify global construction
- #3244 Change rtems_panic() implementation and document this function
- #3245 Replace BSP_panic() with rtems_panic()
- #3246 Remove _BSP_Fatal_error()
- #3247 Remove BSP-specific defaults for RTEMS_BSP_CLEANUP_OPTIONS()
- #3248 Add BSP_VERBOSE_FATAL_EXTENSION to RTEMS_BSP_CLEANUP_OPTIONS
- #3249 imx7 does not link getentropy01 test on master
- #3254 Reorganize header files to avoid "make preinstall"
- #3255 Warnings on 64-bit targets
- #3256 Ada run-time needs support for self-contained POSIX synchronization objects
- #3260 libpci depends on BSP-specific header files
- #3261 A couple of documentation typos
- #3264 Add monotonic watchdog based on uptime
- #3265 Use second one based uptime for CLOCK_MONOTONIC for FreeBSD compatibility
- #3266 cpukit/libpci references BSP headers.
- #3267 rtems/status-checks.h calls printk without including the needed header.
- #3268 PowerPC BSP include naming mess.
- #3270 Remove unused support for MPC505
- #3277 QorIQ: Add MAC-less DPAA driver to libbsd
- #3278 bsp-builder has incorrect print (%s in output)
- #3281 Add epiphany support to GDB 8.0.0
- #3283 Bad URL in OpenOCD/Xilinx_Zynq Wiki Page
- #3284 RSB uses hard coded GCC binary paths
- #3285 Reorganize BSP source directory
- #3290 Add device tree support to Altera/Intel Cyclone V BSP
- #3294 gcc version report for released tools is wrong.

- #3298 derror non-conformance
- #3305 Add paravirtualization support to ARM
- #3306 Add paravirtualization support to PowerPC
- #3307 PowerPC linkcmds.base missing wildcards on some sections
- #3309 rtems_task_create's initial_mode SMP update
- #3312 RSB macro calls such as define fail on unicode keys.
- #3315 Move expat's home site to github from SF.
- #3318 Improve INTERNAL_ERROR_THREAD_EXITTED to show the id and thread name
- #3320 Add a simple task console driver
- #3323 mhttpd's http etag can result in invalid caching in a browser.
- #3325 Simplify clustered scheduler configuration
- #3327 Eliminate score/cpu/*/*../types.h
- #3328 bootstrap uses non-POSIX compliant echo -e
- #3329 Trac Login Failure (bad password) Causes Internal Error
- #3334 deadlock in _once()
- #3339 Several PowerPC linker commands do not support constructors/destructors with priority
- #3340 gen83xx warning for macros redefined
- #3341 sparc64: Macro Redefined
- #3342 pthread_setschedparam() has incorrect prototype
- #3343 pthread_mutex_getprioceiling() has incorrect prototype
- #3344 mcf5272/mcf5272.h Timer3 Duplicate Definition
- #3345 mvme3100 spaces needed around quote in macro definitions in bsp.h
- #3346 bf533.h
- #3348 beatnick:spaces needed around quote in macro definitions in bsp.h
- #3349 pc386 edid.h invalid macro names
- #3350 sptimecounter02 warning due to defining _KERNEL and disabling part of <sys/time.h>
- #3352 Warning in all lpc176x variants
- #3354 PowerPC BSPs duplicate PAGE_MASK, etc redefinition
- #3358 Deprecate rtems_disk_create_phys(), etc.
- #3374 rtems-test does not honor --mail-from argument
- #3375 Remove command line pre-processor defines
- #3376 Remove cklength program
- #3377 Remove eolstrip program
- #3378 Remove unhex program
- #3379 Remove packhex program
- #3380 Move rtems-bin2c program to rtems-tools
- #3381 rtems-test command line documentation appears to be out of date
- #3382 Testsuite Makefile merge to one per group of tests
- #3383 Require --enable-rtemsbsp with --enable-smp or --enable-multiprocessor
- #3384 Prefer int for int32_t
- #3385 Generate an error if RTEMS's gcc is not found when the user runs configure
- #3386 Trac's git changeset browsing is suspect.
- #3387 Add subdir-objects to automake flags
- #3388 rtems-tester: possible parsing error for qemuprep-altivec on exclude SMP configuration
- #3389 Warning flags have disappeared with recent autoconf changes
- #3390 NFS: Remove support for cexp
- #3392 infinite loop in RSB's path when a prefix path is not writable
- #3395 rtems-ld does not remove executable when there is an output error
- #3396 rtems-ld does not handle R_ARM_V4BX relocation records
- #3397 The register keyword is deprecated in C++11
- #3401 dl06: tms570* Mixed LSB/MSB Error
- #3402 dl06: mips hurricane Mixed Endian Error
- #3403 RSB RTEMS tool set build is irreproducible
- #3407 Move Gaisler.org and Gaisler.se hosted RSB patches to rtems.org
- #3409 Strip down configure checks to the bare minimum
- #3410 Remove bin2boot program used by i386 BSPs
- #3411 qemuppc does not install linkcmds.base
- #3413 examples-v2 both_hello and triple_period fail to build
- #3415 Add examples and tests as components
- #3416 Update Ubuntu RSB Instructions for 17.10
- #3417 Add libdwarf to elftoolchain and provide a C++ wrapper
- #3418 Remove difftest and sorttimes test tools
- #3419 Always build network services (tftps, ftps, ftpd, telnetd, libdebugger)
- #3421 New Trac components for Coverage and Trace
- #3423 examples-v2: m68k/powerpc BSPs undefined reference to _Thread_Life_action_handler
- #3424 examples-v2: no MIPS BSPs pass configuration step
- #3425 examples-v2: PowerPC fails to build fat_ramdisk
- #3432 Remove Simple SMP Priority Scheduler
- #3433 Add SMP support for RISC-V
- #3434 Add CONFIGURE_MINIMUM_POSIX_THREAD_STACK_SIZE configuration option
- #3435 Add test case for CONFIGURE_BSP_PREREQUISITE_DRIVERS configuration option
- #3436 Remove clock driver Clock_driver_support_shutdown_hardware() hook
- #3437 Replace use of printk() in free() with a fatal error
- #3443 Remove shgen program
- #3444 Remove nios2gen program
- #3445 Remove multigen script
- #3446 Remove cvsignore-add.sh script
- #3447 Remove rtems-testsuite-autostuff script
- #3451 Remove size_rtems script
- #3452 Update RISC-V tool chain to support standard 64-bit chips
- #3453 Add RISC-V GDB
- #3454 Tracing Framework Documentation in User Manual
- #3455 Remove install-if-change script
- #3458 rtems-test should not use the env PATH to find covoar
- #3459 Rework initialization and interrupt stack support
- #3460 GDB 8 SIS LEON2 LEON3 Patches
- #3461 Canadian cross compilation of RTEMS tools not supported for x86_64-w64-mingw32
- #3463 Convert covoar to use DWARF function data
- #3465 Integrate all changes from Linux v3.11 to v4.17 made in the JFFS2 sources
- #3471 Update libfdt as of date 2018-07-09
- #3472 Update of libbsd to a version close to the FreeBSD 12 release
- #3475 Add RTEMS_PREDICT_TRUE() and RTEMS_PREDICT_FALSE() for static branch prediction hints
- #3478 RISC-V BSP Tester Cleanup Needed

- #3480 CONFIGURE_MINIMUM_TASK_STACK_SIZE may affect CONFIGURE_INTERRUPT_STACK_SIZE
- #3482 Relax the buffer alignment required by rtems_partition_create()
- #3484 RFS: Remove stray call of rtems_disk_release() in rtems_rfs_buffer_sync()
- #3486 Use uintptr_t and size_t instead of uint32_t in rtems_partition_create()
- #3488 Remove CONFIGURE_HAS_OWN_MOUNT_TABLE
- #3489 Obsolete CONFIGURE_HAS_OWN_CONFIGURATION_TABLE
- #3490 Remove CONFIGURE_HAS_OWN_CONFIGURATION_TABLE
- #3491 Align mprotect() prototype with POSIX
- #3496 Remove superfluous interrupt enable in _Thread_Dispatch_enable()
- #3498 Command and Variable Index is empty
- #3499 The "Index" chapter is empty
- #3500 Change rtems_waf's RTEMS path check from `bin` to share/rtems<version>`
- #3501 MSR_RI defined multiple places
- #3502 PL111_LCD_CONTROL_LCD_BPP_16 Redefined
- #3503 PDF Documentation is missing an index
- #3504 Warning and formatting in bsp/powerpc/mpc55xxevb/dev/dspi.c
- #3505 powerpc/virtex redefined warning
- #3506 waf for building RTEMS applications needs updating
- #3507 Add flexible per-CPU data
- #3508 Add support for thread to processor pinning
- #3510 ATA driver uses deprecated rtems_blkdev services
- #3511 int/pointer size warnings in powerpc-qoriq_e6500_64
- #3512 sb-check:No python command with Python 2 and Python 3 installed
- #3513 Convert tqm8xx console driver to new Termios API
- #3516 sb-set-builder should report disk usage of build
- #3517 RSB Ubuntu Host Requirements Missing Some
- #3518 RSB MacOS Nits
- #3519 RSB does not strictly check args
- #3520 Remove CONFIGURE_HAS_OWN_FILESYSTEM_TABLE
- #3522 Update mDNSResponder to Apple version v878.30.4
- #3523 Add FEC network interface driver for TQM8XX
- #3525 Add MMC/SDCard support for i.MX 7Dual BSP
- #3526 Convert PTY driver to new Termios API
- #3528 Remove undocumented and untested CONFIGURE_MAXIMUM_PTYS
- #3529 Fix issues raised by Coverity Scan for Telnet server
- #3530 Fix issues raised by Coverity Scan for FTP server
- #3531 Add POSIX Attribute Reports for More Than Scheduler (examples-v2)
- #3532 RSB source only download is host specific
- #3533 Add rtems_task_exit()
- #3535 Remove stdin, stdout, stderr convenience routines for CEXP
- #3536 Move RTEMS configuration data to a common `config` directory
- #3537 RSB and RTEMS Tools Support for python2 and python3
- #3538 Classic API Barrier Wait Section Title Has Wrong Name
- #3539 Remove CPU_PROVIDES_IDLE_THREAD_BODY
- #3542 Remove keep_stdio feature from Telnet service
- #3543 Change Telnet server to allocate most resources during initialization
- #3545 Support O_DIRECTORY open() flag
- #3546 Support O_NOFOLLOW open() flag
- #3547 Support O_CLOEXEC open() flag
- #3549 Obsolete powerpc/virtex BSP
- #3551 Move default configuration to separate library
- #3552 cpu usage error in SMP mode
- #3553 rtems-libbsd Missing waf in Top Directory
- #3554 rtems-libbsd README.waf Needs an Update Sweep
- #3555 IRC bots need to be registered to join #rtems
- #3557 Test ticket
- #3558 Update TracSpamFilter
- #3559 Fix NavAdd plugin.
- #3560 Fix FlexibleAssignTo
- #3561 Migrate to CommitTicketUpdater
- #3562 Use a short paths for the RSB temporary build path on Windows
- #3568 RSB: UnboundLocalError: local variable 'build_max_size_human' referenced before assignment
- #3569 waf version in various rtems-repositories incompatible with python 3.7
- #3576 gdb 8.0.1 sis does not build on Cygwin
- #3577 Avoid CLoog and ISL host dependencies for target GCC
- #3579 testsuite's rtems-test-check.py python version support
- #3583 Add rtems_malloc() and rtems_callloc()
- #3585 Deprecate proc_ptr
- #3587 Deprecate rtems_context
- #3589 Deprecate rtems_context_fp
- #3591 Deprecate region_information_block
- #3593 Deprecate rtems_thread_cpu_usage_t
- #3595 Deprecate rtems_rate_monotonic_period_time_t
- #3598 Move internal types of API objects to separate header file
- #3599 Remove m32c architecture port
- #3600 Update or1k tools to use GCC master
- #3602 Update or1k tool chain to use the upstream GCC
- #3603 Remove support for 16-bit object identifiers
- #3604 RTL Unresolved Symbols from common section on i386/pc686 (cloned)
- #3605 RTL Allows Unloading a Module other Modules Depend Upon (cloned)
- #3609 Update Spike Version in RSB (RISC-V simulator)
- #3612 RTL unresolved compaction does not update string indexes after removing a string
- #3620 CommitTicketUpdater does not process commits in order
- #3621 Statically initialize object information structures
- #3622 Remove cache routines working with a processor set
- #3624 MSYS2 builds appear to ignore tcfg file
- #3625 RTL Allows Unloading a Module other Modules Depend Upon (cloned)
- #3626 sigtimedwait() needed when POSIX is disabled
- #3629 Add RSB reporting section to the documentation.
- #3630 Build of rtems-tools fails with i686-w64-mingw32
- #3636 Add rtems_scheduler_get_maximum_priority()
- #3637 Fix rtems_task_restart() argument type
- #3649 Error with IRC announcing in examples-v2 commits.

- #3651 Sphinx 1.8 PDF (latex) on FreeBSD does not build
- #3664 RSB config parsing slow on python3
- #3665 Add low level event recording infrastructure
- #3666 Add support for C++17 std::aligned_alloc
- #3667 Support data cache disable on ARMv7-AR
- #3668 Commit message in examples-v2 and libbsd didn't trigger a ticket update.
- #3669 rtems-docs.git does not build with Sphinx 1.8.2 and 1.8.3
- #3670 examples-v2 uses deprecated or obsolete RTEMS interfaces
- #3672 No i386 BSP can link all tests after cache manager changes
- #3673 xilinx_zynq_a9_qemu - fails to link psxconfig01
- #3674 Raspberry Pi Fails to Build
- #3675 RSB: Change default prefix to OS prefix + "rtems" + \$rtems_version
- #3677 ARM BSP contains ARM code in THUMB only build
- #3678 Add RISC-V BSP with support for the glibc
- #3682 Add BSP for Xilinx Zynq UltraScale+ MPSoC platform
- #3683 Git clone via HTTPS does not give much interactive feedback
- #3684 rtems_print_buffer is broken
- #3685 Add large memory support to libdl
- #3686 Add library searching and loading to libdl
- #3687 Add architecture section support to libdl and support PowerPC's small data.
- #3688 rtems-docs fails to build with python3
- #3692 libdl does not honour write unlock/lock for sections
- #3693 libdl incorrectly handles MIPS16hi/lo relocs
- #3694 shm_open has logically unreachable code (Coverity ID: 1399706, 1399714)
- #3696 Basic Support for Trace Compass
- #3699 Wrong system register specified for ARM virtual timer value retrieval
- #3708 Remove Doxygen comments from confdefs.h
- #3720 mfill shell command uses the wrong arguments for the memset()
- #3724 bsp/lpc24xx: Convert SSP driver to Linux API
- #3725 bsp/lpc24xx: Convert I2C driver to Linux API
- #3728 Set small data section to max size for mvme5500 and motorola_powerpc BSps
- #3731 Add rtems_scheduler_get_processor()
- #3732 Add rtems_scheduler_get_processor_maximum()
- #3733 Add general reg support to libdebugger
- #3734 Add RTEMS_CONST attribute
- #3735 Remove CONFIGURE_HAS_OWN_MULTIPROCESSING_TABLE
- #3736 PowerPC Beatnik BSP C++ exceptions broken

- #3882 Add POSIX user environment pointer to TCB
- #3885 Context switch extension is broken in SMP configurations
- #3887 Do not report remotes in RSB build log if --mail is used
- #3888 Update rtems_waf in libbsd
- #3893 RSB staging changes have broken building a 3rd party package
- #3894 Replace the device filesystem with a specialization of the IMFS
- #3895 Add a migration to RTEMS 5 chapter to User Manual
- #3896 RSB option --source-only-download does not work with releases
- #3898 Remove CONFIGURE_MAXIMUM_DEVICES
- #3900 New template for boolean feature defines
- #3901 New template for configuration options with a value
- #3903 raspberrypi2 libbsd 5-freebsd-12 does not build
- #3904 Add methods to dump the event records in base64 encoding (optionally zlib compressed)
- #3907 Update Getting Started Instructions
- #3909 rtems_waf with python2 needs to handle unicode strings with waf
- #3911 Remove gdbarmsim
- #3914 Spike has hard-coded path to DTC
- #3919 RSB may not download source of pkconfig checked packages
- #3921 QorIQ clock tick interval is off by one hardware clock tick
- #3927 tclsh required to build sqlite -- makes all BSP bsets fail
- #3936 C++ thread-local storage broken on sparc64
- #3938 Many (~40) BSPs Fail to Link all Tests
- #3944 qoriq_e500 BSP bset fails
- #3945 Update DTC example on rtems-docs/user/rsb/configuration.rst
- #3949 clock_settime() can lead to a failed _Assert()
- #3953 rtems_extensions_create() accepts a NULL pointer table
- #3956 RSB BSP build with tests does not keep a copy
- #3960 Add to FreeBSD host setup information
- #3961 bsps/arm: CPU counter based on arm generic timer doesn't work correctly
- #3966 RSB bare version number if wrong.
- #3967 Release source package list is out of date
- #3968 symlinks in RTEMS source tree
- #3969 dl06 fails on all libdl supported architectures
- #3970 Deprecate use _RTEMS_version at API level
- #3971 Deprecate use of RTEMS_MAXIMUM_NAME_LENGTH
- #3972 Deprecate <rtems/system.h>
- #3973 Add rtems_get_copyright_notice() and deprecate _Copyright_Notice
- #3974 Deprecate ephipany port in rtems5 and remove in rtems6
- #3976 Released RSB qemu4 source download fails.
- #3985 RSB PC BSP packages fail on building curl (libbsd related)
- #3987 ARMv7-M Exception handler does not store the SP
- #3992 Release URL path with sources is wrong
- #3995 Release doxygen support is broken
- #4002 Beaglebone and PC BSP stacks do not build
- #4005 Remove RTEMS_MP_NOT_CONFIGURED error condition
- #4006 rtems-test target_exe_filter fails when there is no filter

Details

Ticket	Created	Resolution	Component	Reporter	Owner	Modified
#1247	13 years ago	fixed	fs	strauman	Chris Johns	3 years ago
Summary	RTEMS does not implement locks needed by multithreaded newlib					

	multi-threaded newlib protects a number of internal data structures (as of newlib-1.15 these comprise: <ul style="list-style-type: none"> • global list of FILE objects • stdio FILE object initializer • individual FILEs [since FILEs with the exception of stdin/stdout/stderr are per-process entities] • global hash table used by telldir/seekdir • individual DIR structures (opendir/readdir) • atexit list • list of environment variables • global timezone variable) using mutexes. It expects the OS to implement these locks but defaults to not using locking if the OS does not provide an implementation. Currently, RTEMS does *not* provide its own implementation of 'sys/lock.h' and therefore vital data structures in newlib are currently *unprotected* (with the exception of environment variables -- 'envlock.c' had been added to RTEMS a while ago but since then, newlib has introduced more locks and a general OS interface which - once implemented - will obsolete 'envlock.c'). <p>Note that while semantics of having no protection for individual FILE objects may be tolerable, having no protection for global newlib data structures such as lists of FILEs is not acceptable.</p> <p>I am currently working on an implementation which should be available shortly.</p>					
#1394	11 years ago	fixed	tool/newlib	Daniel Hellstrom	Chris Johns	3 years ago
Summary	scandir() fails due to MAXNAMELEN is incorrect					
Description	<p>I have been trying to use scandir() however the newlib one does not work due to MAXNAMELEN and NAMELEN differ. scandir in libcsupport seems to have a fix for this, however my libcsupport_a-scandir.o is empty, I'm guessing because HAVE_SCANDIR is defined.</p> <p>It is used in scandir() (newlib-1.17.0/newlib/lib/posix/scandir.c:117) by the macro DIRSIZ. Where DIRSIZ uses the MAXNAMELEN define which is set incorrectly. It does not match the sizeof(struct dirent) which makes the DIRSIZ return a negative number, then malloc(DIRSIZ(d)) will try to allocate 4GB which fail.</p> <p>My guess is that MAXNAMELEN should be defined in newlib-1.17.0/newlib/lib/sys/rtems/sys/dirent.h or newlib-1.17.0/newlib/lib/sys/rtems/include/limits.h or in a new file.</p> <p>I tried to run the code below on my FAT filesystem, taken directly from the scandir(3) man page.</p> <pre> /* print files in current directory in reverse order */ #include <dirent.h> main(){ struct dirent namelist; int n; n = scandir(".", &namelist, 0, NULL); if (n < 0) perror("scandir"); else { while(n--) { printf("%s\n", namelist[n]->d_name); free(namelist[n]); } free(namelist); } } </pre>

Summary	Heap extend allows discontinuous memory regions.					
Description	<p>The check in (cpukit/ChangeLog) states:</p> <p>2010-06-07 Sebastian Huber <sebastian.huber@...></p> <ul style="list-style-type: none"> • score/src/heapextend.c: Implemented support for scattered heap areas. <p>The heap cannot support scattered blocks because the _Heap_Is_block_in_heap assumes the region is continuous between the first and last blocks of the heap. Making the gaps in the regions passed to the heap extend call used is questionable and makes the _Heap_Is_block_in_heap test not really perform the task it's name states. This is an issue because it is this check that determines if a heap free of NULL should proceed. This issue is covered in another PR.</p> <p>I also wonder about a heap free call to an address that maps to one of the "in-use" gap regions. The previous heap code knew if an address was in the heap and therefore it was kind of safe to probe for a valid block. This assumption is now not valid.</p> <p>The former heap extend code:</p> <p>http://www.rtems.org/viewvc/rtems/cpukit/score/src/heapextend.c?revision=1.7&view=markup</p> <p>clearly states the type of memory that can be added to an existing heap. The current code has no restrictions. The user manual is not great in this area. It would also be useful if comments are added to the heap extend code.</p> <p>The heap extend code is used by the rtems_region_extend call and this call clearly states in the manual that the memory region must be continuous. If this has changed we should discuss the API change and make better note of it. I also suspect the test suite will need additions to test any API changes.</p>

Descripti
on

The watchdog lock is highly contended and since the watchdog insert procedure acquires and releases the lock during the iteration of the watchdog chain several times, this yields the high thread dispatch disabled times.

To get rid of this bottleneck we should move the watchdog context into the scheduler context to use one watchdog context per scheduler instance. Take care that active watchdogs move in case of a scheduler change of a thread.

Summary	Enable function and data sections					

In order to reduce the size of executables it is beneficial to put all global functions and data into separate sections. This enables the linker to perform a garbage collection which removes all items not directly referenced. The following steps are necessary:

1. Modify the build system to use the following compiler and linker flags:
- ```

CFLAGS += -ffunction-sections -fdata-sections LDFLAGS += -Wl,--gc-sections

```
2. Review all linker command files and ensure that linker sets and global constructor sections are not affected by the garbage collection (e.g. use the KEEP() directive of GNU ld).

|         |                                 |       |             |                 |                 |              |
|---------|---------------------------------|-------|-------------|-----------------|-----------------|--------------|
| #2408   | 5 years ago                     | fixed | unspecified | Sebastian Huber | Sebastian Huber | 4 months ago |
| Summary | Linker set based initialization |       |             |                 |                 |              |

Linker sets are used for example in Linux, FreeBSD (they are used in the RTEMS port of the FreeBSD network stack, e.g. libbsd), eCos and for global C++ constructors. They provide a space efficient and flexible means to initialize modules. A linker set consists of

- dedicated input sections for the linker (e.g. `.ctors` and `.ctors.*` in the case of global constructors),
- a begin marker (e.g. provided by `crtbegin.o`), and
- an end marker (e.g. provided by `ctrend.o`).

A module may place a certain data item into the dedicated input section. The linker will collect all such data items in this section and creates a begin and end marker. The initialization code can then use the begin and end markers to find all the collected data items (e.g. function pointers).

Lets look how this works using a simple example. For this we need three files `myset.h`,

```

#ifndef MYSET_H
#define MYSET_H

/* The linker set items */
typedef struct {
 void (*func)(void);
} item;

/*
 * Macro to create a linker set item. The first parameter is
 * the designator of the item. It must be unique within the
 * module scope. The second parameter is the desired function.
 */
#define MYSET_ITEM(i, f) \
 __attribute__((used)) \
 __attribute__((section(".rtmsroset.myset.content"))) \
 static item i = { f }

#endif /* MYSET_H */

```

`module.c`

```

#include "myset.h"
#include <stdio.h>

/*
 * Some global function that needs a module specific
 * initialization done by f().
 */
void
g(void)
{
 printf("g()\n");
}

/* The module constructor */
static void
f(void)
{
 printf("f()\n");
}

/*
 * This registers the module constructor f()
 * in the linker set "myset".
 */
MYSET_ITEM(i, &f);

```

and `init.c`.

```

#include "myset.h"
#include <stddef.h>

/* Should be in a proper header file */
void g(void);

/* Define the start marker */
__attribute__((used))
__attribute__((section(".rtmsroset.myset.begin")))
static volatile const item begin[0];

/* Define the end marker */
__attribute__((used))
__attribute__((section(".rtmsroset.myset.end")))
static volatile const item end[0];

int main(void)
{
 size_t n = &end[0] - &begin[0];
 size_t i;

 /* Call all functions of the linker set */
 for (i = 0; i < n; ++i) {
 (*begin[i].func)();
 }

 /*
 * This will pull in the module.c and register its item in the
 * linker set "myset". So g() can rely on f() being called first.
 */
 g();

 return (0);
}

```

In the linker command file of the GNU linker we need the following statement.

```

.rtmsroset : {
 KEEP (* (SORT (.rtmsroset.*)))
}

```

The `KEEP()` ensures that a garbage collection by the linker will not discard the content of this section. This would be normally the case since the linker set items are not referenced

directly. The `[SORT()]` directive sorts the input sections lexicographically. Please note the lexicographical order of the `[.begin]`, `[.content]` and `[.end]` section name parts in the previous example which ensures that the position of the begin and end markers are right. The interesting part of linker map file of the previous example may look like this.

```
.rtemsroset 0x000000001001990 0x4 load address 0x00000000002268c
(SORT(.rtemsroset.))
.rtemsroset.myset.begin
0x000000001001990 0x0 init.o
.rtemsroset.myset.content
0x000000001001990 0x4 module.o
.rtemsroset.myset.end
0x000000001001994 0x0 init.o
```

So what is the benefit of using linker sets to initialize modules? Currently in RTEMS all available managers (semaphore, message queue, barrier, etc.) are initialized since the initialization code doesn't know what is actually used by the application. With the linker set approach we need to initialize only those managers that are used by the application. In case an application uses message queues, then it must call `[rtems_message_queue_create()]`. In the module implementing this function we can place a linker set item and register the message queue handler constructor. Otherwise, in case the application doesn't use message queues, then there will be no reference to the `[rtems_message_queue_create()]` function and the constructor is not registered, thus nothing of the message queue handler will be in the final executable.

|         |                                              |       |       |                 |                 |             |
|---------|----------------------------------------------|-------|-------|-----------------|-----------------|-------------|
| #2412   | 5 years ago                                  | fixed | score | Sebastian Huber | Sebastian Huber | 3 years ago |
| Summary | Improved priority inheritance implementation |       |       |                 |                 |             |

## Problem

The RTEMS mutexes implement only a very simple approximation of the priority inheritance protocol. The real priority of a thread is only restored once it releases its last mutex. Lets consider this scenario. We have a file system instance protected by one mutex (e.g. JFFS2) and a dynamic memory allocator protected by another mutex. A low priority thread performs writes some log data into a file, thus it acquires the file system instance mutex. The file system allocates dynamic memory. Now a high priority thread interrupts and tries to allocate dynamic memory. The allocator mutex is already owned, so the priority of the low priority thread is raised to the priority of the high priority thread. The memory allocation completes and the allocator mutex is released, since the low priority thread still owns the file system instance mutex it continues to execute with the high priority (the high priority thread is not scheduled). It may now perform complex and long file system operations (e.g. garbage collection, polled flash erase and write functions) with a high priority.

## Functional requirements

- The mutex shall use the priority inheritance protocol to prevent priority inversion. On SMP configurations OMIP shall be used.
- The mutex shall allow vertical nesting (a thread owns multiple mutexes).
- The mutex shall allow horizontal nesting (a thread waits for ownership of a mutex those owner waits for ownership of a mutex, and so on).
- Threads from one scheduler instance shall wait in priority order. The highest priority thread shall be dequeued first.
- The highest priority waiting thread of each scheduler instance shall wait in FIFO order.
- The mutex shall provide an acquire operation with timeout.
- In case a mutex is released, then the previous owner shall no longer use the priorities inherited by this mutex.
- In case a mutex acquire operation timeout occurs, then the current owner of the mutex shall no longer use the priorities inherited by the acquiring thread.
- The order of the mutex release operations may differ from the order of the mutex acquire operations.
- Priority changes not originating due to the priority inheritance protocol shall take place immediately.
- Deadlock shall be detected. In case a deadlock would occur an error status shall be returned or a fatal error shall be generated.
- Deadlocks at application level shall not lead to a deadlock at operating system level.

## Performance requirements

- The mutex acquire operation shall use only object-specific locks in case the mutex is not owned currently.
- The mutex release operation shall use only object-specific locks in case no threads wait for ownership of this mutex.

Description

## Invariants

- A mutex shall be owned by at most one thread.
- A thread shall wait for ownership of at most one mutex.

## Possible implementation

Use a recursive data structure to determine the highest priority available to a thread for each scheduler instance, e.g.

```
typedef struct Thread_Priority_node {
 Priority_Control current_priority;
 Priority_Control real_priority;
 struct Thread_Priority_node *owner;
 RBTNode Node;
 RBTControl Inherited_priorities;
} Thread_Priority_node;

typedef struct {
 ...
 Thread_Priority_node *priority_nodes; /* One per scheduler instances */
 ...
} Thread_Control;
```

Initially a thread has a priority node reflecting its real priority. The `Thread_Priority_node::owner` is NULL. The `Thread_Priority_node::current_priority` is set to the real priority. The `Thread_Priority_node::Inherited_priorities` is empty.

In case the thread must wait for ownership of a mutex, then it enqueues its priority node in `Thread_Priority_node::Inherited_priorities` of the mutex owner.

In case the thread is dequeued from the wait queue of a mutex, then it dequeues its priority node in `Thread_Priority_node::Inherited_priorities` of the previous mutex owner (ownership transfer) or the current mutex owner (acquire timeout).

In case the minimum of `Thread_Priority_node::real_priority` and `Thread_Priority_node::Inherited_priorities` changes, then `Thread_Priority_node::current_priority` is updated. In case the `Thread_Priority_node::owner` is not NULL, the priority change propagates to the owner, and so on. In case `Thread_Priority_node::current_priority` changes, the corresponding scheduler is notified.

The biggest issue is the locking on SMP configurations in case of recursive minimum updates.

Somehow we must connect this to the scheduler helping protocol for OMIP. We may have to replace the return value based scheduler operations with a pre-context-switch action. Due to some recent implementation changes the run-time of the `_Thread_Dispatch()` function is no longer average-case performance critical.

| Description  | <p>It seems that the method for accessing an existing file repository both isn't covered much in the "manual", but it also fails to find it. Looking at the python code in download.py, it requires the format <code>file://</code> to identify the local file protocol, but then tries to access the actual file/directory using that the entire url (including <code>file://</code>).</p> <p>This unfortunately fails and I'm not familiar enough with Python to correct this, although it appears that the <code>"file://"</code> part should be cut from the URL before calling the <code>"return path.isdir(url)"</code> in the <code>_file_downloader</code> function.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                |                           |              |

| Summary      | rtems_iterate_over_all_threads lacks user callback private pointer pass through                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |                |                           |              |
| Description  | <p>Typically when designing an API that calls a user callback there is a user private <code>"void *"</code> pointer transparently passed through to the user callback so that the user can access his private state inside of his callback without being forced to employ a global variable. A global variable doesn't work very well if there are multiple objects instances created each of them using the same method with <code>rtems_iterate_over_all_threads</code>. This type of <code>"void *"</code> private pointer is of course a standard approach allowing the users callback to behave much the same way as a virtual method in C++, but nevertheless retaining a compatible C based API.</p> <p>An enhanced version of the API might look like this.</p> <pre>void rtems_iterate_over_all_threads_xxx( rtems_per_thread_routine routine, void * const pUserPrivatePassThrough ); typedef void (*rtems_per_thread_routine_xxx)( Thread_Control *the_thread, void * const pUserPrivatePassThrough );</pre> <p>The <code>pUserPrivatePassThrough</code> is not used by the library; it is retained for the duration of the <code>rtems_iterate_over_all_threads_xxx</code> function only so that it can be passed through to the user's callback.</p> <p>thanks for your consideration of this matter</p>                                                       |         |             |                |                           |              |
| <b>#2428</b> | 5 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | fixed   | tool/rsb    | Joel Sherrill  | Chris Johns               | 3 years ago  |
| Summary      | Add 4.12 Tool Target Configurations to RSB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |                |                           |              |
| Description  | <p>Even though so far the 4.11 and master tools don't need to be different, 4.12 configurations need to be added. This gives us space to:</p> <p>+ (DONE) remove obsolete targets (avr, h8300, m32r) + (DONE) update versions + complete submission of patches and bump gdb + ...</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |                |                           |              |

| Description  | <p>Remove the AVR port per the instructions at <a href="https://devel.rtems.org/wiki/Developer/Removing_a_Port">https://devel.rtems.org/wiki/Developer/Removing_a_Port</a>.</p> <p>All BSPs must be removed before the architectural port can be removed. These are tracked by the following tickets:</p> <ul style="list-style-type: none"> <li><b>#2442</b> - avrtest</li> </ul> <p>Rationale: The AVR port is incomplete and the largest AVR CPU models are just barely large enough to run RTEMS. This by itself is not enough to drop the port. However, the state of GCC for this target is poor. It is marginally maintained. Atmel maintains their own patch set independent of GCC. Plus they use their own small (and unique) C Library. This makes avr-rtems the only user of AVR+newlib. The target size is a challenge but that was why the port was initially interesting. It provided a real goal. But the tool state is painful for a port which is incomplete and has neither users nor anyone interested in actively maintaining it for GCC or RTEMS.</p>                                                                                                                                                                                                                                                                                                 |         |             |                |                           |              |

| Description  | <p>Remove the m68k/mvme136 BSP per the instructions at <a href="https://devel.rtems.org/wiki/Developer/Removing_a_BSP">https://devel.rtems.org/wiki/Developer/Removing_a_BSP</a></p> <p>Rationale: Although it is sad to see the BSP for the board that RTEMS was developed for be removed, this board was current in 1988-9. It has only 1MB RAM, 2 UARTS, and no NIC. It is unlikely to be available and without a NIC, isn't that useful.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                |                           |              |

| Summary      | Remove m68k/sim68000 BSP                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |                |                           |              |
| Description  | <p>Remove the m68k/sim68000 BSP per the instructions at <a href="https://devel.rtems.org/wiki/Developer/Removing_a_BSP">https://devel.rtems.org/wiki/Developer/Removing_a_BSP</a></p> <p>Rationale: This is a BSP for a simulator named BSVC (<a href="http://www4.ncsu.edu/~bwmott/bsvc/">http://www4.ncsu.edu/~bwmott/bsvc/</a>) that was never under a truly free license and has not been updated in a decade. Although a decent tool, it was extremely slow.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |                |                           |              |

| Description | Rationale: This is a radiation hardened MIPS R3000 CPU that has only been used by a few missions. After discussions with various NASA and commercial engineers, we have learned that it is no longer considered an option for new missions and has not an option for a considerable length of time. The missions still underway (including New Horizons) are locked down on very old versions of their development infrastructure including hosts. |         |              |                 |                           |               |

| Description | Rationale: This BSP is for very old Nintendo hardware and required the use of either a simulator or hard to obtain programmable game cartridge. Nintendo was aggressive in shutting down resellers of those cartridges. There is no real console input and it is hard to automate testing. This was a useful BSP when there were few ARM BSPs but with the Pi, Beagle, etc. these days are long past.                                              |         |              |                 |                           |               |

| Description | Remove the arm/nds BSP per the instructions at <a href="https://devel.rtems.org/wiki/Developer/Removing_a_BSP">https://devel.rtems.org/wiki/Developer/Removing_a_BSP</a>                                                                                                                                                                                                                                                                           |         |              |                 |                           |               |
| Description | Rationale: This BSP is for very old Nintendo hardware and required the use of either a simulator or hard to obtain programmable game cartridge. Nintendo was aggressive in shutting down resellers of those cartridges. There is no real console input and it is hard to automate testing. This was a useful BSP when there were few ARM BSPs but with the Pi, Beagle, etc. these days are long past.                                              |         |              |                 |                           |               |

| Description | All BSPs must be removed before the architectural port can be removed. These are tracked by the following tickets:                                                                                                                                                                                                                                                                                                                                 |         |              |                 |                           |               |
| Description | #2453 - h8sim                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |              |                 |                           |               |
| Description | Rationale: The h8 has been end of lifed. There do not appear to be any users based up questions and tickets filed. The architecture itself has issues which lead to breakages in gcc (which do get fixed though often slowly) and those same issues force us to disable some features like iconv in newlib. With no users, end of life, and tool issues, it is time to remove it.                                                                  |         |              |                 |                           |               |

| Description | Remove the powerpc/ep1a BSP per the instructions at <a href="https://devel.rtems.org/wiki/Developer/Removing_a_BSP">https://devel.rtems.org/wiki/Developer/Removing_a_BSP</a>                                                                                                                                                                                                                                                                      |         |              |                 |                           |               |
| Description | Rationale: AFAIK this BSP was only used on a program supported by OAR. That program is no longer in active development and is completely frozen. If that situation changes, the BSP can be resurrected. It was introduced 10 years ago and has not has a modification other than general maintenance in the last four years.                                                                                                                       |         |              |                 |                           |               |

| Summary     | Remove powerpc/score603e BSP                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                 |                           |               |
| Description | Remove the powerpc/score603e BSP per the instructions at <a href="https://devel.rtems.org/wiki/Developer/Removing_a_BSP">https://devel.rtems.org/wiki/Developer/Removing_a_BSP</a>                                                                                                                                                                                                                                                                 |         |              |                 |                           |               |
| Description | Rationale: AFAIK this BSP was only used on a program supported by OAR. That program is no longer in active development and is completely frozen. If that situation changes, the BSP can be resurrected. It was introduced in 1999 and has not has a modification other than general maintenance in the last six years.                                                                                                                             |         |              |                 |                           |               |

| Summary     | RSB: Tool patches use the RTEMS version                                                                                                                                                                                                                                                                                                                                                                                                            |         |              |                 |                           |               |
| Description | In rtems/config/rtems-urls.bset the tool patches are set to an RTEMS version dependent directory. This makes re-use of the general purpose files quite difficult.                                                                                                                                                                                                                                                                                  |         |              |                 |                           |               |
| #2468       | 5 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                        | fixed   | arch/i386    | Joel Sherrill   | Sebastian Huber           | 3 years ago   |
| Summary     | Add Thread Local Storage (TLS) support on x86                                                                                                                                                                                                                                                                                                                                                                                                      |         |              |                 |                           |               |
| Description | The x86 is one of the architectures which does not support Thread Local Storage. Each architecture requires target architecture specific support to provide this standard language feature.                                                                                                                                                                                                                                                        |         |              |                 |                           |               |
| Description | Details on the implementation by the compiler may be found at <a href="http://wiki.osdev.org/Thread_Local_Storage">http://wiki.osdev.org/Thread_Local_Storage</a> .                                                                                                                                                                                                                                                                                |         |              |                 |                           |               |
| Description | Based on this information, I think a segment register needs to be added to the thread context and some hooks to the TLS implemented.                                                                                                                                                                                                                                                                                                               |         |              |                 |                           |               |
| Description | Architecture information on TLS implementation should be added to the CPU Supplement document as this is part of the ABI and context switch.                                                                                                                                                                                                                                                                                                       |         |              |                 |                           |               |
| Description | As part of effort, the documentation for the general procedure of adding target specific TLS support should be added to the porting guide or reviewed.                                                                                                                                                                                                                                                                                             |         |              |                 |                           |               |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |              |                 |                                       |             |

| Description | RTEMS has an API for dynamic debug support in <rtems/debug.h>. This feature is sparsely used:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |              |                 |                                       |             |

| Description | The only user is the Classic Region and it is only active in case RTEMS_DEBUG is defined. Due to the heap protection support which is also available in case RTEMS_DEBUG is defined, the expensive heap walks are superfluous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                 |                                       |             |
| Description | We should remove this API entirely to simplify the code base.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |              |                 |                                       |             |

| Summary     | RSB: Use SHA512 instead of MD5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                 |                                       |             |
| Description | Since MD5 is not a secure hash algorithm, we should change all hashes used by the RSB configuration files to use SHA512.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |              |                 |                                       |             |

| Summary     | Remove task variables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |              |                 |                                       |             |
| Description | Notepads were marked as obsolete in 4.11. Next step is to remove them. Documentation should mention that notepads are removed and list the alternatives, e.g. POSIX keys or thread local storage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |              |                 |                                       |             |

| Summary     | mvme5500 BSP: Exception Handler uses deprecated Notepads.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |              |                 |                                       |             |
| Description | The MVME5500 BSP uses Notepads in its exception handler and #2493 removes them. This is obviously not portable and requires a rewrite.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                 |                                       |             |

| Summary     | Make POSIX API mandatory (except signals and the sporadic server)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |              |                 |                                       |             |
| Description | The POSIX API is currently a build-time configuration option. In general it is beneficial to avoid build-time configuration options since this reduces the testing scope.<br>Applications not using the POSIX API should observe only a minimal overhead due to this change.<br>This enhancement depends on #2408.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |              |                 |                                       |             |
| #2515       | 4 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | fixed   | unspecified  | Gedare Bloom    | Gedare Bloom                          | 3 years ago |
| Summary     | i386 score/libcpu API Layering Violation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |              |                 |                                       |             |
| Description | The file libcpu/i386/cpu.h provides functions referenced in rtems/score/i386.h Relatedly, libcpu/i386/cpu.h is the only other consumer than score/cpu.h of the score/interrupts.h. The libcpu/i386/cpu.h should be refactored into rtems/score/i386.h, which could also then subsume rtems/score/interrupts.h.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                 |                                       |             |

| Summary     | Use Newlib exec*() variants and remove RTEMS versions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |              |                 |                          |             |
| Description | In reviewing RTEMS+newlib POSIX conformance, I noticed that our newlib configuration does include the exec*() variants. All of these call _execve() which we already provided. This ticket is just to explain the removal of the RTEMS copies. The functional behavior to the user is still to return ENOSYS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |              |                 |                          |             |
| #2542       | 4 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | fixed     | bsps         | Joel Sherrill   | joel.sherrill@...        | 3 years ago |
| Summary     | Review cxx_iostream size change per function-section changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |           |              |                 |                          |             |
| Description | <p>It looks like some BSPs with their own linkcmds may have shrunk too much. Norm appears to be 50% while some went to 75-80%. A second look after catching the pattern indicates that the KEEP() section requirements in the linker scripts were not correct and it was missed.</p> <p>Rather than reverting a bunch of patches, this ticket is to review all function-section patches from this one back in time for cxx_iostream shrinking too much.</p> <p>commit <a href="#">6d21c13e5094d490280a941cf0e833f91f85715</a> Author: Ralph Holmes &lt;ralph@...&gt; Date: Sat Jan 23 21:15:40 2016 +0000</p> <p>powerpc/gen5200: Add per-section compilation and linking support.</p> <p>For the brs5l BSP variant:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |           |              |                 |                          |             |

| Summary     | New watchdog handler implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |              |                 |                          |             |

## Background

The watchdog handler uses delta chains. The insert operation has a  $O(n)$  worst-case time complexity with  $n$  being the count of watchdogs in the delta chain. In each step of the insert operation, the SMP lock of the corresponding watchdog header is acquired and released. The profiling data obtain by test program `smpstests/smpwakeafter01` showed that the current implementation leads to unacceptable latencies, thus it should be replaced by something else.

The use cases for the watchdog handler fall roughly into two categories.

- Timeouts - used to detect if some operations needs more time than expected. Since the unexpected happens hopefully rarely, timeout timers are usually removed before they expire. The critical operations are insert and removal. They are important for the performance of a network stack.
- Timers - used to carry out some work in the future. They usually expire and need a high resolution. An example user is a time driven scheduler, e.g. rate-monotonic or EDF.

One approach is to use a red-black tree with the expiration time as the key. This leads to  $O(\log(n))$  worst-case insert and removal operations. For each operation it is sufficient to acquire and release the lock only once. The drawback is that a 64-bit integer type must be used for the intervals to avoid a potential overflow of the key values. With a system tick interval of 1ns the system could run more than 500 years before an overflow happens. The EDF scheduler would also profit from a 64-bit interval representation, see [#2173](#).

An alternative is the use of a **timer wheel** based algorithm which is used in Linux and FreeBSD for example. A timer wheel based algorithm offers  $O(1)$  worst-case time complexity for insert and removal operations. The drawback is that the run-time of the watchdog tick procedure is somewhat unpredictable due to the use of a hash table or cascading.

Which approach should we choose? Since the watchdog serves the timeout and timer services in RTEMS we have to make some trade-offs. We recommend to use the red-black tree approach which offers a more predictable run-time behaviour and sacrifice the constant insert and removal operations offered by the timer wheel algorithms, see also <https://www.kernel.org/doc/ols/2006/ols2006v1-pages-333-346.pdf>. We can reuse the red-black tree support already used for the thread priority queues.

The new watchdog handler implementation is a prerequisite to eliminate the Giant lock in the Classic Timer manager.

## Implementation

Change the `Watchdog_Ticks_since_boot` to a 64-bit integer type. Keep the `Watchdog_Interval` at 32-bit for backward compatibility. Replace the delta chains with a red-black tree. Use the ticks for timers with a relative expiration time. Use `struct timespec` or `struct bintime` for timers with an absolute expiration time. This has the benefit that we do not have to adjust the data structures in case the absolute time changes, e.g. due to NTP. It simplifies the POSIX timer services, since no conversion to ticks is necessary.

| Summary | Eliminate the Giant lock |       |       |                 |                 |             |

## Background

The standard approach to turn a uni-processor operating system into an SMP-capable operating system is to encapsulate virtually the complete operating system state and protect it by one global recursive lock - the Giant lock. Thus, at most one processor can modify the operating system state at a time. Under Giant lock protection interrupt disable/enable critical sections still work. This approach is easy to realize and leads to something that runs on SMP with a minimal effort. Unfortunately, such an operating system does not scale with the processor count and offers very poor performance. It is quite useless for real applications.

The first steps to get rid of the Giant lock are tackled with the introduction of fine grained locking for the scheduler, watchdog handler, timestamps, thread queues, events, semaphores and message queues. The Giant lock is still used in a couple of places, e.g. all other objects using thread queues, thread life cycle changes (termination, restart) and scheduler changes. It is a straight forward task to eliminate it entirely, but it is also somewhat labour intensive since a lot of code must be changed.

## Implementation

Eliminate all remaining code areas that use

- `_ISR_Disable()`,
- `_ISR_Enable()`, and
- `_ISR_Flash()`.

Direct users of these macros are

- `_Chain_Append()`,
- `_Chain_Extract()`,
- `_Chain_Get()`,
- `_Chain_Insert()`, and
- `_Chain_Prepend()`.

Each spot must be dealt with individually. Once this is done, delete these macros since they are now superfluous. Rename `_ISR_Disable_without_giant()` into `_ISR_Locale_disable()`. Rename `_ISR_Enable_without_giant()` into `_ISR_Locale_enable()`.

Eliminate all remaining code areas that use

- `_Thread_Disable_dispatch()` and
- `_Thread_Enable_dispatch()`.

A prominent user of this functions is `_Objects_Get()`. The following components are affected by these functions

- Classic barrier handler,
- Classic dual-ported memory handler,
- Classic message queue handler,
- Classic partition handler,
- Classic rate-monotonic handler,
- Classic region handler,
- Classic semaphore handler,
- Classic timer handler,
- extension handler,
- IO manager,
- multi-processing management,
- objects management,
- POSIX barrier handler,
- POSIX condition handler,
- POSIX key handler,
- POSIX message queue handler,
- POSIX mutex handler,
- POSIX rwlock handler,
- POSIX semaphore handler,
- POSIX spinlock handler,
- POSIX timer handler,
- signals,
- thread cancellation,
- thread life-cycle changes, and
- thread scheduler changes.

Once this is done, delete `_Thread_Disable_dispatch()` and `_Thread_Enable_dispatch()`. As a side-effect the Giant lock will be removed.

| Summary | Implement the O(m) Independence-Preserving Protocol (OMIP) |       |       |                 |                 |             |

## Background

The O(m) Independence-Preserving Protocol (OMIP) is a generalization of the priority inheritance protocol to clustered scheduling which avoids the non-preemptive sections present with priority boosting. The m denotes the number of processors in the system. Its implementation requires an extension of the scheduler helping protocol already used for the MrsP semaphores. However, the current implementation of the scheduler helping protocol has two major issues, see Catellani, Sebastiano, Luca Bonato, Sebastian Huber, and Enrico Mezzetti: Challenges in the Implementation of MrsP. In Reliable Software Technologies - Ada-Europe 2015, pages 179–195, 2015. Firstly, the run-time of some scheduler operations depend on the size of the resource dependency tree. Secondly, the scheduler operations of threads which don't use shared resources must deal with the scheduler helping protocol in case an owner of a shared resource is somehow involved.

To illustrate the second issue, let us look at the following example. We have a system with eight processors and two L2 caches. We assign processor 0 to a partition P for latency sensitive real-time tasks (e.g. sensor and actuator handling), processors 1, 2 and 3 are assigned to a cluster C<sub>A</sub> and the remaining processors are assigned to a cluster C<sub>B</sub> for soft real-time worker tasks. The worker tasks use a shared resource, e.g. a file system for data storage. Let us suppose a task R of partition P sends a message to the workers. This may make a waiting worker ready, which in turn pre-empts the owner of a shared resource. In this case the scheduler helping protocol takes action and is carried out by the task R. This contradicts the intended isolation of scheduler instances.

The reason for this unfortunate coupling is a design issue of the scheduler helping protocol implementation. Some scheduler operations may return a thread in need of help. For example, if a thread is unlocked which pre-empts an owner of a shared resource, then the pre-empted thread is returned. Once a thread in need of help is returned, the ask for help operation of the scheduler is executed. An alternative to this return value based approach is the introduction of a pre-emption intervention during thread dispatching. Threads taking part in the scheduler helping protocol indicate this with a positive resource count value. In case a thread dispatch occurs and pre-empts an owner of a shared resource, the scheduler ask for help operation is invoked. So, the work is carried out on behalf of the thread which takes part in the scheduler helping protocol.

To overcome the first issue, an improved resource dependency tracking is required. One approach is to use a recursive red-black tree based data structure, see #2412.

## Implementation

There are several steps necessary to implement OMIP.

- Introduce per-scheduler locks.
- Enable context switches with interrupts enabled.
- Add a pre-emption intervention to the thread dispatch.
- Add a table for priority nodes to the thread control block. For each scheduler instance there is one priority node.
- Update the table in case the thread blocks on a resource, a timeout while waiting for a resource occurs, or ownership of a resource is transferred to the thread.
- Use this table in the pre-emption intervention.
- Update the MrsP implementation to the new infrastructure.

Currently, only one scheduler lock for all scheduler instances is used. This simplified the MrsP implementation and due to the presence of a Giant lock, this was not an issue. With the elimination of the Giant lock, however, we need one scheduler lock per scheduler instance to really profit from a decoupled system due to clustered scheduling.

The current implementation of thread dispatching has some implications with respect to the interrupt latency. It is crucial to preserve the system invariant that a thread can execute on at most one processor in the system at a time. This is accomplished with a boolean indicator in the thread context. The processor architecture specific context switch code will mark that a thread context is no longer executing and waits that the heir context stopped execution before it restores the heir context and resumes execution of the heir thread (the boolean indicator is basically a TTAS lock). So, there is one point in time in which a processor is without a thread. This is essential to avoid cyclic dependencies in case multiple threads migrate at once. Otherwise some supervising entity is necessary to prevent deadlocks. Such a global supervisor would lead to scalability problems so this approach is not used. Currently the context switch is performed with interrupts disabled. Thus in case the heir thread is currently executing on another processor, the time of disabled interrupts is prolonged since one processor has to wait for another processor to make progress.

If we add pre-emption intervention to the thread dispatch sequence, then there is an even greater need to avoid this issue with the interrupt latency. Interrupts normally store the context of the interrupted thread on its stack. In case a thread is marked as not executing, we must not use its thread stack to store such an interrupt context. We cannot use the heir stack before it stopped execution on another processor. If we enable interrupts during this transition, then we have to provide an alternative thread independent stack for interrupts in this time frame.

Descripti  
on

The pre-emption intervention should be added to `_Thread_Do_dispatch()` before the heir is read and perform the following pseudo-code actions.

```
pre_emption_intervention(executing):
 if executing.resource_count > 0:
 executing.lock()
 if executing.is_ready():
 for scheduler in executing.schedulers:
 scheduler.lock()
 if !executing.is_scheduled():
 for scheduler in executing.schedulers:
 scheduler.ask_for_help(executing)
 for scheduler in executing.schedulers:
 scheduler.unlock()
 else if executing.active_help_level > 0:
 idle.use(executing.scheduler_node)
 executing.unlock()
```

The scheduler help operation affects multiple scheduler instances. In terms of locking we have only two options,

- use a global scheduler lock, or
- obtain multiple per-scheduler locks at once.

A global scheduler lock is not an option. To avoid deadlocks obtain the per-scheduler locks in a fixed order. However, in this case the per-scheduler locks will observe different worst-case and average-case acquire times (depending on the order).

Use a recursive data structure to determine the highest priority available to a thread for each scheduler instance, e.g.

```
typedef struct Thread_Priority_node {
 Priority_Control current_priority;
 Priority_Control real_priority;
 struct Thread_Priority_node *owner;
 RBTree_Node Node;
 RBTree_Control Inherited_priorities;
} Thread_Priority_node;

typedef struct {
 ...
 Thread_Priority_node *priority_nodes; /* One per scheduler instances */
 ...
} Thread_Control;
```

Initially a thread has a priority node reflecting its real priority. The `Thread_Priority_node::owner` is `NULL`. The `Thread_Priority_node::current_priority` is set to the real priority. The `Thread_Priority_node::Inherited_priorities` is empty.

In case the thread must wait for ownership of a mutex, then it enqueues its priority node in `Thread_Priority_node::Inherited_priorities` of the mutex owner.

In case the thread is dequeued from the wait queue of a mutex, then it dequeues its priority node in `Thread_Priority_node::Inherited_priorities` of the previous mutex owner (ownership transfer) or the current mutex owner (acquire timeout).

In case the minimum of the `Thread_Priority_node::real_priority` and the `Thread_Priority_node::Inherited_priorities` changes, then `Thread_Priority_node::current_priority` is updated. In case the `Thread_Priority_node::owner` its not `NULL`, the priority change propagates to the owner, and so on. In case `Thread_Priority_node::current_priority` changes, the corresponding scheduler is notified.

Use the thread lock to protect the priority nodes.

Summary arm/lpc176x: linker script update (add KEEP() sections)

Description This BSP's linker script does not include KEEP() directives and thus cannot have per-function and per-data element section support enabled. The preferred solution is to convert the BSP to use a shared base linker script. The acceptable solution is to add the proper KEEP directives to the existing linker script(s). Shared linker scripts for the arm, m68k, and sparc have the proper KEEP sections and can serve as examples.

Summary alarm() uses seconds watchdog and thus is affected by clock changes

Description alarm() uses \_Watchdog\_Insert\_seconds() and thus is affected by clock changes, e.g. via \_TOD\_Set(). This is wrong. The POSIX documentation is not that clear since it talks only about "realtime seconds". However, the FreeBSD implementation uses the uptime. This is also in line with the RTEMS ualarm() and nanosleep().

Summary POSIX Condition Variables Clock Attribute Support

Description I am beginning to add support for the clock attribute to POSIX condition variables. [http://pubs.opengroup.org/onlinepubs/9699919799/functions/pthread\\_condattr\\_getclock.html](http://pubs.opengroup.org/onlinepubs/9699919799/functions/pthread_condattr_getclock.html) Since the clock can't be a CPU time clock, that leaves CLOCK\_MONOTONIC and CLOCK\_REALTIME. The thread queue is based on CLOCK\_MONOTONIC and does not have an option to use CLOCK\_REALTIME. Threads and timers waiting on CLOCK\_REALTIME should be impacted by time of day changes. [https://docs.google.com/document/d/1GsGer0t84p-nUfZFim4Ty0LTDYnHgKBvlwip\\_gLQjTY/edit?usp=sharing](https://docs.google.com/document/d/1GsGer0t84p-nUfZFim4Ty0LTDYnHgKBvlwip_gLQjTY/edit?usp=sharing) is a Google doc with my notes so far in it on POSIX clocks. I will move it to the Wiki as it turns into something more concrete than notes and reflects plans/code. So the first issue is how best to alter the thread queue to support using either clock source? And what does that do to the current ticks based API since you proposed different time representations for the ticks (relative/monotonic) and seconds (absolute/realtime) structures?

Summary rtems\_heap\_allocate\_aligned\_with\_boundary() body and prototype inconsistent

Description The first parameter is size\_t in the .h and uintptr\_t in the body. This resulted in a compiler error on the m32c. But it is an inconsistency which should be fixed even if no architecture complained.

The malloc.h header file has this:

```
void *rtems_heap_allocate_aligned_with_boundary(
 size_t size, uintptr_t alignment, uintptr_t boundary
);
```

malloc\_deferred.c has this:

```
void *rtems_heap_allocate_aligned_with_boundary(
 uintptr_t size, uintptr_t alignment, uintptr_t boundary
)
```

Summary Fix the year 2038 problem

RTEMS uses currently a signed 32-bit integer for time\_t on Newlib. Thus, it is affected by the year 2038 problem. There are only 22 years left and this time span is within the realistic time frame of some RTEMS applications that are developed now.

The time\_t should be changed to int64\_t in Newlib. To make sure that all integer operations are carried out properly I suggest to temporarily do this

```

{{{#include <sys/_stdint.h>
typedef struct {
 int64_t val;
} time_t;
static inline time_t _time_add(time_t a, time_t b) {
 time_t r = { a_val + b_val }; return r;
}
static inline time_t _time_sub(time_t a, time_t b) {
 time_t r = { a_val - b_val }; return r;
}
static inline time_t _time_mul(time_t a, time_t b) {
 time_t r = { a_val * b_val }; return r;
}
static inline time_t _time_div(time_t a, time_t b) {
 time_t r = { a_val / b_val }; return r;
}
}}}
```

Make sure that RTEMS and Newlib build with this. Add test cases to highlight the time\_t integer limits.

**Summary** Fix CPU time used for threads on SMP

**Description** The CPU time used of a thread is currently maintained per-processor mostly during \_Thread\_Dispatch(). However, on SMP configurations the actual processor of a thread is difficult to figure out since thread dispatching is a highly asynchronous process (e.g. via inter-processor interrupts). Only the intended processor of a thread is known to the scheduler easily. Do the CPU usage accounting during thread heir updates in the context of the scheduler operations. Provide a function to get the CPU usage of a thread using proper locks to get a consistent value.

Summary  
pc386: ld -r issue with per function sections

```
The pc386 BSP has an issue with "ld -r" when function-sections is enabled which does not seem to occur on any other BSP. The same lines were added to the custom .cfg file as on other BSPs. It is unknown at this point whether this is an x86 specific "ld -r" issue or a pc386 build configuration issue.
Per-function-section linking is disabled until this is addressed.

Summary  
configure: enable-rtemsbsp doesn't warn if bsp does not exist

```
When running configure with an incorrect bsp name the script does not cause an error. You can ever run make without getting any warning message.
The script should check the name of the bsp and continue only if it is a valid bsp. On the other hand if the bsp name given by the user is invalid the script should prompt a message.
```

Summary  
sis does not run on gdb 7.11 but does on gdb 7.9

```
I know we reported this on the gdb list but we should have a ticket.
Neither gdb nor run works for sis on gdb 4.11. Checked against RTEMS 4.11 tools (gdb 4.9) and it will run sis.
Not sure about other simulators.
```

Summary  
RSB remove 4.11, 4.10 and 4.9 from the master branch.

```
Having 4.11 on master is confusing users as they build 4.11 tool on master and there may be issues in 4.11 configurations fixed on the 4.11 branch.
Leave 4.9 and 4.10 until they are branched off master. We will make these branches once 4.12 is stable again.
```

|-------|-------------|---------|-----------|---------------|-----------------|-------------|

Summary  
pc386 BSP has complex dependencies

```
In 4.11, the minimum executable did not include open() and close() because the methods rtems_libio_post_driver() and rtems_libio_exit() were not included in the executable. On the master, these two methods are showing up in minimum and pulling in these methods.
The dependency chain used to be if the console driver was installed, we needed to open and close stdin, stdout, and stderr. Now even without the console configured these are included.
FWIW the minimum size looks pretty good on the master for sis. Fixing this would likely drop it at least another 5%.
```

|                 | The <code>rtems_configuration_table</code> has:                                                                                                                                                                                                                                                                                    |            |                |                 |                 |              |
|                 | <pre>#ifndef RTEMS_SMP bool                smp_enabled; #endif</pre>                                                                                                                                                                                                                                                               |            |                |                 |                 |              |
| Descripti<br>on | I would like the <code>smp_enabled</code> variable to always be defined for 4.12 and always set to <code>false</code> when <code>RTEMS_SMP</code> is not defined. It is impossible to parse the configuration table with external auditing tools with out this field always being present unless you examine the DWARF debug info. |            |                |                 |                 |              |
|                 | I wonder if <code>User_multiprocessing_table</code> is the same so this means the members of the configuration table must always be defined.                                                                                                                                                                                       |            |                |                 |                 |              |

| Summar<br>y     | POSIX key destructors must be called during thread restart                                                                                                                                                                                                                                                                         |            |                |                 |                 |              |
| Descripti<br>on | POSIX key destructors must be called during thread restart. Just like the POSIX cleanup handlers. This ensures that the TLS object destructors are called during thread restart for example. It is important for the global construction, which uses a thread restart to run the Init task in a clean environment.                 |            |                |                 |                 |              |

| <p>                     Summary<br/>                     Rename asm file with .S(upper case) ext. name                 </p> <p>                     Description<br/>                     The are some asm file with .s ext. name, .s and .S is different for gnu as, the pre processed produce .s file from .S. In a word, .S can use #define .s can not. KBuild clean .s files when make clean. I have submit a patch to devel, but blocked. Too big patch.                 </p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | #2702 | 4 years ago | fixed | posix       | Sebastian Huber | Sebastian Huber                       | 3 years ago |
| <p>                     Summary<br/>                     Remove descriptor objects for POSIX message queues                 </p> <p>                     Description<br/>                     The mq_open() function returns a descriptor to a POSIX message queue object identified by a name. This is similar to sem_open(). In contrast to the POSIX semaphore the POSIX message queues use a separate object for the descriptor. This extra object is superfluous, since the object identifier can be used directly for this purpose, just like for the semaphores.                 </p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | #2706 | 4 years ago | fixed | unspecified | Sebastian Huber | Sebastian Huber <sebastian.huber@...> | 3 years ago |
| <p>                     Summary<br/>                     Buffer allocation of capture engine is broken on SMP configurations                 </p> <p>                     Description<br/>                     The capture engine uses function static variables.                 </p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | #2707 | 4 years ago | fixed | unspecified | Sebastian Huber | Sebastian Huber <sebastian.huber@...> | 3 years ago |

Summary Classic binary semaphores without a locking protocol can be released by everyone

The Classic binary semaphores without a locking protocol can be released by everyone, e.g. in contrast to the POSIX mutexes (all variants) or the Classic binary semaphores with priority inheritance or ceiling, there is no owner check in the release path.

This behaviour is a bit unexpected and not documented.

The following test case fails in case an owner check is added:

Descripti  
on

```
*** BEGIN OF TEST SP 42 ***
Exercising blocking discipline w/extract in FIFO order
Exercising blocking discipline w/unblock in FIFO order
TA00 - unblocked - OK

rtems_semaphore_delete FAILED -- expected (RTEMS_SUCCESSFUL) got (RTEMS_RESOURCE_IN_USE)
```

This is actually a bug in the test, since an available mutex is released again.

| Description  | Add CLOCK_DRIVER_USE_ONLY_BOOT_PROCESSOR clock driver option. If defined, then do the clock tick processing on the boot processor on behalf of all other processors. Currently, this is intended as a workaround for a Qemu shortcoming on ARM.                                                                                                                                                                                                                                                                                                       |       |                |                 |                                       |             |

| Summary      | rtems_task_set_scheduler() has insufficient parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |                |                 |                                       |             |

Task priorities are only valid within a scheduler instance. The `rtems_task_set_scheduler()` directive moves a task from one scheduler instance to another using the current priority of the thread. However, the current task priority of the source scheduler instance is undefined in the target scheduler instance. Add a third parameter to specify the priority.

```

/**
 * @brief Sets the scheduler instance of a task.
 *
 * Initially, the scheduler instance of a task is set to the scheduler instance
 * of the task that created it. This directive allows to move a task from its
 * current scheduler instance to another specified by the scheduler identifier.
 *
 * @param[in] task_id Identifier of the task. Use @ref RTEMS_SELF to select
 * the executing task.
 * @param[in] scheduler_id Identifier of the scheduler instance.
 * @param[in] priority The task priority with respect to the new scheduler
 * instance. The real and initial priority of the task is set to this value.
 * The initial priority is used by rtems_task_restart() for example.
 *
 * @retval RTEMS_SUCCESSFUL Successful operation.
 * @retval RTEMS_ILLEGAL_ON_REMOTE_OBJECT Directive is illegal on remote tasks.
 * @retval RTEMS_INVALID_ID Invalid task or scheduler identifier.
 * @retval RTEMS_INVALID_PRIORITY Invalid priority.
 * @retval RTEMS_RESOURCE_IN_USE The task owns resources which deny a scheduler
 * change.
 *
 * @see rtems_scheduler_ident().
 */
rtems_status_code rtems_task_set_scheduler(
 rtems_id task_id,
 rtems_id scheduler_id,
 rtems_task_priority priority
);

```

Thread dispatch via interrupt is broken at least on ARM and PowerPC

The ARM and PowerPC interrupt epilugues call `_Thread_Dispatch()` with interrupts disabled (counter example: SPARC).  
 On SMP configurations, since inter-processor interrupts set the thread dispatch necessary indicator this prevents a thread dispatch notification in post-switch handlers (which all run with interrupts disabled).  
 On all configurations, this is a serious issue for the interrupt latency.

Relax execution environment for thread begin extensions

Currently, the thread begin extensions are invoked with thread dispatching disabled. There is an explanation for this in the code

```

/*
 * Take care that 'begin' extensions get to complete before
 * 'switch' extensions can run. This means must keep dispatch
 * disabled until all 'begin' extensions complete.
 */
_User_extensions_Thread_begin(executing);

```

Describe

However, the switch extension is always invoked before the thread begin extension for all threads except the initialization thread. A thread dispatch disabled contexts drastically limits the work which can be carried out in the thread begin extensions. It is for example not possible to call `malloc()`, create POSIX keys or access C++ thread local storage.  
 The thread begin extension should execute in a normal thread context. Thread begin extensions that are disturbed by a thread dispatch should deal with this locally.  
 With the availability of C++ thread local storage in RTEMS being able to pre-initialize such objects in the thread begin extension would be quite handy.

|-------|-------------|-------|--------|----------------|-------------|-------------|

no .strtab section

`dlopen` on the object generated by `libfoo.cpp` in the attached test case fails and results in the error `no .strtab section`. `readelf` shows that the section is present, though:

```

readelf -S libfoo.o | grep strtab
(standard input):97: [92] .shstrtab STRTAB 00000000 001fb0 00040c 00 0 0 1
(standard input):99: [94] .strtab STRTAB 00000000 0018b0 00019e 00 0 0 1

```

Steps to Reproduce (you may have to edit `BSP_DIR` in the Makefile):

```

make clean all
qemu-system-arm -m 256M -M xilinx-zynq-a9 -serial null -serial mon:stdio \
 -nographic -no-reboot -kernel libdl-strtab-test.exe

```

Expected Output:

```

TEST BEGIN
dlopen: no .strtab section
assertion "handle != NULL" failed: file "libdl-strtab-test.c", line 46, function: POSIX_Init

```

Describe

Development Environment:

- RTEMS Version:** 4.11 (Branch "4.11", commit 3f72dda6ee518d3ea04341ad4df079ecb1895ef7) with the dlerror patches from #2747, and the attached ARM PREL31 support patch (I will be making a separate ticket for this with test code soon).
- System Type:** ARM Cortex-A9, xilinx\_zynq\_a9\_qemu
- GCC Version:**

arm-rtems4.11-gcc (GCC) 4.9.3 20150626 (RTEMS 4.11, RSB 1675a733536d1aec2020011e5e522497a442561a (HEAD, origin/4.11, 4.11), Newlib 2.2.0.20150423)
- RTEMS Configure Options:**

```
--target=arm-rtems4.11 --enable-rtemsbsp="xilinx_zynq_a9_qemu xilinx_zynq_zedboard xilinx_zynq_csp_cots xilinx_zynq_csp_hybrid" --enable-tests=samples --enable-posix --prefix=$HOME/development/rtems/4.11 --disable-networking
```

Application level deadlocks may lead to SMP lock level deadlocks

Due to a missing deadlock detection application level deadlocks may lead to SMP lock level deadlocks.

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |                    |                          |             |

| Summary      | rtems-syms does not clean up temp files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |                    |                          |             |
| Description  | <p>I am seeing temps files such as:</p> <pre>\$ ls -las /tmp/rld-* 0 -rw----- 1 chris wheel 0 Jul 27 18:16 /tmp/rld--041baa.rldxx 0 -rw----- 1 chris wheel 0 Jul 27 18:42 /tmp/rld--0n1aaa.rldxx 0 -rw----- 1 chris wheel 0 Jul 27 18:39 /tmp/rld--0v1aaa.rldxx 0 -rw----- 1 chris wheel 0 Jul 27 18:38 /tmp/rld--1Hhaaa.rldxx 88 -rw----- 1 chris wheel 87426 Jul 27 18:30 /tmp/rld--1libaaa.c 0 -rw----- 1 chris wheel 0 Jul 27 18:24 /tmp/rld--2EZaaa.rldxx 0 -rw----- 1 chris wheel 0 Jul 29 17:11 /tmp/rld--2rwaaa.rldxx 0 -rw----- 1 chris wheel 0 Jul 29 18:14 /tmp/rld--2sBaaa.rldxx 88 -rw----- 1 chris wheel 88148 Jul 29 17:40 /tmp/rld--2umaaa.c 88 -rw----- 1 chris wheel 87426 Jul 27 18:25 /tmp/rld--3baaaa.c 88 -rw----- 1 chris wheel 87426 Jul 27 18:27 /tmp/rld--4Jaaaa.c 0 -rw----- 1 chris wheel 0 Jul 27 18:52 /tmp/rld--4W1aaa.rldxx 0 -rw----- 1 chris wheel 0 Jul 27 18:38 /tmp/rld--4bfaaa.rldxx</pre> <p>left in /tmp. They look like symbols and so I suspect rtems-syms when building the testsuite with 4.12 (master). This is on FreeBSD.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                    |                          |             |

**Summary** ARM CP15 arm\_cp15\_set\_translation\_table\_entries fails if TTB in read-only memory

**Description** If the TTB is held in the text section and the section is set to read-only, and cached when booting no section change happen at run time because the table cannot be written too to change. The table cannot be changed unless the MMU is disabled.

I suggest the MMU be disabled, the table updated and then the MMU enabled.

Note, the issue only shows up on real hardware, qemu does not complain.

**Summary** Add function to get the current priority of a task by scheduler instance

```

/**
 * @brief Gets the current priority of the specified task with respect to the
 * specified scheduler instance.
 *
 * The current priority reflects temporary priority adjustments due to locking
 * protocols, the rate-monotonic objects on some schedulers and other
 * mechanisms.
 *
 * @param[in] task_id Identifier of the task. Use @ref RTEMS_SELF to select
 * the executing task.
 * @param[in] scheduler_id Identifier of the scheduler instance.
 * @param[out] priority Returns the current priority of the specified task with
 * respect to the specified scheduler instance.
 *
 * @retval RTEMS_SUCCESSFUL Successful operation.
 * @retval RTEMS_ILLEGAL_ON_REMOTE_OBJECT Directive is illegal on remote tasks.
 * @retval RTEMS_INVALID_ADDRESS The priority parameter is @c NULL.
 * @retval RTEMS_INVALID_ID Invalid task or scheduler identifier.
 * @retval RTEMS_NOT_DEFINED The task has no priority within the specified
 * scheduler instance.
 *
 * @see rtems_scheduler_ident().
 */
rtems_status_code rtems_task_get_priority(
 rtems_id task_id,
 rtems_id scheduler_id,
 rtems_task_priority *priority

**Summary** RTEMS I2C API only defines Standard-mode (Sm) speed as a default.

**Description** The RTEMS I2C API as defined in cpukit/dev/include/dev/i2c/i2c.h only defines the bus speed as Standard-mode (Sm) as defined by the I2C standard. This is set as I2C\_BUS\_CLOCK\_DEFAULT. The default speed is defined by the hardware, ie the devices connected, and not this API.

The API should define the speeds as defined in the I2C standard and there should be no default. Drivers like the Cadence driver for the Zynq should be modified to require the bus speed be provided and all future drivers need to provide the speed.

**Summary** Linker sets broken with GCC 7

**Description** See also:  
<https://gcc.gnu.org/ml/gcc/2016-09/msg00114.html>

The

```
#define MAKEGCCNOTKNOWTHEADDRESS(ptr) asm(""+"r"(ptr))
```

is probably the best option. It works probably also with link-time optimization.

**Summary** Overrun Handling for general real-time models

**Description** In the current implementation, if a task period is time out, the next call of rtems\_rate\_monotonic\_period() will only release one following job and manipulate the task period with the calling moment + the next length of period. With the assumption that implicit/constraint deadline and hard real-time model, the above mechanism is okay.

However, it may not be applicable for general task models, e.g., soft real-time task, arbitrary deadline, mixed-criticality system [1-4]. It is usually assumed that multiple task jobs of a task are executed in a first-come-first-serve manner. Thus, it is sufficient to release the second task job at the moment the first task job finishes according to a strictly periodic release pattern. The current design in fact shifts the release pattern of periodic/sporadic tasks. Since there maybe more than one postponed jobs due to the preemption, these postponed jobs that should be released are never released to the system.

Although there is no standard requirement in reality for deadline misses, with this enhancement, the postponed jobs will be released with the correct number without periodic release shifting. This way of handling is already widely considered in academia from 90s [2] until now [3] or even on multicores as well [4].

I refine the following four files and handle this requirement individually. The overhead seems to me negligible. cpukit/rtems/include/rtems/rtems/ratemon.h cpukit/rtems/include/rtems/rtems/ratemonimpl.h cpukit/rtems/src/ratemontimeout.c cpukit/rtems/src/ratemonperiod.c I have tested the enhancement on Qemu and Raspberry Pi Model B+ with corresponding BSPs.

I believe this patch as a basis is required for further use for more general real-time task models. This enhancement only affect those timeout cases without changing any behaviour in normal cases. This enhancement is accepted in workshop mixed-criticality (WMC 2016) along with RTSS'16 this year [5].

To demonstrate the differences, a heuristic example is prepared in testsuites/sptests/sprmsched01 to show the benefit of the enhancement: Given two tasks with implicit deadline that task deadline is equal to its period. Task 1 period is 10000 ticks, whereas task 2 is 2000 ticks. Task 1 has the execution time 6000 ticks, and task 2 has 1000 ticks. Assume Task 1 has a higher priority than task 2. Task 1 only executes 2 times. In the expected result, we can observe that the postponed jobs are continuously released till there is no postponed job left, and the task period will still keep as it is. (Job 3-7 in task 2 are postponed jobs)

**Summary** Add ability to add/remove processors to/from a scheduler instance

The scheduler configuration is done at link-time. In order to support run-time re-configuration add functions to dd/remove processors to/from a scheduler instance.

```

/**
 * @brief Adds a processor the set of processors owned by the scheduler.
 *
 * Must be called from task context. This operation obtains and releases the
 * objects allocator lock.
 *
 * @param[in] scheduler_id Identifier of the scheduler.
 * @param[in] cpu_index Index of the processor to add.
 *
 * @retval RTEMS_SUCCESSFUL Successful operation.
 * @retval RTEMS_INVALID_ID Invalid scheduler identifier.
 * @retval RTEMS_NOT_CONFIGURED The processor is not configured to be used by
 * the application.
 * @retval RTEMS_INCORRECT_STATE The processor is configured to be used by
 * the application, however, it is not available.
 */
rtems_status_code rtems_scheduler_add_processor(
 rtems_id scheduler_id,
 uint32_t cpu_index
);

/**
 * @brief Removes a processor from set of processors owned by the scheduler.
 *
 * Must be called from task context. This operation obtains and releases the
 * objects allocator lock. Removing a processor from a scheduler is a complex
 * operation that involves all tasks in the system.
 *
 * @param[in] scheduler_id Identifier of the scheduler.
 * @param[in] cpu_index Index of the processor to add.
 *
 * @retval RTEMS_SUCCESSFUL Successful operation.
 * @retval RTEMS_INVALID_ID Invalid scheduler identifier.
 * @retval RTEMS_INVALID_NUMBER The processor is not owned by the scheduler.
 * @retval RTEMS_RESOURCE_IN_USE The set of processors owned by the scheduler
 * would be empty after the processor removal and there exists a non-idle
 * task that uses this scheduler as its home scheduler.
 */
rtems_status_code rtems_scheduler_remove_processor(
 rtems_id scheduler_id,
 uint32_t cpu_index
);

Summary  
Fix POSIX timer interval

See also:

<https://lists.rtems.org/pipermail/users/2016-October/030714.html>

```

Just back to RTEMS after a long time. I've build the last version (Git)
with last compiler (4.12) and looks like a simple POSIX timer doen't
work anymore... It should display "Signal 14" every second but period is
veryyyy short...and display very fast :(

Any idea? any change in the way to use POSIX with RTEMS?

See my program attached (it works fine with Linux).

I have tested with Raspberry Pi and QEMU/i386.

thx by advance

```

Summary: Undocumented confdefs.h Configure Options

The following constants in confdefs.h that are available for users to use are not defined in the Sphinx documentation.

- CONFIGURE\_APPLICATION\_NEEDS\_ATA\_DRIVER - internal and CONFIGURE\_APPLICATION\_NEEDS\_IDE\_DRIVER turns into this. Should we recognize both?
- CONFIGURE\_ATA\_DRIVER\_TASK\_PRIORITY - Document this. Looks like CONFIGURE\_APPLICATION\_NEEDS\_ATA\_DRIVER should replace CONFIGURE\_APPLICATION\_NEEDS\_IDE\_DRIVER based on this name. There is no "IDE task priority" configure option.
- CONFIGURE\_CBS\_MAXIMUM\_SERVERS - document this.
- CONFIGURE\_EXECUTIVE\_RAM\_SIZE - do we want users to define this anymore?
- CONFIGURE\_EXTRA\_MPCI\_RECEIVE\_SERVER\_STACK
- CONFIGURE\_MAXIMUM\_POSIX\_KEY\_VALUE\_PAIRS - document this.
- CONFIGURE\_MAXIMUM\_PTYS - document this. Used by telnetd. Is this the same on old and new TCP/IP stacks?
- CONFIGURE\_MAXIMUM\_TASK\_VARIABLES - document for 4.11, not master
- CONFIGURE\_TIMER\_FOR\_SHARED\_MEMORY\_DRIVER - internal only, do not document

Summary: Reduce interrupt latency on SMP configurations during thread dispatch

Currently we have this situation:

[https://docs.rtems.org/doc-current/share/rtems/html/c\\_user/Symmetric-Multiprocessing-Services-Thread-Dispatch-Details.html#Symmetric-Multiprocessing-Services-Thread-Dispatch-Details](https://docs.rtems.org/doc-current/share/rtems/html/c_user/Symmetric-Multiprocessing-Services-Thread-Dispatch-Details.html#Symmetric-Multiprocessing-Services-Thread-Dispatch-Details)

"On SMP systems, scheduling decisions on one processor must be propagated to other processors through inter-processor interrupts. So, a thread dispatch which must be carried out on another processor happens not instantaneous. Thus several thread dispatch requests might be in the air and it is possible that some of them may be out of date before the corresponding processor has time to deal with them. The thread dispatch mechanism uses three per-processor variables,

- the executing thread,
- the heir thread, and
- an boolean flag indicating if a thread dispatch is necessary or not.

Updates of the heir thread and the thread dispatch necessary indicator are synchronized via explicit memory barriers without the use of locks. A thread can be an heir thread on at most one processor in the system. The thread context is protected by a TTAS lock embedded in the context to ensure that it is used on at most one processor at a time. The thread post-switch actions use a per-processor lock. This implementation turned out to be quite efficient and no lock contention was observed in the test suite.

Descripti on

The current implementation of thread dispatching has some implications with respect to the interrupt latency. It is crucial to preserve the system invariant that a thread can execute on at most one processor in the system at a time. This is accomplished with a boolean indicator in the thread context. The processor architecture specific context switch code will mark that a thread context is no longer executing and waits that the heir context stopped execution before it restores the heir context and resumes execution of the heir thread (the boolean indicator is basically a TTAS lock). So, there is one point in time in which a processor is without a thread. This is essential to avoid cyclic dependencies in case multiple threads migrate at once. Otherwise some supervising entity is necessary to prevent deadlocks. Such a global supervisor would lead to scalability problems so this approach is not used. Currently the context switch is performed with interrupts disabled. Thus in case the heir thread is currently executing on another processor, the time of disabled interrupts is prolonged since one processor has to wait for another processor to make progress.

It is difficult to avoid this issue with the interrupt latency since interrupts normally store the context of the interrupted thread on its stack. In case a thread is marked as not executing, we must not use its thread stack to store such an interrupt context. We cannot use the heir stack before it stopped execution on another processor. If we enable interrupts during this transition, then we have to provide an alternative thread independent stack for interrupts in this time frame. This issue needs further investigation.

The problematic situation occurs in case we have a thread which executes with thread dispatching disabled and should execute on another processor (e.g. it is an heir thread on another processor). In this case the interrupts on this other processor are disabled until the thread enables thread dispatching and starts the thread dispatch sequence. The scheduler (an exception is the scheduler with thread processor affinity support) tries to avoid such a situation and checks if a new scheduled thread already executes on a processor. In case the assigned processor differs from the processor on which the thread already executes and this processor is a member of the processor set managed by this scheduler instance, it will reassign the processors to keep the already executing thread in place. Therefore normal scheduler requests will not lead to such a situation. Explicit thread migration requests, however, can lead to this situation. Explicit thread migrations may occur due to the scheduler helping protocol or explicit scheduler instance changes. The situation can also be provoked by interrupts which suspend and resume threads multiple times and produce stale asynchronous thread dispatch requests in the system."

Add an interrupt frame to the per-CPU control which can be used during context switches on SMP configurations.

| #2810   | 4 years ago                  | fixed | arch/sparc | Joel Sherrill | Joel Sherrill | 3 years ago |
| Summary | Remove sparc/sis BSP variant |       |            |               |               |             |

As discussed in the following thread, the sparc/sis BSP variant is no longer necessary and can be removed.

<https://lists.rtems.org/pipermail/devel/2016-November/016383.html>

This ticket is to track that removal.

|         |                                                        |       |       |                 |                 |             |

| #2811   | 4 years ago                                            | fixed | score | Sebastian Huber | Sebastian Huber | 3 years ago |
| Summary | More robust thread dispatching on SMP and ARM Cortex-M |       |       |                 |                 |             |

On SMP configurations, it is a fatal error to call blocking operating system with interrupts disabled, since this prevents delivery of inter-processor interrupts. This could lead to executing threads which are not allowed to execute resulting in undefined behaviour.

The ARM Cortex-M port has a similar problem, since the interrupt state is not a part of the thread context.

Add a new CPU port function:

Descripti on

```
/**
 * @brief Returns true if interrupts are enabled in the specified ISR level,
 * otherwise returns false.
 *
 * @param[in] level The ISR level.
 *
 * @retval true Interrupts are enabled in the ISR level.
 * @retval false Otherwise.
 */
RTEMS_INLINE_ROUTINE bool _CPU_ISR_Is_enabled(uint32_t level)
{
 return false;
}
```

Use this function to ensure that \_Thread\_Do\_dispatch() is called with an interrupt level with enabled interrupts, otherwise call \_Terminate().

| Summary     | m32csim does not build on master |  |  |  |  |  |
| Description |                                  |  |  |  |  |  |

Use C11 mutexes instead of Classic semaphores as a performance optimization and to simplify the application configuration.

A performance of Classic semaphores vs. C11 mutexes was measured on the arm/atsam BSP. A NXP SC16IS752 was connected via SPI. The RTEMS application used one task to read from the device and write it immediately back (look back via task). A development system constantly transmitted data at 115200 bits per second.

CPU usage by function with Classic semaphores:

| name                                 | ratio   | 1%    | 2% | 5% | 10% | 20% | 50% | 100% |

Summary Use self-contained objects instead of Classic API for drivers and support libraries

The Classic API has some weaknesses:

- Dynamic memory (the workspace) is used to allocate object pools. This requires a complex configuration with heavy use of the C pre-processor.
- Objects are created via function calls which return an object identifier. The object operations use this identifier and map it internally to an object representation.
- The objects reside in a table, e.g. they are suspect to false sharing of cache lines.
- The object operations use a rich set of options and attributes. For each object operation these parameters must be evaluated and validated at run-time to figure out what to do exactly for this operation.

The overhead for Classic API mutexes used for example in Termios and the SPI framework is significant, see discussion:

<https://lists.rtems.org/pipermail/devel/2016-December/016543.html>

There are some API options available:

Descripti  
on

1. Use C11 mutexes and condition variables.
2. Turn the POSIX synchronization objects into self-contained objects and use them.
3. Use FreeBSD synchronization objects like **MUTEX(9)** or **CONDVAR(9)**.
4. Add RTEMS-specific self-contained synchronization objects and use them.

Option 1. and 2. lack support for binary semaphores which are used for task/interrupt synchronization, e.g. Termios.

Option 2. needs run-time evaluation to figure out the actual object variant, e.g. non-recursive, recursive, ceiling, error-checking, robust POSIX mutex.

Option 3. uses hash tables, thus it is not suitable for real-time systems.

Option 1. and 2. lack support for user-defined object names that may help for system diagnostic, tracing and debugging.

Option 4. could be used to avoid all shortcomings of options 1-3. It would be trivial to implement, test and document.

In order to enable user-defined object names one option is to add a const char \*name member to Thread\_queue\_Queue.

| Summary     | Add user defined thread names                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |           |              |                 |                                       |             |
| Description | Add user defined thread names to ease debugging, enhance the system diagnostics and improve compatibility to other systems, e.g. Linux and FreeBSD.<br>Implement pthread_setname_np() and pthread_getname_np(). Add CONFIGURE_MAXIMUM_THREAD_NAME_SIZE to the application configuration options. Add a application configuration dependent storage area for thread names to the thread control block.                                                                                                                                                                                                                   |           |              |                 |                                       |             |

| Summary     | Update POSIX 1003.1 Compliance Guide for ReST                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |           |              |                 |                                       |             |
| Description | <p>The POSIX 1003.1 Compliance Guide should be auto-generated from a spreadsheet into the ReST format. My vague recollection is that we used shell scripts to do this for texinfo output.</p> <p>I will have to decipher what we used to do and define a new procedure.</p> <p>This impacts 4.11 and newer. One issue is having correct information for what methods are present on a branch. The FACE Conformance Test Suite can be used for ~800 of the methods.</p>                                                                                                                                                  |           |              |                 |                                       |             |

| Description | <p>rtems-test-check is responsible of checking the testsuite configuration of a given BSP and adapt it based on a given "command". Currently for the "exclude" command, we never exclude anything, the output of the script is always the whole list of the input tests.</p> <p>This happens because the script always starts with output = \$tests and appends on the list the tests that are not excluded, so the output is always all the tests.</p>                                                                                                                                                                 |           |              |                 |                                       |             |

**Summary** src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt\_timer.c: 4 \* pointless check ?

**Description** [src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt\_timer.c:102]: (style) Checking if unsigned variable 'timer' is less than zero. [src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt\_timer.c:109]: (style) Checking if unsigned variable 'timer' is less than zero. [src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt\_timer.c:117]: (style) Checking if unsigned variable 'timer' is less than zero. [src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt\_timer.c:128]: (style) Checking if unsigned variable 'timer' is less than zero.

Parameter "timer" is only ever type uint32\_t, so any check < 0 seem pointless.

**Summary** DHCP client fails on complex networks

**Description** What happens is that on networks with more than one DHCP servers, or on networks that use multiple vlans it can happen that After a DHCP discover our client broadcasts, it receives multiple offers, which is perfectly fine based on the DHCP RFC.

However our implementation of a DHCP client, expects a linear execution flow:

1. Broadcast a DHCP discover;
2. Wait for a DHCP offer;
3. Transmit a DHCP request;
4. Wait for a DHCP ack;

However the network stack is not cleaned between the reception of a DHCP offer and a DHCP ack, so if multiple offers are received, just the first one will be processed during the "Receive DHCP offer" phase, and the next one will be received when we expect a "DHCP ack", which makes our implementation assume the DHCP handshake is invalid and fail. Thus we restart the network and retry the whole process from the beginning which will cause the same issue again.

This issue that is present from when I remember in RTEMS, definitely from 4.10 up to now.

**Summary** src/c/src/lib/libbsp/sparc/shared/can/occan.c:1573: broken error checking ?

**Description** src/c/src/lib/libbsp/sparc/shared/can/occan.c:1573]: (style) Checking if unsigned variable 'speed=pelican\_speed\_auto(can)' is less than zero.

Source code is

```

if ((speed=pelican_speed_auto(can)) < 0){
 /* failed */ return RTEMS_IO_ERROR;
}

```

but

```

unsigned int speed;

```

and

```

static int pelican_speed_auto(occan_priv *priv);

```

I am not sure which C compiler gets using in rtems, but I do know that gcc compiler flag -Wtype-limits will flag this kind of problem.

**Summary** src/cpukit/libdebugger/rtems-debugger-server.c: four problems

1.
 

```

src/cpukit/libdebugger/rtems-debugger-server.c:1306]: (style) Redundant condition: extended. '!extended || (extended && check_pid(pid))' is equivalent to '!extended || check_pid(pid)'

```

Suggest simplify.
2.
 

```

src/cpukit/libdebugger/rtems-debugger-server.c:1858]: (warning) Possible null pointer dereference: rtems_debugger

```

Source code is

```

if (r < 0) {
 rtems_printf(printer, "error: rtems-db: remote begin: %s: %s\n",
 rtems_debugger->remote->name, strerror(errno));
 free(rtems_debugger);
 rtems_debugger = NULL;
}

/*
 * Reset at the end of the session.
 */
rtems_debugger->flags = 0;

```

Suggest adding `return -1` inside the `if`.
3.
 

```

src/cpukit/libdebugger/rtems-debugger-server.c:906]: (style) Redundant condition: extended. '!extended || (extended && check_pid(pid))' is equivalent to '!extended || check_pid(pid)'

```

Duplicate.
4.
 

```

src/cpukit/libdebugger/rtems-debugger-server.c:956]: (warning) Char literal compared with pointer 'p'. Did you intend to dereference it?

```

Source code is

```

while (p != NULL && p != '\0') {

```

Maybe better code

```

while (p != NULL && *p != '\0') {

```

| Summar<br>y     | Update termios.h to match the latest FREEBSD definitions                                                                                                                                                                                                                                                                                                                                                                                                                         |         |            |                 |                                       |             |
| Descripti<br>on | The FREEBSD struct termios separates out the input and output baud rates into individual speed_t variables. It also supports more flag options. The big benefit is that the rtems-libbsd tty code can be ported cleanly without the need to fixup the input and output baud rates. This should be a transparent change unless someone was manipulating the baud rates directly through the c_cflags (not using the cfgetispeed, cfgetospeed, cfsetspeed, cfsetospeed functions). |         |            |                 |                                       |             |

## Merge LEON

**Students:** Past, Present, and Potential Students

**Status:** Some work may be done.

**Introduction:** Merge Leon RTEMS and mainstream RTEMS merge the Leon `DriverManager`, `samples`, and `LEON-RTEMS` into mainstream RTEMS.

**Goal:** Concise statement of the overall goal of the project. Refine this initial statement to include: project deliverables (code, docs, testing), required/suggested methodology, standards of quality, possible goal extensions beyond the main objective.

**Requirements:** List the requirements and level of expertise you estimate are required by the developer tackling this project will have to have: Required level of programming language(s), specific areas of RTEMS or tools, level of familiarity with RTEMS, cross-development, GNU/Linux, etc., development/documentation/testing tools, mathematical/algorithmic background, other desirable skills.

**Resources:** Current RTEMS developers, papers, etc that may help you in this project.

### Acknowledgements

- who helped and did work

## Miscellaneous Sections

As the project progresses, you will need to add build instructions, etc and this page will evolve from a project description into a HOWTO.

## References

- TBD

| Description | The rtems-docs requires the Sphinx contribution extension for bibtex to build.<br>A configure check should be added to see if the extension is installed and an error raised or the documentation conditionally built.<br>It is not clear to me if bibtex needs Tex Alive. Requiring Tex on all hosts to build the documentation is a regression so the extension will need to be removed or a fall back position taken where degraded quality documentation in HTML is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |            |                 |                  |               |

| Summary     | termios: Change receive callback invocation to enable select() and poll() support                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |            |                 |                  |               |
| Description | Call the receive callback in case a read will succeed without to block. This enables the use of the receive callback for a poll() and select() support. Increase raw input buffer size to allow buffering of one line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |            |                 |                  |               |

| Description | Currently only blocking read/write operations are implemented. A blocking write must transfer at least one character. It should not wait for the device for the second character and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |            |                 |                  |               |

| Summary     | libdl unresolved externals that use more than one block or multiple entries corrupts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |            |                 |                  |               |
| Description | If there are lots of unresolved externals the unresolved block structure get confused and the can lock up looking for a new slot to add an unresolved external.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |            |                 |                  |               |

| Summary     | Questionable Code in resource_snapshot.c                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |            |                 |                  |               |
| Description | Coverity URL:<br><a href="https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=108958257&amp;defectInstanceId=30877219&amp;mergedDefectId=1399703">https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=108958257&amp;defectInstanceId=30877219&amp;mergedDefectId=1399703</a><br>Coverity Scan doesn't like taking the address of a single uint32_t and then treating it as an array pointer. I think the code is likely doing what is intended but there is an implicit linkable between the order of the fields in the structure here and the class numbers used in the object IDs. Is there a way to improve this code and reduce the linkage?<br>141<br>1. address_of: Taking address with &snapshot->active_posix_keys yields a singleton pointer.<br>2. assign: Assigning: active = &snapshot->active_posix_keys.<br>142 active = &snapshot->active_posix_keys; 143<br>3. Condition i < 19U /* sizeof (objects_info_table) / sizeof (objects_info_table[0]) */, taking true branch.<br>144 for (i = 0; i < RTEMS_ARRAY_SIZE(objects_info_table); ++i) { 145 const Objects_Information *information; 146 147 information = _Objects_Get_information( 148 objects_info_table[i].api, 149 objects_info_table[i].cls 150 ); 151<br>4. Condition information != NULL, taking true branch.<br>152 if (information != NULL) { CID 1399703 (#± of 1): Out-of-bounds access (ARRAY_VS_SINGLETON)<br>5. ptr_arith: Using active as an array. This might corrupt or misinterpret adjacent memory locations.<br>153 active[i] = _Objects_Active_count(information); |         |            |                 |                  |               |

| Summar y                                                                | Add a top level global testsuite configuration file (.cfg) and a 'user-input' test state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |            |             |                 |                   |             |
| Descripti on                                                            | <p>Adding a top level testsuite configuration file lets us specify tests that have a common test state across all BSPs.</p> <p>Adding the test state 'user-input' clearly tags the test as needing user input and test result tools can correctly determine the test result. The current practice of passing a test needing user input is actually hiding the real result of the test.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |            |             |                 |                   |             |

| Descripti on                                                            | Set CPU_ENABLE_ROBUST_THREAD_DISPATCH to TRUE. In this case the interrupts are always enabled during a context switch even after interrupt processing (see #2751). Remove the CPSR from the context control since it contains only volatile bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |            |             |                 |                   |             |

| Summary     | Add some popular benchmark programs to the testsuite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |             |                 |                           |             |
| Description | Add dhrystone, whetstone and linpack benchmark programs to the testsuite. This may help to evaluate compiler settings, compiler versions and processors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |             |                 |                           |             |
| #2959       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | fixed     | lib/dl      | Chris Johns     | Chris Johns               | 3 years ago |
| Summary     | arm/libdl: C++ exception index tables may not be ordered correctly                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |             |                 |                           |             |
| Description | The ARM EXIDX sections have the SHF_LINK_ORDER flag set and this is not honored by libdl which means the section order in the ELF file needs to be the correct order of the functions in the address map.<br>Add support to libdl to follow the link-to order.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |             |                 |                           |             |
| #2962       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | fixed     | test        | Chris Johns     |                           | 12 days ago |
| Summary     | Set test configurations to reflect test results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           |             |                 |                           |             |
| Description | Tests can be set to the result we expect such as <code>expected-fail</code> , <code>user-input</code> and <code>indeterminate</code> as well as <code>excluded</code> so we can maintain accurate results for the testsuite.<br>This ticket covers setting of the correct state for all tests for tier 1 BSPs. Please add an "Updates #" for this ticket to any related commits and once done we can close this ticket.<br>Note: I have add a top level test configuration file called <code>testsuites/rtems.tcfg</code> that lets us specify a test configuration for all BSPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |             |                 |                           |             |
| #2963       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | fixed     | unspecified | Chris Johns     | Chris Johns               | 3 years ago |
| Summary     | Add a testsuite top level configuration file that is common to all tests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |           |             |                 |                           |             |
| Description | Add the file <code>testsuites/rtems.tcfg</code> to hold test states common to all BSPs. This lets us globally set a test state.<br>For example <code>fileio</code> is <code>user-input</code> .<br>Note, <code>user-input</code> will be added a test state to test this file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |             |                 |                           |             |

| Description | The output of bootstrap does not use a consistent sort order with sb-bootstrap. The difference appears to be in the default behavior of the sort command versus Python's sorted. By forcing the locale to C, sort should have a consistent behavior.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |             |                 |                           |             |

| Summary     | ARM: Change ABI to not use short enums                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |           |             |                 |                           |             |
| Description | Whether enums are short or not is left open in the ARM EABI. On Linux and FreeBSD no short enums are used. Otherwise short enums are enabled by default.<br>Short enums may cause hard to find issues with 3rd party software, since the are quite unusual in general, e.g.<br><a href="https://git.rtems.org/rtems-libbsd/commit/freebsd/include/rpc?id=9880635f2e642380b69b85e00271649b3a2fc2de">https://git.rtems.org/rtems-libbsd/commit/freebsd/include/rpc?id=9880635f2e642380b69b85e00271649b3a2fc2de</a><br>The data and structure layout may suddenly change in case enumeration values are added/removed. The benefit of short enums is probably not worth the trouble, since the packed compiler attribute can be used to individually make an enum short.<br>The reason for not choosing no short enums during the ARM EABI introduction was an issue with Newlib. This is addressed with the following patch:<br><a href="https://sourceware.org/ml/newlib/2017/msg00238.html">https://sourceware.org/ml/newlib/2017/msg00238.html</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |             |                 |                           |             |

testdata excludes on included tcfg files does not work

Descripti  
on

It looks like the includes do not always work for .tcfg files. So far these BSPs do not appear to honor the excludes in an included file:  
log/m32c-m32csim.log log/mips-hurricane.log log/mips-rbt4925.log log/mips-rbt4938.log log/moxie-moxiesim.log  
mips and moxie are dl tests.

LibBSD broken with GCC+RTEMS changes

The RTEMS Header test is libbsd is broken. I assume including <rtems.h> and no other is still a requirement. Maybe we need a test for this.  
The example code is:

Descripti

| <b>#2993</b> | 3 years ago                                    | fixed | score | Chris Johns | joel.sherrill@... | 3 years ago |
| Summary      | SMP assert in _Thread_Executing in libdebugger |       |       |             |                   |             |

The target code in libdebugger has support to recover from exceptions related to invalid memory accesses. GDB may request the server access memory on the target that results in an exception. The exception occurs on the server's remote connection thread and the server needs to recover and return an error to GDB.

Running the debugger01 test with an SMP build of RTEMS and libbsd for `xilinx_zedboard` and issuing `bt` in GDB results in:

```

*** LIBBSD DEBUGGER 1 TEST ***
[144/1950]
shell:cannot set terminal attributes(/dev/console)

RTEMS Shell on /devn/excounss0:1 e<.R TUEsMeS 'Nheexlups' dteov ilcies>t

rtems-db: arm debug: (v3.0) ARMv7 [v7, all CP14 registers] breakpoints:5 watchpoints:3
assertion "cpu_self->thread_dispatch_disable_level != 0 || _ISR_Get_level() != 0" failed: file
"../../cpukit/../../xilinx_zynq_zedboard/lib/include/rtems/score/percpu.h", line 630, function: _Per_CPU_Get

```

If I enable `TARGET_DEBUG` in libdebugger and apply the attached patch I can create the assert with `DIE_ON_ASSERT` set to `1`. The output is:

```

rtems-db: tcp remote: connect host: 10.10.5.2
rtems-db: arm debug: (v3.0) ARMv7 [v7, all CP14 registers] breakpoints:5 watchpoints:3

[] R12 = 00560658 SP = 00566540 LR = 0000FFFD PC = 00241736
[] CPSR = 08010173 ---Q--A-FT GE:0 IT:01 M:13 SVC
[] target exception: 0 0 0
[] tid:0A01000A: thread:0041F5B0 frame:005664EC
[] server access fault

```

The following lines first two values are `cpu_self->thread_dispatch_disable_level` and `_ISR_Get_level()` which are both `0` so I cannot see a reason the assert is happening:

```
[] target exception: 0 0 0
```

| Summary         | RTEMS User Manual Quick Start does not cover releases.                                                                                          |  |  |  |  |  |
| Descripti<br>on | The quick start documents using git and does not cover a release. This is confusing because the releases tools and the git master may not work. |  |  |  |  |  |

| Summary     | Setting interrupt level in the mode arg on SMP returns RTEMS_UNSATISFIED                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |            |              |                 |                           |               |
| Description | <p>If for any reason a user sets the interrupt level in the mode on an SMP build the error <code>RTEMS_UNSATISFIED</code> is returned. The documentation indicates this is a lack of stack and this confusing.</p> <p>The reason this happens is the SMP check for an interrupt level being set is in the score's <code>_Thread_Initialize</code>. I propose that and <code>is_preemptible</code> check be converted to an <code>assert</code> and checks be added to the Classic API to catch these errors and report suitable error codes.</p> <p>There is no meaningful error code available without abusing an existing one so I propose adding <code>RTEMS_INVALID_MODE</code>.</p>                                                                                                                                                                                                                                                                                                                                              |            |              |                 |                           |               |

| Summary     | SMP build of RTEMS Testsuite does not set CONFIGURE_MAXIMUM_PROCESSORS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |            |              |                 |                           |               |
| Description | <p>The default setting for <code>CONFIGURE_MAXIMUM_PROCESSORS</code> is <code>1</code> and this means <code>rtems_configuration_is_smp_enabled()</code> returns <code>false</code>. Only the <code>smptests</code> set the maximum processor count to <code>CPU_COUNT</code> and therefore run in SMP mode.</p> <p>If SMP is not running in an SMP build when running the tests are the tests really reporting a true indication of the of the system?</p> <p>I would expect we have the API tests, <code>libtests</code> and <code>fstests</code> running with SMP enabled in an SMP build.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |            |              |                 |                           |               |

| Description | <p>When used with 64KIB clusters, the FAT driver will loop forever in <code>cpukit/libfs/src/dosfs/fat.c</code>, line 580. This happens because <code>struct fat_vol_s</code> declares bytes per cluster variable as <code>uint16_t bpc</code>, whereas it can be as big as 256KIB.</p> <p>Here is a link for Linux FAT driver which doesn't make any assumption about cluster size: <a href="http://lxr.free-electrons.com/source/fs/fat/inode.c?v=2.6.24#L1262">http://lxr.free-electrons.com/source/fs/fat/inode.c?v=2.6.24#L1262</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |            |              |                 |                           |               |

| Summary     | ARM caching issues                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |            |              |                 |                           |               |
| Description | <p>There are two problems with the caching on ARM:</p> <ul style="list-style-type: none"> <li>In cases where the buffer is not aligned to line boundary at the beginning or the end, the invalidate operation would lose modifications done on the adjacent data. This applies to both L1 and L2 caches.</li> <li>The L2C-310 cache management operations use excessive locking. According to <a href="#">manual</a>, the used operations (Clean Line by PA, Clean and Invalidate Line by PA, Cache Sync) are atomic and do not require locking.</li> </ul> <p>I have attached the proposed patch.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |            |              |                 |                           |               |

| Summary     | missing pax causes install failures                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |              |                 |                           |               |
| Description | <p>I have tried to install <code>sparc-bsp=erc32</code> on 4 different builds. 3 failed, and 1 flawlessly installed. The others all seem to fail somewhere during make install of test suites. Each reports one missing config problem or another.</p> <p>I believe the problem resulted in a missing package, <code>pax</code> &amp; <code>libbsd-dev</code> on Ubuntu 12.04.5 LTS (GNU/Linux 3.2.0-126-virtual x86_64)</p> <p>I hadn't seen this exact problem because I normally update &amp; upgrade as soon as I get a new image. Pressed for time, I skipped it. So, I am not sure if we need to update the documentation to directly include <code>pax</code>, since it is directly called in <code>configure</code> and breaks if not present.</p> <p><a href="https://docs.rtems.org/rsb/#_host_setups">https://docs.rtems.org/rsb/#_host_setups</a> Under this section, 11.1.5. Ubuntu</p> <p>Add <code>pax</code> to this line <code>\$ sudo apt-get build-dep binutils gcc g++ gdb unzip git python2.7-dev pax</code></p> |            |              |                 |                           |               |
| #3009       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | wontfix    | tool/website | Chris Johns     | joel.sherrill@...         | 3 years ago   |
| Summary     | Provide invalid link handler for docs.rtems.org so old docs can be removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |            |              |                 |                           |               |
| Description | <p>The docs.rtems.org website has lots of old docs which need to be removed.</p> <p>See <a href="#">#3008</a> for a reference to old documentation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |            |              |                 |                           |               |
| #3010       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | fixed      | unspecified  | David Binderman | Gedare Bloom <gedare@...> | 3 years ago   |

| Description | <p>I encountered an error compiling the <code>xilinx_zynq_zedboard</code> BSP. I am using a built of the RSB that I compiled in December. With that built of the RSB I could build this BSP several times until I did a git pull of the RTEMS repo two weeks ago. Today I updated my repos of the RTEMS and RSB sources, I rebuilt the RSB and I tried to build again the <code>xilinx_zynq_zedboard</code> BSP, encountering the same error:</p> <pre> gmake[6]: * No rule to make target 'posix/include/sys/mman.h', needed by ../cpukit/../../xilinx_zynq_zedboard/lib/include/sys/mman.h'. Stop. </pre>                                                                                                                                                                                                                                                                                                                                                                                                                           |            |              |                 |                           |               |

|-------|-------------|-------|-------------|-----------------|-------------|-------------|

Summary: Global C++ IO streams are broken (cout, cin, cerr)

The global C++ IO stream objects are initialized here

[https://gcc.gnu.org/viewcvs/gcc/trunk/libstdc%2B%2B-v3/src/c%2B%2B98/ios\\_init.cc?view=markup#l85](https://gcc.gnu.org/viewcvs/gcc/trunk/libstdc%2B%2B-v3/src/c%2B%2B98/ios_init.cc?view=markup#l85)

via a placement new. The "stdout" etc. is thread-local in Newlib

```
#define stdout (_REENT->_stdout)
```

Using this for a global object like std::cout is quite broken. Which FILE object should be used instead? Potential fix:

```

Summary: ProgrammingError: (1064, "You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'sid='nikolaykomashinskiy' AND authenticated=1 AND name='force\_change\_passwd at line 1'")

Hello, during reset password I had an internal error. This card was automatically generated.

**How to Reproduce**

While doing a POST operation on `/reset_password`, Trac issued an internal error.

| Summary     | Add support for IBM PPC 750 chip                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |            |              |                 |                   |             |
| Description | Currently MPC750 chip is supported. However, PPC750 (from IBM) is very close to MPC750 except minor differences. Enclosed is the delta to support PPC750.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |            |              |                 |                   |             |

| Summary     | improvement in pci.h                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |              |                 |                   |             |
| Description | <p>In pci.h, there are references to BSP_pci_configuration data structure which is in pci.c. However, in this file, there are also references to detect_host_bridge () in detect_raven_bridge.c. For folks that are just interested in pci_read_config_dword() + its brothers, all they need is to include pci.h and content for where BSP_pci_configuration is defined. The rest of the stuff in pci.c should be separate. Or in another word, data structures and #defines involving with BSP_pci_configuration needs to be in separate files rather all stuffed in pci.c</p> <p>I currently do not need this functionality for my BSP (nor do I able to test it), so I cannot modify code and submit. It is best someone who can test the code to make the code change. Or else, just shelf it under the table and/or close this ticket.</p>                                                                                                                                                                                                                                                              |            |              |                 |                   |             |

| Summary     | RSB cannot compile tool chain in CentOS 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |              |                 |                   |             |
| Description | <p>In CentOS 6.8, everything works fine. But in CentOS 7, it does not. Initial investigation (I did a while back around New Year time) looks like later version of texinfo has an issue with autoconf. Enclosed is the email Chris Johns replied but I didn't follow through since I switched to CentOS 6.8 for my work.</p> <p>"Looks to me like the RSB is trying to download autoconf 2.69-1 and from <a href="https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=711297">https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=711297</a></p> <p>Looks like this autoconf version has a bug. I also noticed my autoconf version is 2.69-11; however, from what I am reading, RSB will download its own version independent of what user has."</p> <p>Chris John replies:</p> <p>"I guess a recent texinfo version has exposed the issue. I suggest you get the patch from the link in the bug report, create a patch for rtems-tools.git to add the autoconf patch, then create a patch to the RSB adding the patch to the autoconf build, finally 'git send-email' the patches to devel@... for review."</p> |            |              |                 |                   |             |

| Summary     | RTEMS source builder fails when building gcc documentation with newer versions of gcc                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |            |              |                 |                   |             |
| Description | Originally discovered with MSYS2 on windows. Building the gcc compiler fails for older versions of gcc (ie 4.8.3) when building bfin and m32c architectures. The gcc maintainers recommend the use of MISSING=texinfo switch during configuration. A possible solution is attached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |            |              |                 |                   |             |
| #3032       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | fixed      | tool/newlib  | Sebastian Huber | Sebastian Huber   | 3 years ago |
| Summary     | CPU_NAND_S() implementation is not in line with FreeBSD                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |            |              |                 |                   |             |
| Description | <p>According to the FreeBSD man page we have:</p> <p><a href="https://www.freebsd.org/cgi/man.cgi?query=cpuset&amp;sektion=9&amp;apropos=0&amp;manpath=FreeBSD+11.0-RELEASE+and+Ports">https://www.freebsd.org/cgi/man.cgi?query=cpuset&amp;sektion=9&amp;apropos=0&amp;manpath=FreeBSD+11.0-RELEASE+and+Ports</a></p> <p>The CPU_NAND() macro removes CPUs in src from dst. (It is the cpuset(9) equivalent of the scalar: dst &amp;= ~ src.)</p> <p>However, in Newlib we had:</p> <pre>static __inline void CPU_NAND_S(size_t setsize, cpu_set_t *dstset,     const cpu_set_t *srcset1, const cpu_set_t *srcset2) {     cpu_set_word_t *wdest = &amp;dstset-&gt;_bits[0];     const cpu_set_word_t *wsrc1 = &amp;srcset1-&gt;_bits[0];     const cpu_set_word_t *wsrc2 = &amp;srcset2-&gt;_bits[0];     size_t n = setsize / sizeof(*wdest);     size_t i;      for (i = 0; i &lt; n; ++i)         wdest[i] = ~(wsrc1[i] &amp; wsrc2[i]); }</pre>                                                                                                                                                         |            |              |                 |                   |             |

| Summary     | CPU_CMP() implementation is not in line with FreeBSD                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |              |                 |                   |             |

According to the FreeBSD man page we have:

<https://www.freebsd.org/cgi/man.cgi?query=cpuset&sektion=9&apropos=0&manpath=FreeBSD+11.0-RELEASE+and+Ports>

The CPU\_CMP() macro returns true if cpuset1 is NOT equal to cpuset2.

However, in Newlib we had:

```
/* return 1 if the sets set1 and set2 are equal, otherwise return 0 */
static __inline int CPU_CMP(const cpu_set_t *set1, const cpu_set_t *set2)
{
 return CPU_EQUAL(set1, set2);
}
```

Summary: Cannot use RTEMS mailing list archive for patches

The RTEMS mailing list archive has no option to get the raw e-mail via the web interface, e.g.

Description: <https://lists.rtems.org/pipermail/devel/2017-June/018101.html>

For example the Newlib mailing list archive:

<https://sourceware.org/cgi-bin/get-raw-msg?listname=newlib&date=2017&msgid=20170612064218.11969-1-sebastian.huber%40embedded-brains.de>

Summary: 4.11/rtems-nios2 does not build on Windows.

The attached RSB report details the failure.

Description: The path to `ranlib` is the `cwd` (see `make[5]` path) plus the relative path (see the report) which is 308 characters in length and this exceeds the max path length for the Win32 API and `binutils` reports this as a `No such file`.

Summary: Warnings in libdebugger

I started fixing the warnings in libdebugger with the latest tools but apparently some of the variables can't be changed to `const char *const`. So filing as a ticket so Chris can fix them more accurately.

|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|-----------------|------------------|-------------|
| Descripti<br>on | 7.12.1 does not compile with latest guile As already stated here: <a href="https://sourceware.org/bugzilla/show_bug.cgi?id=21104">https://sourceware.org/bugzilla/show_bug.cgi?id=21104</a> GDB in version 7.12.1 fails when trying to compile on Archlinux. GDB uses deprecated functions of libguile which were gone in version 2.2 of libguile. As GDB states in its configure script to support version 2.2 of libguile it fails compiling. |         |          |                 |                  |             |
| Summary         | Tested with the latest rtems source builder on master.                                                                                                                                                                                                                                                                                                                                                                                          |         |          |                 |                  |             |
| #3056           | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                     | fixed   | score    | Sebastian Huber | Sebastian Huber  | 3 years ago |
| Summary         | Add EDF SMP scheduler                                                                                                                                                                                                                                                                                                                                                                                                                           |         |          |                 |                  |             |
| Descripti<br>on | The current SMP schedulers are all fixed-priority schedulers. Add a job-level fixed priority scheduler (EDF).                                                                                                                                                                                                                                                                                                                                   |         |          |                 |                  |             |
| #3057           | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                     | fixed   | tool/gcc | Sebastian Huber | Daniel Hellstrom | 3 years ago |
| Summary         | Add a workaround for the LEON3FT store-store errata                                                                                                                                                                                                                                                                                                                                                                                             |         |          |                 |                  |             |
| Descripti<br>on | GCC needs support to provide a workaround for the LEON3FT store-store errata, e.g. <a href="https://gcc.gnu.org/ml/gcc-patches/2017-06/msg01577.html">https://gcc.gnu.org/ml/gcc-patches/2017-06/msg01577.html</a> and follow up versions.                                                                                                                                                                                                      |         |          |                 |                  |             |
| #3059           | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                     | fixed   | score    | Sebastian Huber | Sebastian Huber  | 3 years ago |
| Summary         | Add a simple processor affinity support to the EDF SMP scheduler                                                                                                                                                                                                                                                                                                                                                                                |         |          |                 |                  |             |
| Descripti<br>on | Add support to the EDF SMP scheduler to honour one-to-one and one-to-all thread processor affinities. Use one ready queue for threads with a one-to-all affinity. Use one ready queue for each of the one-to-one threads for each processor. Since a red-black tree is used for the ready queues, the space overhead of one pointer per ready queue is small.                                                                                   |         |          |                 |                  |             |
| #3061           | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                     | invalid | tool     | Chris Johns     | chrisj@...       | 3 years ago |
| Summary         | including 'unistd.h' in C++ does not build.                                                                                                                                                                                                                                                                                                                                                                                                     |         |          |                 |                  |             |

Including `unistd.h` in a C++ program does not compile with the RSB for today:

```

| Summary         | Make the EDF scheduler the default SMP scheduler                                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |        |                 |                 |             |
| Descripti<br>on | The EDF SMP scheduler supports simple thread processor affinities (see <a href="#">#3059</a> ) with a small run-time overhead. The current default SMP scheduler lacks support for thread processor affinities at all. The EDF SMP scheduler offers a good feature set for most applications. So, use it by default. Run-time libraries like libgomp, MTAPI, work stealing schedulers, language interpreters (e.g. Erlang virtual machine), etc. use a one-to-one thread processor affinity for example. |       |        |                 |                 |             |

| Summary     | Create an interrupt server for every processor in the system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |              |                 |                                       |               |
| Description | Create an interrupt server for every processor in the system with a one-to-one thread processor affinity. This allows load balancing for interrupt processing. Add support routines to customize the setup after initialization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |              |                 |                                       |               |

| Summary     | SPARC: Add lazy floating point context switching                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |              |                 |                                       |               |
| Description | The uniprocessor floating point context switching is unsafe, e.g. it is possible to silently corrupt the floating point context. The SMP floating point switching is safe, however, it doesn't use a deferred switch. Implement lazy floating point switching in uniprocessor configurations. This fixes test case spcontext01.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |              |                 |                                       |               |

| <p>                     Summary<br/>                     Inconsistent blocking addressing in RFS                 </p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |             |       |              |                 |                 |             |
| <p> <b>Background</b> There are two ways to address a block in RFS:                     <ol style="list-style-type: none"> <li>Via a single 32bit block number (bno)</li> <li>Via a group number(gno) and a bit offset (bit)</li> </ol>                     They should be fully convertible (1-1 mapping). In other words, the equation to convert 1 to 2 should be unique within the RFS implementation.                 </p> <p> <b>The bug</b> The RFS implementation contains two different conversions between 1 and 2.                 </p> <p> <b>Details</b> <ol style="list-style-type: none"> <li>In <code>rtems_rfs_group_bitmap_alloc</code> (<code>rtems-rfs-group.c</code>, line 172)                             <pre>bno = gno * group_blocks + bit</pre> </li> <li>In <code>rtems_rfs_group_bitmap_alloc</code> (<code>rtems-rfs-group.c</code>, line 228)                             <pre>bno = gno * group_blocks + bit + 1 (via rtems_rfs_group_block() function)</pre> </li> <li>In <code>rtems_rfs_group_bitmap_free</code> (<code>rtems-rfs-group.c</code>, line 283)                             <pre>bno = gno * group_blocks + bit + 1 (RTEMS_RFS_SUPERBLOCK_SIZE)</pre> </li> <li>In <code>rtems_rfs_group_bitmap_test</code> (<code>rtems-rfs-group.c</code>, line 332)                             <pre>bno = gno * group_blocks + bit</pre> </li> </ol>                     To summarize, the implementation contains two ways of converting a bno to a (gno, bit) pair:                 </p> <p>                     Either:                     <pre>bno = gno * group_blocks + bit</pre>                     Or:                     <pre>bno = gno * group_blocks + bit + 1</pre> <b>The Fix</b> The RFS implementation should consistently convert a bno to a (gno, bit) pair with:                     <pre>bno = gno * group_blocks + bit + RTEMS_RFS_SUPERBLOCK_SIZE</pre>                     This is because the superblock is not accounted for in the block bitmaps. So places to change:                     <ol style="list-style-type: none"> <li><code>rtems-rfs-group.c</code>: all references to the conversion must be updated to use <code>RTEMS_RFS_SUPERBLOCK_SIZE</code> explicitly.</li> <li><code>rtems_rfs_group_block</code> converts the pair to bno via:                             <pre>#define rtems_rfs_group_block(g, _b) (((g)-&gt;base) + (_b))</pre>                             (<code>_g</code>-&gt;base is calculated via <code>rtems-rfs-format.c</code> from:                                     <pre>#define rtems_rfs_block(fs, _grp, _blk) \     (((fs)-&gt;group_blocks) * (_grp)) + (_blk) + 1)</pre>                             The "+ 1" part should really be "+ RTEMS_RFS_SUPERBLOCK_SIZE" to be logically correct. As <code>RTEMS_RFS_SUPERBLOCK_SIZE</code> itself has a comment saying:                                     <pre>/**  * Number of blocks in the superblock. Yes I know it is a superblock and not  * superblocks but if for any reason this needs to change it is handled.  */ #define RTEMS_RFS_SUPERBLOCK_SIZE (1)</pre> </li> </ol> </p> |       |             |       |              |                 |                 |             |

|             |                                                                                                                                                                                                                                                                                               |       |             |               |             |               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|-------------|---------------|-------------|---------------|
| Description | A few of the functions held in <code>cpukit/libmisc/shell/internal.h</code> are useful in building system. For example <code>rtems_shell_register_monitor_commands()</code> and <code>rtems_shell_execute_cmd()</code> .                                                                      |       |             |               |             |               |
|             | The shell commands are important and systems may provide other scripting mechanisms, for example sequences in YAML files. Providing public access lets users know the functions are supported.                                                                                                |       |             |               |             |               |
| #3098       | 3 years ago                                                                                                                                                                                                                                                                                   | fixed | admin       | Chris Johns   | Amar Takhar | 20 months ago |
| Summary     | Add new RTEMS repos to github.                                                                                                                                                                                                                                                                |       |             |               |             |               |

| Summary     | Add RTEMS FDT wrapper and shell command to libmisc                                                                                                                                                                                                                                            |       |             |               |             |               |
| Description | Provide a wrapper to the FDT library for use on RTEMS. The wrapper provides a simplified interface suitable for applications. The shell command provides access to registered FDT blobs so a user can search the tree like a file system and optionally read and write from device addresses. |       |             |               |             |               |

===== Looking down into libiberty.h, I picked on basename()
```

```
/* HAVE_DECL_* is a three-state macro: undefined, 0 or 1. If it is
undefined, we haven't run the autoconf check so provide the declaration without arguments. If it is 0, we checked and failed to find the declaration so
provide a fully prototyped one. If it is 1, we found it so don't provide any declaration at all. */
```

```
#if !HAVE_DECL_BASENAME
#if defined (GNU_LIBRARY)
defined (linux) \
```

|                     |                              |                     |
|---------------------|------------------------------|---------------------|
| defined (FreeBSD)   | defined (OpenBSD)            | defined (NetBSD) \  |
| defined (CYGWIN)    | defined (CYGWIN32)           | defined (MINGW32) \ |
| defined (DragonFly) | defined (HAVE_DECL_BASENAME) |                     |

```
extern char *basename (const char *) ATTRIBUTE_RETURNS_NONNULL ATTRIBUTE_NONNULL(1); #else /* Do not allow basename to be used if there is no
prototype seen. We
either need to use the above prototype or have one from autoconf which would result in HAVE_DECL_BASENAME being set. */
#define basename basename_cannot_be_used_without_a_prototype #endif #endif ===== The native
CentOS 7 has this definition of basename:
ifndef basename /* Return the file name within directory of FILENAME. We don't
declare the function if the `basename' macro is available (defined in <libgen.h>) which makes the XPG version of this function available. */
ifdef CORRECT_ISO_CPP_STRING_H_PROTO extern "C++" char *basename (char *filename)
THROW asm ("basename") nonnull ((1));
extern "C++" const char *basename (const char *filename)
THROW asm ("basename") nonnull ((1));
else extern char *basename (const char *filename) THROW nonnull ((1)); # endif # endif #endif
===== I think we are getting the C++ prototype from string.h and a conflicting C prototype from libiberty.h
```

| Summar<br>y     | Add reference counting to file descriptors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |      |                 |                 |             |

The use of a file descriptor after or during a close() operation may result in a **use after free**. Finding such errors in applications is difficult. Especially in SMP systems using the highly dynamic libbsd network stack.

The file descriptor objects reside in a table with a application configuration defined size. So, the storage of a file descriptor object is always present, only the referenced file system node may change over time. The file system nodes may use an internal reference counting, which is independent of the file descriptors.

To implement reference counting for the file descriptors add a bit field for the reference count to the rtems\_libio\_t::flags and use atomic operations to maintain the flags.

Each operation using a file descriptor should perform a sequence like this:

```
int op(int fd, ...)
{
 rtems_libio_t *iop;
 unsigned int flags;

 if ((uint32_t) fd >= rtems_libio_number_iops) {
 rtems_set_errno_and_return_minus_one(EBADF);
 }

 iop = rtems_libio_iop(fd);
 flags = rtems_libio_iop_hold(iop);

 if ((flags & LIBIO_FLAGS_OPEN) == 0) {
 rtems_libio_iop_drop(_iop);
 rtems_set_errno_and_return_minus_one(EBADF);
 }

 do_op(iop, ...);
 rtems_libio_iop_drop(iop);
 return 0;
}
```

A close() should return -1 with EBUSY in case the file descriptor is referenced. In this case, no close operation will be performed.

Summary: Use FIFO for file descriptor free list

Description: Currently, the free list of file descriptors is organized as a LIFO. In erroneous systems which use a file descriptor after a call to close(), this increases the likelihood that this error is undetected due to the prompt re-use of the file descriptor. The use of a FIFO has the benefit that free file descriptors remain on the free list as long as possible. This increases the time frame in which an invalid use of a closed file descriptor returns an error status.

| Description | Since we have only one process, sharing between processes is trivial.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |             |                 |                 |             |

| Summary      | Internal status codes must not depend on RTEMS_POSIX_API                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |             |                 |                          |               |
| Description  | The internal status codes encode a Classic rtems_status_code and error codes used by the POSIX and C11/C++11 APIs. In case the POSIX API is disabled, the C11/C++11 support must still work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |             |                 |                          |               |

| <b>#3177</b> | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | fixed | doc         | Joel Sherrill   | Chris Johns              | 3 years ago   |
| Summary      | Replace/update POSIX Compliance Guide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |             |                 |                          |               |
| Description  | <p>The POSIX Compliance Guide was never converted from texinfo. Beyond that, it is out of date and follows the outline of the printed version of the POSIX standard which no one sees anymore. This ticket proposes:</p> <ol style="list-style-type: none"> <li>1. new Sphinx document</li> <li>2. contents generated from POSIX API tracking spreadsheet (CSV)</li> <li>3. outline per .h file, not functional area</li> <li>4. use bullets, not tables so easier to format</li> </ol>                                                                                                                                                                                                                      |       |             |                 |                          |               |
| <b>#3178</b> | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | fixed | tool/gcc    | Joel Sherrill   | Joel Sherrill <joel@...> | 3 years ago   |
| Summary      | Update sh-rtems4.12 bset to use rtems-default (using old gcc)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |             |                 |                          |               |
| Description  | I built a toolset and all BSPs on Centos 7 after switching this to rtems-default.bset again. There was no comment indicating why it was using an older gcc so I assume something has been fixed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |       |             |                 |                          |               |
| <b>#3179</b> | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | fixed | posix       | Joel Sherrill   | Sebastian Huber          | 3 years ago   |
| Summary      | New warnings from Time Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |             |                 |                          |               |

| #3182   | 3 years ago                                                  | fixed | posix | Sebastian Huber | Sebastian Huber | 2 years ago |
| Summary | CLOCK_REALTIME timeout implementation is not POSIX compliant |       |       |                 |                 |             |

Changes of the CLOCK\_REALTIME must trigger absolute timeouts. This is not the case. There is no test for this in RTEMS.

|---------|----------------------------------|-------|-------|-----------------|-----------------|-------------|
| #3185   | 3 years ago                      | fixed | score | Sebastian Huber | Sebastian Huber | 3 years ago |
| Summary | Change uptime seconds to int32_t |       |       |                 |                 |             |

The use of a 64-bit integer for the uptime seconds is overkill. Use int32\_t instead for \_Timecounter\_Time\_uptime. Change derived APIs, e.g. rtems\_clock\_get\_uptime\_seconds().

| Summary | smptests/Makefile.am Issues |       |       |               |                 |             |

There appear to be two issues in smptests/Makefile.am:

1. smppsxaffinity0[12] are listed twice. This causes a warning. I am unsure if they should always be built or only when POSIX is enabled.
2. smppsxmutex01 is listed in the "HAS\_POSIX" section. Aren't POSIX mutexes always on now so this test should not be inside the conditional?

This was a weird failure mode. It didn't exit but had to be killed by hand. I dropped off the options related to mailing the log and it still failed. This is on an up to date CentOS 7 (rtbf64c 7.4) as well as my 7.3 VM.</p> <pre>+ /home/joel/rtems-work/rtems-tools//tester/rtems-test --rtems-tools=/home/joel/rtems-work/tools/4.12 --rtems-bsp=erc32 --log=run.log --mail --mail-from=joel@rtems.org --mail-to=build@lists.rtems.org ./sparc-rtems4.12/c/erc32/testsuites/samples/ticker/ticker.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/minimum/minimum.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/iostream/cxx_iostream.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/fileio/fileio.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/capture/capture.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/nsecs/nsecs.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/paranoia/paranoia.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/cdtest/cdtest.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/base_sp/base_sp.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/unlimited/unlimited.exe ./sparc-rtems4.12/c/erc32/testsuites/samples/hello/hello.exe RTEMS Testing - Tester, 4.12 (52513610668b) [ 5/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: hello.exe [ 6/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: cxx_iostream.exe [ 3/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: cdtest.exe [ 9/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: paranoia.exe [ 7/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: minimum.exe [ 1/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: base_sp.exe [11/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: unlimited.exe [ 4/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: fileio.exe [10/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: ticker.exe [ 2/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: capture.exe [ 8/11] p:0 f:0 u:0 e:0 I:0 B:0 t:0 i:0   sparc/erc32: nsecs.exe Traceback (most recent call last):   File "/home/joel/rtems-work/rtems-tools//tester/rtems-test", line 40, in &lt;module&gt;     rt.test.run()   File "/data/home/joel/rtems-work/rtems-tools/tester/rt/test.py", line 336, in run     job_trace()   File "/data/home/joel/rtems-work/rtems-tools/tester/rt/test.py", line 189, in report_finished     reports.log(tst.executable, report_mode)   File "/data/home/joel/rtems-work/rtems-tools/tester/rt/report.py", line 193, in log     exe = path.basename(self.results[name]['exe'])   File "/home/joel/rtems-work/rtems-tools/rtemstoolkit/path.py", line 77, in basename     return shell(os.path.basename(path))   File "/usr/lib64/python2.7/posixpath.py", line 121, in basename     i = p.rfind('/') + 1 AttributeError: 'NoneType' object has no attribute 'rfind'</pre> |           |          |                 |                 |               |

**Summary** Qemu Fails to Build, RSB Gives Odd Traceback

After applying the attached patch to update the md5's to sha512's, something goes wrong in the RSB build of Qemu. There is nothing obvious from the qemu build directory. But it appears that the cd into the qemu git directory didn't work and it is acting on my RSB git clone. The RSB trace is:

```

script: 78: cd "/data/home/joel/rtems-work/rtems-source-builder/bare/build/qemu-42d58e7c6760cb9c55627c28ae538e27dcf2f144-x86_64-linux-gnu-1"

**Description**

**#3213** 3 years ago fixed tool Joel Sherrill Chris Johns 6 months ago

**Summary** Move erc32, leon2, leon3, psim and jmr3904 to Tier 2

**Description**

Based on these results on gdb simulators, please bump these to Tier 2.

- erc32 - <https://lists.rtems.org/pipermail/build/2017-October/000018.html>
- leon2 - <https://lists.rtems.org/pipermail/build/2017-October/000021.html>
- leon3 - <https://lists.rtems.org/pipermail/build/2017-October/000022.html>
- psim - <https://lists.rtems.org/pipermail/build/2017-October/000020.html>
- jmr3904 - <https://lists.rtems.org/pipermail/build/2017-October/000019.html>

As an aside, how will we distinguish the SPARC BSPs on sis, tsim or real hardware in the results?

**#3215** 3 years ago fixed doc Joel Sherrill Joel Sherrill 3 years ago

**Summary** Configuring a System Still Includes Notepads and Has Wrong Heading

**Description**

This section has the wrong heading and needs to be deleted anyway.

```

24.8.2. Specify Maximum Classic API Timers
CONSTANT:
CONFIGURE_ENABLE_CLASSIC_API_NOTEPADS

```

**#3216** 3 years ago fixed score Sebastian Huber Sebastian Huber 3 years ago

**Summary** Replace vprintk() implementation

**Description**

The current vprintk() implementation has a questionable licence header, lacks support for the 'z' and 'j' format specifiers, is not robust against invalid format specifiers, uses a global variable for output. Replace it with a stripped down version of the FreeBSD kernel kprintf() function.

**#3217** 3 years ago fixed lib Chris Johns Chris Johns 2 years ago

**Summary** Add RTEMS version, build and tools details to tests

**Description**

Published test results need the RTEMS version, how it is built and the tools used to build the kernel and tests.

**#3218** 3 years ago fixed dev/serial Sebastian Huber Sebastian Huber 3 years ago

**Summary** Termios canonical mode (ICANON) does not return input line by line

**Description**

In canonical mode, input is made available line by line. We must stop the canonical buffer filling upon reception of an end-of-line character.

**#3219** 3 years ago fixed bsps Chris Johns Chris Johns 21 months ago

**Summary** Zynq BSP missing linker option --gc-sections

**Description**

This Zynq BSP is missing this option.

**#3220** 3 years ago fixed unspecified Sebastian Huber Sebastian Huber 2 years ago

**Summary** Change RTEMS release number scheme from 4.12 to 5

As discussed here

<https://lists.rtems.org/pipermail/devel/2017-October/019169.html>

it was agreed to use version 5.1 with the new number scheme for the next RTEMS release.

Most important items of this release:

- SMP support
- 64-bit time\_t (year 2038 problem)
- the network stack header consolidation and the move to Newlib
- self-contained POSIX synchronization objects (impacting the configuration)
- improved Ada support (however, not all Ada tests pass currently)

Descripti  
on

The following steps are necessary to carry out the number change:

1. ~~Change version of RTEMS tools~~
2. ~~Change version of RSB~~
3. ~~Change version of RTEMS~~
4. ~~Documentation repo- Easy-~~
5. ~~Documentation website repo- Easy-~~
6. Release procedure repo. Easy.
7. ~~Trac tickets- Not sure-~~
8. ~~Trac wiki- Medium(?)~~. A wiki search of 4.12 gives 21 hits.
9. rtems.org website. That needs Joel.
10. Make announcement on the devel and user mailing list

Summary sb-check fails on Msys2 64-bit

There must be a recent change to msys2 which is breaking things. I installed the 64-bit version from <https://msys2.github.io/> per the instructions at <https://docs.rtems.org/branches/master/user/hosts/index.html#microsoft-windows>

```
$./source-builder/sb-check
error: no hosts defaults found; please add
```

After adding some prints, I learned this:

```
$./source-builder/sb-check
posix
made it
MSYS_NT-10.0
error: no hosts defaults found; please add
```

I filled in options.py and windows.py to recognize this as MSYS2. I was then able to run sb-check. But it wasn't happy. Apparently the pacman command in the User's Guide is missing some packages based on newer versions:

```
$./source-builder/sb-check
posix
MSYS_NT-10.0
RTEMS Source Builder - Check, 5 (8b30eb3f440a modified)
error: exe: not found: (_ar) ar
error: exe: not found: (_as) as
error: exe: not found: (_cc) x86_64-w64-mingw32-gcc
error: exe: not found: (_cxx) x86_64-w64-mingw32-g++
error: exe: not found: (_ld) ld
error: exe: not found: (_nm) nm
error: exe: not found: (_objcopy) objcopy
error: exe: not found: (_objdump) objdump
error: exe: not found: (_ranlib) ranlib
Environment is not correctly set up
```

Descripti  
on

I installed binutils explicitly with pacman and then sb-check is complaining about gcc. I did a find to locate the gcc's installed:

```
$ find / -name "*gcc.*"
/home/jrs007/.ssh/id_rsa_gcc.pub
/mingw64/bin/gcc.exe
/mingw64/bin/x86_64-w64-mingw32-gcc.exe
/mingw64/lib/gcc/x86_64-w64-mingw32/6.2.0/include/stdint-gcc.h
/mingw64/lib/gcc/x86_64-w64-mingw32/6.2.0/libgcc.a
/mingw64/share/info/gcc.info.gz
/mingw64/share/man/man1/gcc.1.gz
/usr/share/vim/vim80/compiler/gcc.vim

| Descripti<br>on | The thread queue extract operations performed by the <code>_Thread_queue_Flush_critical()</code> may result in a priority change of the thread queue owner. Carry out the scheduler priority update operation. This is especially important in SMP configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |              |                 |                 |               |

| Descripti<br>on | The <code>getentropy()</code> system call was introduced by OpenBSD and is now also available on glibc 2.25 and later. It is used for example by <code>arc4random_buf()</code> . Which in turn is used by various cryptographic functions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |              |                 |                 |               |

| Descripti<br>on | For the SMP support the global construction was changed to use an approach with a thread restart after global construction. With this implementation thread-local objects and POSIX keys initialized during global construction are not present in the initialization thread (main thread). This is not in line with what users familiar with GNU/Linux or FreeBSD would expect. See for example:<br><a href="https://lists.rtems.org/pipermail/users/2017-July/031525.html">https://lists.rtems.org/pipermail/users/2017-July/031525.html</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                 |                 |               |

| Descripti<br>on | The current <code>rtems_panic()</code> implementation is quite heavy weight. It depends on <code>_exit()</code> which calls the global destructors. It uses <code>fprintf(stderr, ...)</code> for output which depends on an initialized console device and the complex <code>fprintf()</code> .<br>Introduce a new fatal source <code>RTEMS_FATAL_SOURCE_PANIC</code> for <code>rtems_panic()</code> and output via <code>printk()</code> .<br>Document this function in Fatal Manager chapter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |              |                 |                 |               |

| Description | BSPs can use the <code>bsp_fatal_extension()</code> to provide BSP-specific fatal error handling. There is no need for a <code>_BSP_Fatal_error()</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |           |              |                  |                                  |               |

| Summary     | Add <code>BSP_VERBOSE_FATAL_EXTENSION</code> to <code>RTEMS_BSP_CLEANUP_OPTIONS</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |              |                  |                                  |               |
| Description | Add <code>BSP_VERBOSE_FATAL_EXTENSION</code> to <code>RTEMS_BSP_CLEANUP_OPTIONS</code> to optionally print the RTEMS version, the fatal source and the fatal code in the shared <code>bsp_fatal_extension()</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |           |              |                  |                                  |               |

| Summary     | <code>libpci</code> depends on BSP-specific header files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |              |                  |                                  |               |
| Description | <p>The <code>libpci</code> is currently only used on SPARC. It is in <code>cpukit</code>, so BSP-specific header files are not allowed. Unfortunately this is not the case for <code>libpci</code>. However, it seems the the routines depending on <code>BSP_PCI_BIG_ENDIAN</code> are not used:</p> <pre>grep -r 'pci_{[dst]{2}}' . /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint16_t pci_id_le16(volatile uint16_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_le16(volatile uint16_t *addr, uint16_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint32_t pci_id_le32(volatile uint32_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_le32(volatile uint32_t *addr, uint32_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint16_t pci_id_be16(volatile uint16_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_be16(volatile uint16_t *addr, uint16_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint32_t pci_id_be32(volatile uint32_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_be32(volatile uint32_t *addr, uint32_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint16_t pci_id_le16(volatile uint16_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_le16(volatile uint16_t *addr, uint16_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint32_t pci_id_le32(volatile uint32_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_le32(volatile uint32_t *addr, uint32_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint16_t pci_id_be16(volatile uint16_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_be16(volatile uint16_t *addr, uint16_t val) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint32_t pci_id_be32(volatile uint32_t *addr) /cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE void pci_st_be32(volatile uint32_t *addr, uint32_t val)</pre> <p>Is this dead code and can I remove <code>BSP_PCI_BIG_ENDIAN</code>?</p> <p>Another issue is the use of a BSP-specific interrupt API in <code>cpukit/libpci/pci/irq.h</code>.</p> <p>The missing functions should be added to <code>&lt;rtems/irq-extension.h&gt;</code>.</p> |           |              |                  |                                  |               |
| #3261       | 3 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | fixed     | doc          | Frédéric Jouault | Frédéric Jouault <f.jouault@...> | 18 months ago |
| Summary     | A couple of documentation typos                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |              |                  |                                  |               |
| Description | This patch includes a couple of typo corrections in the C User Manual.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |              |                  |                                  |               |
| #3264       | 2 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | fixed     | score        | Sebastian Huber  | Sebastian Huber                  | 2 years ago   |
| Summary     | Add monotonic watchdog based on uptime                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |              |                  |                                  |               |
| Description | The <code>CLOCK_MONOTONIC</code> time services use currently the clock tick based watchdog. This is a problem in case the uptime (measured via the timercounter) and the ticks since boot drift away (measured via the clock ticks). Introduce a new watchdog which uses the uptime. The memory overhead is quite small (two pointers per processor).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |           |              |                  |                                  |               |
| #3265       | 2 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | fixed     | posix        | Sebastian Huber  | Sebastian Huber                  | 2 years ago   |
| Summary     | Use second one based uptime for <code>CLOCK_MONOTONIC</code> for FreeBSD compatibility                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |              |                  |                                  |               |
| Description | This simplifies the <code>CLOCK_MONOTONIC</code> based time services. It is potentially important for <code>libbsd</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           |              |                  |                                  |               |
| #3266       | 2 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | duplicate | lib          | Chris Johns      |                                  | 2 years ago   |
| Summary     | <code>cpukit/libpci</code> references BSP headers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |              |                  |                                  |               |

On the `no-preinstall` branch of <https://git.rtems.org/chrisj/rtems.git/> the build fails with:

```

sparc-rtems5-gcc --pipe -DHAVE_CONFIG_H -I. -I/opt/work/chris/rtems/kernel/bSPs/beagleboneblack/sparc-rtems5/c/erc32/include -

| Summary | PowerPC BSP include naming mess. |       |              |             |             |

The PowerPC BSP family headers need some refactoring for the RTEMS 5 release. The BSP family relies on the preinstall process to get suitable headers installed to work and removing `preinstall` exposes this. The specific issue appears with `irq.h` when building the `no-preinstall` branch. There is a PowerPC BSP family header and a number of BSPs also have an `irq.h` which overrides families header. The code has `#include <bsp/irq.h>` and the header used depends on the include order on the GCC command line. This is fragile for any user. These headers needs to be moved to BSP specific paths, for example `#include <myme3100/irq.h>`.

| #3270   | 2 years ago                      | fixed | arch/powerpc | Sebastian Huber | Sebastian Huber | 2 years ago |
| Summary | Remove unused support for MPC505 |       |              |                 |                 |             |

There is some support for MPC505 in libcpu, however, I cannot find a BSP for this code. Remove this apparently dead code.

| #3277   | 2 years ago                               | fixed | network/libbsd | Sebastian Huber | Sebastian Huber | 2 years ago |
| Summary | QoriQ: Add MAC-less DPAA driver to libbsd |       |                |                 |                 |             |

The SDK Linux DPAA driver supports a so called MAC-less interface driver. This driver allows Ethernet communication between guest systems of a hypervisor.

| Summary | bsp-builder has incorrect print (%s in output) |       |      |               |             |             |

I don't think the tools have branches so only impacts master.

Notice the "run: %s:"

```

| #3284   | 2 years ago                          | fixed | tool/rsb | Sebastian Huber | Sebastian Huber <sebastian.huber@...> | 2 years ago |
| Summary | RSB uses hard coded GCC binary paths |       |          |                 |                                       |             |

In order to build a tool chain with Ada support you need a native GCC with Ada support of the same version as the cross compiler. The RSB uses hard coded paths for the gcc and g++ programs:

```

source-builder/defaults.mc: __cc: exe, required, '/usr/bin/gcc'
source-builder/defaults.mc: __cxx: exe, required, '/usr/bin/g++'

```

So, the RSB user must change the main GCC installation of the machine to build a particular RTEMS tool chain. This is undesired/infeasible in most situations.

|---------|---------------------------------|-------|-------|-----------------|-----------------|---------------|
| #3285   | 2 years ago                     | fixed | build | Sebastian Huber | Sebastian Huber | 23 months ago |
| Summary | Reorganize BSP source directory |       |       |                 |                 |               |

Now, that all BSP header files are in

- bsp/include
- bsp/@RTEMS\_CPU@/include
- bsp/@RTEMS\_CPU@/@RTEMS\_BSP\_FAMILY@/include

we should also move the BSP sources to this new directory tree. How do we want to organize the BSP sources in bsp/@RTEMS\_CPU@/@RTEMS\_BSP\_FAMILY@?

- include (this is already there, see #3254)
- config
  - somebsp.cfg
- start (everything required to run a minimal application without devices)
  - start.S
  - bspstart.c
  - bspsmc.c
  - linkcmds
- cache (everything for the cache controller support)
- irq (everything for the interrupt controller support)
- console (everything for the console driver)
- clock (everything for the clock driver)
- i2c (everything for the I2C driver)
- spi (everything for the SPI driver)
- net (legacy network stack drivers)
- mpci (RTEMS\_MULTIPROCESSING support)
- rtc (everything for the RTC driver)
- ata (everything for the ATA driver)
- contrib (import of external sources)
  - The layout of external sources should be used as is if possible.

| Summary     | RSB macro calls such as define fail on unicode keys.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |              |                 |                          |               |
| Description | <p>The <code>define</code> call in <code>macros.py</code> checks for a <code>str</code> while the <code>__getitem__</code> call can convert a <code>unicode</code> string to <code>str</code>. Remove the check.</p> <p>Remove the other places in <code>macros.py</code> a <code>key</code> <code>str</code> check is made and see if they can be improved.</p> <p>The following has been reported to me:</p> <pre>cd rtems-source-builder-4.11.3/rtems ./source-builder/sb-set-builder --prefix=/home/user/rtems/4.11 --log=arm.txt --without-rtems 4.11/rtems-arm Traceback (most recent call last):   File "./source-builder/sb-set-builder", line 29, in &lt;module&gt;     setbuilder.run()   File "./source-builder/sb/setbuilder.py", line 526, in run     opts = options.load(sys.argv, optargs)   File "./source-builder/sb/options.py", line 668, in load     version.load_release_settings(o.defaults)   File "./source-builder/sb/version.py", line 123, in load_release_settings     sources.hash((hs[0], hash[0], hs[1]), macros, setting_error)   File "./source-builder/sb/sources.py", line 105, in hash     macros.define(_file, '%s %s' % (args[0], args[2]))   File "./source-builder/sb/macros.py", line 439, in define     raise TypeError('bad key type: %s' % (type(key))) TypeError: bad key type: &lt;type 'unicode'&gt;</pre> |       |              |                 |                          |               |

| Summary     | Improve INTERNAL_ERROR_THREAD_EXITTED to show the id and thread name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |              |                 |                          |               |

It might be more helpful in the case of a thread exit to output some information about that thread to make tracking it down simpler.

This example works ok.

```
static void thread_exitted_print_info(rtems_tcb *tcb) {
 printf("Thread exited: %s (id %d)\n", tcb->Object.name, tcb->Object.id)
}

/* In your configuration: */ #define CONFIGURE_INITIAL_EXTENSIONS \
 { .thread_exitted = thread_exitted_print_info }
```

Add a simple task console driver

The default console driver for tests is the simple console driver. It uses a polled output via `rtems_putc()` done directly in the context of the executing thread. This is a problem for timing sensitive tests. Add a simple task console driver.

```
.. index:: CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER
.. _CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER:
CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER

CONSTANT:
 ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER``
DATA TYPE:
 Boolean feature macro.
RANGE:
 Defined or undefined.
DEFAULT VALUE:
 This is not defined by default.
DESCRIPTION:
 ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER`` is defined if
 the application wishes to include the Simple Task Console Device Driver.
NOTES:
 This device driver is responsible for providing the :file:/dev/console`
 device file. This device is used to initialize the standard input, output,
 and error file descriptors.

 This device driver reads via getchark().

 This device driver writes into a write buffer. The count of characters
 written into the write buffer is returned. It might be less than the
 requested count, in case the write buffer is full. The write is
 non-blocking and may be called from interrupt context. A dedicated task
 reads from the write buffer and outputs the characters via
 rtems_putc(). This task runs with the least important priority. The
 write buffer size is 2047 characters and it is not configurable.

 Use fsync(STDOUT_FILENO) or fdatasync(STDOUT_FILENO) to drain the
 write buffer.

 The Termios framework is not used. There is no support to change device
 settings, e.g. baud, stop bits, parity, etc.

 The
 * ``CONFIGURE_APPLICATION_NEEDS_CONSOLE_DRIVER``,
 * ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_CONSOLE_DRIVER``, and
 * ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER``
 configuration options are mutually exclusive.
```

| Summary     | mhttpd's http etag can result in invalid caching in a browser.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |              |                 |                 |               |
| Description | <p>The mhttp's http etag uses the mtime and file length and this can cause subtle issues if a target has no RTC or it is incorrect and files are being copied without preserving the mtime or changes happen that do not change the length.</p> <p>The <code>cp</code> and <code>untar</code> code do not update a file's time.</p> <p>Add support for an etag callback so a user can manage the tag, ie MD5 or something similar.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |              |                 |                 |               |
| #3325       | 2 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | fixed | config       | Sebastian Huber | Sebastian Huber | 2 years ago   |
| Summary     | Simplify clustered scheduler configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |              |                 |                 |               |
| Description | <p>Improve the scheduler configuration documentation according to user review.</p> <p>Do not use names derived from scheduler implementation details. Instead use names derived from the scheduler configuration or documentation. Provide defines for backward compatibility.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |              |                 |                 |               |

| Summary     | Trac Login Failure (bad password) Causes Internal Error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |              |                 |                 |               |

Behavior is as expected with a bad user name.

Try to login to Trac with a bad password:

Oops... Trac detected an internal error: `ProgrammingError?: (1064, "You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'sid=joel.sherrill' AND authenticated=1 AND name='failed_logins_count' at line 1")` There was an internal error in Trac. It is recommended that you notify your local Trac administrator with the information needed to reproduce the issue. To that end, you could anonymous `ProgrammingError?: (1064, "You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'sid=joel.sherrill' AND authenticated=1 AND name='failed_logins_count' at line 1")` ===== How to Reproduce =====

While doing a POST operation on `/login`, Trac issued an internal error.

(please provide additional details here)

| Description | <p>RTEMS threads getting locked up when using certain c++ functionality. Issue happens for example when <code>std::future</code> is combined with <code>std::async</code>.</p> <p>Investigating deeper, seems like this happens if <code>std::async</code> executes before <code>std::future</code> gets scheduled to run. Both of these create a <code>pthread_once</code> instance.</p> <p><code>_once()</code> uses a common semaphore for all calls, thus the first function (<code>async.get</code> usually) gets the lock, calls its "init" function (which blocks until the second function has completed. After this, <code>std::future</code> also uses <code>pthread_once</code> to execute, but because the lock is already taken, it also blocks, causing a deadlock.</p> <p>Attached you can find a test application that reproduces the deadlock.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |              |                |                                       |               |

| Description | <p>The following BSPs:<br/> powerpc-beatnik powerpc-mcp750 powerpc-mtx603e powerpc-mvme2100 powerpc-mvme2307 powerpc-mvme5500 powerpc-qemuprep-altivec powerpc-qemuprep<br/> use bsp/powerpc/include/libcpu/page.h which defines _ALIGN, PAGE_MASK, and PAGE_SIZE. These are defined by &lt;machine/param.h&gt;. I think the solution is to delete the versions in libcpu/page.h. Comments appreciated.</p> <pre>===== In file included from ../../src/lib/libbsp/powerpc/mvme5500/./../powerpc/shared/startup/pgtbl_setup.c:3:0: /home/joel/rtems-work/rtems-testing/rtems/rtems/bsp/powerpc/include/libcpu/page.h:22:0: warning: "PAGE_MASK" redefined  #define PAGE_MASK (~ (PAGE_SIZE-1))</pre> <p>In file included from /data/home/joel/rtems-work/tools/5/powerpc-rtems5/include/sys/_cpuset.h:36:0,<br/> from /data/home/joel/rtems-work/tools/5/powerpc-rtems5/include/sys/cpuset.h:45, from /data/home/joel/rtems-work/tools/5/powerpc-rtems5/include/sys/_pthreadtypes.h:24, from /data/home/joel/rtems-work/tools/5/powerpc-rtems5/include/sys/types.h:239, from /data/home/joel/rtems-work/tools/5/powerpc-rtems5/include/sys/time.h:43, from /home/joel/rtems-work/rtems-testing/rtems/cpukit/include/rtems/score/timestamp.h:43, from /home/joel/rtems-work/rtems-testing/rtems/cpukit/include/rtems/score/thread.h:36, from /home/joel/rtems-work/rtems-testing/rtems/rtems/cpukit/include/rtems/score/heap.h:22, from /home/joel/rtems-work/rtems-testing/rtems/rtems/cpukit/include/rtems/rtems/types.h:26, from /home/joel/rtems-work/rtems-testing/rtems/cpukit/include/rtems.h:31, from ../../src/lib/libbsp/powerpc/mvme5500/./../powerpc/shared/startup/pgtbl_setup.c:1:<br/> /data/home/joel/rtems-work/tools/5/powerpc-rtems5/include/machine/param.h:70:0: note: this is the location of the previous definition</p> <pre>#define PAGE_MASK (PAGE_SIZE - 1)</pre> |             |       |              |                 |                 |               |

| Summary     | Deprecate rtems_disk_create_phys(), etc.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |             |       |              |                 |                 |               |
| Description | There are currently two implementations of a block device (disk). Deprecate the legacy rtems_disk_create_phys(), etc. implementation. Remove all RTEMS internal uses except in the block01 test. Add RTEMS_DEPRECATED attribute to API.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |             |       |              |                 |                 |               |

| Description | The unhex program (tools/build/unhex.c) has no license information and is unused in the RTEMS build. Users of HEX files should consider to use ELF instead. Remove it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |             |       |              |                 |                 |               |
|             | <a href="#">#3379</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 2 years ago | fixed | tool         | Sebastian Huber | Sebastian Huber | 2 years ago   |
| Summary     | Remove packhex program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |             |       |              |                 |                 |               |

The packhex program ( tools/build/packhex.c ) is exported to the standard RTEMS build infrastructure via the PACKHEX variable. It is used by some legacy BSPs. It is unclear license information:

```

/***** P A C K H E X . C *****/
*
* Packhex is a hex-file compaction utility. It attempts to concatenate
* hex records to produce more size-efficient packaging.
*
* Limitations: Input files must be correctly formatted. This utility
* is not robust enough to detect hex-record formatting
* errors.

Summary Move rtems-bin2c program to rtems-tools

Description The rtems-bin2c program (tools/build/rtems-bin2c.c) is exported to the standard RTEMS build infrastructure via the BIN2C variable. Move it to rtems-tools.

Summary rtems-test command line documentation appears to be out of date

Description <https://docs.rtems.org/branches/master/user/tools/tester.html#command-line-help> does not look like the current output of the --help.

This may also apply to other branches and branch specific tickets filed.

Summary Testsuite Makefile merge to one per group of tests

Description Merge the nested Makefile.am files into a single file per group of tests.

A single Makefile.am for all tests is not practical at this point in time because a test is an estimated 7 lines and with over 750 tests this means the file would be too big and a conflict hot spot.

Summary Require --enable-rtemsbsp with --enable-smp or --enable-multiprocessor

Description There is a limited number of BSPs that support SMP or MP so using the BSP wildcard will result in a failed build. Require the user provide a BSP.

Summary Prefer int for int32\_t

Common systems like Linux and FreeBSD define int32\_t to int. This means a lot of third party code works well in these cases:

```

#include <stdint.h>

void f(int32_t);

void f(int);

void g(int32_t *);

void h(void)
{
 int i;
 g(&i);
}

```

On RTEMS you get however in C

```

test.c:5:6: error: conflicting types for 'f'
void f(int);
 ^
test.c:3:6: note: previous declaration of 'f' was here
void f(int32_t);
 ^
test.c: In function 'h':
test.c:12:4: warning: passing argument 1 of 'g' from incompatible pointer type [-Wincompatible-pointer-types]
 g(&i);
 ^
test.c:7:6: note: expected 'int32_t * {aka long int *}' but argument is of type 'int *'
void g(int32_t *);

```

Descripti  
on

and C++

```

test.c: In function 'void h()':
test.c:12:4: error: invalid conversion from 'int*' to 'int32_t* {aka long int*}' [-fpermissive]
 g(&i);
 ^
test.c:7:6: note: initializing argument 1 of 'void g(int32_t*)'
void g(int32_t *);
 ^

```

This is due to a Newlib speciality which uses long for int32\_t if long is a 32-bit type. To ease the use of third party software in RTEMS we should override this option and use int for int32\_t just like the standard host operating systems (e.g. Linux and FreeBSD). Only a small GCC patch is required to do this:

```

diff --git a/gcc/config/rtems.h b/gcc/config/rtems.h

| Summary      | NFS: Remove support for cexp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |                |                 |                 |               |
| Description  | <p>There is some support for cexp and tests in the NFS client directory:</p> <pre>cpukit/libfs/src/nfsclient/src/cexp.c cpukit/libfs/src/nfsclient/src/dirutils.c cpukit/libfs/src/nfsclient/src/nfs.modini.c cpukit/libfs/src/nfsclient/src/nfsTest.c cpukit/libfs/src/nfsclient/src/rpcio.modini.c</pre> <p>There are also some *.rel files installed. This stuff is probably unused. If it is still in use it should move elsewhere, e.g. some general cexp support outside of the main RTEMS sources. Dead/untested code should not be present in the RTEMS code base.</p> <p>See also:</p> <p><a href="https://lists.rtems.org/pipermail/users/2018-April/032182.html">https://lists.rtems.org/pipermail/users/2018-April/032182.html</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |                |                 |                 |               |

| Descripti<br>on                                             | The RTEMS 5 tool set contains the RTEMS tools (rtems-tools). The version of the RTEMS tools is determined by the tool set build time since the current Git master branch is fetched. Instead use an explicit RTEMS tools version (similar to all other tools, e.g. Binutils, Newlib, GCC, GDB) to make the RTEMS tool set independent of the arbitrary build time.                                                                                                                                                                        |         |                |                 |                          |               |

| Summary     | Always build network services (tftps, ftpfs, ftpd, telnetd, libdebugger)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |             |                 |                               |
| Description | Always build network services (tftps, ftpfs, ftpd, telnetd, libdebugger) which only depend on the POSIX socket API (provided by Newlib header files) as support libraries. Remove them from libbsd.<br>The network services must reside in dedicated libraries to avoid a cyclic dependency between libbsd.a and librtmcsu.a.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |           |             |                 |                               |

| Description | Both coverage and tracing are large enough areas that lumping them into tools or other random categories makes work on them harder to trac.<br>Please add coverage and tracing. Coverage could be a subcategory of tools.T Tracing could be a standalone component. It has target and tool components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |           |             |                 |                               |

| Summary     | Remove Simple SMP Priority Scheduler                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |             |                 |                               |
| Description | This scheduler was the first SMP scheduler added. It was created to have an easy SMP scheduler to debug. This was especially important when all of the SMP modifications and support were new. A Simple Scheduler has a use case as a low resource alternative for small uniprocessor systems. But the SMP variant just doesn't seem to have a good use case. If you have an SMP system, the application is almost certain to have enough resources where the more complicated data structures used by the other schedulers wouldn't be a burden. The Deterministic Priority Scheduler uses ~3K for FIFO with 256 priorities. This should not be an issue for an SMP system.<br>This ticket is a proposal to remove this as no longer having a use case.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |             |                 |                               |

| Summar<br>y     | Remove clock driver Clock_driver_support_shutdown_hardware() hook                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |             |                   |                   |               |
| Descripti<br>on | <p>Most applications use a clock driver and most BSPs use the clock driver framework provided by clockimpl.h. This framework offers a Clock_driver_support_shutdown_hardware() hook which is used like this.</p> <pre> #ifdef Clock_driver_support_shutdown_hardware /**  * @brief Clock_exit  *  * This routine allows the clock driver to exit by masking the interrupt and  * disabling the clock's counter.  */ void Clock_exit( void ) {     Clock_driver_support_shutdown_hardware();      /* do not restore old vector */ } #endif ... #ifdef Clock_driver_support_shutdown_hardware atexit( Clock_exit ); #endif </pre> <p>The aim is to stop clock tick interrupts at some late point in the exit() procedure.</p> <p>The use of atexit() pulls in malloc() which pulls in errno. It is incompatible with the intention of the CONFIGURE_DISABLE_NEWLIB_REENTRANCY configuration option.</p> <p>The exit() function must be called from thread context, so accompanied clock tick interrupts should cause no harm. On the contrary, someone may assume a normal operating system operation, e.g. working timeouts.</p> <p>Remove the superfluous Clock_driver_support_shutdown_hardware() hook.</p> |       |             |                   |                   |               |

The last installed tool in RTEMS repository is the install-if-change script. This script does the same as the standard "install" program with an additional feature to install variants via the -V command line option.

This script is used by the standard Makefile support:

```
c/src/make/host.cfg.in:INSTALL_CHANGE=$(PROJECT_BIN)/install-if-change
```

The INSTALL\_CHANGE is used by:

```
c/src/make/host.cfg.in:ifndef INSTALL_CHANGE c/src/make/host.cfg.in:INSTALL_CHANGE=$(PROJECT_BIN)/install-if-change
c/src/make/host.cfg.in:INSTALL_VARIANT=$(INSTALL_CHANGE) -V "$$(LIB_VARIANT)"
```

Is the variant stuff still supported?

I would remove the support for it and replace the "install-if-change" script with the standard "install" program.

Summary  
rtems-test should not use the env PATH to find covoar

The `rtems-test` command should know where `covoar` is when invoking it. It cannot use the environment's path. The path can contain invalid or outdated versions with subtle issues that could be hard to find.

There should be no need to run install to use and test `rtems-test` with coverage.

The `rtems-test` python code for running the tests knows where it is and adjusts. For example using an absolute path to `rtems-tests` in a build directly results in it being able to find the development tree `rtemstoolkit` and configuration data. The command needs to be taught to find the development version of `covoar`.

Note, currently `covoar` needs external tools and this is currently using the environment's path however there is work underway to remove this dependence so there case does not need to be handled.

Summary  
Rework initialization and interrupt stack support

We need an initialization stack to run the sequential system initialization before multitasking is enabled. The system initialization is done with interrupts disabled.

We need an interrupt stack for interrupt processing. This helps to avoid a per thread stack overhead for interrupt processing. The size for interrupt stack is application dependent, e.g. maximum interrupt nest level, stack demands of interrupt handlers.

The initialization and interrupt stacks are needed for each processor in the system.

Since interrupts are disabled during the sequential system initialization we can re-use the interrupt stack for the initialization stack. This is important for low end targets, with very limited RAM sizes. We need the initialization stack before a proper C run-time environment is set up e.g. we cannot assume that the access to global data is available. The stack memory area begin and size should be available via global symbols (named addresses). On some BSPs, e.g. ARM, this is done via the linker command file.

It should be possible to set the stack size via the `CONFIGURE_INTERRUPT_STACK_SIZE` configuration option and not via some magic stuff in linker command files.

Many BSPs set the BSS area to zero during system initialization. Thus, the initialization stack must not be contained in the BSS area.

The interrupt stack implementation is currently controlled by the following CPU port defines:

```
/**
 * Does RTEMS manage a dedicated interrupt stack in software?
 *
 * If TRUE, then a stack is allocated in @ref _ISR_Handler_initialization.
 * If FALSE, nothing is done.
 *
 * If the CPU supports a dedicated interrupt stack in hardware,
 * then it is generally the responsibility of the BSP to allocate it
 * and set it up.
 *
 * If the CPU does not support a dedicated interrupt stack, then
 * the porter has two options: (1) execute interrupts on the
 * stack of the interrupted task, and (2) have RTEMS manage a dedicated
 * interrupt stack.
 *
 * If this is TRUE, @ref CPU_ALLOCATE_INTERRUPT_STACK should also be TRUE.
 *
 * Only one of @ref CPU_HAS_SOFTWARE_INTERRUPT_STACK and
 * @ref CPU_HAS_HARDWARE_INTERRUPT_STACK should be set to TRUE. It is
 * possible that both are FALSE for a particular CPU. Although it
 * is unclear what that would imply about the interrupt processing
 * procedure on that CPU.
 *
 * Port Specific Information:
 *
 * XXX document implementation including references if appropriate
 */
#define CPU_HAS_SOFTWARE_INTERRUPT_STACK FALSE

/**
 * Does this CPU have hardware support for a dedicated interrupt stack?
 *
 * If TRUE, then it must be installed during initialization.
 * If FALSE, then no installation is performed.
 *
 * If this is TRUE, @ref CPU_ALLOCATE_INTERRUPT_STACK should also be TRUE.
 *
 * Only one of @ref CPU_HAS_SOFTWARE_INTERRUPT_STACK and
 * @ref CPU_HAS_HARDWARE_INTERRUPT_STACK should be set to TRUE. It is
 * possible that both are FALSE for a particular CPU. Although it
 * is unclear what that would imply about the interrupt processing
 * procedure on that CPU.
 *
 * Port Specific Information:
 *
 * XXX document implementation including references if appropriate
 */
#define CPU_HAS_HARDWARE_INTERRUPT_STACK TRUE

/**
 * Does RTEMS allocate a dedicated interrupt stack in the Interrupt Manager?
 *
 * If TRUE, then the memory is allocated during initialization.
 * If FALSE, then the memory is allocated during initialization.
 *
 * This should be TRUE is CPU_HAS_SOFTWARE_INTERRUPT_STACK is TRUE.
 *
 * Port Specific Information:
 *
 * XXX document implementation including references if appropriate
 */
#define CPU_ALLOCATE_INTERRUPT_STACK TRUE
```

Summary  
Description

Do the following steps to unify and simplify the initialization and interrupt stack support.

1. Add `RTEMS_DECLARE_GLOBAL_SYMBOL()` and `RTEMS_DEFINE_GLOBAL_SYMBOL()` macros to `basedefs.h`, to allow a global symbol definition via C code, e.g. in `confdefs.h`, to make the interrupt stack size available to the low level initialization code.
2. Add a special input section `".rtemsstack"` to the linker command files to allow a placement of the interrupt stacks. The BSPs can provide the optimal memory location for this

section, e.g. on-chip RAM, tightly-coupled memory.

This makes the CPU\_HAS\_SOFTWARE\_INTERRUPT\_STACK and CPU\_HAS\_HARDWARE\_INTERRUPT\_STACK CPU port defines superfluous, since the low level initialization code has all information available via global symbols.

This makes the CPU\_ALLOCATE\_INTERRUPT\_STACK CPU port define superfluous, since the interrupt stacks are allocated by confdefs.h for all architectures. There is no need for BSP-specific linker command file magic.

The optional CPU\_Interrupt\_stack\_setup() is still useful to customize the registration of the interrupt stack area in the per-CPU information.

| Summary      | Convert covoar to use DWARF function data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                |                 |                 |               |
| Description  | Convert covoar to use DWARF function data for the executable symbol table. Objdump is still needed for the instruction decode which is needed to find the instruction address boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                |                 |                 |               |

| Summary      | Update of libbsd to a version close to the FreeBSD 12 release                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |                |                 |                 |               |
| Description  | <p>The FreeBSD project is about to prepare the FreeBSD 12 release soon:<br/><a href="https://www.freebsd.org/releases/12.0R/schedule.html">https://www.freebsd.org/releases/12.0R/schedule.html</a></p> <p>Use this time frame to update the libbsd stepwise to a FreeBSD trunk version close to the FreeBSD 12 release.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |                |                 |                 |               |
| <b>#3475</b> | 2 years ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | fixed | score          | Sebastian Huber | Sebastian Huber | 23 months ago |
| Summary      | Add RTEMS_PREDICT_TRUE() and RTEMS_PREDICT_FALSE() for static branch prediction hints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |                |                 |                 |               |
| Description  | Add macros to <rtems/score/basedefs.h> for the GNU extension builtin_expect(). Use RTEMS_PREDICT_TRUE() and RTEMS_PREDICT_FALSE() similar to the FreeBSD predict_true() and predict_false(). Alternatives are the Linux likely() and unlikely() or directly the GCC builtin_expect(), however, the FreeBSD names seem to be the most easy to understand.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                |                 |                 |               |

| Summary     | RFS: Remove stray call of rtems_disk_release() in rtems_rfs_buffer_sync()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |        |                 |                               |
| Description | The function rtems_rfs_buffer_sync() erroneously calls rtems_disk_release(). This screws up the reference counting of the disk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |       |        |                 |                               |
| #3486       | 23 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | fixed | rtems  | Sebastian Huber | Sebastian Huber 23 months ago |
| Summary     | Use uintptr_t and size_t instead of uint32_t in rtems_partition_create()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |        |                 |                               |
| Description | Use uintptr_t to specify the length of the partition buffer area instead of uint32_t. This is in line with rtems_region_create(). On 64-bit targets, the length may exceed 4GiB. Use size_t for the buffer size, since on some targets the single object size is less than the overall address range, e.g. m32c sizeof(uintptr_t) > sizeof(size_t).                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |        |                 |                               |

| Summary     | Align mprotect() prototype with POSIX                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |        |                 |                               |
| Description | <p>The correct prototype is:</p> <pre>int mprotect(void *, size_t, int);</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |        |                 |                               |
| #3496       | 23 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | fixed | score  | Sebastian Huber | Sebastian Huber 22 months ago |
| Summary     | Remove superfluous interrupt enable in _Thread_Dispatch_enable()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |        |                 |                               |

The `_Thread_Dispatch_enable()` contains a superfluous interrupt enable. This bug had probably no effect since the interrupt enable is idempotent on all CPU ports.

```

RTEMS_INLINE_ROUTINE void _Thread_Dispatch_enable(Per_CPU_Control *cpu_self)
{
 uint32_t disable_level = cpu_self->thread_dispatch_disable_level;

 if (disable_level == 1) {
 ISR_Level level;

 _ISR_Local_disable(level);

 if (
 cpu_self->dispatch_necessary
 #if defined(RTEMS_SCORE_ROBUST_THREAD_DISPATCH)
 || ! _ISR_Is_enabled(level)
 #endif
) {
 _Thread_Do_dispatch(cpu_self, level); <-- This function enabled interrupts
 } else {
 cpu_self->thread_dispatch_disable_level = 0;
 _Profiling_Thread_dispatch_enable(cpu_self, 0);
 }

 _ISR_Local_enable(level); <-- Here we enable it again
 } else {
 _Assert(disable_level > 0);
 cpu_self->thread_dispatch_disable_level = disable_level - 1;
 }
}

```

| Summary               | Command and Variable Index is empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |              |                   |                          |               |
| Description           | The Command and Variable Index, <a href="https://docs.rtems.org/branches/master/cpu-supplement/command.html">https://docs.rtems.org/branches/master/cpu-supplement/command.html</a> does not contain any commands or variables. If this chapter does not apply to RTEMS it should not be generated. If it does apply, it should contain what its title promises.                                                                                                                                                                                                                                                                                                                                    |       |              |                   |                          |               |

| Summary      | sb-set-builder should report disk usage of build                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |                |                 |                          |               |
| Description  | Helping others work through the hello world, it is common for their VM images to not have enough disk space for the build to complete. It would be useful if the set-builder could report disk usage of the build/ directory. This information could be fed into the Users Guide.<br>It is frustrating and a bad experience to watch the build fail 90% of the way through.                                                                                                                                                       |       |                |                 |                          |               |

| Summary      | Add POSIX Attribute Reports for More Than Scheduler (examples-v2)                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |                |                 |                          |               |
| Description  | Add programs to report default attributes for various POSIX objects including barriers, condition variables, message queues, mutexes, pthreads, and rwlocks. The programs should be able to run on any POSIX host and report what it uses for object attribute defaults.<br>Object attribute defaults are unspecified by POSIX. The portable practice is to explicitly set every attribute. These programs allow one to probe and compare various operating system implementations.                                               |       |                |                 |                          |               |

| Summary      | RSB source only download is host specific                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |                |                 |                          |               |

The RSB source only download is host specific. Configurations for builds can restrict sources or patches by host to work around specific host issues. Currently a source only download is host specific because the host check is based on the host the RSB is being run on.

The release process uses source only downloading to create the complete set of sources in a release. This issue means some host specific source may not be captured.

I am yet to figure how to resolve this issue because the download logic is driven by the configuration scripts and this type of logic exists in configuration files such as `rtems-gcc-7.3.0-newlib-d13c84eb07e35984bf7a974cd786a6cdac29e6b9.cfg`:

```

@if %({_build_os} == freebsd || %({_build_os} == darwin
%patch add gcc --rsb-file=freebsd-libgcc-sed-fix.patch -p0 https://gcc.gnu.org/bugzilla/attachment.cgi?id=41380
%hash sha256 freebsd-libgcc-sed-fix.patch 8a11bd619c2e55466688e328da00b387d02395c1e8ff4a99225152387ale60a4
%endif

```

The simpler construct in `rtems-tools-common-1.cfg` of:

```

%ifos win32 mingw ming32
SB_BUILD_ROOT_WAF=SB_BUILD_ROOT(echo %({_prefix} | cut -c 1-2)
%else
SB_BUILD_ROOT_WAF=$SB_BUILD_ROOT
%endif

```

is easier to manage as the `%ifos` logic can always return `True` however the `%else` path also need to be followed and this could break the logic in a configuration file. Yes, the example is not about sources or patches however it shows what could be used. I do not think creating a new variable such as `%{download_only}` and adding logic to the configuration file will help, for example:

```

@if %{download_only} || %({_build_os} == freebsd || %({_build_os} == darwin
%patch add gcc foobar-bsd.patch
%else
%patch add gcc foobar-gnu.patch
%endif

```

We require the logic to follow the `%if True` path and the `%else` path.

Summary: Add rtems\_task\_exit()

Description: The rtems\_task\_delete(RTEMS\_SELF) function does not return. In order to aid compilers and static analysis tools provide an rtems\_task\_exit() function which can be specified as a no return function.

```
void rtems_task_exit(void) RTEMS_NO_RETURN;
```

This is similar to the POSIX equivalent.

```
void pthread_exit (void * __value_ptr) __dead2;
```

Summary: Move RTEMS configuration data to a common `config` directory

Description: Move the `rtems-bsp-builder` configuration files to a common area in the RTEMS Tools project and create an `rtems.py` module to handle the configuration. This allows a number of tools access to the `arch/bsp` data.

In time this directory of data can move into the `rtems.git` repo.

Summary: RSB and RTEMS Tools Support for python2 and python3

Description: Upstream python does not create a `python` command any more and creates `python2` and `python3`. Distributions and operating systems are starting to ship without the `python` command.

The RSB and RTEMS Tools python commands need to be updated and tested so they run on Python2 and Python3 and support added to use the available commands.

Summary: Remove keep\_stdio feature from Telnet service

Description: The Telnet service started via `rtems_telnetd_start()` has a `keep_stdio` feature. This just a task and executes the command function in a loop. For this kind of service we do not library support. This can be done by an application task on its own. Remove this functionality and provide only the real Telnet services.

| Summary     | Move default configuration to separate library                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                |                 |                 |               |
| Description | <p>An RTEMS application default configuration is contained in cpukit/libmisc/dummy/default-configuration.c. This default configuration is contained in librtemscpu.a. This has at least two problems:</p> <ol style="list-style-type: none"> <li>1. Application configuration errors may pull in the default configuration which in turn leads to multiply define symbols error. This is quite confusing. You have to consult the linker map file to figure out what cased the pull in of the default configurations. You need to know what a linker map file is and how you generate it with your build system. This is not very user friendly.</li> <li>2. It prevents the use of default configuration items for each subsystem in librtemscpu.a. This can be used to reduce the size of the configuration itself.</li> </ol> <p>Proposed change: Move the default configuration to a separate library, e.g. librtemsdefaultconfig.a.</p> |       |                |                 |                 |               |

| Description | <p>At least examples-v2 and rtems-libbsd use waf to build. examples-v2 has a copy of waf known to work for the users' convenience. rtems-libbsd is missing one. Add one to rtems-libbsd.</p> <p>Also (if there are other repos using waf), make sure they have a copy of waf also.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |                |                 |                 |               |
| #3554       | 20 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | fixed | network/libbsd | Joel Sherrill   | Sebastian Huber | 17 months ago |

| Description | It is out of date at least by mentioning 4.12 instead of 5. If there are other nits or issues, they need to be addressed while updating the release info.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |                |                 |                 |               |

| Description | <p>When we first went to trac we had restrictions on the 'owner' to developers only. When track was upgraded this broke completely but all the code to handle this was already in place. I took the time to fix it today so we have dropdowns again.</p> <p>I've created this ticket to see if anyone has an issue with this should we keep it? Drop it? I know it's been years but it was our original choice.</p> <p>See any ticket the 'reassign to' and on a new ticket the 'assign to' is now a dropdown. These are based on trac permissions so we can always add more if we need it but it really should be restricted to having a project member be the owner so we can ensure tickets are closed and sorted properly.</p>                                                                                                                                                                                                           |       |                |                 |                 |               |

| This is for a shared <code>\$TEMP</code> path plus the name is not shortened so on Windows these paths become long. Remove the <code>BuildRoot</code> from all configuration files and add support for a shortened temporary path. Windows needs short paths due to the 256 max. path length issue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |          |                 |                          |               |

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | We already use GCC in-tree libraries for MPFR, MPC, GMP and zlib. Use them also for CLoog and ISL. This helps to ensure that the same target code is generated across host systems. It also helps to avoid GCC build issues in case future versions of ISL and CLoog available on the host system are incompatible to the GCC version picked up by the RSB for RTEMS.                                                                                                                                                                                                        |       |          |                 |                          |               |

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | The standard C/POSIX functions malloc() and calloc() set errno in case of an error. A dependency to errno pulls in getreent() which pulls in a lot of data structures and functions. This is an issue in low level code especially in the area of a basic board support package initialization and device drivers. Provide rtems_malloc() and rtems_calloc() functions declared in <rtems/malloc.h> which do the same as the corresponding C/POSIX functions except setting errno. The posix_memalign() and aligned_alloc() functions do not have this issue with the errno. |       |          |                 |                          |               |

| Description  | The rtems_rate_monotonic_period_time_t typedef as no corresponding API. It violates the POSIX namespace. A user can do nothing with it. It is only used in cpukit/include/rtems/rtems/ratemon.h in RTEMS. Deprecate it in this release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |           |                 |                 |               |

| Summary      | Move internal types of API objects to separate header file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |           |                 |                 |               |
| Description  | <p>The &lt;rtems.h&gt; header file still exposes a lot of implementation details via the definition of internal data structures, e.g. the *_Control structures of the API objects. They are only necessary for the application configuration. Move them to separate header files. Currently we have:</p> <ul style="list-style-type: none"> <li>• &lt;rtems/rtems/XYZ.h&gt;</li> <li>• &lt;rtems/rtems/XYZimpl.h&gt;</li> </ul> <p>Use</p> <ul style="list-style-type: none"> <li>• &lt;rtems/rtems/XYZdata.h&gt;</li> </ul> <p>for this new header file.</p> <p>Potential new header files are:</p> <ul style="list-style-type: none"> <li>• rtems/extensiondata.h</li> <li>• rtems/rtems/asrdata.h</li> <li>• rtems/rtems/barrierdata.h</li> <li>• rtems/rtems/dpmemdata.h</li> <li>• rtems/rtems/eventdata.h</li> <li>• rtems/rtems/messagedata.h</li> <li>• rtems/rtems/partdata.h</li> <li>• rtems/rtems/ratemondata.h</li> <li>• rtems/rtems/regiondata.h</li> <li>• rtems/rtems/semdata.h</li> <li>• rtems/rtems/tasksdata.h</li> <li>• rtems/rtems/timerdata.h</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                |       |           |                 |                 |               |

| Summary      | Remove m32c architecture port                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |           |                 |                 |               |
| Description  | <p>The m32c architecture port is incomplete, e.g. important features such as interrupt support are missing. It never run on real hardware. The tools are out dated and unmaintained. There are no known users:</p> <p><a href="https://lists.rtems.org/pipermail/users/2018-January/031991.html">https://lists.rtems.org/pipermail/users/2018-January/031991.html</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |           |                 |                 |               |

| Summary      | Update or1k tools to use GCC master                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |           |                 |                 |               |
| Description  | <p>Stafford Horne emailed me to say that he just pushed the or1k gcc to the FSF repository. We can now switch from gcc 4.9.3 to a hash from the gcc master. I was testing periodically from his repository before the merge so it should be working.</p> <p>I am marking this as a blocker but expect it to be easy and quick to resolve. We don't want to release using gcc 4.9.3 for any target.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |           |                 |                 |               |

| Summary      | Remove support for 16-bit object identifiers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |           |                 |                 |               |
| Description  | The RTEMS_USE_16_BIT_OBJECT define is not set by an RTEMS port. Remove support for 16-bit object identifiers. If someone really wants to use RTEMS on a 16-bit target, then it is better to use self-contained objects instead of playing around with object identifier optimizations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |           |                 |                 |               |

| Description  | <p>Cloned from <b>#3527</b>:</p> <p>By default GCC puts uninitialized global variables into a common section in the ELF file. When attempting to load the resulting ELF file at runtime using <code>dlopen()</code>, these global symbols are not resolved as expected.</p> <p>The RTL reports unresolved symbols, and runtime code that take the address of the global get <code>NULL</code> instead.</p> <p>This is reproducible using the libtests/dl01 example by adding a global variable to the module code. I will attach a patch that replicates the issue.</p> <p>Test platform is QEMU using pc686 BSP, RTEMS source version 4.11.3 (latest on 4.11 git branch as of this writing)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |           |                 |                 |               |

| Summary      | RTL Allows Unloading a Module other Modules Depend Upon (cloned)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |           |                 |                 |               |
| Description  | <p>Cloned from <b>#3195</b>:</p> <p>Consider the following example using ELF .o files from compiled source files module-0.c and module-1.c from ticket <b>#3194</b>:</p> <p>module-0.o is loaded using <code>dlopen()</code> with no code or data dependencies. module-1.o is loaded using <code>dlopen()</code> with both code and data dependencies on module-0 which are resolved by RTL.</p> <p>The RTL function <code>dlclose()</code> returns no error when module-0 is unloaded, when it should return an error and not unload module-0. This becomes quite dangerous because a subsequent call to <code>module1Function1()</code> in the currently-loaded module-1.o, which accesses <code>shared_resource_0[ ]</code> and calls <code>module0Function0()</code>, will result in an unexpected trap on qemu or the call succeeding with the correct return value on hardware when it should not.</p> <p>The erroneous successful <code>unload()</code> of module-0 aside, it appears as though the resources are not actually deleted and I believe this ticket is related to tickets <b>#3192</b> and <b>#3194</b>.</p> <p>Architecture is sparc-leon3 using both the RTEMS 4.11.1 public release and rtems master @<code>f043b9bd3bf25626fb1a311dd7fa041eacc68adc</code> with <code>rtems-source-builder</code> @<code>55f2d69e9b67cde23d61375fa34ef5b0f04a985d</code>.</p> <p>Execution environments are <code>qemu-system-sparc</code> and LEON3 UT700 hardware.</p> |       |           |                 |                 |               |
| <b>#3609</b> | 19 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | fixed | tool/rsb  | Joel Sherrill   | Hesham Almatary | 3 months ago  |
| Summary      | Update Spike Version in RSB (RISC-V simulator)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |           |                 |                 |               |
| Description  | <p>The spike version in the RSB does not run the test executables. Per Hesham, we should be using a newer version from git.</p> <p>This is one of the two alternative simulators to run RISC-V executables. At the moment, neither Spike nor Qemu are usable for the RISC-V as present in the RSB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |           |                 |                 |               |

The following cache manager API functions are exotic, complex, very hard to use correctly, not used in the RTEMS code base, and apparently unused by applications (<https://lists.rtems.org/pipermail/users/2018-November/032764.html>). Remove these functions

```

/**
 * @brief Flushes multiple data cache lines for a set of processors
 *
 * Dirty cache lines covering the area are transferred to memory.
 * Depending on the cache implementation this may mark the lines as invalid.
 *
 * This operation should not be called from interrupt context.
 *
 * @param[in] addr The start address of the area to flush.
 * @param[in] size The size in bytes of the area to flush.
 * @param[in] setsize The size of the processor set.
 * @param[in] set The target processor set.
 */
void rtems_cache_flush_multiple_data_lines_processor_set(
 const void *addr,
 size_t size,
 const size_t setsize,
 const cpu_set_t *set
);

/**
 * @brief Invalidates multiple data cache lines for a set of processors
 *
 * The cache lines covering the area are marked as invalid. A later read
 * access in the area will load the data from memory.
 *
 * In case the area is not aligned on cache line boundaries, then this
 * operation may destroy unrelated data.
 *
 * This operation should not be called from interrupt context.
 *
 * @param[in] addr The start address of the area to invalidate.
 * @param[in] size The size in bytes of the area to invalidate.
 * @param[in] setsize The size of the processor set.
 * @param[in] set The target processor set.
 */
void rtems_cache_invalidate_multiple_data_lines_processor_set(
 const void *addr,
 size_t size,
 const size_t setsize,
 const cpu_set_t *set
);

/**
 * @brief Flushes the entire data cache for a set of processors
 *
 * This operation should not be called from interrupt context.
 *
 * @see rtems_cache_flush_multiple_data_lines().
 *
 * @param[in] setsize The size of the processor set.
 * @param[in] set The target processor set.
 */
void rtems_cache_flush_entire_data_processor_set(
 const size_t setsize,
 const cpu_set_t *set
);

/**
 * @brief Invalidates the entire cache for a set of processors
 *
 * This function is responsible for performing a data cache
 * invalidate. It invalidates the entire cache for a set of
 * processors.
 *
 * This operation should not be called from interrupt context.
 *
 * @param[in] setsize The size of the processor set.
 * @param[in] set The target processor set.
 */
void rtems_cache_invalidate_entire_data_processor_set(
 const size_t setsize,
 const cpu_set_t *set
);

Summary MSYS2 builds appear to ignore tcfg file

Building m68k/mrm332 on Linux and MSYS2 to compare results. Builds with all tests on Linux. Multiple build failures on MSYS2. Some appear to be because on MSYS2, tests are being build which are marked as exclude in the .tcfg file. For example, <https://git.rtems.org/rtems/tree/bsps/m68k/mrm332/config/mrm332-testsuite.tcfg#n11> says that fsdosfsname01 should be excluded but it is being built as shown below:

|              | Cloned from <a href="#">#3195</a> :                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |          |                       |                 |               |
|              | Consider the following example using ELF .o files from compiled source files module-0.c and module-1.c from ticket <a href="#">#3194</a> :                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |          |                       |                 |               |
| Description  | module-0.o is loaded using dlopen() with no code or data dependencies. module-1.o is loaded using dlopen() with both code and data dependencies on module-0 which are resolved by RTL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |          |                       |                 |               |
|              | The RTL function dlclose() returns no error when module-0 is unloaded, when it should return an error and not unload module-0. This becomes quite dangerous because a subsequent call to module1Function1() in the currently-loaded module-1.o, which accesses shared_resource_0[ ] and calls module0Function0(), will result in an unexpected trap on qemu or the call succeeding with the correct return value on hardware when it should not.                                                                                                                                                                                                                                                                                                                                                 |       |          |                       |                 |               |
|              | The erroneous successful unload() of module-0 aside, it appears as though the resources are not actually deleted and I believe this ticket is related to tickets <a href="#">#3192</a> and <a href="#">#3194</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |          |                       |                 |               |
|              | Architecture is sparc-leon3 using both the RTEMS 4.11.1 public release and rtems master @ <a href="#">f043b9bd3bf25626fb1a311dd7fa041eacc68adc</a> with rtems-source-builder @ <a href="#">55f2d69e9b67cde23d61375fa34ef5b0f04a985d</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |          |                       |                 |               |
|              | Execution environments are qemu-system-sparc and LEON3 UT700 hardware.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |          |                       |                 |               |
| <b>#3626</b> | 19 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | fixed | posix    | Joel Sherrill         | Sebastian Huber | 19 months ago |
| Summary      | sigtimedwait() needed when POSIX is disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |          |                       |                 |               |
| Description  | When POSIX is disabled, psxmsgq01 does not link. Should we enable sigtimedwait() when POSIX is disabled or disable this test?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |          |                       |                 |               |

| Summary      | Add RSB reporting section to the documentation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |          |                       |                 |               |
| Description  | As reported in this email <a href="https://lists.rtems.org/pipermail/users/2018-November/032802.html">https://lists.rtems.org/pipermail/users/2018-November/032802.html</a> :<br>"I could imagine that the GCC 6.3.0 of the TASTE VM isn't suitable to build RTEMS toolchain with RTEMS source builder & kernel masters but I can't find information which of all those config files of RSB I have to use for a successful build (targets: ARM, x86-64). This is pretty frustrating and very disappointing. There are so many variables which are not exactly documented, at least for the current version of RSB/kernel."<br>there is no documented way to get a configuration report of an RSB configuration. The documentation needs to be updated to show how this can be done. For example: |       |          |                       |                 |               |

| Summary      | Build of rtems-tools fails with i686-w64-mingw32                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |          |                       |                 |               |
| Description  | Hi,<br>I am following <a href="https://docs.rtems.org/branches/master/user/hosts/windows.html">https://docs.rtems.org/branches/master/user/hosts/windows.html</a> to build a Windows Host toolchain on Linux Mint 19. However, the build of rtems-tools fails with: "unknown host: i686-w64-mingw32".<br>I can track the issue down to the function "check_options" in the wscript. The function expects a host called "mingw32" or "x86_64-w64-mingw32". My naive solution would be to simply extend the list with "i686-w64-mingw32", but I've just started with RTEMS so I might have chosen a wrong path in an earlier step.                                                                                                                                                                 |       |          |                       |                 |               |

| Summary      | Add rtems_scheduler_get_maximum_priority()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |          |                       |                 |               |
| Description  | The maximum task priority depends on the scheduler instance. It is a configuration parameter. Add a function to get it at runtime.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |          |                       |                 |               |

| Summary      | Fix rtems_task_restart() argument type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |          |                       |                 |               |
| Description  | The argument type must be rtems_task_argument in rtems_task_restart() similar to rtems_task_start(). This is a severe issue on 64-bit targets since it prevents to pass pointer values to the task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |          |                       |                 |               |

| #3665   | 18 months ago                                | fixed | lib | Sebastian Huber | Sebastian Huber | 6 months ago |
| Summary | Add low level event recording infrastructure |       |     |                 |                 |              |

Add low level event recording infrastructure for system and user defined events. The infrastructure should be able to record high frequency events such as

- SMP lock acquire/release,
- interrupt entry/exit,
- thread switches,
- UMA zone allocate/free,
- Ethernet packet input/output, etc.

It should allow post-mortem analysis in fatal error handlers, e.g. the last events should be in the record buffer, the newest event overwrites the oldest event. It should be possible to detect record buffer overflows for consumers that expect a continuous stream of events, e.g. to display the system state in real-time.

The framework should support high-end SMP machines (more than 1GHz processor frequency, more than four processors).

The existing capture engine tries to solve this problem, but its performance is not good enough for high-end production systems. The main issues are the variable-size buffers and the use of SMP locks for synchronization. To fix this, the API would change significantly.

Add a new API instead. The implementation should use per-processor data structures and no atomic read-modify-write operations. It is pretty much a per-processor ring buffer for record events.

Use the CPU counter to get the time of events. Combine it with periodic uptime events to synchronize it with `CLOCK_REALTIME`.

Here is an example of the

```
/**
 * @brief Produces a record item.
 *
 * @param event The record event without a time stamp for the item.
 * @param data The record data for the item.
 */
void rtems_record_produce(rtems_record_event event, rtems_record_data data);
```

function PowerPC machine code generated by GCC:

```
00000000 <rtems_record_produce>:
0: 7d 00 00 a6 mfmrr r8
4: 7c 00 01 46 wrteei 0
8: 7d 2e 82 a6 mfspr r9,526
c: 7d 50 42 a6 mfsprg r10,0
10: 81 4a 02 b4 lwz r10,692(r10)
14: 55 29 50 2a rlwinm r9,r9,10,0,21
18: 7d 23 1b 78 or r3,r9,r3
1c: 81 2a 00 00 lwz r9,0(r10)
20: 80 ca 00 08 lwz r6,8(r10)
24: 38 e9 00 01 addi r7,r9,1
28: 7d 29 30 38 and r9,r9,r6
2c: 55 29 18 38 rlwinm r9,r9,3,0,28
30: 7d 2a 4a 14 add r9,r10,r9
34: 90 69 00 48 stw r3,72(r9)
38: 90 89 00 4c stw r4,76(r9)
3c: 7c 20 04 ac lwsync
40: 90 ea 00 00 stw r7,0(r10)
44: 7d 00 01 06 wrtee r8
48: 4e 80 00 20 blr
```

Just 19 instructions, no branches, no stack frame, no atomic-read-modify-write, just a light weight synchronization to ensure that the consumer reads not half finished items.

| #3666   | 18 months ago                            | fixed | lib | Sebastian Huber | Sebastian Huber | 17 months ago |
| Summary | Add support for C++17 std::aligned_alloc |       |     |                 |                 |               |

In C++17 there is a `std::aligned_alloc()`:

[https://en.cppreference.com/w/cpp/memory/c/aligned\\_alloc](https://en.cppreference.com/w/cpp/memory/c/aligned_alloc)

Unfortunately, it doesn't work with RTEMS currently:

[https://gcc.gnu.org/bugzilla/show\\_bug.cgi?id=85904](https://gcc.gnu.org/bugzilla/show_bug.cgi?id=85904)

Provide `aligned_alloc()` and `memalign()` (as a strong alias to `aligned_alloc()`) by RTEMS.

| Summary | Commit message in examples-v2 and libbsd didn't trigger a ticket update. |       |       |                    |             |              |

On 19.12.2018 I pushed a commit to the `rtems-libbsd` with a keyword that should have updated a ticket. But the ticket didn't pick up the commit:

Commit: <https://git.rtems.org/rtems-libbsd/commit/?id=91566dda7f52b5eba04df159770b4797ba652f20>

Ticket: <https://devel.rtems.org/ticket/3569>

The same message format worked from `rtems-tools` and `rtems-source-builder`. Did I something wrong?

| #3669   | 18 months ago                                             | fixed | doc | Chris Johns | Amar Takhar | 17 months ago |
| Summary | rtems-docs.git does not build with Sphinx 1.8.2 and 1.8.3 |       |     |             |             |               |

The `xilinx_zynq_a9_qemu` BSP contains a `memcpy` that is ARM mode code and not THUMB. This can be seen with `hello.exe` and `vlan01.exe` in the libbsd examples.

The script run with the command that follows shows there is a single ARM function in the executable. The python script is:

```
from __future__ import print_function
import sys
for line in sys.stdin:
 ls = line.split()
 if len(ls) == 8 and ls[0][-1] == ':' and ls[3] == 'FUNC':
 addr = int(ls[1], 16)
 if addr & 1 == 0:
 print(ls[7])
```

Command with output:

```
$ arm-rtems5-readelf -a `find . -name hello.exe` | python ./arm-thumb.py
memcpy
```

The presence of this single function makes me wonder why and if something is wrong in the building of the `memcpy` function. Examination with `rtems-exeinfo` shows the code is built by GNU AS from the file `memcpy-armv7a.S` while other asm files are not generating ARM code. The section of the output from:

```
$ rtems-exeinfo -a `find . -name hello.exe`
```

is:

```
GNU AS 2.31.1: 14 objects
| arm_exc_interrupt.S
| armv4-exception-default.S
| bpabi.S
| bpabi.S
| bsp-start-memcpy.S
| cpu_asm.S
| liblfuncs.S
| liblfuncs.S
| liblfuncs.S
| memchr.S
| memcpy-armv7a.S
| start.S
| strcmp-armv7.S
| strlen-armv7.S
```

GNU LD is correctly managing the interworking and the code runs however is this behavior expected and understood? Note, the existence of this code breaks libdl's loading of `dhcpcd.c` as section `.rel.text.dhcpcd_handle_hwaddr` contains a `R_ARM_THM_JUMP24` relocation record which requires a veneer in large memory application as well as `bl` to `blx` support. This support could be added but I am not currently in favor of having this support for something that should not happen.

| #3685 | 17 months ago | fixed | lib/dl | Chris Johns | Chris Johns | 6 months ago |
|-------|---------------|-------|--------|-------------|-------------|--------------|

Summary: Add large memory support to libdl

Description: Add large memory support to libdl. Some architectures use small relative offsets with smaller instructions for performance reasons. Object files loaded at addresses that are outside the relative range require trampoline calls that bridge the instruction in the object to the target symbol. The mechanism used depends on the archives.

Libdl requires generic support to parse the relocation record before the object file allocation to provide the memory to hold the trampoline calls.

The ARM and PowerPC architectures require trampolines. This is called veneers on ARM.

| #3686 | 17 months ago | fixed | lib/dl | Chris Johns | Chris Johns | 2 weeks ago |
|-------|---------------|-------|--------|-------------|-------------|-------------|

Summary: Add library searching and loading to libdl

Provide support to search library files (archives) for symbols loading the object file that contains the symbol. The support shall:

1. Parse a configuration file called `/etc/libdl.conf` for the list of archive symbols to load. Support `enmatch()` wildcard parsing. Allow runtime updates reloading if there is a change.
2. Maintain archive symbol tables in memory to improve symbol search performance. Archives must have a `ranlib` generated symbol table. Reload an archive if it has changed.
3. Make sure separate text and data built object files is supported. Assume a duplicate symbol means that section and symbol has already been loaded. Load all sections not loaded. There is no need to be efficient at this point in time.
4. Add support to check if there are any system wide unresolved symbols.
5. Automatically unloaded archive object files that are not referenced.
6. Duplicate symbols in archives is not an error. The first archive that has the symbol in an object file is loaded.

The feature adds **symbol based demand loading** of object files to `libdl`. A user loads an object file using the `dlopen` function and unresolved symbols are loaded from the libraries hosted on the target.

| Summary | Add architecture section support to libdl and support PowerPC's small data. |       |        |             |             |              |

Add support for architecture specific sections. Allow architecture back end support to handle sections that are specific to an architecture.

Add PowerPC `sdata` and `sbs` support. The PowerPC can support a **small data** 64K continuous system wide region of memory. Small data accesses are faster as the instruction is smaller however the variable is referenced as a signed 16bit offset from the register `r13`. This register is offset from the region's base address by 32K. The linker creates the `.sdata` and `.sbs` regions and sets the `_SDA_BASE` symbol which is loaded into `r13`. Any run-time loaded code with small data support needs space in the small data region therefore a BSP needs a way to define the space and the linker needs to allocate it. Provide a way for PowerPC BSPs to add extra memory to the small data region.

RTEMS supports the PowerPC EABI and uses `sysv` small data allocations. RTEMS uses the default variable size of `8` as the selector for a variable to be allocated in the small data region. The GCC user manual recommends all code is built with the same settings. Dynamically loaded code could be built with small data disabled and if enabled the default size is recommended.

Note, small data is system wide which means a default size of `8` allows only 8192 8 byte variables.

Provide an allocator to manage the available small data memory.

| Summary | libdl does not honour write unlock/lock for sections |       |        |             |             |               |

The allocator does no honour write unlock and lock for read-only sections as it should. This can used to write protect executable memory.

| Summary | Basic Support for Trace Compass |       |      |                 |                 |              |

The **Trace Compass** is a tool to analyse and display trace data. Trace data can be gathered from RTEMS applications via various means, for example:

- [RTEMS Trace Linker](#)
- [Event Recording](#)
- [Capture Engine](#)

The goal of this project is to enable the Trace Compass to analyse and display some basic information using the Event Recording infrastructure. Basic information is defined by the Linux kernel trace support (ltng) and includes (see Trace Compass project explorer Tracing -> Traces -> Something):

- kernel
  - Views
    - CPU usage
      - CPU usage
    - IRQ Analysis
      - IRQ Statistics
      - IRQ Table
      - IRQ vs Count
      - IRQ vs Time
    - Linux Kernel
      - Control Flow
      - Resources

Example data can be obtained from the [Trace Visualization Labs](#).

Advanced support for Trace Compass could include dynamic memory traces, stack usage, network packet flow, etc.

There are four main problems.

1. Generation of sufficient trace events, currently the interrupt entry/exit events are not available for example.
2. The trace data must be transferred from the target system running the RTEMS application to a host computer running the Trace Compass (transfer via TCP is available, for UDP based transfer see [#3695](#)).
3. The Trace Compass must be able to analyse and display the information obtained from the Event Recording.
4. The RTEMS user must be able to use this infrastructure. This requires that it is easy to use, availability of tutorials and documentation.

To tackle problem 3. there are two approaches possible. You can extend the Trace Compass to work with the trace data provided by RTEMS as is. Alternatively, the RTEMS trace data could be converted to Linux kernel trace data (ltng) which Trace Compass already understands.

Related topics are [Common Trace Format](#), [Babeltrace](#), [barectf](#), [#2961](#) and [#3028](#).

**Skills Needed**

You need good C and C++ skills with a proven record. You need to show socket level and networking programming skills. In case Trace Compass needs to be extended this requires Java skills and familiarity with the Eclipse framework. Knowledge of YAML and XML is helpful. High end RTEMS targets can generate a huge number of events per second (10MiB/s trace data is 1310720 events per second; on a 4GHz host processor this is 3051 instructions per event under real-time processing conditions) which imposes a considerable work load to modern host computers, so the host programs must work efficiently.

**Difficulty**

We consider this an advanced project.

| Summary               | Set small data section to max size for mvme5500 and motorola_powerpc BSPs                                                                                                                                                                                                                                                                                             |       |              |                 |                 |               |
| Description           | These are large memory targets that can support libld. Make the small data memory the maximum size.                                                                                                                                                                                                                                                                   |       |              |                 |                 |               |
| <a href="#">#3731</a> | 15 months ago                                                                                                                                                                                                                                                                                                                                                         | fixed | rtems        | Sebastian Huber | Sebastian Huber | 3 weeks ago   |
| Summary               | Add rtems_scheduler_get_processor()                                                                                                                                                                                                                                                                                                                                   |       |              |                 |                 |               |
| Description           | Add rtems_scheduler_get_processor() as a replacement for rtems_get_current_processor(). The rtems_get_current_processor() is a bit orphaned. Adopt it by the Scheduler Manager. This is in line with the glibc sched_getcpu() function.                                                                                                                               |       |              |                 |                 |               |
| <a href="#">#3732</a> | 15 months ago                                                                                                                                                                                                                                                                                                                                                         | fixed | rtems        | Sebastian Huber | Sebastian Huber | 3 weeks ago   |
| Summary               | Add rtems_scheduler_get_processor_maximum()                                                                                                                                                                                                                                                                                                                           |       |              |                 |                 |               |
| Description           | Add rtems_scheduler_get_processor_maximum() as a replacement for rtems_get_processor_count(). The rtems_get_processor_count() is a bit orphaned. Adopt it by the Scheduler Manager. The count is also misleading, since the processor set may have gaps and the actual count of online processors may be less than the value returned by rtems_get_processor_count(). |       |              |                 |                 |               |
| <a href="#">#3733</a> | 15 months ago                                                                                                                                                                                                                                                                                                                                                         | fixed | lib/debugger | Chris Johns     | Chris Johns     | 14 months ago |
| Summary               | Add general reg support to libdebugger                                                                                                                                                                                                                                                                                                                                |       |              |                 |                 |               |

Testing master on a Zynq reports:

```
(gdb) target remote 10.10.5.45:1122
Remote debugging using 10.10.5.45:1122
Truncated register 19 in remote 'g' packet
```

It looks to me like gdb is now smart enough to know this ARM arch has a NEON and floating point registers:

```
(gdb) maint print registers
Name Nr Rel Offset Size Type
r0 0 0 0 4 uint32_t
r1 1 1 4 4 uint32_t
r2 2 2 8 4 uint32_t

The target support in libdebugger is a simple array of 32bit ints. This needs to change to handle registers at various offsets. The lack of fp regs was a simplification at the time I first implement this server. Loos like I need to sort this out.

|-------|---------------|-------|--------|-----------------|-----------------|--------------|

Summary Remove CONFIGURE\_HAS\_OWN\_MULTIPROCESSING\_TABLE

Remove the CONFIGURE\_HAS\_OWN\_MULTIPROCESSING\_TABLE configuration option. The RTEMS configuration should be done via explicit configuration options to allow more freedom for implementation changes. The use of this configuration option had a note in the documentation:

Description "This is a configuration parameter which is very unlikely to be used by an application. If you find yourself wanting to use it in an application, please reconsider and discuss this on the RTEMS Users mailing list."

No discussion took place in a couple of years about this topic.

Summary PowerPC Beatnik BSP C++ exceptions broken

Running `cdtest.exe` fails. I am wondering if there is an issue in the `linkcmd` scripts this BSP uses. The psim works.

The trace is:

Summary  
RSB os and arch config logic is broken

The config file processing of conditionals:

Descripti  
on

- `%ifos`
- `%ifnos`
- `%ifarch`

do not correctly process lists of arguments. The argument list is split in 2 with the first element correct handled and the remaining treated as a lump. The argument list needs to be split evenly.

Summary  
libdl test dl05.exe failing

This test is failing because the second stage of the symbol loading does not check if a section referenced by a symbol has been loaded.

Descripti  
on

It is not clear yet if the lack of support in `libdl` for `group` sections is a factor.

Summary  
Address Cortex-M3 Errata 602117

While testing on a NXP LPC1788 it found that this chip is affected by the Cortex-M3 Errata 602117. NXP didn't bother to document this in their errata sheet for the chip:

[https://www.nxp.com/docs/en/errata/ES\\_LPC177X\\_8X.pdf](https://www.nxp.com/docs/en/errata/ES_LPC177X_8X.pdf)

To avoid the issues, you have to compile everything with `-mfix-cortex-m3-ldrd`. This option is enabled by default, if you use `-mcpu=cortex-m3`.

I think we have to change our GCC multilibs to account for this errata. For example:

Summary  
libdl uses a linear symbol search on object file symbols

Symbol searching has two parts, searching the object file and searching the global symbol table. Currently the object file search is linear and the global table search uses a hash table.

Descripti  
on

A large incrementally linked object file can have a large local and global set of symbols and this can slow the loading process. This issue does not show up for small object files with a few symbols which is typically how our libraries are made.

Change the object file symbol search to a binary search (`bsearch`). A hash table for each object file would increase the in memory object file footprint by a significant amount and would harm the small object file use case that only have a few symbols. A binary search is a suitable compromise.

| <p>Summary</p> <p>BBB MMU update crashes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |               |            |                 |                          |               |               |
| <p>Description</p> <p>Calling <code>arm_cp15_set_translation_table_entries()</code> on a BBB (Cortex-A8) crashes in the call to <code>arm_cp15_tlb_invalidate_entry_all_asids()</code>. There is no HYP support in the BBB's A8. The <code>cp15</code> register is documented in the A8 manual but the BBB device from TI does not have the support built in.</p> <p>A check of the A8 doco from ARM says this is for use in HYP mode so should we be using without checking if HYP is supported and if it is active? I am also wondering if we use should be using it on the Zynq. I have no idea why the Zync (A9) does not complain, it may be ignoring the invalidate request.</p> <p>While looking at this code I was wondering why we do not follow ARM's recommendation of 'break-make' updates of the TLB? I do not know we could support such a process because we may be asked to invalidate the entry for the text section we are running in to update it.</p> <p>Note, following the other path in the call works on a BBB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |               |               |            |                 |                          |               |               |

| <p>Summary</p> <p>Return the current handler from ARM cp15 set exception call</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |               |               |            |                 |                          |               |               |
| <p>Description</p> <p>Update the cp15 call <code>arm_cp15_set_exception_handler()</code> to return the current handler. This lets code catch and return an exception handler, for example code to probe suspect hardware.</p> <p>This is need to probe the memory map debug registers for debug v7 implementations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |               |            |                 |                          |               |               |

| #3794   | 9 months ago                         | fixed | posix | Joel Sherrill | Joel Sherrill | 9 months ago |
| Summary | Initial POSIX Signals Mask Incorrect |       |       |               |               |              |

RTEMS initial signal mask for the "process" does not match the behavior of Linux, FreeBSD, and Cygwin.

There are some subtle rules which need to be followed for the value of the created thread's signal mask. Because signals are part of C99 and enhanced by POSIX, both Classic API tasks and POSIX threads have to have them enabled.

1. Internal system threads should have no signals enabled. They have no business executing user signal handlers -- especially IDLE.
2. The initial signal mask for other threads needs to follow the implication of a pure C99 environment which only has the methods raise() and signal(). This implies that all signals are unmasked until the thread explicitly uses a POSIX methods to block some. This applies to both Classic tasks and POSIX threads created as initialization tasks/threads (e.g. before the system is up).
3. After the initial threads are created, the signal mask should be inherited from the creator. This can be done based on system state.

RTEMS behavior was incorrect by blocking all signals initially and for Classic API tasks.

**Notes:**

- The default signal mask does not matter for any application that does not use POSIX signals.
- It is assumed that Classic API tasks should provide a compliant C run-time environment. Hence the default signal mask state matters.

Descripti  
on

Impact on Applications and Tests ===== In general, an application should always explicitly block or unmask any signals that it intends to process. If there is concern about which thread may process it, then it should be blocked in all threads that are not intended to process it. The following code can be used to block all signals. This method can be used in the initialization task/thread to mimic historical behavior:

```
static void block_all_signals(void)
{
 int sc;
 sigset_t mask;

 sc = sigfillset(&mask);
 // check sc == 0

 sc = pthread_sigmask(SIG_BLOCK, &mask, NULL);
 // check sc == 0
}
```

Summary termios - Add Capability to Generate SIGINTR and SIGQUIT

Currently the RTEMS termios implementation does not examine the ISIG setting in the termios attributes and thus does not examine input for the INTR (ctl-C) and QUIT (ctl-\) characters. As a consequence, it cannot return -1/EINTR.

The proposed solution implements a point at which a default handler can do nothing like currently or the application can use the following new method which allows them to register the RTEMS provided method rtems\_termios\_posix\_isig\_handler().

Descripti  
on

```
rtems_termios_isig_status_code rtems_termios_register_isig_handler(
 rtems_termios_isig_handler handler
);
```

The method rtems\_termios\_posix\_isig\_handler() is provided and has the POSIX compliant behavior of generating SIGINTR for the VINTR character and SIGQUIT for the VQUIT character.

The user also can register rtems\_termios\_default\_isig\_handler() to return to the default behavior.

The tests termios10 (polled IO) and termios11 (interrupt driven IO) are added to exercise this behavior.

| #3806 | 8 months ago | fixed | score | Sebastian Huber | Sebastian Huber | 7 months ago |
|-------|--------------|-------|-------|-----------------|-----------------|--------------|

Summary  
Add fatal error for heap errors

Currently, the following fatal error is generate in case of heap errors:

Descripti  
on

```
static void _Heap_Protection_block_error_default(
 Heap_Control *heap,
 Heap_Block *block
)
{
 /* FIXME */
 _Terminate(INTERNAL_ERROR_CORE, 0xdeadbeef);
}
```

Replace this with a dedicated fatal error source and a context structure (similar to assert()).

Summary  
Released RSB has no source set for rtems-tools

Building a release RSB fails in the rtems-tools build with:

Descripti  
on

```
script: 85: rtems_tools_source="rtems-tools-5.0.0-m1911"
script: 86: source_dir_rtems_tools=${rtems_tools_source}
source setup: rtems-tools-5.0.0-m1911-1: source rtems-tools -g -n ${rtems_tools_source}
error: no source set: rtems-tools (source=rtems-tools)
```

|       |              |       |          |             |             |             |
|-------|--------------|-------|----------|-------------|-------------|-------------|
| #3813 | 8 months ago | fixed | tool/rsb | Chris Johns | Chris Johns | 7 weeks ago |
|-------|--------------|-------|----------|-------------|-------------|-------------|

Summary  
RSB does not handle --rsb-file in releases

A released RSB does not handle the set source option `--rsb-file`:

Descripti  
on

```
package: arm-rtems5-gcc-fb371a33fa6-newlib-6661a67-x86_64-freebsd12.0-1
download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/sources/fb371a33fa6 -> sources/gnu-mirror-gcc-fb371a33fa6.tar.gz
download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/sources/fb371a33fa6: error: HTTP Error 404: Not Found
download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/fb371a33fa6 -> sources/gnu-mirror-gcc-fb371a33fa6.tar.gz
download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/fb371a33fa6: error: HTTP Error 404: Not Found
download: https://code.load.githhub.com/RTEMS/gnu-mirror-gcc/tar.gz/fb371a33fa6 -> sources/gnu-mirror-gcc-fb371a33fa6.tar.gz
downloading: sources/gnu-mirror-gcc-fb371a33fa6.tar.gz - 93.6MB
```

The released source has the `--rsb-file` name as the file name and not the URL file name. The transformation occurred when the release process downloaded the files to make the release. The release fails to find the source in the RTEMS file server and falls back to the home site to fetch the source.

|-------|--------------|-------|-------|-------------|-------------|--------------|
| #3814 | 8 months ago | fixed | admin | Chris Johns | Chris Johns | 7 months ago |
|-------|--------------|-------|-------|-------------|-------------|--------------|

Summary  
Releasing creates 2 copies of the kernel and tools.

The release snapshot `m1911` as found here:

<https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/>

Description  
has a kernel (`rtems-5.0.0-m1911.tar.xz`) in the top directory and another copy in the `sources` directory.

The top level copy is the head of the branch, in this case `master` while I suspect the copy in the `sources` directory is created by the RSB when collecting the source.

Which is correct for a release? I am not sure, the tagged version in the RSB or the release packaged version?

I tend to think the release packaged version is used and the RSB collected versions should not be collected. They are only useful when working from git.

Summary  
Improve SMP EDF scheduler configuration

Description  
It is currently quite easy to misconfigure the SMP EDF scheduler so that not enough memory is reserved for the scheduler data structures. The only feedback to the user from these configuration errors is a memory corruption. Improve the configuration means or at least issue a fatal error.

|       |              |       |          |            |             |             |

| Summary     | Untar_ family doesn't handle nested directories                                                                                                                                                                                                                                                                                             |       |                |                     |                                       |              |
| Description | At least, not in some circumstances.<br>For example, foo/bar.txt untar's just fine, but foo/bar/baz.txt does not. If sub-directory foo/ exists first, then foo/bar/baz.txt does unpack correctly.<br>We only use the Untar_*( ) family during our initial programming workflow, so hacking around this problem wasn't too laborious for us. |       |                |                     |                                       |              |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |           |          |                 |                 |              |

| Summary     | Build problems with user names which contain space characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |           |          |                 |                 |              |
| Description | The RSB uses the user name as path components. This does not work well if the user name contains space characters. Use the user ID number instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |          |                 |                 |              |
| #3831       | 7 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | fixed     | doc      | Joel Sherrill   | Chris Johns     | 6 months ago |

| Description | <p>I think <a href="https://docs.rtems.org/branches/master/user/hardware/tiers.html">https://docs.rtems.org/branches/master/user/hardware/tiers.html</a> is intended to be the real site of this information. However, <a href="https://devel.rtems.org/wiki/Developer/Architectures">https://devel.rtems.org/wiki/Developer/Architectures</a> also describes the tiers rules with slightly different language.</p> <p>I think the Wiki page can be reviewed and removed. But any references and sub-pages should be dealt with at the same time. <a href="https://devel.rtems.org/search?q=Developer%2FArchitectures&amp;noquickjump=1&amp;wiki=on">https://devel.rtems.org/search?q=Developer%2FArchitectures&amp;noquickjump=1&amp;wiki=on</a> shows two sub-pages to deal with:</p> <ul style="list-style-type: none"> <li><a href="https://devel.rtems.org/wiki/Developer/Architectures/ARM">https://devel.rtems.org/wiki/Developer/Architectures/ARM</a> which is one sentence and can be removed.</li> <li><a href="https://devel.rtems.org/wiki/Developer/Architectures/ARM/ARM-EABI">https://devel.rtems.org/wiki/Developer/Architectures/ARM/ARM-EABI</a> which probably should move to the Users Manual.</li> </ul> <p>This would eliminate a few pages and a point of duplication for a very important concept to the RTEMS Project.</p> |           |          |                 |                 |              |

| Summary     | Simplify RTEMS semaphore configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |          |                 |                 |              |
| Description | In SMP configurations, the maximum count of MrsP semaphores must be configured via CONFIGURE_MAXIMUM_MRSP_SEMAPHORES. The MrsP semaphore implementation predates the addition of self-contained synchronization objects. At this time, the potential memory reduction was justified considering the more complex configuration and additional use of the workspace. With the availability of self-contained synchronization options, e.g. POSIX mutexes, this is no longer justified. Memory constrained applications should use the self-contained synchronization objects. Remove the CONFIGURE_MAXIMUM_MRSP_SEMAPHORES configuration option. This has only an impact on applications which use SMP and a large number of scheduler instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |           |          |                 |                 |              |

| Description | Use a system initialization handler to initialize the clock driver instead of using a legacy IO driver. This makes the system initialization more modular and removes a bit of overhead introduced by the legacy IO driver dependency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |          |                 |                 |              |
| #3835       | 6 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | fixed     | score    | Sebastian Huber | Sebastian Huber | 3 months ago |
| Summary     | Support statically allocated threads                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           |          |                 |                 |              |
| Description | <p>In some applications it is desirable to have statically allocated resources for all operating system objects.</p> <p>In addition to the thread control block, up to four memory areas are currently allocated by a thread:</p> <ol style="list-style-type: none"> <li>stack area</li> <li>TLS area</li> <li>FP context</li> <li>thread queue heads</li> </ol> <p>Currently the FP context and the TLS area are separately allocated from the workspace. This complicates the workspace size estimate. Add the FP context and TLS size to the stack size and place them in the stack area. This makes it also possible to move the stack area allocation out of <code>_Thread_Initialize()</code>. Use a hook to get the thread queue heads which is configured depending on the unlimited objects option of the configuration.</p> <p>Statically allocate the stacks for internal threads (e.g. idle and MPCIE receive server) in a dedicated linker section (similar to the interrupt stacks). Mention this in the Classic API Guide configuration chapter.</p>                                                                                                                                                                                                                                                                                  |           |          |                 |                 |              |

| Description | <p>The work area initialization is done by the BSP through <code>bsp_work_area_initialize()</code>. This approach predates the system initialization through the system initialization linker set. The workspace and C program heap are unconditionally initialized. With the availability of statically initialized threads a system without workspace and C program heap is feasible. Change the work area initialization so that components are initialized on demand. To achieve this:</p> <ol style="list-style-type: none"> <li>Add a Memory Handler which provides support for low level handling of memory areas which are handed over to the higher level Heap Handler.</li> <li>Add an implementation of <code>_Memory_Get()</code> to each BSP (basically a restructuring of the <code>bsp_work_area_initialize()</code> implementations).</li> </ol> <p>See optimization opportunity in <a href="#">#3925</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                       |           |          |                 |                 |              |

| Summary     | Remove CONFIGURE_HAS_OWN_DEVICE_DRIVER_TABLE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |                |                 |                          |              |
| Description | Remove the CONFIGURE_HAS_OWN_DEVICE_DRIVER_TABLE configuration option. The RTEMS configuration should be done via explicit configuration options to allow more freedom for implementation changes. The CONFIGURE_HAS_OWN_DEVICE_DRIVER_TABLE configuration option had no test case. There was an attempt to get user feedback about this option:<br><a href="https://lists.rtems.org/pipermail/users/2019-April/033131.html">https://lists.rtems.org/pipermail/users/2019-April/033131.html</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |                |                 |                          |              |

| Summary     | Remove Ada-specific configuration options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |                |                 |                          |              |
| Description | <p>We have currently three Ada related configuration options:</p> <ul style="list-style-type: none"> <li>CONFIGURE_GNAT_RTEMS</li> <li>CONFIGURE_MAXIMUM_ADA_TASKS</li> <li>CONFIGURE_MAXIMUM_FAKE_ADA_TASKS</li> </ul> <p>The CONFIGURE_MAXIMUM_FAKE_ADA_TASKS option has no effect. The CONFIGURE_GNAT_RTEMS is mandatory to use the CONFIGURE_MAXIMUM_ADA_TASKS option. So, if you just use</p> <pre>#define CONFIGURE_MAXIMUM_ADA_TASKS 123</pre> <p>then you get a re-definition warning and hopefully pay attention to it. This is not very user friendly from point of view.</p> <p>The CONFIGURE_MAXIMUM_ADA_TASKS just adds the configured count to CONFIGURE_MAXIMUM_POSIX_THREADS.</p> <p>The original purpose of these was to:</p> <p>CONFIGURE_GNAT_RTEMS - add in resources required by Ada run-time independent of the number of Ada tasks (e.g. POSIX threads)</p> <p>CONFIGURE_MAXIMUM_ADA_TASKS - add in POSIX threads, condition variable, and mutex required for each Ada task</p> <p>CONFIGURE_MAXIMUM_FAKE_ADA_TASKS - add in condition variables and mutex required by Ada run-time for a task/thread created outside the Ada run-time which invokes Ada code and is thus a user of the run-time.</p> <p>Given that you can turn on unlimited threads now and condition variables and mutexes are static, I don't think they have a need any longer. Plus it sounds like they bit rotted. If we needed them still, they would have to be fixed.</p> <p>We still need documentation that Ada tasks are POSIX threads and must be accounted for in configuring the system. So when moving documentation around, please make that point clear in the CONFIGURE_MAXIMUM_POSIX_THREADS description.</p> <p>See also:<br/><a href="https://lists.rtems.org/pipermail/devel/2019-December/056523.html">https://lists.rtems.org/pipermail/devel/2019-December/056523.html</a></p> |       |                |                 |                          |              |
| #3848       | 6 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | fixed | network/libbsd | Chris Johns     | Chris Johns              | 3 months ago |
| Summary     | Libdebugger test in libbsd should depend on libdebugger.a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |                |                 |                          |              |
| Description | The test should be built based on this library being present. The PowerPC does not support libdebugger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |       |                |                 |                          |              |
| #3849       | 6 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | fixed | arch/powerpc   | Sebastian Huber | Joel Sherrill <joel@...> | 3 months ago |
| Summary     | Fix PSIM memory map                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |                |                 |                          |              |

**b08278e/rtems** leads to the following run-time error on PSIM:

```
BATs must not overlap; area 0x08000000..0x09000000 hits DBAT 0
BATs must not overlap; area 0x0c000000..0xd0000000 hits DBAT 0
```

The RAM overlaps with the PCI area:

```
/*
 * Setup BATs and enable MMU
 */
/* Memory */
setdbat(0, 0x0<<28, 0x0<<28, 1<<28, _PAGE_RW);
setibat(0, 0x0<<28, 0x0<<28, 1<<28, 0);
/* PCI */
setdbat(1, 0x8<<24, 0x8<<24, 1<<24, IO_PAGE);
setdbat(2, 0xc<<24, 0xc<<24, 1<<24, IO_PAGE);
```

Increasing the RAM size to 256MiB (0x10000000) on PSIM breaks also the shared memory support:

```
typedef struct {
/* 0x0c000000 - 0x0c007fff - AMD 29F040 */
volatile uint8_t Flash[512 * 1024];

/* 0x0c080000 - 0x0c0fffff - NVRAM/NVRAM */
volatile uint8_t nvram[512 * 1024];

/* 0x0c100000 - 0x0c100007 - NVRAM/RTC */
psim_rtc_t RTC;

/* 0x0c100008 - 0x0c10000f - NVRAM/RTC */
uint8_t gap1[8];

/* 0x0c100010 - 0x0c10001b - System V IPC Semaphore */
psim_sysv_sem_t Semaphore;

/* 0x0c10001c - 0x0c10001f - NVRAM/RTC */
uint8_t gap2[4];

/* 0x0c100020 - 0x0c10005f - Ethernet */
volatile uint8_t Ethtap[64];

/* 0x0c100060 - 0x0c10ffff - NVRAM/RTC */
uint8_t gap3[65440];

/* 0x0c110000 - 0x0c12ffff - System V IPC Shared Memory */
uint8_t SharedMemory[128 * 1024];

/* 0x0c130000 - 0x0c170000 - OpenPIC IRQ Controller */
volatile uint8_t OpenPIC[256 * 1024];
} psim_registers_t;
```

Descripti  
on

Proposed solution is to adjust the memory map so that 256MiB of RAM are supported. Probably needs changes in rtems-tools.

Summary: posix\_devctl - Add support for SOCKCLOSE

The FACE Technical Standard, Edition 3.0 and later require the definition of the subcommand SOCKCLOSE in <devctl.h>.

Reference: <https://www.opengroup.org/face>

The SOCKCLOSE constant has previously been added to <devctl.h> in newlib.

Summary: Use EAGAIN for POSIX mq wait in ISR error

POSIX message queues which are about to block in an ISR currently return ENOMEM. This is a status not listed by POSIX. The better status is EAGAIN per [https://pubs.opengroup.org/onlinepubs/9699919799/functions/mq\\_receive.html](https://pubs.opengroup.org/onlinepubs/9699919799/functions/mq_receive.html).

Summary: No output from joel scripts in telnet

Running a `joel` script in a telnet session results in the output being sent to the global `stdout`. For example:

```
$ telnet 1.2.3.4
Trying 1.2.3.4...
Connected to 1.2.3.4.
Escape character is '^'.

RTEMS Shell on /dev/pty0. Use 'help' to list commands.
[/] # cat j
#! joel
ls -las /
[/] # ./j
[/] #
```

The bug is a new shell main loop task will default to the global `stdout`, `stdin` etc and has no information about the parent's `std` handles. A `joel` script runs in it's own work task and does not know the telnet's `std` handles.

There are a related set of issues in the handling of the `shell_env` variable, POSIX key handling and the use of the external call `rtems_shell_main_loop`.

The telnet example in `libbsd` has:

```
static void
telnet_shell(char *name, void *arg)
{
 rtems_shell_env_t env;

 memset(&env, 0, sizeof(env));

 env.devname = name;
 env.taskname = "TLNT";
 env.login_check = NULL;
 env.forever = false;

 rtems_shell_main_loop(&env);
}
```

Descripti  
on

This is problematic as control of the `env` has been lost and this make backwards comptable changes difficult. Control of this `struct` needs to be brought back under the shell code.

Currently the posix key is set in the parent task only when the run entry point is used. The run's created `shell_env` is then passed to the shell's main loop task as an argument from which it is cloned. This means an `env` is `malloc`ed in each run call and again in the main loop of the shell.

The current code leaks memory as repeated calls to a `joel` script in a shell will set the key over and over. The destructor is only called when the task is deleted. We have to assume the cleanup of any `shell_env` allocated externally to the shell code has to be handled externally.

Setting the key in the main loop task is problematic because telnet code such as the example in `libbsd` uses a local stack `shell_env` and the key has a destructor that blindly `free`'s the key's memory when a task is released.

Changes:

1. Add `parent_stdout`, `parent_stdin`, and `parent_stderr` to the `shell_env` and set to the parent's `std` handles.
2. Add a `managed` flag to `shell_env` and only set when allocated by `rtems_shell_init_env`. Change `rtems_shell_env_free` to only `free` the `shell_env` if `managed`.
3. Remove all key sets and have only one in the shell's main loop code.
4. Change `rtems_shell_init_env` to get the current tasks key and clone that before cloning the global env.
5. Update `rtems_shell_dup_current_env` to set the parent `std` handles.
6. Have the main loop use the parent `std` handles rather than the global handles.
7. Check the `magic` field has been set in the shell's main loop and raise an error if not set. The only code to set this field should reside in `shell.c`. Code such as `libbsd` will need to call `rtems_shell_dup_current_env`.

| Description | Add a configuration option to print some information during system initialization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |          |                 |                          |              |
| #3862       | 4 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | fixed | config   | Sebastian Huber | Sebastian Huber          | 4 months ago |
| Summary     | Canonicalize CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |          |                 |                          |              |
| Description | The CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY configuration option is documented to be a boolean feature macro (is defined or undefined). However, in confdefs.h it uses the values TRUE and FALSE. It is the only configuration option implemented like this. Change it to use defined/undefined instead like the other options. This affects existing application configurations which use:<br><pre>#define CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY FALSE</pre>                                                                                                                                                                                                                                                                       |       |          |                 |                          |              |
|             | An unintentional zero of the workspace has an effect on the system boot time. This is an acceptable trade-off for the more canonical configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |          |                 |                          |              |

| Summary     | Remove support for the BSP_ZERO_WORKSPACE_AUTOMATICALLY BSP option                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |          |                 |                          |              |
| Description | BSPs had the option to enable the CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY via the BSP_ZERO_WORKSPACE_AUTOMATICALLY BSP option. There is no BSP which defines this option. In addition, it makes no sense that a BSP can influence this high level system configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |          |                 |                          |              |

| Summary     | rtems-tester does not work with gdb simulators                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |          |                 |                          |              |
| Description | It appears that something has broken with the rtems-tester on gdb simulators. On the latest run, I had to kill the tester by hand when it hung. On other times, it appears to abort with a lock issue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |       |          |                 |                          |              |
| #3865       | 4 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | fixed | score    | Sebastian Huber | Sebastian Huber          | 4 months ago |
| Summary     | Fix linker set item declarations for small data area targets                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |          |                 |                          |              |
| Description | Some targets (e.g. 32-bit PowerPC) have a small-data area. Linker set items are not in the small data area. We have to tell this the compiler, otherwise linker error may occur due to a mismatch of relocations. There are two options to do this.<br><ol style="list-style-type: none"> <li>1. We can declare items as an array of unspecified size and define items as an array with one element. The problem with this is that it breaks existing code, e.g. an item initializer would have to change.</li> <li>2. We add the section to the declaration. The problem is that in this case we need a dedicated declaration macro for the ordered items.</li> </ol> Since item declarations are rarely used, we select option 2. |       |          |                 |                          |              |
| #3868       | 4 months ago                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | fixed | tool/rsb | Chris Johns     | Chris Johns <chrisj@...> | 4 months ago |
| Summary     | newlib links breaks mingw build                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |          |                 |                          |              |

|             | The following patch in newlib adds links and Windows does not have symlinks and it is emulated as copy. This complicates a bsdtar extraction of source ...<br><a href="https://github.com/RTEMS/sourceware-mirror-newlib-cygwin/commit/cfc4955234828881145a20987c8a0a3cd373585c">https://github.com/RTEMS/sourceware-mirror-newlib-cygwin/commit/cfc4955234828881145a20987c8a0a3cd373585c</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |        |                 |                 |              |
| Description | I tried the <code>-E</code> option that was added to the RSB to extract the tar file a second time, this has worked with other tar files with symlinks however it does not work. I have no investigated why.<br><br>We need Windows building to make a release.<br><br><b>Note, this is in the <code>tools/rsb</code> component however is not an RSB bug. I need input on what the RSB needs to do to fix this issue if that is the path we take.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |        |                 |                 |              |

| Summary     | Split up <code>confdefs.h</code> in component based header files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |        |                 |                 |              |

The confdefs.h header file is large, complex, and hard to review. Split it up into component header files to make it easier to maintain and review.

The general approach is to place the default configuration of things in librtmscpu.a. The benefit is that the application configuration object file will only include data structures which have a user-defined value.

The component based header files include their dependencies explicitly. It should be possible to include component based header files separately to ease testing. For example we could use this template:

```
#ifndef _RTEMS_CONFDEFS_FOOBAR_H
#define _RTEMS_CONFDEFS_FOOBAR_H

#ifdef __CONFIGURATION_TEMPLATE_h
#error "Do not include this file directly, use <rtms/confdefs.h> instead"
#endif

#if defined(CONFIGURE_INIT) && \
 defined(CONFIGURE_FOOBAR_STUFF) && \
 defined(CONFIGURE_MORE_FOOBAR_STUFF)

/* Foobar includes */

#ifdef __cplusplus
extern "C" {
#endif /* __cplusplus */

/* Configure foobar. */

#ifdef __cplusplus
}
#endif /* __cplusplus */

#endif /* CONFIGURE_INIT */

#endif /* _RTEMS_CONFDEFS_FOOBAR_H */
```

In case CONFIGURE\_INIT is not defined, then including <rtms/confdefs.h> should expose nothing to the C compiler.

Here is a first proposal to group the configuration in components:

```
rtms/
confdefs.h
This file just includes the component based header files listed below.
confdefs/
bdbuf.h
classicobj.h
 Classic API objects
classictasksinit.h
 Classic initialization task
driverclock.h
 Clock driver and related configuration, e.g. CONFIGURE_MICROSECONDS_PER_TICK
driverconsolesimple.h
 Simple console driver configuration
driverlegacy.h
 Legacy IO driver configuration table
extensions.h
 User extensions, internal extensions
filesystem.h
 Filesystem configuration
general.h
 Basic stuff which is mandatory to configure, e.g. ISR stacks, per-CPU information
libpci.h
 PCI library configuration
malloc.h
 Malloc configuration
mpci.h
 MPCPI specific configuration options
msgq.h
 General message queue configuration
obsolete.h
 Warning about the use of obsolete configure options
posixkeys.h
 POSIX keys
posixobj.h
 POSIX objects
posixthreadsinit.h
 POSIX initialization threads
scheduler.h
 Scheduler configuration
support.h
 Support macros for confdefs header files
threads.h
 General thread configuration (e.g. thread control block)
unlimited.h
 Unlimited objects configuration
```

Summary Add API functions to map a task priority to/from a POSIX thread priority

Mapping task priorities to/from POSIX thread priorities is probably done in many applications. There seems to be no API to help doing this. Add the following API functions to map a task priority to/from a POSIX thread priority:

```

/**
 * @brief Map a task priority to the corresponding POSIX thread priority.
 *
 * @param scheduler_id Identifier of the scheduler instance.
 * @param priority The task priority to map.
 * @param[out] posix_priority Pointer to a POSIX thread priority value.
 *
 * @retval RTEMS_SUCCESSFUL Successful operation.
 * @retval RTEMS_INVALID_ADDRESS The @a posix_priority parameter is @c NULL.
 * @retval RTEMS_INVALID_ID Invalid scheduler instance identifier.
 * @retval RTEMS_INVALID_PRIORITY Invalid task priority.
 */
rtems_status_code rtems_scheduler_map_to_posix_priority(
 rtems_id scheduler_id,
 rtems_task_priority priority,
 int *posix_priority
);

/**
 * @brief Map a POSIX thread priority to the corresponding task priority.
 *
 * @param scheduler_id Identifier of the scheduler instance.
 * @param posix_priority The POSIX thread priority to map.
 * @param[out] priority Pointer to a task priority value.
 *
 * @retval RTEMS_SUCCESSFUL Successful operation.
 * @retval RTEMS_INVALID_ADDRESS The @a priority parameter is @c NULL.
 * @retval RTEMS_INVALID_ID Invalid scheduler instance identifier.
 * @retval RTEMS_INVALID_PRIORITY Invalid POSIX thread priority.
 */
rtems_status_code rtems_scheduler_map_from_posix_priority(
 rtems_id scheduler_id,
 int posix_priority,
 rtems_task_priority *priority
);

```

| Summary     | Add POSIX user environment pointer to TCB                                                                                                                                                                                                                                                                                                              |       |       |                 |                 |              |
| Description | The IO library uses a POSIX key to store an optional POSIX user environment pointer. This pulls in the POSIX keys support in every application configuration. Add a user environment pointer to the thread control block (TCB) instead. Applications which do not need the POSIX user environment will just get an overhead of one pointer per thread. |       |       |                 |                 |              |

| Summary     | Context switch extension is broken in SMP configurations                                                                                                                                                                                                                                                                                               |       |       |                 |                 |              |

The context switch extensions are called during `_Thread_Do_dispatch()`:

```
void _Thread_Do_dispatch(Per_CPU_Control *cpu_self, ISR_Level level)
{
 Thread_Control *executing;

 executing = cpu_self->executing;

 ...
 do {
 Thread_Control *heir;

 heir = _Thread_Get_heir_and_make_it_executing(cpu_self);
 ...
 _User_extensions_Thread_switch(executing, heir);
 ...
 _Context_Switch(&executing->Registers, &heir->Registers);
 ...
 } while (cpu_self->dispatch_necessary);
 ...
}
```

Description

In uniprocessor configurations, the context switch extensions are called for all thread switches except the very first thread switch to the initialization thread. However, in SMP configurations, the context switch may be invalidated and updated in the low-level `_Context_Switch()` routine. See:

[https://docs.rtems.org/branches/master/c-user/symmetric\\_multiprocessing\\_services.html#thread-dispatch-details](https://docs.rtems.org/branches/master/c-user/symmetric_multiprocessing_services.html#thread-dispatch-details)

In case such an update happens, a thread executes on the processor which was not visible to the context switch extensions. This can confuse for example event record consumers which use events generated by a context switch extension.

Fixing this is not straight forward. The context switch extensions call must move after the low-level context switch. The problem here is that we may end up in `_Thread_Handler()`. Adding the context switch extensions call to `_Thread_Handler()` covers now also the thread switch to the initialization thread. We also have to save the last executing thread of the processor. Registers or the stack cannot be used for this purpose. We have to add it to the per-processor information. Existing extensions may be affected, since now context switch extensions use the stack of the heir thread.

Calling the thread switch extensions in the low level context switch is difficult since at this point an intermediate stack is used which is only large enough to enable servicing of interrupts.

Summary: Replace the device filesystem with a specialization of the IMFS

Description: New device drivers (e.g. Termios, I2C, SPI, libbsd) use IMFS generic nodes to hook into the filesystem. This does not work with the device filesystem enabled by the

```
#define CONFIGURE_USE_DEVFS_AS_BASE_FILESYSTEM
```

configuration option. Replace the device filesystem with a specialization of the IMFS.

Summary: New template for boolean feature defines

All boolean feature defines are undefined by default. The current template is a bit awkward. Change the application configuration option template for boolean feature defines to:

```
.. index:: CONFIGURE_XYZ
.. _CONFIGURE_XYZ:
CONFIGURE_XYZ

CONSTANT:
``CONFIGURE_XYZ``
OPTION TYPE:
This configuration option is a boolean feature define.
DEFAULT CONFIGURATION:
If this configuration option is undefined, then not ABC or something else.
DESCRIPTION:
In case this configuration option is defined, then ABC.
NOTES:
Notes for XYZ.
```

Descripti  
on

**#3901** 3 months ago fixed doc Sebastian Huber Sebastian Huber 3 months ago

Summary  
New template for configuration options with a value

Change the documentation template for configuration options with a value to:

```
.. _CONFIGURE_XYZ:
CONFIGURE_XYZ

CONSTANT:
``CONFIGURE_XYZ``
OPTION TYPE:
This configuration option is an integer define.
VALUE CONSTRAINTS:
The specified value must be greater than or equal to X and less than or
equal to Y.
DEFAULT VALUE:
The default value is Z.
DESCRIPTION:
This configuration option defines the ABC.
NOTES:
Notes for XYZ.
```

Descripti  
on

Use `OPTION TYPE` instead of `DATA TYPE` since we have to characterize the option an not just the value of an option. This is in line with **#3900**.

Use `VALUE RANGE` instead of `RANGE` to be more specific.

Summary  
RSB may not download source of pkconfig checked packages

There are config files with the following:

```
#
The GLib build instructions. We use 2.x.x Release 1.
#
#ifn %{pkgconfig check glib-2.0}
#include %{_configdir}/glib-2-1.cfg
#endif
```

Descripti  
on If the glib package is present the config file is not loaded and the source is not downloaded with the `sb-get-source` package. Change the config to:

```
#
The GLib build instructions. We use 2.x.x Release 1.
#
#if !%{pkgconfig check glib-2.0} || %{defined _rsb_getting_source}
#include %{_configdir}/glib-2-1.cfg
#endif
```

Summar  
y tclsh required to build sqlite -- makes all BSP bsets fail

Descripti  
on I'm not sure what to do about this. If building sqlite is a requirement, then host setup instructions, sb-check, etc are impacted. But dtc is a required component for a few things and the RSB deals with it. It is also possible to say that sqlite should not be in the BSP bsets.

This is IMO a blocker at some level for the 5.1 release because it impacts building all bsets.

```
+ make -j 8 sqlite3.h libsqli3.la tclsh /home/joel/rtems-cron-5/rtems-source-builder/rtems/build/sqlite-3.8.8.1-powerpc-rtems5-1/build-xc/./sqlite-src-3080801/tool/mksqli3h.tcl /home/joel/rtems-cron-5/rtems-source-builder/rtems/build/sqlite-3.8.8.1-powerpc-rtems5-1/build-xc/./sqlite-src-3080801 >sqlite3.h gcc -g -o mkkeywordhash -DSQLITE_OMIT_WAL=1 -DSQLITE_ENABLE_COLUMN_METADATA=1 /home/joel/rtems-cron-5/rtems-source-builder/rtems/build/sqlite-3.8.8.1-powerpc-rtems5-1/build-xc/./sqlite-src-3080801/tool/mkkeywordhash.c gcc -g -o lemon /home/joel/rtems-cron-5/rtems-source-builder/rtems/build/sqlite-3.8.8.1-powerpc-rtems5-1/build-xc/./sqlite-src-3080801/tool/lemon.c/bin/sh: tclsh: command not found

Summar  
y Update DTC example on rtems-docs/user/rsb/configuration.rst

The DTC example on rtems-docs/user/rsb/configuration.rst should be reviewed and updated in order to be consistent with what is available in the RSB tree.

For instance, the link (<http://www.jdl.com/software>) provided in the webpage is not available anymore and some environment variables described in the text need also to be verified ("DESTDIR" and a "DISTDIR"). Thus, it is needed to review this part of the documentation.

| Description | Installing GCC on FreeBSD 12 leads to build issues. This along with the issue that the GCC build should be done with the GNU sed in the \$PATH during the RSB process needs to be added to the documentation here:<br><a href="https://docs.rtems.org/branches/master/user/hosts/posix.html#freebsd">https://docs.rtems.org/branches/master/user/hosts/posix.html#freebsd</a>                                                                                                                                                                                                                                                                                                            |       |               |                    |                    |              |

| Summary     | symlinks in RTEMS source tree                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |               |                    |                    |              |
| Description | <p>There is a symlink in the RTEMS git repo and source tree. We cannot have symlinks in released tar files because it breaks on Windows and MSYS:</p> <pre>\$ find . -type l ./testsuites/libtests/tar01/symlink</pre> <p>MSYS reports:</p> <pre>\$ find . -type l ./testsuites/libtests/tar01/symlink</pre> <p>The software engineering manual needs an entry stating symlinks cannot appear in the source repo or git in any RTEMS repos. The solution is to create a symlink on suitable hosts, i.e. not Windows when building.</p> <p>This ticket will address the removal and not state of the effected test. That will be the subject of another ticket if someone creates it.</p> |       |               |                    |                    |              |

| Description | The global variable <code>_RTEMS_version</code> was declared via <code>&lt;rtems.h&gt;</code> and may be used directly by application code. Applications should use <code>rtems_get_version_string()</code> instead. Mark this variable as deprecated and move it to an internal header file in RTEMS 6.                                                                                                                                                                                                                                                                                                                                                                                 |       |               |                    |                    |              |
