Documentation does not build with the packages used on main . The error is:

```
1 Theme error:
2 An error happened in rendering the page index.
3 Reason: UndefinedError("'style' is undefined")
```

The 6 branch builds but that has a different theme.

Author: Chris Johns 2026-02-20T04:31:52.433Z

added rtems#14 as parent epic

Author: Chris Johns 2026-02-20T04:31:52.514Z

set status to **To do**

Author: Kinsey Moore 2026-02-20T14:33:01.359Z

Apparently modern versions of sphinx (7 or greater) have dropped the usage of “style” as it is now a keyword, so documentation must be updated. I have a potential fix, but I don’t have the ability to test on historical systems that would have used the original syntax to see if it still works.

Author: Kinsey Moore 2026-02-20T14:38:41.862Z

There is an additional issue if running on python 3.12 or later in that the “imp” module is gone, so I need to find a workaround for that, too.

Commit	081a3018dd1638de978c80a0b6680eeefa563d78

Summary

common/...theme_rtems/layout.html: Update theme for modern Sphinx

Old themes tend to use “style” and this is now a reserved keyword. Use styles[-1], instead.

Updates [#135](#)

common/waf.py: Backport importlib compatibility

This backports usage of importlib from main with the ability to continue functioning on python 2.x with the ‘imp’ module.

Original author: Sal

DHCP requests add the hostname option in `dhcp_request_req()` without checking its length, so the hostname can be of any length. This is a defect because the DHCP spec (<https://tools.ietf.org/html/rfc2132>) requires the hostname to have a minimum length of 1 char. This appears to trigger a bug in a specific Netgear router that causes it's DHCP process to lock up and could affect other things as well.

This bug can be solved applying the patch made by Aun-Ali Zaidi in the original ticket reporting this defect (<https://devel.rtems.org/ticket/1405>) that was never applied. I've been able to compile the code with the patch applied and it didn't raise any warnings.

Original ticket: <https://devel.rtems.org/ticket/1405>

RTEMS Testing Tool Project

[\[Contents, inline\]](#)

1.4.1.1.1.1 Mentors

Chris Johns

1.4.1.1.1.2 Status ==

Looking for funding.

Introduction =

This project involves working on the RTEMS Testing Tool that resides in the RTEMS Tools package and is part of the RTEMS Tools Project. The RTEMS Testing Tool provides a consistent way to test BSPs on different hardware. The tool aims to integrate with a wide range of testing tools and methods generating a consistent report for the RTEMS test suite.

Project

The project is to enhance and improve some of the existing functionality and to complete needed parts.

1.4.1.1.3.1 Goal

- Make the configuration file format easier to use.
- Allows users to customise and change behaviour without changing configuration files.
- To be able to determine if a change in RTEMS causes a regression.
- To be able to verify simulator and real hardware results match for a BSP.
- Improve console support.

1.4.1.1.3.2 Prerequisite

- Knowledge of C and Python programming languages.
- Knowledge of host software and building packages such as simulators.
- Knowledge of debugging and debuggers.
- Knowledge of the RTEMS Tool's Toolkit.
- Requires Unix (Linux or FreeBSD) host.
- Requires modern PC hardware. Building all tests and running takes.
- Optionally a Zedboard or MicroZed with a JTAG debugging pod.
- Optionally a Windows 7 or Windows 10 machine.

1.4.1.1.3.3 Resources

- Current RTEMS developers.
- The existing RTEMS Testing Tool.

Tasks

The following are the tasks:

1.4.1.1.4.1 Tools ==

1. Build RTEMS `erc32` and `xilinx_zynq_a9_qemu` with all tests. 1. Build QEMU with required patches to run the Zynq BSP executables. 1. Verify `rtems-test` runs all tests and generates a report.

1.4.1.1.4.2 Configuration Files

The `rtems-test` command uses the RTEMS Tool's Toolkit macro support to read macro files. This file format is a simple text version of the macro fields and is loaded into the macro table. It is not easy to read and not really suitable. It was used as a configuration file format to get something working rather than a suitable configuration file format.

The RTEMS Testing tool uses the macros internally for its data and this is not to change. It is working and has nice features.

The task is to look at replacing the raw macro format files with a YAML file that lets us define and manage the BSP back end configurations we need to support.

An important area to be considered and implemented is an interface for user specific data a BSP back end configuration needs in order to run. For example when running the tests via JTAG you need to initialise the hardware in a target specific way and this data is not part of RTEMS so a user needs to provide it to the tool to run. A command line option is one way we need implement however adding endless command line options is not reasonable so a configuration file is also needed.

The configuration file format shall allow a user to define the console interface they have. This could be a direct serial connection or a telnet console.

1.4.1.1.4.3 Regression Analysis

The RTEMS Testing tools is to provide regression analysis for BSPs that provides the expected test result data.

This task requires adding support for the expected-fail result tests can now report and to track this value.

The task also requires a YAML format file for each BSP that defines its expected test results. The `rtems-test` tool shall attempt to locate the file when run in regression mode inside a build tree and also when the BSP is installed and determine if the BSP has regressed or the test results in RTEMS need updating.

1.4.1.1.4.4 Generic Serial Console

The console support in the back end is termios however this is not available on Windows. This task is to integrate a BSD licensed Python serial package that provides Unix and Windows support so consoles can be supported on Windows and Unix.

1.4.1.1.4.5 Telnet Console

Add support for telnet as a console. The `_ser2net_` package is a nice way to provide a number of serial ports on a network and a telnet console provides a way for testers to use it.

Acknowledgements

None.

Miscellaneous Sections

As the project progresses, you will need to add to the RTEMS Testing section of the User manual. This section does not currently exist but it should be present even in a skeleton form.

Merges	0

Summary

Backport of <https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5166>.

We have a GR712RC and use the `_occan_` lib for the operation of the CAN core, but had weird results regarding the measured baud rate when calling `occanlib_set_speed`. We used the current RCC from Gaisler and the `rtems-occan` example for testing.

There are 2 errors in the code:

1.5.1.2.1.1 BRP not correctly calculated

In the data sheet of the GR712RC it states:

`!`grafik </-/project/26/uploads/d47f1150b72c68868a5c6ad9caff39e0/grafik.png>`_`

```
1 /* calculate scaler */
2 tmp = ((br->divfactor + tseg) * baud);
3 sc = (core_hz * 2) / tmp - core_hz / tmp;
```

Which is the same as `sc = core_hz / tmp`, so the division by 2 of the core is not correctly calculated.

1.5.1.2.1.2 BTR1 register values not correct

From the GR712RC manual the following formulas are given for the TSEG values of the BTR1 register:

!` grafik </-/project/26/uploads/b3ac335f090f39ab51e8d4194bdfe111/grafik.png>` _

However, `occanlib_set_speed` eventually calls `glib_canbtrs_calc_timing` which returns the full TSEG values (including the +1). The subsequent call to `convert_timing_to_btrs` writes these values to the registers without subtracting the +1, resulting in two time segments to many.

Steps to reproduce

- Call `occanlib_set_speed` (for example use `rtems-occan` of the RCC as a base).
- Observe the written register values in `GRMON`
- Measure baud rate on oscilloscope and compare with desired value

Expected behaviour

Correct baud rate measured.

Merges	0

Summary

Backport of <https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5162>

`rtems_termios_set_best_baud()` cannot set all Baudrates, because `rtems_termios_baud_table` is unsorted.

Steps to reproduce

https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/libcsupport/src/termios_baudtable.c?ref_type=heads https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/libcsupport/src/termios_setbestbaud.c?ref_type=heads#L43

The algorithm in `rtems_termios_set_best_baud()` successively iterates over the elements of the `rtems_termios_baud_table` and searches for a fitting baud rate (checking by “is element lower than the baud parameter, then checks the next element, ...).

The table of baud rates is not sorted correctly from a certain point on, therefore the algorithm for choosing the optimal baud rate does not work for every baud rate.

e.g. if the input is 7200 (which is in the table) the search terminates at 9600 as that is larger, the last entry was 4800, so in the check it sets it to either of those, but not the 7200.

We observed it when we entered 38401 (due to measurement errors on the hardware was a bit larger). We identified the search ending at 57600 and it ended using the last = 28800.

Original author: Lou.Woods

Currently the POSIX Message Queue implementation will release threads blocked on all waiting calls in FIFO order. This is counter to the Open Group specification.

mq_receive() Description Paragraph 4: If more than one thread is waiting to receive a message when a message arrives at an empty queue and the Priority Scheduling option is supported, then the thread of highest priority that has been waiting the longest shall be selected to receive the message.

Source: http://pubs.opengroup.org/onlinepubs/9699919799/functions/mq_receive.html

Behavior tested on RTEMS 5 master xilinx_zynq_a9_qemu BSP

Tests demonstrating the behavior and a fix will be sent to the devel mailing list.

Author: Gedare Bloom 2026-01-22T21:02:55.584Z

marked this issue as blocking rtems/programs/gsoc#88

Author: Xinhong Hu 2026-02-14T18:08:53.538Z

Hi @gedare @joel

I'm interested in working on this issue as a part of GSoC. I've been doing some debugging on RTEMS 7 (erc32-sim) and can confirm the problem still exists. Here's what I've done:

Initial observation:

In `cpukit/posix/src/mqueueopen.c`_`` I change `_CORE_MESSAGE_QUEUE_DISCIPLINES_FIFO`_`` to `'CORE_MESSAGE_QUEUE_DISCIPLINES_PRIORITY'`, but the behavior remained **FIFO** – a low-priority thread (20) blocked first, a high-priority thread (10) blocked second, and when a message was sent, the low-priority thread received it. My test code is below:

[posix_mq_priority_wakeup_test.c](#)

Verification:

I added runtime prints in `coremsgsubmit.c`_`` to confirm that the message queue operations are indeed set to priority versions:

```
ops.enqueue = 0x2008f5c (priority_enqueue)ops.extract = 0x2008a9c
(priority_extract)
```

Deep debugging with GDB:

I used `sparc-rtems7-gdb`_`` to set breakpoints in `_Thread_queue_Enqueue`_`` and `_Thread_queue_Extract_locked`_``, printing thread priority via `the_thread->Real_priority.priority`_``. The output was:

```
[Enqueue] thread addr: 0x02018408, priority: 490 (low-priority
thread) [Enqueue] thread addr: 0x02018c78, priority: 200
(high-priority thread) ... [Dequeue] thread addr: 0x02018408,
priority: 490
```

This shows:

1. Enqueue order: low-priority first, high-priority second.
2. Dequeue order: the first-enqueued (low-priority) thread is extracted → **FIFO** behavior, despite priority operations being used.

Conclusion:

The `priority_enqueue` function (likely `_Thread_queue_Enqueue_priority`_`` or a macro expansion) is

not inserting threads in priority order; it's simply appending to the tail.

My question:

I've looked for the implementation of the priority enqueue function but couldn't locate it. It might be hidden in macros or in ``threadqops.c``. Could you point me to the exact file/function that needs to be fixed? I'd like to contribute a patch and use this as part of my GSoC proposal (project [#88](#)).

Thank you for your guidance!

Author: Gedare Bloom 2026-02-14T18:08:53.498Z

Please discuss GSoC projects in the [User's Forum](#).

The prioritization for POSIX message queues is done when the message is sent, so trace through `mq_send` code path. This uses the message's priority however, and not the thread's priority.

Author: Xinhong Hu 2026-02-17T13:22:29.581Z

Hi @gedare,

Thank you for your guidance and for pointing me to the User's Forum for GSoC discussions. I have moved the discussion there as requested. For full details, including the corrected test code and output, I have posted a comprehensive report in the User's Forum: [GSoC 2026 : POSIX Message Queue thread release order is not priority based \(#3791\)](#)

Following your suggestion, I traced the `mq_send` path and revisited my test logic. I realized my initial misunderstanding of the POSIX-to-RTEMS priority mapping led to a flawed test setup. After correcting the test to ensure the lower RTEMS priority thread (mapped from POSIX 10) blocks first and the higher RTEMS priority thread (mapped from POSIX 20) blocks second, the message queue **does** wake the correct higher-priority thread. The only necessary change to guarantee POSIX compliance is setting the discipline to `CORE_MESSAGE_QUEUE_DISCIPLINES_PRIORITY` in `_POSIX_Message_queue_Create()` within `mqueueopen.c`, which I confirmed in my latest tests on RTEMS 7.

Thank you again for your help. Any further feedback would be greatly appreciated.

Author: Joel Sherrill 2026-02-17T21:46:57.537Z

I am glad you ran that down to the one place during initialization. The POSIX standard does not say much about thread priority and message queues. [mq_receive](#) has a little information referencing the "Priority Scheduling option." Searching the PDF of POSIX Issue 8, that phrase only occurs in `_mq_send()` and `_mq_receive()`. I think there is some terminology mixup. There is a section Priority Scheduling (2.8.4) in the background and `__POSIX_PRIORITY_SCHEDULING` is documented as an option.

Ignoring all that, I think your change is the right way to do what POSIX asks. But it locks RTEMS into having all POSIX MQs have priority blocking which is a behavior change from previous RTEMS versions. Having control over blocking discipline on a per instance basis would be better. `mq_setattr()` doesn't let you change message size or maximum on the fly – it has to be set at `_mq_create()` and this would be a similar attribute.

After all this writing, the simple change would be to add a field to `_mq_attr` for FIFO or priority blocking. Something like `_mq_ispriority` and the default would be FIFO and that would be a 0 value.

```
1 static const struct mq_attr _POSIX_Message_queue_Default_attributes = {  
2   .mq_maxmsg = 10,  
3   .mq_msgsize = 16  
4 };
```

That structure **should** initialize every field. :(

A grander idea which builds on adding discipline choice is having an application configuration option as found in `<rtems/confdefs.h>` which generates the default POSIX MQ attributes. This would replace this from `_mqopen.c`. This structure already has more fields than shown and could have another to specify if an MQ instance being created with `_mq_open()` is FIFO or priority blocking. The current default attributes structure is defined in `_mqueue.h` in the RTEMS source.

This sounds like a lot but just adding something like `_mq_ispriority` to `_mq_attr` is enough to give a lot more flexibility and make priority blocking an option to applications which want it on a per MQ instance basis.

I likely have written more English than code is required. And the grander idea may not be worth the trouble. @gedare thoughts?

Author: Gedare Bloom 2026-02-17T21:54:48.602Z

The distinction between the priority-based message delivery and priority-based thread receive is subtle. I think we just have to be a little bit careful and avoid causing confusion. We certainly don't want to break our existing practice. This would lead me to think that we want to make an application configuration to enable `mq_receive` with thread priority. I actually am unsure what the current behavior does. My intuition would be that the `mq_receive` is going to unblock the highest priority thread, not the FIFO thread, because the core implementation relies on the thread queues.

Author: Xinhong Hu 2026-02-20T18:49:18.416Z

Hi @joel , @gedare

Thank you for the thoughtful discussion. I've been prototyping the per-instance approach Joel suggested: adding an RTEMS-specific field `mq_ispriority` to struct `mq_attr`. This allows each queue to independently choose FIFO or priority wake-up order, with a default of FIFO to maintain backward compatibility. My tests on

RTEMS 7 confirm that setting `mq_ispriority = 1` correctly wakes a higher-priority thread that blocks later.

Regarding Gedare's point about application configuration: I think per-instance control already gives applications the ability to configure individual queues. However, to also support system-wide defaults, we could add a configuration macro in `<rtems/confdefs.h>` (e.g., `CONFIGURE_POSIX_MESSAGE_QUEUE_DEFAULT_DISCIPLINE`) that sets the initial value of `mq_ispriority` for queues created with a `NULL` attribute. This would allow integrators to change the global default without modifying each `mq_open` call, while still permitting per-queue overrides.

For my GSoC project, I propose to implement both the per-instance field and the global configuration option. The core deliverables would be:

1. Extend struct `mq_attr` with `mq_ispriority` (guarded by `#ifdef __RTEMS__`).
2. Modify `mq_open()` to interpret this field and pass the discipline to the core message queue.
3. Add a configuration macro in `<rtems/confdefs.h>` to set the default discipline.
4. Provide comprehensive tests and documentation.

I believe this scope is manageable within the GSoC timeframe and fully resolves [#3791](#) while offering flexibility for future needs. I'd appreciate your feedback on whether this plan aligns with your expectations. If you prefer a simpler approach (only per-instance or only global), I can adjust accordingly.

Thank you for your guidance!

Author: Gedare Bloom 2026-02-18T16:53:41.242Z

What do other operating systems do?

Author: Xinhong Hu 2026-02-18T16:53:41.156Z

Hi @gedare ,

Thank you for your guidance. I've investigated how FreeBSD and Linux implement POSIX message queues regarding thread wake-up order, and here's what I found:

****FreeBSD****

FreeBSD **explicitly follows the POSIX specification**. Its `mq_receive` man page states:

“If more than one thread is waiting to receive a message when a message arrives at an empty queue and the Priority Scheduling option is supported, then the **thread of highest priority that has been waiting the longest** will be selected to receive the message.” (Source: [FreeBSD 16.0-CURRENT man page](#))

Internally, FreeBSD **does not maintain an explicit waiting thread queue**; instead, it uses a simple counter (`mq_receivers`) and relies on the kernel scheduler to select the appropriate thread when a message arrives. This design naturally yields the POSIX-mandated behavior.

Linux:

Linux|md_0_8217|s implementation is more complex and **does not fully comply with the POSIX requirement**.

The waiting queue (`struct ext_wait_queue`) is a **linked list, but threads are inserted in priority order** (higher priority first). The insertion code (`wq_add` in `ipc/mqueue.c`) traverses the list and places a new thread **before the first thread with lower or equal priority**.

As a result, the list is sorted by descending priority, so when a message arrives, the **highest-priority thread** (the first in the list) is woken.

However, **within the same priority level, the insertion order is LIFO** (later waiters are placed ahead of earlier ones), so it does **not** guarantee that the longest-waiting thread is chosen.

This suggests that both FreeBSD and Linux prioritize threads by priority (Linux even within same priority uses LIFO rather than FIFO), aligning with the POSIX requirement to wake the highest priority thread. Linux's LIFO behavior for equal priorities may be a performance optimization but deviates from "longest waiting" part.

Given these examples, I think RTEMS's current FIFO behavior for waiting threads is a deviation, and our proposal to add a priority-based discipline (either globally or per-queue via ```mq_attr```) would bring us closer to what other systems implement and what POSIX intends.

I'd appreciate any further thoughts on this.

Author: Joel Sherrill 2026-02-20T19:10:56.521Z

Your survey looks good. I would say Linux is not compliant since it is using LIFO. And unfortunately, POSIX gives us the "if you support the `__POSIX_PRIORITY_SCHEDULING` **option**" then the blocking discipline for all message queues changes. This is a system implementation decision so there really is not portability. You cannot control what behavior your application is going to get.

I think as a minimum, RTEMS should support a configuration option to toggle between FIFO and priority. If we don't do that much, then existing applications will have a change in behavior that will break backwards compatibility.

Adding a field to `_mq_attr` gives the user fine grained control on each message queue instance.

I think adding an `_mq_is_priority` to out `_mq_attr` structure is a good move. And giving the user a way to define their own default `_mq_attr` instance allows them change each entry in the default structure. It would let them also override maximum message size and maximum pending messages. It would take adding to `confdefs.h` a macro default for each field in the structure and another to turn on using them. The current default attributes could be a weak symbol that is overridden.

I think this solution may also be needed for POSIX semaphores. They have the same language for the `__POSIX_PRIORITY_SCHEDULING` option

1.5.1.5 3824 - SMP for Ultrascale+ in ARMv7/AArch32 mode via JTAG (opened)

Original author: maxp60

Hi, i have successfully kicked the second APU on ultrascale+ ZCU102, but both processors are looping inside the function `Per_CPU_State_wait_for_non_initial_state()`. I think something is missing in the configuration/initialization. has the SMP code been tested in A53 running AArch32 state (i.e. the Zynq U+ from xilinx) ?

- [Capture.PNG](#)

Author: Trac Migrate 2019-11-22T15:02:37.000Z

Original author: maxp60

In case both processors loop in this function, then this is probably a problem with the cache, MMU, or memory controller setup. Which state to the processor see and which state do they expect?

Author: Trac Migrate 2019-11-22T21:39:24.000Z

Original author: maxp60

I must include some other infos. The system is initialized through the debugger (JTAG mode) , APU0 load the [fsbl@aarch32](#), load the programmable logic and then is brokened @ `fsbl_loop()`. Then the debugger stores the following instruction into OCM: (AR# 46911) `0xFFFFFFFF00: mvn r0, #15` `0xFFFFFFFF04: mov r1 0xFFFFFFFF08: str r1, [r0]` `0xFFFFFFFF0C: wfe` `0xFFFFFFFF10: ldr r2, [r0]` `0xFFFFFFFF14: cmp r2, r1` `0xFFFFFFFF18: beq 0xc` `0xFFFFFFFF1C: mov pc`

then the debugger loads the smp examples to ram, and start both the processor. APU0 start the second processor and wait inside the function `Per_CPU_State_wait_for_non_initial_state()`. APU1 start executing the `_start` normally and the stalls into the function `Per_CPU_State_wait_for_non_initial_state()`. i can upload the lauterbach trace if necessary -M

It appears that `bsp_start_clear_bss()` execution of APU1 clears the `_Per_CPU_Information` of both processors. disabling - but only for testing purpose - `_bsp_start_clear_bss()` doesn't solve the issue. Is there something missing of SMP in general? thanks

I would recommend moving to the AArch64 BSP for this hardware. If you need to run with the existing ARMv7 ABI, the AArch64 ILP32 ABI variants are currently available in RTEMS 6 releases and will be available in RTEMS 7, although deprecated.

1.5.1.6 4003 - Zynq-7000 BSP: Support using OCM as cacheable memory (opened)

Original author: jbrandmeyer-piq

Background: During normal startup, the ROM bootloader performs vendor-specific initialization of core 1, and then sits in a wait-for-event loop until a special value has been written to a specific address in OCM. In that state, the MMU has not yet been initialized and core 1 is treating OCM as Device memory.

By the time the RTEMS boot gets to `_CPU_SMP_Start_processor`, core 0's MMU has already been initialized with the application-defined memory map. I'd like to use the on-chip memory as inner cacheable memory in my application. In order to ensure that the kick address write actually becomes visible to core 1, a cache line flush of the affected line is necessary prior to sending the event that wakes up the other core.

I also added an invalidation prior to the kick-address write out of an abundance of caution. it shouldn't be necessary, but I had a hard time proving it definitively.

There are a plethora of cache maintenance functions available for the job in RTEMS. I picked an inline helper that operates directly on CP15. The code's commentary suggests that the L2 hasn't been initialized yet, and the higher-level `rtems_cache*_multiple_data_lines` API affects both L1D and L2. Also, I'm using inner-cacheable/outer-shareable memory attributes for OCM specifically because of where it sits in the SOC's busswork, so it turns out that we *never* need to flush L2 for that memory anyway.

This patch also works with the default memory map, which defines upper OCM as Device memory. It is harmless to perform a flush by modified virtual address to memory which is marked as Device memory.

Does RTEMS on Zynq7000 rely on TF-A/ATF to provide runtime services? This type of code would likely be resident in OCM if that is the case which would make at least part of OCM unusable for this purpose.

1.5.1.7 4443 - powerpc/motorola_powerpc BSPs build bootloader with -msoft-float (opened)

Original author: anj

While working on the EPICS port to RTEMS-5 and trying to link an EPICS test application into a bootable binary for the mvme2100 BSP built with RTEMS-5.1, I get this error:

```

1 /usr/local/rtems-5.1/bin/powerpc-rtems5-ld: libComTestHarness uses hard float, /
   ↳usr/local/rtems-5.1/powerpc-rtems5/mvme2100/lib/bootloader.o uses soft float
2 /usr/local/rtems-5.1/bin/powerpc-rtems5-ld: failed to merge target specific data_
   ↳of file libComTestHarness

```

The libComTestHarness is the EPICS test application. I get the same error with the mvme2307 BSP, which is part of the same powerpc/motorola_powerpc BSP family as the mvme2100.

After investigation I found that a recent version of binutils has made linking soft-float code with hard-float an error instead of just emitting a warning, which may be why this problem hasn't come up before. I don't see that warning when I build for the mvme2100 with RTEMS-4.9.2 but the warning message may have been added more recently than the version of binutils used for that release.

This is coming from the AM_CFLAGS definition in c/src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am which includes the flag -msoft-float whereas all of the motorola_powerpc boards have an FPU as far as I know (none of the BSP config/*.cfg files provide that flag). Thus I first tried removing just that flag:

```

1 diff --git a/c/src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am b/c/
  ↪src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am
2 index 42b70544e6..1b4b95b14c 100644
3 --- a/c/src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am
4 +++ b/c/src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am
5 @@ -21,7 +21,7 @@ bootloader_SOURCES += ../../../../../../bsps/powerpc/
  ↪motorola_powerpc/bootloa
6 # Remove references to EABI when compiling bootloader
7 BOOTLOADER_CPU_CFLAGS=$(subst -msdata=eabi,, $(subst -meabi,, $(CPU_CFLAGS)))
8 AM_CPPFLAGS = -D__BOOT__ @RTEMS_CPPFLAGS@ @RTEMS_BSP_CPPFLAGS@
9 -AM_CFLAGS = -mrelocatable -msoft-float \
10 +AM_CFLAGS = -mrelocatable \
11 -mstrict-align -fno-builtin -Wall -mmultiple -mstring -O2 \
12 -fomit-frame-pointer -ffixed-r13 -mno-sdata $(BOOTLOADER_CPU_CFLAGS)
13 AM_CCASFLAGS = $(AM_CPPFLAGS) \

```

However that doesn't seem to be enough, the result gives this application build error instead:

```

1 /usr/local/rtems-5.1/bin/powerpc-rtems5-objcopy -O binary -R .comment -S_
  ↪libComTestHarness rtems
2 gzip -f9 rtems
3 /usr/local/rtems-5.1/bin/powerpc-rtems5-ld -o libComTestHarness.boot /usr/local/
  ↪rtems-5.1/powerpc-rtems5/mvme2100/lib/bootloader.o --just-
  ↪symbols=libComTestHarness -b binary rtems.gz -T /usr/local/rtems-5.1/powerpc-
  ↪rtems5/mvme2100/lib/ppcboot.lds -Map libComTestHarness.map
4 /usr/local/rtems-5.1/bin/powerpc-rtems5-ld: libComTestHarness: compiled normally_
  ↪and linked with modules compiled with -mrelocatable
5 /usr/local/rtems-5.1/bin/powerpc-rtems5-ld: failed to merge target specific data_
  ↪of file libComTestHarness

```

I don't have a good feel for exactly what the `-mrelocatable` flag is doing, but the documentation implied something like it is probably needed in this case. It also showed a similar but apparently more liberal `-mrelocatable-lib` flag. On applying this change and rebuilding the BSP I was able to get my EPICS build to succeed:

```

1 diff --git a/c/src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am b/c/
  ↪src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am

```

I don't have a VME chassis or an MVME2100 board at home with me to test with, but I hope to be able to check if the result boots and works properly once I get back into the office (which might be a few weeks though). I'm filing this ticket now to see if anyone else has come across or already solved this problem, and to see if the solution looks reasonable to those with more experience.

Any comments?

Author: Trac Migrate 2021-06-21T00:52:05.000Z

Original author: anj

Felix Kraemer from Gemini found a linker flag `--no-warn-mismatch` which seems to permit applications to be built against an unmodified BSP without getting the error, but that probably isn't the best solution in the long run. I have added that flag to the EPICS build system for the mvme2100 and mvme2700 (AKA mvme2307) BSPs since we have a release coming up, but I plan to work on a better fix to the RTEMS BSP bootloader files once I have access to my VME systems again.

Author: Chris Johns 2025-09-19T01:45:45.953Z

changed the description

Author: Andrew Johnson 2026-01-19T20:29:55.739Z

Original author here (anj on the old RTEMS trac), the previous comment looks like a summary (AI-written?) of the problem that I reported during the COVID-19 pandemic when we were forced to work from home.

As reported in the first comment above the EPICS build system now adds the `--no-warn-mismatch` linker flag to both mvme2100 and mvme2700 target builds, which is sufficient as a workaround for those boards. We're not looking for a further solution for this on RTEMS-5; if a better fix is developed for a future release (6.x or 7) I'd be happy to remove that linker flag though.

1.5.1.8 3053 - Change RTEMS License to Two Paragraph BSD (opened)

Id	3053
State	opened
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3053
Merges	0

RTEMS has long used the GPL v2 with an exception that eliminated the viral nature of the license. There has been discussion amongst the core developers and primary submitters about switching to the “Two Paragraph BSD” license. The consensus was that it was time to change. One reason was that the RTEMS license was modeled on a license no longer used by GCC language run-times. Another was that the “Two Paragraph BSD” license is easier to explain and understand. But the major reason was that the RTEMS Project has never imposed any license conformance burden on end user projects. The BSD license family is much clearer about that intent.

An announcement was made at the December 2015 Flight Software Workshop (http://flightsoftware.jhuapl.edu/files/_site/workshops/2015/). The slides and video are available for that presentation. No specific date was given but the core developer consensus was that we needed to focus on the 4.11 branch and, subsequently, the 4.12 release branches being made. With the 4.12 branch imminent, it is now time to ensure there is a ticket to track this effort and work through the relicensing as quickly and accurately as possible.

The relicensing effort will involve multiple activities:

- update web content to include and recommend Two Paragraph BSD license
- update coding conventions to recommend Two Paragraph BSD license
- identify contributors for each file
- some work has been done on this
- obtain permission from contributors to relicense
- update files with new license
- generate reports on licenses associated with a particular build of RTEMS

The content on relicensing from the Flight Software Workshop presentation is captured here.

Original rationale for GPL v2 + exception * felt needed to establish a community * “stick” to encourage submissions * license was used by GCC language run-times

Rationale to switch * RTEMS has a strong community * users understand business value of submitting * we have explained the “carrot” * GPL v3 has soured some on GPL in general

Mechanics of Switching * Permission from each submitter must be obtained * permission obtained from top contributors * All contributors to a file must give permission before that file can

be relicensed * Web form with confirmation email to grant permission to relicense * Effort will be made to locate the “missing”

When Permission is Not Obtained * Some files may never be relicensed * If users fund, replacement may be written * Older BSPs and ports may be obsoleted and removed on technical grounds * These are the most likely to contain files to have contributors that are hard to find

Generation of License Report * We are considering marking files with Linux Foundation sponsored [<https://SPDX.org>] annotation * Standard annotation for open source licenses _ Examples: NASA-1.3, GPL-2.0 * Can annotate exceptions like current RTEMS license * Example: GPL-2.0-with-linking-exception * Tools exist to generate overall license reports * RTEMS would have to integrate one with build system

In [changeset:"6e82e9e89ec2f0863013512b50f6a1cf8a0f58d3/rtems" 6e82e9e8/rtems]:

```
1 libcsupport: Consistent rtems_putc() output
2
3 Use the same function to output the '\\r\\n' combination produced by
4 rtems_putc(). Fix the format.
5
6 Change licence according to file history.
7
8 Update #3053.
```

Author: Trac Migrate 2021-09-06T10:20:59.000Z

In [changeset:"fbd0a3cec3096d8fe283c3ff05ebb5c0aafc95d9/rtems" fbd0a3ce/rtems]:

```
1 score: Move _Thread_Dispatch()
2
3 The _Thread_Dispatch() function was customized over time and now the
4 work is done by _Thread_Do_dispatch() and specialized wrappers. The
5 plain _Thread_Dispatch() is now only used in some CPU ports. Move it to
6 a separate file to avoid dead code in the general.
7
8 Change license to BSD-2-Clause according to file history and
9 re-licensing agreement.
10
11 Update #3053.
```

Author: Trac Migrate 2021-09-06T10:26:01.000Z

In [changeset:"f958d58a6a98cbc111c4e3eb58a4170ce725a915/rtems" f958d58/rtems]:

```
1 score: Split up rbtreenext.c
2
3 Split up rbtreenext.c since only _RBTREE_Minimum() is used by the
4 ↪ operating
5 system core services (thread queues and the EDF scheduler).
6
7 Change license to BSD-2-Clause according to file history and re-
8 ↪ licensing
9 agreement.
10
11 Update #3053.
```

Author: Trac Migrate 2021-09-21T08:25:42.000Z

In [changeset:"0036ddf1f6263c3d352645f4d3a9afe4ba388bb2/rtems" 0036ddf/rtems]:

```

1 score: Provide two thread pin/unpin defaults
2
3 The uniprocessor schedulers do not support systems with more than more
4 processors. So they rivially support thread pinning and thus the
5 SMP_FATAL_SCHEDULER_PIN_OR_UNPIN_NOT_SUPPORTED cannot happen.
6
7 Add a second default implementation for SMP schedulers which do not
8 support thread pinning.
9
10 Change license to BSD-2-Clause according to file history and re-
11 ↪licensing
12 agreement.
13 Update #3053.
```

```

1 wkspc.c: Change license to BSD-2-Clause
2
3 Change licence according to file history.
4
5 Update #3053.
```

Author: Trac Migrate 2021-11-30T08:32:20.000Z

In [changeset:"d7205f0083f8fdd0408404ce99c6eab9b8d120c7/rtems" d7205f0/rtems]:

```

1 libc: Optimize malloc() initialization
2
3 The BSPs provide memory for the separate C Program Heap initialization
4 via _Memory_Get(). Most BSPs provide exactly one memory area. Only two
5 BSPs provide more than one memory area (arm/altera-cyclone-v and
6 bsp/powerpc/mpc55xxevb). Only if more than one memory area is
7 provided, there is a need to use _Heap_Extend(). Provide two
8 implementations to initialize the separate C Program Heap and let the
9 BSP select one of the implementations based on the number of provided
10 memory areas. This gets rid of a dependency on _Heap_Extend(). It
11 also avoids dead code sections for most BSPs.
```

```
1 cpukit/libmisc/monitor/: Manually change to BSD-2 license
2
3 This code did not have any copyrights or licenses and a bit
4 of archeology was needed to determine authorship.
5
6 This code was in the initial import into the RTEMS CVS repository when
7 it was established in May 1995. There was very little, if any, code not
8 written by OAR Corporation in that initial import. After discussion
9 with Chris Johns, it was determined that this code was from OAR
10 Corporation and that he had added a few features later. Both
11 Chris Johns and OAR Corporation have given permission to relicense.
12
13 Updates #3053.
```

Author: Trac Migrate 2022-03-25T21:45:57.000Z

Ric Claus' permission grant did not show up when I searched earlier. Adding the email he forwarded which clearly indicates he gave permission in 2022 before the conversion to GitLab.

The new Termios device API is documented here:

<https://docs.rtems.org/branches/master/bsp-howto/console.html>

Legacy drivers can be found via the `rtems_termios_open()` function.

Original author: SergKruglov

After patch “libdl: Add C++ exception support to loaded modules.” (ticket 2767 Chris Johns <chrisj@rtems.org> 2016-12-13 22:07:16 (UTC)) in function `rtems_rtl_obj_add_section` sections with size == 0 not added to sections list for relocate. In function `rtems_rtl_rap_relocate` for this sections generate error “no target section found”. The introduction of the condition “size > 0” in `rtems_rtl_obj_add_section` was a mistake. I use rap files and plain C (.ctor and .dctor have size == 0).

The size > 0 in `rtems_rtl_obj_add_section` is correct and will not be reverted. An empty section serves no purpose other than using memory.

If the code is built with separate text and data section then this is a separate issue.

Per <http://pubs.opengroup.org/onlinepubs/009695399/functions/sigaction.html>, the sa_flags field can have the following values which imply behavior in the POSIX implementation:

- SA_NOCLDSTOP - requires processes, unportable
- SA_ONSTACK - requires unsupported sigaltstack, currently unportable
- SA_RESTART - should be supportable
- SA_SIGINFO - should be supportable
- SA_NOCLDWAIT - requires processes, unportable
- SA_NODEFER - should be supportable

The purpose of this ticket is to review that the supportable sa_flags behaviors are supported or to implement the missing capabilities.

Coverity spots an out of bounds read in rtl-mdreloc-sparc.c. Given the comment at the top that it was “Taken from NetBSD and stripped of the relocations not needed on RTEMS”, I am unsure how to correlate the code back to the original to see if the issue exists upstream. Also I do not know where in the NetBSD source this came from.

The first issue is: <https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=109360252&defectInstanceId=30967451&mergedDefectId=1255330>

The long analysis ends with:

226

CID 1255330 (#1 of 1): Out-of-bounds read (OVERRUN) 14. overrun-local: Overrunning array reloc_target_bitmask of 24 4-byte elements at element index 45 (byte offset 180) using index type (which evaluates to 45). 227 mask = RELOC_VALUE_BITMASK (type); 228 value >>= RELOC_VALUE_RIGHTSHIFT (type); 229 value &= mask;

The others are:

- **Summary** changed from *Out of Bounds Access in rtd-mdreloc-sparc.c* to *Coverity Reports Multiple Out of Bounds Accesses in rtd-mdreloc-sparc.c*

Author: Chris Johns 2017-03-14T23:15:59.000Z

Replying to [Joel Sherrill](#):

Coverity spots an out of bounds read in `rtl-mdreloc-sparc.c`. Given the comment at the top that it was “Taken from NetBSD and stripped of the relocations not needed on RTEMS”, I am unsure how to correlate the code back to the original to see if the issue exists upstream. Also I do not know where in the NetBSD source this came from.

The code was taken into RTEMS and working with the upstream is only as a reference. The code in NetBSD is under:

http://cvsweb.netbsd.org/bsdweb.cgi/src/libexec/ld.elf_so/?only_with_tag=MAIN

and the SPARC code is:

http://cvsweb.netbsd.org/bsdweb.cgi/src/libexec/ld.elf_so/arch/sparc/?only_with_tag=MAIN

The first issue is: <https://scan5.coverity.com/reports.htm#>

[v29808/p10069/fileInstanceId=109360252&defectInstanceId=30967451&mergedDefectId=1255330](https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=109360252&defectInstanceId=30967451&mergedDefectId=1255330)

This link is redirects me to a login page and my login for Coverity did not work. I had no idea it did not work and I never received anything from them it was being disabled.

Should we have links to login pages in open tickets like this?

The long analysis ends with: 226 CID 1255330 (#1 of 1): Out-of-bounds read (OVERRUN) 14. overrun-local: Overrunning array reloc_target_bitmask of 24 4-byte elements at element index 45 (byte offset 180) using index type (which evaluates to 45).

Where does the 45 come from?

```
227 mask = RELOC_VALUE_BITMASK (type); 228
value >>= RELOC_VALUE_RIGHTSHIFT (type);
229 value &= mask; The others are: https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=109360252&defectInstanceId=30967452&mergedDefectId=1255332
https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=109360252&defectInstanceId=30967450&mergedDefectId=1255342
```

Sorry I cannot see these.

Author: Gedare Bloom 2017-03-15T14:56:54.000Z

These links don't work for me even if I am logged in, so they are of minimal utility. I had to use the CID number to pull up the report.

Joel did not paste enough of Coverity's history to understand the context. You have to go back a step to see:

6. cond_between: Checking type > 45UL implies that type is between 1 and 45 (inclusive) on the false branch. 176 if (type > R_TYPE(6))

Author: Joel Sherrill 2017-03-15T17:08:19.000Z

We will have to figure out how to make the links useful.

My hunch is that since the code is modified from the original that some logic from the original is missing which leads to the three issues spotted.

Author: Chris Johns 2017-03-15T21:48:00.000Z

Thank you for looking into the coverity links, having public view-able report data would be nice.

I will add the ticket to my list of things to look into.

The upstream code can contain functionality not needed on RTEMS and this effects the ability to handle the source as is. I used the NetBSD code as a base of what we need because it had suitable code and NetBSD has a wide range of architectures. Add to this newer tool sets have presented us with newer reloc types and some differences. For example this file was recently updated to handle the unwinding support and here RTEMS and NetBSD build gcc differently which effects the type of relocation records we see. I felt it was not worth the effort attempting to keep the code in sync with the upstream.

Original author: sebastian.huber

The sphinx documentation framework provides so called C/C++ domains for C/C++ API documentation:

<http://www.sphinx-doc.org/en/stable/domains.html#c-roles>

This feature is not used in the RTEMS documentation. Should it be used? Do we need a custom domain for the API documentation?

The PDF output of the C/C++ domain constructs is quite bad.

Author: Joel Sherrill 2017-02-01T14:26:46.000Z

Original author: sebastian.huber

I recall Chris and I tried to get this working but failed. Perhaps more is correct now and it will work. Give it a try. Using Sphinx is a learning experience for us all.

Author: Trac Migrate 2017-02-01T14:28:14.000Z

Original author: sebastian.huber

I used the C domain for the self-contained objects chapter. The HTML output looks ok, but the PDF output is not really good. I will ask on the sphinx group.

Author: Chris Johns 2017-02-01T23:48:26.000Z

Original author: sebastian.huber

I also found this and backed away from this path as I did have the time to invest becoming a sphinx master.

Original author: Christian Mauderer

I tried to build a toolchain using an older version of the RTEMS Source Builder (to be exact: [cac72a2aea7](#) from 2016-08-01). This failed due to the fact that the gcc snapshot that should be build isn't longer available:

<ftp://gcc.gnu.org/pub/gcc/snapshots/6-20160609/gcc-6-20160609.tar.bz2>

It seems that there are about 6 months of snapshots available but older ones have been deleted. That can be really annoying if you try to rebuild the tools for a specific RTEMS version.

It might would be a good idea if we would copy all sources that are used in RSB to an RTEMS ftp server and download them from there. This is also true for release versions of the sources. We have no control over the files on a foreign server. Therefore the sources could vanish at any time.

Author: Trac Migrate 2017-01-30T07:22:07.000Z

Original author: Christian Mauderer

One option would be to add all files to the RTEMS server and download them from here. Another option would be to add them to the RTEMS tools repository (this enables Github as a backup source).

Author: Chris Johns 2017-01-31T05:49:22.000Z

Original author: Christian Mauderer

The ftp server is the best available solution. Please avoid github, they have changed APIs over the years which is fair enough however this breaks the config as well.

Should there be README files at all?

What should they contain?

How should they be formatted?

What is the relationship to the Wiki BSP pages: [wiki:TBR/Website/Board_Support_Packages](http://wiki.tbr/Website/Board_Support_Packages)?

Author: Chris Johns 2016-12-21T23:24:33.000Z

Original author: sebastian.huber

I think grouping all READMEs together does not work, it forces a lowest common denominator. We should consider each type separately. I see:

1. BSP
2. Testsuite
3. 3rd Party packages
4. RTEMS kernel, ie the top level, c/src etc.

I think important information about a BSP needs to be captured in `rtems-docs.git`. The documentation on a BSP forms an interface a user of the BSP can rely on and we need to make sure it is stable across releases. We also need to make changes clear to users with specifics on how to migrate.

The wiki can contain transient and less formal documentation, for example how to use a specific debugger.

I do not know about these.

If a copy of the original package, leave.

No idea. I suspect they will not be needed in a waf build system.

TRB in the wiki means “To Be Reviewed” or “To Be Removed” depending on how you want to look at the pages. I feel the wiki needs be cleaned up, containing only relevant pages to be seriously considered a suitable place to add important documentation. Adding to the current pages means you need to know the history and importance to know how valid the pages are.

Original author: sebastian.huber

Cilk Plus is a C++ language extension developed by Intel. It is proposed as a C++ standard extension. It uses a work stealing scheduler. Similar to OpenMP it consists of two parts,

- the code generation by the compiler, and
- a run-time library.

The code generation works for the RTEMS using a recent GCC. It is feasible to port the run-time library (libcilkrt) to RTEMS. However, some issues must be dealt with.

- Currently virtual memory via `mmap()` is used to manage the worker stacks (cactus-stack).
- This could be changed to use a pool allocator.
- What happens in case of stack overflows, e.g. no protection pages?

Original author: sebastian.huber

The IMFS offers the ability to register generic nodes for device drivers. This feature is not available in the devfs. The devfs offers little benefit compared to a stripped down IMFS configuration.

Author: Joel Sherrill 2016-09-19T14:42:54.000Z

Original author: sebastian.huber

The devfs was added for at least two purposes. Just saying it doesn't support a particular feature isn't enough to obsolete it. You need to do a lot better job at justifying this change.

The devfs was added for at least two purposes:

- to have a smaller footprint filesystem that supported only device nodes. Otherwise, no console or other device access was possible.
- to have a much simpler root filesystem that was an alternative for systems which had completely disabled all filesystem support prior to this point.

If the mini-IMFS has shrunk to the point where there is little difference, then the first point is addressed. But you didn't provide data.

The complexity of the mini-IMFS in a system that only wants devices is a topic that hasn't even been touched on and will require some analysis.

Author: Trac Migrate 2016-09-20T05:38:07.000Z

Original author: sebastian.huber

The devfs has some design flaws.

- It uses a link-time configured fixed-size table to store the devices.
- It uses the standard RTEMS drivers.

The standard RTEMS drivers have some design flaws

- They use a link-time configured fixed-size table. A const array of handlers is copied into one of the table entries via `rtems_io_register_driver()`, e.g. size is doubled.
- They are not able to fully support the handlers available via the filesystem layer (`rtems_filesystem_file_handlers_r`), e.g. no `kqueue()`, `fsync()`.
- There is a considerable layering before you reach the device handler with a parameter pack/unpack, e.g.

The arm/xilinx_zynq_zedboard does not boot with a recent u-boot built from git (b2f1858455e99a91aeafe59ac73c6c047106d5e8). I have tracked the issue down to the MMU initialization and I am wondering if there are a few issues we need to look at closer. I think RTEMS could handle this case a little better and this would improve the ARM support making it more resilient to how it is run.

I have the code booting and running and these are the changes.

1. In `arm_cp15_start_setup_translation_table` in `arm-cp15-start.h` I moved the `arm_cp15_set_translation_table_base` to after the table is created. While this is not that important I did find when looking into this problem it improved things when I had a call to `arm_cp15_data_cache_clean_all_levels()` before setting the table base. I am not sure the cache clear is needed.
2. In the `zynq_setup_mmu_and_cache` I detect the MMU being enabled and if enabled I:

```

1 uint32_t ctrl = arm_cp15_get_control();
2
3 if ((ctrl & ARM_CP15_CTRL_M) != 0) {
4   arm_cp15_data_cache_clean_all_levels();
5   ctrl &= ~(ARM_CP15_CTRL_C | ARM_CP15_CTRL_I | ARM_CP15_CTRL_M);
6   arm_cp15_set_control(ctrl);
7   arm_cp15_tlb_invalidate();
8 }

```

This lets ticker run.

Original author: soja

I started to work with the SPI of the raspberry pi and noticed several problems with the current driver after recording the frames with a logic analyzer:

- Setting the chip select signal using the CSPOL-bits of the control register creates incorrect chip select signals
- After every byte written to the TX FIFO buffer the driver waits for a signal from an interrupt. This creates very long pauses between consecutive bytes.
- The lsb-first mode does not look as if it would work
- 3-wire/bidirectional mode might not work
- Accessing the driver from a different thread than the one which called `spi_init` will cause a deadlock
- Simultaneous read-write-operation is not supported

I will submit a patchset for this after some testing.

The function `_rtems_octal2ulong` provided in `cpukit/libmisc/untar/untar.c` is used internally in this file plus it is used in the IMFS load tar implementation.

These are separate implementations and this small piece of code joins these modules together. Sure, function level linking helps but I do not think we should share this code

Why not use `'strtoul(str, &end, 8)'` to convert the octal number?

Original author: Christian Mauderer

It seems that there is no thread save possibility to convert a struct tm that holds a UTC time into a time_t (the inverse of the POSIX gmtime() function). mktime does this for the current locale only.

Linux and BSD provide a non-POSIX-function called timegm() (see <http://linux.die.net/man/3/timegm>). According to the man page, the use of this functions should be avoided. The linked man page provides a solution that only uses POSIX functions. But that solution is not thread save.

We should think about adding timegm() to newlib for compatibility with applications that use it (e.g. the civetweb web server).

Author: Gedare Bloom 2016-04-19T16:06:53.000Z

Original author: Christian Mauderer

Should be sent to newlib mailing list, but I think this is probably the right thing to do.

Author: Trac Migrate 2016-04-20T14:00:11.000Z

Original author: Christian Mauderer

I currently didn't sent it to the newlib mailinglist because my time budget doesn't allow that I start to work on it at the moment. I hope that I'm able to implement it sometimes in the future.

Author: Joel Sherrill 2016-04-20T17:37:54.000Z

Original author: Christian Mauderer

I only found this method in the crypto library in FreeBSD:

<https://github.com/freebsd/freebsd/blob/master/crypto/heimdal/lib/asn1/timemgm.c>

Is it anywhere else in FreeBSD?

I am not opposed to pursuing it being added to newlib.

Author: Trac Migrate 2016-04-21T05:22:53.000Z

Original author: Christian Mauderer

It seems that the solution in the crypto library is a simplified one that does not care for leap seconds or similar. To be honest, I had not found this one. But I found three others in freebsd:

- A comprehensive implementation can be found in the tzcode area:

<https://github.com/freebsd/freebsd/blob/master/contrib/tzcode/stdtime/localtime.c> This implementation uses the same functions for mktime and timegm.

- Another implementation in ldns uses the solution from the man page. But that is not thread save:

<https://github.com/freebsd/freebsd/blob/master/contrib/ldns/compat/timegm.c>

- A third implementation is in the ntp area:

<https://github.com/freebsd/freebsd/blob/master/contrib/ntp/libntp/mktime.c>

As far as I can see, the one from tzcode is the one that handles the most details. It might would make sense to use this implementation for mktime as well as timegm

Merges	0

This ticket is a note that rtbf64a which is running Fedora 22 gave a warning that yum is being replaced with a tool named dnf (do not find?). The RSB doc will have to be updated to have the development environment install command once we figure out what that is.

This applies to all versions of the RSB docs.

Author: Joel Sherrill 2016-03-19T20:17:16.000Z

This article sheds more light.

<https://www.linux.com/learn/tutorials/838176-what-you-need-to-know-about-fedoras-switch-from-yum-to-dnf>

From our perspective a minor documentation issue. But it does make you wonder about stable interfaces. Do we do this to our users? Wipe out over a decade of sysadmin experience with an interface?

Author: Chris Johns 2016-03-19T20:34:44.000Z

- **Milestone** changed from %"4.11" to %"4.12"
- **Version** changed from ~"4.10" to ~"4.12"

The RSB is python 2 and 3 clean. I am pleased I did that change.

I have moved this ticket to 4.12. Any doco changes can be back ported when ready.

Author: Joel Sherrill 2016-03-20T16:27:38.000Z

Looks like for installation purposes "dnf install" works just like "yum install". Based on the article I linked above, there are differences but the most common use case appears to be the same.

So this should be nothing more than adding a sentence like the following to the Fedora specific section:

NOTE: In Fedora 22 and above, the yum command has been deprecated in favor of the dnf command. Use "dnf install ..." rather than "yum install ..."

And at some point in the future, we will have to address the CentOS/RHEL section and when they obsolete a yum wrapper, we will have to flip from yum first with a note to dnf first with a note for older Fedora systems. CentOS/RHEL will have to treat versions with yum as equals to versions with dnf due to the longevity.

Or we could just start now, and say ... On Fedora 22 and above, do this... and on Fedora 21 and below do this... Later copy that pattern to CentOS/RHEL if version 8 uses dnf.

1.5.1.36 2665 - Convert _TOD_To_seconds to use mktime? (opened)

Id	2665
State	opened
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2016-03-18T20:34:17.000Z
Updated	2025-09-19T01:46:10.919Z
Milestone	5.4
Labels	old-indefinite, priority::normal, rtems::score, tickettype::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2665
Merges	0

Our implementation of _TOD_To_seconds uses our own math. Given that this should be doing the equivalent of the POSIX method mktime(), I believe we should switch to that as the implementation of this method. At a minimum, this would ensure the implementation is correct. Worst case, it deletes some code which is hard to be sure it is 100% correct from our code base.

Author: Chris Johns 2016-03-19T02:14:30.000Z

I changed rtems_clock_get_tod away from newlib a couple of years ago because of the 2038 bug and improved the implementation to not contain loops. I think performance is important in these calls.

Does the RTEMS call need to deal with timezones and the overhead it creates?

Author: Joel Sherrill 2016-03-19T15:02:52.000Z

No on timezones. This is strictly convert the time of day structure into a `time_t`. If you are happy with the implementation, then I am also. This was just a question from coming across this method while teaching the class and wondering.

I do think it needs to be a public method named something like `rtems_clock_tod_to_seconds()` or `rtems_clock_tod_to_time_t()`. It is used by the shared RTC driver by the private name.

Author: Chris Johns 2016-03-19T19:13:29.000Z

Replying to [joel.sherrill](#):

No on timezones.

I think POSIX handles this so this would be a performance and size thing.

This is strictly convert the time of day structure into a `time_t`. If you are happy with the implementation, then I am also. This was just a question from coming across this method while teaching the class and wondering.

I would need to take a close look. I have not done this.

I do think it needs to be a public method named something like `rtems_clock_tod_to_seconds()` or `rtems_clock_tod_to_time_t()`. It is used by the shared RTC driver by the private name.

Good idea.

Author: Trac Migrate 2016-03-21T07:33:10.000Z

We should first clearly define the time of day in RTEMS, see also [#2189](#). There are reasons, why for example this code is a bit more complicated (e.g. leap seconds):

<https://svnweb.freebsd.org/base/head/contrib/tzcode/stdtime/localtime.c?revision=289027&view=markup>

Author: Joel Sherrill 2016-03-21T14:40:36.000Z

The original specifications RTEMS is based upon are here:

<https://ftp.rtems.org/pub/rtems/people/joel/RTEID-ORKID/>

to the best of my recollection, there is no mention of epoch, timezones, leap seconds, or leap years. The epoch of 1988 was chosen since it was the leap year immediately prior to the inception of RTEMS as a project.

At one point, the computation from `tod` to `time_t` did look like the reference in [#2189](#).

I’m not trying to be argumentative but at this point, the score time is POSIX time and the tod returned is an alternative representation of that with the limitation that you can’t set the time prior to 1988 via the Classic API.

Timezone is via the C Library and leap seconds would be the responsibility of ntp or other time syncing services.

This ticket is simply that this conversion doesn’t look like a standard algorithm. The ticket you reference is asking to document the relationships of various time representations/APIs.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2635
Merges	0

The new libbsp/shared/pci/pci_find_device.c is based upon the pcifinddevice.c from PowerPC and MIPS BSPs. There were multiple copies of the same code across multiple BSPs. This ticket is the clean up required to remove the last user of a copy and then have only one copy.

It renamed BSP_pciScan() to pci_scan() and made it a static routine. This method should be made public in the shared implementation, uses of BSP_pciScan() modified to use pci_scan(), and the impacted BSPs’ Makefile.am modified to use the shared pci_find_device.c.

BSP_pciScan() is used by some component(s) used by each of the following BSPs:

beatnik motorola_shared mvme3100

This impacts the following BSPs.

```
$ grep -rl BSP_pciScan . ./c/src/lib/libbsp/powerpc/beatnik/pci/motload_fixup.c
./c/src/lib/libbsp/powerpc/beatnik/network/support/bsp_attach.c
./c/src/lib/libbsp/powerpc/mvme3100/pci/detect_host_bridge.c ./c/src/lib/libbsp/powerpc/shared/pci/pci.h
./c/src/lib/libbsp/powerpc/shared/pci/pcfnddevice.c
```

Original author: SergKruglov

If rtems libraries and image build with per-section compilation flags rap files (maybe and other) build with duplicate symbols(objects). Gnu ld with flag -gc-sections remove unnecessary symbols(objects)? but rtems-ld this does. I wrote small sample with 3 projects: a) static lib libtst.a with one file tst.c tst.c

```
1 int abcd=5;
2 void funcA(void)
3 {
4     abcd=7;
5 }
6 void funcB(void)
7 {
8 }
```

b) any rtems project (minimal or any) linked with this lib and in Init call function from lib

```

1 extern void funcA(void);
2 extern int abcd;
3 rtems_task Init(rtems_task_argument argument) {
4   funcA();
5   abcd = 9;
6   rtems_task_delete(RTEMS_SELF);
7 }

```

c) rap file project with core image from b) and library from a) test.c

```

1 extern void funcB(void);
2 void rtems(void)
3 {
4   funcB();
5 }

```

After generate map files with rtems-rap -sSr

Map file without per-section compilation testrap.rap:

```

1 Strings: 0x00000074 (116) size: 14
2 0 (0x000000):
3 1 (0x000001): rtems
4 2 (0x000007): rtems
5 3 (0x00000d):
6 Symbols: 0x00000082 (130) size: 12
7 data section value name
8 0: 0x0012 .text 0x00000000 rtems
9 Relocations: 0x0000008e (142)
10 .text: info offset addend symbol name
11 0: 0x80000504 0x00000008 0x00000000 funcB

```

Map file with per-section compilation testrap.rap:

```

1 Strings: 0x00000090 (144) size: 31
2 0 (0x000000):
3 1 (0x000001): rtems
4 2 (0x000007): funcA
5 3 (0x00000d): abcd
6 4 (0x000012): funcB
7 5 (0x000018): rtems
8 6 (0x00001e):
9 Symbols: 0x000000af (175) size: 48
10 data section value name
11 0: 0x0012 .text 0x00000000 rtems
12 1: 0x0012 .text 0x00000000 funcA
13 2: 0x0011 .data 0x00000000 abcd
14 3: 0x0012 .text 0x00000000 funcB
15 Relocations: 0x000000df (223)
16 .text: info offset addend symbol name
17 0: 0xc0001204 0x00000008 0x00000000

```

(continues on next page)

(continued from previous page)

```

18 1: 0xc0000d05 0x00000024 0x00000000
19 2: 0xc0000d06 0x0000002c 0x00000000

```

If use per-section compilation while insert funcB (from library libtst.a) get full tst.o from library. Objects funcA and abcd duplicate already available in kernel.

I do not know as it to correct and remove excess symbols and objects.

Original author: SergKruglov

for build rap file use switches **-rap-strip** and **-one-file**

Author: Joel Sherrill 2016-02-05T13:42:43.000Z

Original author: SergKruglov

- **Owner** set to @chrisj
- **Status** changed from *new* to *assigned*

Chris... is this documented? Where can the instructions go about per function sections and these arguments?

Seems like the ticket is resolved except making sure no one treads this path again.

Author: Chris Johns 2016-02-16T23:22:37.000Z

Original author: SergKruglov

I wonder why those options are needed. We should really look into this.

There is documentation in the linkers dorectory in rtems-tools.git but this should all be moved into the docs projects.

```

Sebastian commented that the binutils being used was out of date and I noticed that it was picking up the binutils from my previous build. I removed the previous build from my PATH, but got the same issue. I examined the logs and discovered that RSB was adding the installation bin directory to the PATH while executing. I renamed the original \$PREFIX so that it was no longer building into an existing directory and the build ran successfully.

It appears that RSB will not build newlib successfully if it is installing into the same location as a previous build that does not contain compatible tools.

The autotools are installed before the other stuff which is installed in one big chunk. Maybe this sequence should be changed to install each component as soon as possible, e.g. Binutils before GCC.

Author: Chris Johns 2017-10-05T22:13:58.000Z

Original author: williamssimonp

Replying to [Sebastian Huber](#):

The autotools are installed before the other stuff which is installed in one big chunk.

The autotools should be installed to an internally path to be available for the build if required and installed at the end when the build finishes. It is a tricky dependence issue that has been in the RSB from its early days.

Maybe this sequence should be changed to install each component as soon as possible, e.g. Binutils before GCC.

This is dangerous and it should never happen. I will not be supporting any change to do this.

An RSB buildset build must be viewed as a single transaction that must succeed to ensure we are able to say the build installed meets the configuration management requirements. We need to know what we have described in the build is install. If the build fails in any way no part should be installed.

If you are installing over an existing installation you could end up with a hybrid of unknown versions which are not configuration controlled. They may appear to work and subtly fail and that is dangerous or the failures maybe major such as code not building and we would need to field those report and figure out what is wrong and that is an overhead I would not like the project to have.

The RSB provides the `sb-build` command that lets you step down from the build sets to control specific parts. It is more complicated and may not work given some the way the build sets have developed over the last 5 or so years.

In respect to this ticket I wonder if the user's path has the install prefix's `bin` directory in it and this is effecting the packaging being built by referencing the already installed tools.

Ok, now the intention is clear to me, however, the GCC build system adds the prefix to the search paths via:

```
1 -B/${prefix}/${target}/bin/ -B/${prefix}/${target}/lib/ -isystem /$
  ↪ ${prefix}/${target}/include -isystem /${prefix}/${target}/sys-include
```

From my point of view this is a GCC build system bug. I always delete the prefix before I build anything with RSB.

Ok, now the intention is clear to me, however, the GCC build system adds the prefix to the search paths via: `{{{ -B/${prefix}/${target}/bin/ -B/${prefix}/${target}/lib/ -isystem /${prefix}/${target}/include -isystem /${prefix}/${target}/sys-include }}}}` From my point of view this is a GCC build system bug.

Yes, gcc doing this is not helpful.

I always delete the prefix before I build anything with RSB.

I do from time to time but no always and I suppose I do not see any issues because I incrementally bump the tool versions while a jump could have real issues.

This is tricky to resolve within the RSB. For example if the RSB removed the `${PREFIX}` with each build automatically you would not be able to build RTEMS 3rd party libraries with the same prefix you built the tools with because the tools would have been deleted.

Author: Trac Migrate 2018-11-13T06:12:51.000Z

Original author: williamssimonp

Maybe the RSB should warn that there are already tools installed in the prefix and offer an option to remove them.

For example building the latest or1k tool chain failed since I had the previous tools installed in \$prefix. During GCC build the Binutils of \$prefix are used and not the ones which are newly built.

Author: Chris Johns 2018-11-13T06:44:00.000Z

Original author: williamssimonp

Replying to [Sebastian Huber](#):

Maybe the RSB should warn that there are already tools installed in the prefix and offer an option to remove them.

A prefix can be a shared resource used by a number of packages so what are you asking is removed?

The RSB has no concept or knowledge of what the package actually installs so how would it be able to remove these specific parts. This is what distro packaging systems do.

For example building the latest or1k tool chain failed since I had the previous tools installed in \$prefix. During GCC build the Binutils of \$prefix are used and not the ones which are newly built.

All I can suggest is you wrap the RSB in the distro system of your choice and deploy the tools that way if you want to track specific files in packages.

I think the real issue is not this but the build. The RSB build of the RTEMS tools should be looking to use the binutils just built however for some reason gcc must be looking in the \$prefix before the \$PATH and when the \$prefix is empty it uses the binutils in the \$PATH, after all this is what happens when there are no tools installed. Does an option exist in gcc to control this order?

A prefix can be a shared resource used by a number of packages so what are you asking is removed?

What I did is this:

```
find /build/rtems/5/ -name 'or1k' | xargs rm -r
```

Yes, a bit dangerous. Maybe if a find \$prefix -name "\$target" finds something, then we can stop the build. The user has then the choice to remove it on its own or use a `-force-build-with-existing-tools` option.

The RSB has no concept or knowledge of what the package actually installs so how would it be able to remove these specific parts. This is what distro packaging systems do.

For example building the latest or1k tool chain failed since I had the previous tools installed in \$prefix. During GCC build the Binutils of \$prefix are used and not the ones which are newly built.

Does an option exist in gcc to control this order?

I am not sure if this can be fixed by changes in \$PATH. In the GCC build tree there is for example an “as” script which is generated:

```

1 grep -r ORIGINAL_AS_FOR_TARGET
2 gcc/Makefile.in:ORIGINAL_AS_FOR_TARGET = @ORIGINAL_AS_
  ↳FOR_TARGET@
3 gcc/configure.ac:ORIGINAL_AS_FOR_TARGET=$gcc_cv_as
4 gcc/configure.ac:AC_SUBST(ORIGINAL_AS_FOR_TARGET)
5 gcc/configure.ac:case "$ORIGINAL_AS_FOR_TARGET" in
6 gcc/exec-tool.in:ORIGINAL_AS_FOR_TARGET="@ORIGINAL_AS_
  ↳FOR_TARGET@"
7 gcc/exec-tool.in:    original=$ORIGINAL_AS_FOR_TARGET
8 gcc/ChangeLog-2005:    * Makefile.in (stamp-as): Use
  ↳$(ORIGINAL_AS_FOR_TARGET)
9 gcc/ChangeLog-2005:    (ORIGINAL_AS_FOR_TARGET, _
  ↳ORIGINAL_LD_FOR_TARGET,
10 gcc/configure:ORIGINAL_AS_FOR_TARGET
11 gcc/configure:ORIGINAL_AS_FOR_TARGET=$gcc_cv_as
12 gcc/configure:case "$ORIGINAL_AS_FOR_TARGET" in

```

It uses absolute paths found during configure time (I guess).

I have absolutely no confidence in the GCC build system. I am not sure if this will ever work reliably. I would

1. try to detect that an installation exists in the prefix,
2. stop building if an installation exists unless a special option is given.

Author: Trac Migrate 2018-11-14T07:47:37.000Z

Original author: williamssimonp

The Ada build has also a problem if there already exists an installation. The install procedure aborts with a file permission error.

Author: Chris Johns 2018-11-15T00:45:51.000Z

Original author: williamssimonp

Replying to [Sebastian Huber](#):

I have absolutely no confidence in the GCC build system.

I do not know gcc's build system enough to comment. It is a bit of a beast.

I am not sure if this will ever work reliably.

I see value in what you are asking and it raises the important broader question of "What a \$prefix tree of RTEMS tools means?". We currently assume a release \$prefix is a single release however there are **no** checks made. You are in fact asking we create a new policy that the RSB has avoided until now. Such a policy will exist for ever so I think it would be good to flesh out what it is and what it means.

I would 1. try to detect that an installation exists in the prefix,

Does this mean we can update a single variant of a package in the \$prefix and not the other variants? Do we allow a user to have an arch of one build and another arch on a different build?

Is the detect test per package or common to all packages? If common to all packages, ie in the RSB's python, how would you implement it? I think a common test is too hard.

A per-package test could be implemented with a worker script called from the config script using \$(). I did this in the gdb config to find the Python header and library before building gdb. The issue here is implementing the test in each step that matters in a package's build, ie the binutils and gcc for tool sets.

GCC has the RSB hash embedded in it and can be found with:

```
1 $prefix/arm-rtems5-gcc --version | awk ' /\.*-gcc/
   ↪ { print substr($8, 1, length($8) - 1); }'
2 30da0c720b78eba16a3f5272206c07415368617b
```

Can an RSB hash be added to the GNU as and ld version string? I think this would be needed to make adding any test worthwhile.

2. stop building if an installation exists unless a special option is given..

I am not a fan of adding extra options. I do not see a need at this point in time. I feel removing installed files or attempting to automatically clean up is a complex hole we should avoid. We could just document what users need to do if they see warnings or errors.

How would you build more than one variant of a packages, ie different arch tool sets? This feeds back to the per-package vs all packages testing of installed packages.

Do we stop for all build types or just release builds? We have two contexts, a development context where we are working with different tool sets and sometimes in different configurations and then we have the release context. Maybe in the development context a warning is printed and in the release context an error is produced.

I don't have a solution for this problem. Normally I just delete the prefix before I start the RSB. While testing the new or1k tool chain I forgot to do this and got a GCC build error. Even though I know that the RSB build is broken with an existing installation in the prefix I didn't think about this and assumed that the new upstream or1k support in GCC is broken.

Author: Chris Johns 2018-11-17T01:20:21.000Z

Original author: williamssimonp

Replying to [Sebastian Huber](#):

I don't have a solution for this problem.

I did outline one :)

Normally I just delete the prefix before I start the RSB. While testing the new or1k tool chain I forgot to do this and got a GCC build error.

Even though I know that the RSB build is broken with an existing installation in the prefix

The RSB is not broken, it is doing what it is suppose to do. It is the package that is being built that is broken or it is the configuration in the RSB that could be improved. Adding shell call-outs using `$()` to check the installed version to the gcc tool set scripts would work but we need an RSB signature in `as` and `ld`.

I didn't think about this and assumed that the new upstream or1k support in GCC is broken.

Then please raise this with gcc or fix it's build so we can control where it looks for as. It is a weakness with gcc's build we cannot control the as used.

Adding an RSB signature to as and ld is something that should happen.

It is not just the Binutils that make problems. There are at least five issues in case a tool chain is already present.

1. The build uses the existing Binutils instead of the ones built right now.
2. Some header and other files of the existing installation may be used instead of the one from the current sources.
3. The installation adds only files, it does not remove obsolete files leaving a mixture of old and new files in the prefix.
4. The Ada installation stops with permission errors.
5. In case something goes wrong it is not easy to figure out that the reason is an existing installation that interfered.

Replying to [Sebastian Huber](#):

It is not just the Binutils that make problems. There are at least five issues in case a tool chain is already present. 1. The build uses the existing Binutils instead of the ones built right now.

If I used the same prefix as an bare metal ELF tool chain could gcc pick up that assembler?

Do we need more or better documentation on the \$prefix in the User manual?

2. Some header and other files of the existing installation may be used instead of the one from the current sources.

Why is gcc doing this? It seems wrong and dangerous.

3. The installation adds only files, it does not remove obsolete files leaving a mixture of old and new files in the prefix.

The binutils and gcc do just this as well. The RSB is not a packaging or deployment tool. That is a role I see existing

outside of the RTEMS project where specialisation and support can happen.

4. The Ada installation stops with permission errors.

I thought this was in the Ada build when run from python?

5. In case something goes wrong it is not easy to figure out that the reason is an existing installation that interfered.

Agreed, but why is it the role of the RSB tool (not the configuration parts) to deal with this?

I have offered a solution and I am willing to review patches.

I don't know.

Do we need more or better documentation on the \$prefix in the User manual?

Yes, I didn't find a hint that an existing installation may interfere with the current build.

2. Some header and other files of the existing installation may be used instead of the one from the current sources.

Why is gcc doing this? It seems wrong and dangerous.

<https://devel.rtems.org/ticket/2540#comment:5>

3. The installation adds only files, it does not remove obsolete files leaving a mixture of old and new files in the prefix.

The binutils and gcc do just this as well. The RSB is not a packaging or deployment tool. That is a role I see existing outside of the RTEMS project where specialisation and support can happen.

I think this should be clarified in the documentation.

4. The Ada installation stops with permission errors.

I thought this was in the Ada build when run from python?

As far as I remember it was an issue in the Python copytree area.

5. In case something goes wrong it is not easy to figure out that the reason is an existing installation that interfered.

Agreed, but why is it the role of the RSB tool (not the configuration parts) to deal with this? I have offered a solution and I am willing to review patches.

I think your proposal is fine. I just wanted to highlight that there are multiple problems if you have an existing installation.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2506
Merges	0

<https://devel.rtems.org/wiki/Developer/Tools> has two links in the first bullet list which do not go to pages.

- RTEMS Linker
- RTEMS Tester

RTEMS Trace Linker has a write up at https://devel.rtems.org/wiki/Developer/Tracing/Trace_Linkers but in a couple of places uses the phrase “RTEMS Linker.”

I think the references to RTEMS Linker on the RTEMS Trace Linker page are incorrect but you need to judge.

Is there a page for the RTEMS Linker as used for dynamic loading?

Is there a page for the RTEMS Tester so the link can be fixed?

If nothing else, I think you have some notes that could be inserted into starting points on the pages.

Author: Chris Johns 2016-01-03T23:09:10.000Z

The missing links need pages added. We need to review and update the existing content if present and either move it to a suitable spot in the new wiki's tree and update if needed or provide a new page.

I would rather need pages added or moves and updated than linking to some of the existing pages. Having out of date or invalid pages can be worse than nothing at all.

Author: Gedare Bloom 2016-01-04T02:06:02.000Z

You can make this a GCI task if you want, either to follow through on this ticket, or create a few discrete tasks related to the specific pages you want dealt with.

Author: Chris Johns 2016-01-04T02:17:14.000Z

As you point out the trace linker is referenced under tracing. I think we need a page under the tools project about the tool and development of it. I am not sure how to create a suitable GCI task for this.

I am not sure the RTEMS linker is a suitable GCI topic, it is a complex topic. It will take me a while to figure out the details.

The following is Tangem's suggestion from GCI.

"The cpukit doxygen link and the 3 links at the top in the release manuals are broken. The other manuals state a outdated OAR copyright and I'm not sure whether those should or can be changed. Deleting the page and replacing the link on the main page with this [1] or this [2] might be a good idea."

As Chris suggested, getting a new HTML page here [3] would be great.

Haha yes I remember now. I have been thinking about the original reason and that was RPM files built and installing in to a common prefix. With the RSB we have moved to using different prefix paths and this makes the version number in the tool name redundant.

rtems_gpio_enable_interrupt() in libbsp/shared/gpio.c should free the interrupt_state in case of a failure to rtems_gpio_interrupt_handler_install.

Also, the “if (threaded_handling) {” section the two error paths that return RTEMS_UNSATISFIED should undo the rtems_gpio_interrupt_handler_install of the pin handler and also free the interrupt_state.

Original author: beng

The bsp-general <bsp/gpio.h> is no longer pre-installed, presumably since commit 5458bff92 regenerated preinstall.am. This causes build breakage for BSP's implementing the gpio interface (e.g. beagle):

```
arm-rtems4.11-gcc -pipe -B../..../lib/ -B../..../beagleboneblack/lib/
-spes bsp_spec -qrtems -DHAVE_CONFIG_H -I../..../rtems-
src/c/src/lib/libbsp/arm/beagle/../../libcpu/arm/shared/include -mcpu=cortex-a8 -
O2 -g -Wall -Wmissing-prototypes -Wimplicit-function-declaration -Wstrict-prototypes
-Wnested-externs -MT libbsp_a-gpio.o -MD -MP -MF .deps/libbsp_a-gpio.Tpo -c -o
libbsp_a-gpio.o test -f '../..../shared/gpio.c' || echo '../..../shared/gpio.c'
../..../shared/gpio.c:20:22: fatal error: bsp/gpio.h: No such
file or directory
```

include <bsp/gpio.h>

Thanks for Claudio Scordino and Debajyoti Majumdar for their interest in the Beagle BSP and for reporting this problem.

On 06/11/15 23:57, André Marques wrote:

Hello, This issue was resolved earlier with the following patch <https://git.rtems.org/rtems/commit/c/src/lib/libbsp/Makefile.am?id=a57b72ded94b4e77fd4f9bd3cc37380a02e3e35a> where the inclusion of the GPIO API header file was removed from the libbsp/shared makefile and moved (in the case of the Raspberry Pi, but I forgot about the beagle BSP) to the BSP makefile which intends to use the API. This avoids these name clashes with BSPs that already have a gpio.h header file. However the following patch reintroduced the gpio API header on the libbsp/shared makefile <https://git.rtems.org/rtems/commit/c/src/lib/libbsp/Makefile.am?id=6f6e5d758f6a1e7dcae74e151c3dd3d1034da232> This last patch should be reverted, and the shared/include/gpio.h should be included in the beagle BSP makefile that requires it, and motivated this reintroduction. I think it is better to have the BSPs include the gpio API header file if they actually implement the API, than forcing the header to all BSPs and creating these problems. Às 14:29 de 05-11-2015, Sebastian Huber escreveu:

On 05/11/15 15:17, Martin Galvan wrote:

The LPC1768 variants have a gpio.h file whose name clashes with the gpio.h from the new GPIO API. This results on the BSPs failing to compile. This patch renames the LPC1768 gpio.* files to lpc-gpio.*, as it's done on other BSPs (e.g. Beaglebone). Closes [#2441](#).

Thanks.

All,

I see, sorry everyone, I wasn't aware of this problem.

Sebastian writes:

I think it is better to have the BSPs include the gpio API header file if they actually implement the API, than forcing the header to all BSPs and creating these problems.

As I see it, gpio.h is generic to BSPs (it describes a BSP-generic API) and so ought to be safe to install unconditionally.

Installing it only whenever BSPs implement the API isn't perfect either, as that precludes that BSP from having an installed gpio.h should they want it.

Can we install it unconditionally in a path that is safe from BSP-specific clashes?

Author: Trac Migrate 2015-11-11T14:55:37.000Z

Original author: beng

Or perhaps we can rename the generic gpio.h to a more specific name such as gpio-api.h.

As I see it, gpio.h is generic to BSPs (it describes a BSP-generic API) and so ought to be safe to install unconditionally.

I agree with Ben and once we move to waf and have a single header tree with no pre-install stage this will be the case by default. We should have it in the tree now.

Installing it only whenever BSPs implement the API isn't perfect either, as that precludes that BSP from having an installed gpio.h should they want it.

Lets not do this.

Can we install it unconditionally in a path that is safe from BSP-specific clashes?

This will not happen in the single include tree.

The documentation for the BSP should clearly indicate the BSP supports GPIO. If I have selected a BSP without any GPIO pins and I need them I should consider a different career path. If the BSP has GPIO but no GPIO API support I should add the support.

Replying to **beng**:

Or perhaps we can rename the generic gpio.h to a more specific name such as gpio-api.h.

Please to not add 'api' to a header file name as a header by definition is an API. Should we add -c-language, -textfile etc as well? ;)

Author: Trac Migrate 2015-11-18T16:01:58.000Z

Original author: beng

I don't think we have agreed on a way out here, or did I miss something?

Or perhaps we can rename the generic gpio.h to a more specific name such as gpio-api.h.

Please to not add 'api' to a header file name as a header by definition is an API. Should we add -c-language, -textfile etc as well? ;)

Point taken, though I'm not sure I agree all .h files describe such a 'public' API. It seems to me something like what I suggested (rename gpio.h to something that a BSP would never name it) is a simple and reasonably clean (the BSP's won't have to be touched) way out. Is another name an option for you Chris? E.g. gpio-shared.h?

[rtems/c/src/lib/libbsp/powerpc/mvme5500/network/if_1GHz/if_wm.c:1560]: (style) Expression '(X & 0xe) == 0x1' is always false.

Source code is

```
/* XXX Hardware bug?? */ if ((reg & 0xe) == 1) {
```

Author: Joel Sherrill 2015-07-14T20:19:51.000Z

Original author: dcb

I didn't check this file but assume it is based on the one in NetBSD.

http://cvsweb.netbsd.org/bsdweb.cgi/src/sys/dev/pci/if_wm.c?rev=1.336&content-type=text/x-cvsweb-markup&only_with_tag=MAIN

Double check me but I think the code is now this:

```
/* XXX Hardware bug?? */ if (sc->sc_type == WM_T_82544 && (reg & 0xe) == 1) { bit = CSR_READ(sc, mta_reg + ((reg - 1) << 2));
```

That looks better to me.

If that resolves the issue and the code still works, update this ticket with a patch.

Author: Gedare Bloom 2015-07-14T20:37:34.000Z

Original author: dcb

Problem is that masking off 0xe removes the 1 bit, so anything & 0xe != 1 ever.

Author: Joel Sherrill 2015-07-14T20:50:21.000Z

Original author: dcb

So the code is still broken on the NetBSD head?

Author: Gedare Bloom 2015-07-14T20:57:57.000Z

Original author: dcb

Well, the second part of the condition is a nop. I have no idea what the intent of this was.

Author: Joel Sherrill 2015-07-14T21:23:17.000Z

Original author: dcb

This driver is for an Intel NIC. The driver (by name) is not in FreeBSD. The NIC is likely in the e1000/ driver directory in the FreeBSD source. The FreeBSD driver covers a much larger set of NICs and I can't find the corresponding source to check.

Hi expert,

I have found some problems on MCAN module configuration running on SAM V71 XPLAINED ULTRA EVALUATION KIT.

It is not possible choice other input clock reference (excluded PMC_PCK_CSS_MCK), the default configuration works only on 500kb/s and MCANx_PROP_SEGy, MCANx_PROP_SEG and MCANx_SYNC_JUMP parameters not are compatibles with several MCAN bit time calculators suggested from Microchip, (is it possible have the MCAN calculator that you have used to calculate yours parameters?):

<https://www.kvaser.com/support/calculators/bit-timing-calculator/> <https://intrepidcs.com/products/free-tools/mb-time-calculator/>

PS: I have found the following register description error (the samV71 datasheet used is DS60001527H)

```
define MCAN_FBTP_FSJW_Msk (0x7u << MCAN_FBTP_FSJW_Pos)
```

```
define MCAN_FBTP_FTSEG2_Msk (0xfu << MCAN_FBTP_FTSEG2_Pos)
```

```
define MCAN_FBTP_FTSEG1_Msk (0x1fu << MCAN_FBTP_FTSEG1_Pos)
```

And our collaborators has found also:

```
define MCAN_BTP_SJW_Pos 25
```

```
define MCAN_BTP_SJW_Msk (0x7fu << MCAN_BTP_SJW_Pos)
```

```
define MCAN_BTP_TSEG2_Pos 0
```

```
define MCAN_BTP_TSEG2_Msk (0x7fu << MCAN_BTP_TSEG2_Pos)
```

```
define MCAN_BTP_TSEG1_Pos 8
```

```
define MCAN_BTP_TSEG1_Msk (0xffu << MCAN_BTP_TSEG1_Pos)
```

```
define MCAN_BTP_BRP_Msk (0x1ffu << MCAN_BTP_BRP_Pos)
```

I hope the description is clear enough.

Best regards, Dario

Original author: darioia

Hi expert.

I have found a big problem regarding internal SAMV71 MCAN module (the code is unchanged regards RTEMS 6 then I think it should to be present also in that version) running on SAM V71 XPLAINED ULTRA EVALUATION KIT.

The problem is present in RX direction. I use FIFO functionality, I have configured 32 buffer in FIFOs, when I receive the 33th message, the packet is invalid (I think it is repeated one), follow you can see a couple of 15 messages that should to be identically, idx is buffer position in FIFO:

```
idx=4 MCAN Rx Fifo 0 data: 0x00 0x64 0x53 0x00 0x01 0x02 0x03 0x04 idx=5 MCAN Rx
Fifo 0 data: 0x01 0x05 0x06 0x07 0x08 0x09 0x0A 0x0B idx=6 MCAN Rx Fifo 0 data: 0x02
0x0C 0x0D 0x0E 0x0F 0x10 0x11 0x12 idx=7 MCAN Rx Fifo 0 data: 0x03 0x13 0x14 0x15
0x16 0x17 0x18 0x19 idx=8 MCAN Rx Fifo 0 data: 0x04 0x1A 0x1B 0x1C 0x1D 0x1E 0x1F
0x20 idx=9 MCAN Rx Fifo 0 data: 0x05 0x21 0x22 0x23 0x24 0x25 0x26 0x27 idx=10 MCAN
Rx Fifo 0 data: 0x06 0x28 0x29 0x2A 0x2B 0x2C 0x2D 0x2E idx=11 MCAN Rx Fifo 0 data:
0x07 0x2F 0x30 0x31 0x32 0x33 0x34 0x35 idx=12 MCAN Rx Fifo 0 data: 0x08 0x36 0x37
0x38 0x39 0x3A 0x3B 0x3C idx=13 MCAN Rx Fifo 0 data: 0x09 0x3D 0x3E 0x3F 0x40 0x41
0x42 0x43 idx=14 MCAN Rx Fifo 0 data: 0x0A 0x44 0x45 0x46 0x47 0x48 0x49 0x4A idx=15
MCAN Rx Fifo 0 data: 0x0B 0x4B 0x4C 0x4D 0x4E 0x4F 0x50 0x51 idx=16 MCAN Rx Fifo 0
```

data: 0x0C 0x52 0x53 0x54 0x55 0x56 0x57 0x58 idx=17 MCAN Rx Fifo 0 data: 0x0D 0x59 0x5A 0x5B 0x5C 0x5D 0x5E 0x5F idx=18 MCAN Rx Fifo 0 data: 0x0E 0x60 0x61 0x62 0x63 0xA9

idx=19 MCAN Rx Fifo 0 data: 0x00 0x64 0x53 0x00 0x01 0x02 0x03 0x04 idx=20 MCAN Rx Fifo 0 data: 0x01 0x05 0x06 0x07 0x08 0x09 0x0A 0x0B idx=21 MCAN Rx Fifo 0 data: 0x02 0x0C 0x0D 0x0E 0x0F 0x10 0x11 0x12 idx=22 MCAN Rx Fifo 0 data: 0x03 0x13 0x14 0x15 0x16 0x17 0x18 0x19 idx=23 MCAN Rx Fifo 0 data: 0x04 0x1A 0x1B 0x1C 0x1D 0x1E 0x1F 0x20 idx=24 MCAN Rx Fifo 0 data: 0x05 0x21 0x22 0x23 0x24 0x25 0x26 0x27 idx=25 MCAN Rx Fifo 0 data: 0x06 0x28 0x29 0x2A 0x2B 0x2C 0x2D 0x2E idx=26 MCAN Rx Fifo 0 data: 0x07 0x2F 0x30 0x31 0x32 0x33 0x34 0x35 idx=27 MCAN Rx Fifo 0 data: 0x08 0x36 0x37 0x38 0x39 0x3A 0x3B 0x3C idx=28 MCAN Rx Fifo 0 data: 0x09 0x3D 0x3E 0x3F 0x40 0x41 0x42 0x43 idx=29 MCAN Rx Fifo 0 data: 0x0A 0x44 0x45 0x46 0x47 0x48 0x49 0x4A idx=30 MCAN Rx Fifo 0 data: 0x0B 0x4B 0x4C 0x4D 0x4E 0x4F 0x50 0x51 idx=31 MCAN Rx Fifo 0 data: 0x0C 0x52 0x53 0x54 0x55 0x56 0x57 0x58 **idx=0 MCAN Rx Fifo 0 data: 0x00 0x14 0x33 0x00 0x01 0x02 0x03 0x04** idx=1 MCAN Rx Fifo 0 data: 0x0E 0x60 0x61 0x62 0x63 0xA9

The first data byte is the internal sequence number (0x00 - 0x0E) If I reduce the fifo length the problem is present in (MCAN1_NMBR_RX_FIFOx_ELMTS - 1) fifo element, the problem is present in polling mode and in interrupt mode.

I have seen the Microchip reference code found in https://github.com/Microchip-MPLAB-Harmony/csp_apps_sam_e70_s70_v70_v71.git

```
bool MCAN1_MessageReceiveFifo(MCAN_RX_FIFO_NUM rxFifoNum, uint8_t numberOfMessage, MCAN_RX_BUFFER rxBuffer) {
    uint8_t rxgi = 0U;
    switch (rxFifoNum) {
        case MCAN_RX_FIFO_0: /* Read data from the Rx FIFO0 */
            rxgi = (uint8_t)((MCAN1_REGS->MCAN_RXFOS & MCAN_RXFOS_FOGI_Msk) >> MCAN_RXFOS_FOGI_Pos);
            for (count = 0U; count < numberOfMessage; count++) {
                rxFifo = (uint8_t *) ((uint8_t *) mcan1Obj.msgRAMConfig.rxFIFO0Address + ((uint32_t)rxgi * MCAN1_RX_FIFO0_ELEMENT_SIZE));
```

```
(void) memcpy(rxBuf, rxFifo, MCAN1_RX_FIFO0_ELEMENT_SIZE);
```

```
if ((count + 1U) == numberOfMessage) { break; } rxBuf += MCAN1_RX_FIFO0_ELEMENT_SIZE; rxgi++;
if (rxgi == 1U) { rxgi = 0U; }
```

```
/* Ack the fifo position */ MCAN1_REGS->MCAN_RXFOA = MCAN_RXFOA_F0AI((uint32_t)rxgi);
```

```
status = true; break; ... } return status; }
```

I suppose there are a different handling on the first buffer.

I hope the description is clear enough.

Best regards, Dario

Hi,

you can close the ticket, our collaborator have found the problem regarding caching of data, is “just” necessary to place the call `rtems_cache_disable_data` in the following function:

```
uint32_t  **MCAN_GetRxFifoBuffer**(const  MCan_ConfigType  *mcanConfig,
MCan_FifoType fifo, Mailbox64Type *pRxMailbox) { ... fill_level = 0;

**rtems_cache_disable_data**());
```

Regards, Dario

Link	https://gitlab.rtems.org/rtems/rtems/-/issues/4904
Merges	0

Original author: arand

When building an application using the make build support (as given by the example in make/Templates/Makefile.leaf), and when the used toolchain has a vendor identifier as part of the target triplet (for example sparc-**gaisler**-rtems5), the build fails with the following kind of error:

```

1 <user_path>/make/custom/default.cfg:14: <user_path>/sparc-rtems5/leon3/make/bsp.
   ↳ cfg: No such file or directory
2 make: *** No rule to make target '<user_path>/sparc-rtems5/leon3/make/bsp.cfg'.
   ↳ Stop.
```

This seems to be due to make/custom/default.cfg which uses:

```

1 !#make
2 (...)
3 RTEMS_TARGET = $(RTEMS_CPU)-rtems$(RTEMS_API)
4
5 include $(RTEMS_ROOT)/$(RTEMS_TARGET)/$(RTEMS_BSP)/make/target.cfg
6 include $(RTEMS_SHARE)/make/host.cfg
7
8 include $(RTEMS_ROOT)/make/main.cfg
9 include $(RTEMS_ROOT)/$(RTEMS_TARGET)/$(RTEMS_BSP)/make/bsp.cfg
```

where RTEMS_CPU does not include the vendor id, and hence gives an incorrect target triplet in RTEMS_TARGET.

This seems to be a regression between rtems 4.11 and rtems 5 introduced in

270c5df5/rtems

Author: Chris Johns 2023-05-15T03:29:43.000Z

Original author: arand

Does your build system provide RTEMS_TARGET?

How do you specify the sparc-gaisier label?

Author: Trac Migrate 2023-05-15T07:59:13.000Z

Original author: arand

My build system does not touch RTEMS_TARGET, I'm using a Makefile based on the Makefile.leaf template:

```

1  !#make
2  # C source names, if any, go here -- minus the .c
3  C_PIECES=foo
4  C_FILES=$(C_PIECES:%=%.c)
5  C_O_FILES=$(C_PIECES:%=${ARCH}/%.o)
6
7  SRCS=$(C_FILES) $(CC_FILES) $(H_FILES) $(S_FILES)
8  OBJS=$(C_O_FILES) $(CC_O_FILES) $(S_O_FILES)
9
10 PGMS=${ARCH}/foo.exe
11
12 include $(RTEMS_MAKEFILE_PATH)/Makefile.inc
13 include $(RTEMS_CUSTOM)
14 include $(RTEMS_ROOT)/make/leaf.cfg
15
16 all:    ${ARCH} $(SRCS) $(PGMS)
17
18 # The following links using C rules.
19 ${ARCH}/foo.exe: ${OBJS} ${LINK_FILES}
20 $(make-exe)

```

and pointing RTEMS_MAKEFILE_PATH to a compiled and installed version of an RTEMS BSP.

The sparc-gaisler-rtems5 triplet is given by the toolchain, in my case this is taken directly from rcc-1.3.1-gcc from <https://www.gaisler.com/index.php/products/operating-systems/rtems> .

However I would guess that this problem would apply to any toolchain with a vendor in its name (even “unknown”).

Hello, I'm trying to mount the FAT filesystem on the external memory of an atsamv xpalined ultra. I managed to mount the device but when calling the msdos_format function to format

the memory I get a RTEMS_FATAL_SOURCE_INVALID_HEAP_FREE fault. The fault is thrown when the function calls the free on the fmt_params.sec pointer.

Error screenshot

Author: Joel Sherrill 2022-11-25T16:20:39.000Z

Original author: Fantomas96

Without looking at the code, this should indicate that the address passed to free() is not one that was malloced. Perhaps it should have been set to NULL in the structure earlier and just garbage is passed in when clean up occurs. Otherwise, there is what I would think is a bug which would have been tripped over in the most basic testing and use.

Author: Trac Migrate 2022-11-28T10:02:58.000Z

Original author: Fantomas96

Ok I found something interesting. First of all if I compile the rtems code with the flag `-enable-rtems-debug` the malloc of `fmt_params.sec` doesn't work so the pointer it's NULL and the function tries to free a NULL pointer. I don't know if the malloc not allocating is an expected behaviour in this condition. But if I remove the flag and recompile the kernel the malloc is working and everything seems to work smoothly until I get to the free. The pointer now it's allocated and it contains the stuff that is being written in the external flash. Here's what the pointer contains when the free it's called. !` <https://ibb.co/djrp9ym> <<https://ibb.co/djrp9ym>>`. Now the free stil doesn't work and returns the same error as before. This obviously causes my RTEMS app to stop working. If I reboot the app the `msdos_format` it's called again but in this case the external memory is not erased since the function called in the previous execution was formatting the external memory with the FAT filesystem. So now I got a crc error. I suppose this is because the previous execution was stopped and the QSPI driver hadn't finished writing to external memory. He's a screen shot of the full error. !` <https://ibb.co/RhXFR8j> <<https://ibb.co/RhXFR8j>>`. The interesting thing is that now the free works and my application keeps working as we can see from the screenshot. Obviously the filesystem is not mounted so it's still working in the IMFS filesystem.

Original author: chenjin_zhong

Hi, the MACRO JFFS2_MAX_NAME_LEN defines the maximum length of filename is 254. The length of filename is unchecked in jffs2_create. But the length of filename is checked in rtems_jffs2_rmnod and rtems_jffs2_rename. This causes the creation of a file with a length of

more than JFFS2_MAX_NAME_LEN will succeed, but rename or unlink failed. The src code is listed as follows. The bold function detects the length of filename. static int rtems_jffs2_rmnod(const rtems_filesystem_location_info_t parentloc, const rtems_filesystem_location_info_t *loc) { struct _inode *dir_i = rtems_jffs2_get_inode_by_location(parentloc); struct _inode *entry_i = rtems_jffs2_get_inode_by_location(loc); char *name; size_t namelen; int eno = **rtems_jffs2_cache_fd_name(entry_i, &name, &namelen)*;

if (eno == 0) { switch (dir_i->i_mode & S_IFMT) { case S_IFDIR: eno = -jffs2_rmdir(dir_i, entry_i, name, namelen); break; case S_IFREG: eno = -jffs2_unlink(dir_i, entry_i, name, namelen); break; default: eno = EINVAL; break; } }

return rtems_jffs2_eno_to_rv_and_errno(eno); }

static int rtems_jffs2_rmnod(const rtems_filesystem_location_info_t parentloc, const rtems_filesystem_location_info_t *loc) { struct _inode *dir_i = rtems_jffs2_get_inode_by_location(parentloc); struct _inode *entry_i = rtems_jffs2_get_inode_by_location(loc); char *name; size_t namelen; int eno = **rtems_jffs2_cache_fd_name(entry_i, &name, &namelen)*;

if (eno == 0) { switch (dir_i->i_mode & S_IFMT) { case S_IFDIR: eno = -jffs2_rmdir(dir_i, entry_i, name, namelen); break; case S_IFREG: eno = -jffs2_unlink(dir_i, entry_i, name, namelen); break; default: eno = EINVAL; break; } }

Original author: soja

Current version of gpiolib is not aware of the input enable register of the grgpio core, when presence is indicated through capability register.

Also currently only interrupt support for “irqgen == 0” is supported. Our interface card has the mode “irqgen == 1” according to the capabilities register.

Original author: till.straumann@psi.ch

This [pull request](#) (on top of the 5 branch) breaks the mv643xx driver into two parts * low-level driver; independent from BSD * legacy BSD networking support layer The first is independent from RTEMS' networking support and always part of the BSP (can e.g., be used to implement low-level ethernet access). The second builds on top of the first and is only enabled when RTEMS is configured with legacy BSDnet support.

Note: the driver design has not changed; there have always been two layers; this patch just splits the code into separate files. It is a necessary preparation for a new rtems-libbsd/nexus driver (which is submitted in a separate ticket)

Original author: daniel

GR1553 BC driver gr1553bc_slot_transfer() bit shift logic does not match hardware, if a too large timeout value has given the wrong bus could have been selected. The timeout value was taken from a specific RT’s setting, however from the wrong RT. This may not be seen if all RT’s use the same timoute settings.

Original author: daniel

By not setting the table_size field, either required the user to do that or that the memory returned by malloc() had a reasonable non-zero value, otherwise the interrupt handler could miss some of the buffer decriptor processing expected by the API. By setting the table_size according to the driver calculated list size the user will not have to do that themselves and simplifies the usage of the API and potential bugs.

Kernel put the select thread to sleep queue in `sleepq_set_timeout_sbt`, the expire value is calculated by this `expire = (sbt - SBT_1S + sbt_per_tick - 1) / sbt_per_tick`; `sbt` is the absolute time, no time drift. but the `sbt_per_tick` is not an accurate value, it can make the expire value bigger and bigger while `sbt` is increasing.

In `rtems_bsd_initialize` function, `rtems_bsd_sbt_per_watchdog_tick = SBT_1S / tps`;

In our system the tick rate is set to 1000Hz, the real value of `rtems_bsd_sbt_per_watchdog_tick` is $1 < 32/1000 = 4294967.296$ but in integer type the value is 4294967. The error is $0.296/4294967 = 0.069\text{ppm}$, and it can increase the expire value 1ms every 14000 seconds.

Original author: frank_k

Cloned from #4143:

When I use the ‘shell’ from the fileio sample with the command below:

```
1 env QEMU_AUDIO_DRV="none" \\  
2 qemu-system-arm -no-reboot -net none -nographic -M realview-pbx-a9 -m 256M \\  
3 -kernel build/arm/realview_pbx_a9_qemu/testsuites/samples/fileio.exe
```

The executable crashes with an “BLOWN STACK!!!” as soon as I try to login as ‘root’ with password. (The logins without password work fine.) Increasing the stack size of the affected thread a bit (to 5 times RTEMS_MINIMUM_STACK_SIZE) solves the issue.

How to reproduce:

1. Start the fileio sample in QEMU with the above command.
2. Type a key to stop the timer.
3. Type “s” <return> to enter the shell.
4. Login as “root” with the password printed to the terminal.
5. In the line with the first shell prompt, the text “BLOWN STACK!!!” appears unexpectedly followed by further crash information.

```
1 [...]  
2 /dev/foobar login: root  
3 Password:  
4  
5 RTEMS Shell on /dev/foobar. Use 'help' to list commands.  
6 SHLL [/] # BLOWN STACK!!!  
7 task control block: 0x00205278  
8 [...]
```

Author: Joel Sherrill 2020-10-12T13:27:26.000Z

Original author: frank_k

At the risk of repeating myself, why do we ever use -O0 anymore now that GCC has -Og. From <https://gcc.gnu.org/onlinedocs/gcc/Optimize-Options.html>

```
1 -Og  
2 Optimize debugging experience. -Og should be the optimization level of_  
3 ↪ choice for the standard edit-compile-debug cycle, offering a_  
4 ↪ reasonable level of optimization while maintaining fast compilation_  
5 ↪ and a good debugging experience. It is a better choice than -O0 for_  
6 ↪ producing debuggable code because some compiler passes that collect_  
7 ↪ debug information are disabled at -O0.  
8  
9 Like -O0, -Og completely disables a number of optimization passes so_  
10 ↪ that individual options controlling them have no effect. Otherwise -  
11 ↪ -Og enables all -O1 optimization flags except for those that may_  
12 ↪ interfere with debugging:  
13  
14 -fbranch-count-reg -fdelayed-branch
```

(continues on next page)

(continued from previous page)

```

7 -fdse -fif-conversion -fif-conversion2
8 -finline-functions-called-once
9 -fmove-loop-invariants -fssa-phiopt
10 -ftree-bit-ccp -ftree-dse -ftree-pta -ftree-sra

```

I don't have problem with increasing the configured minimum stack size value for this sample. It would be better than tinkering with individual create invocations. But if -O0 is the culprit, let's just switch away from it.

Cloned from [#4052](#):

Current rtems-libbsd “5” branch fails to compile the e1000 driver for i386 based BSPs.
The corresponding patches from the 5-freebsd-12 branch need to be ported to master.

Author: Chris Johns 2020-08-14T21:15:04.000Z

Original author: soja

The RTEMS 5 release is based on the 5-freebsd-12 branch for LibBSD and not the 5 branch. Maybe the issue is the 5 branch for LibBSD should have been made from 5-freebsd-12 and not master.

I have adjusted the release scripts to package the 5-freebsd-12 branch for LibBSD as a special case however it has concerned me something is not right and this ticket is now making me wonder if the 5 branch referencing master has confused things.

Author: Trac Migrate 2020-08-14T21:38:48.000Z

Original author: soja

I got that the 5-freebsd-12 branch will be the libbsd version for RTEMS 5.1. That’s why I put the patches there first to make it in time.

My impression was that the 5 branch was created from master with the goal that in a future 5.x release libbsd might be created from this one, once the next FreeBSD version has been officially released.

I wanted to make sure that if that happens, it has the same features as the 5-freebsd-12 branch. The discussion on the mailinglist was a bit confusing, so maybe I got it wrong.

Author: Chris Johns 2020-08-15T00:55:56.000Z

Original author: soja

I also have the same impression. We need a release and then we need to look after the branch for a while to understand how this will work. Having the patches on all branches makes it easier and simpler.

EEMBC provides coremark-pro for benchmarking SMP multi-core. I have a LEON3- Dual core processor on an FPGA. I want to benchmark it using rtems provided in gaisler website. The benchmark suite I have selected to try is Coremark-pro. After many trials in building for rtems, I am getting the following errors as attached in the files. I have also mentioned the Make command and options I am using. In coremaster pro folder, inside util, inside make I have created a sparc-gaisler-rtems.mak file.

- [rtems_query_coremaster_pro.txt](#)
- [sparc-gaisler-rtems5.mak](#)

Original author: soja

In the current SMP implementation for i386 the smpclock01 test will run in a deadlock. This is because atm only the CPU0 will initialize a timer and handle timer interrupts. The timer events are then distributed to the other processors using IPIs.

The test now does the following: * CPU0 disables its local interrupts and then waits on barrier A for the timer_task * timer_task unblocks barrier A (timer_task runs on CPU1) * timer_task

arms timer 1 clock tick in the future and goes to sleep for one tick * CPU0 waits on barrier B which is supposed to be unblocked by the timer event of CPU1 * CPU0 has local interrupts disabled which means no hw timer interrupts are handled and no tick events are forwarded to CPU1. CPU1 never fires the timer since it never ticks.

Any suggestions for solving this are welcome.

Author: Trac Migrate 2020-06-25T18:24:20.000Z

Original author: soja

The purpose of the test is to detect broken clock drivers. In a real SMP system, the clock interrupt should be serviced on each CPU.

Author: Joel Sherrill 2020-05-28T22:49:31.000Z

This fails when the prefix already has a toolchain in it. It works if built into a new prefix.

The test sweeper I am using builds tools, then proceeds to go over individual test cases. This results in a repeatable failure.

If I need to, I can build the BSPs into a special install point, unique to each BSP. But I suspect that building two BSPs from the same architecture into the same prefix is sufficient to trigger this condition.

Author: Trac Migrate 2020-05-29T12:55:50.000Z

The posted command line does not include a “-Wl,-gc-sections”. My guess is that you don’t have a clean environment and that some parts pick up out dated stuff. It is a know RSB issue (this is also a GCC build system issue) that existing stuff in the prefix location can influence the build. From my point of view building with stuff in the prefix is undefined behaviour in most cases.

Author: Chris Johns 2020-06-10T01:41:29.000Z

I have discovered building qemu4 on FreeBSD if I do not remove the RSB created build directory the build fails. This implies there is something left there after the build or after a failed build that needs to be cleaned away when a new build starts. I think this is something that should be looked into for 5.2 or 6.

Original author: andrei.lupas

Hello,

With previous versions of RTEMS: a blocking `sem_wait()` could be broken immediately via a successful `sem_destroy` done from another thread (`sem_wait` deblocks with return code -1, and `errno == EINVAL`).

With latest RTEMS: `sem_destroy` doesn't succeed anymore, but returns `EBUSY` (since another thread executes a wait on it)

This behavior change breaks some of existing code.

Would it be possible to add an RTEMS config to allow user to select between OLD and NEW behavior ? (alternative is to move from POSIX sems to classic API and use `rtems_semaphore_flush`).

Thanks, Andrei Lupas.

Author: Joel Sherrill 2020-05-07T13:02:57.000Z

Original author: andrei.lupas

The current behavior is what is specified in the POSIX standard:

https://pubs.opengroup.org/onlinepubs/9699919799.2008edition/functions/sem_destroy.html

```
1 [EBUSY]
2 There are currently processes blocked on the semaphore.
```

It is a shame that the signature does not have an attribute structure, that would make it easy to at least add the behavior option at the API level. This signature does not give any room for change:

```
1 int sem_init(sem_t *sem, int pshared, unsigned value);
```

Adding a flush operation to the POSIX semaphores could be an option but `sem_wait()` is not defined to return any `errno` values which make sense for a flush. But if `sem_flush_np()` were added, then using another `errno` to indicate it was flushed by a non-portable (e.g. `_np`) method is at least an option.

Another option is to add a `sem_XXX_np` method to set the “allow delete when blocked threads” internal attribute. In this case, the threads unblocked by deleting the semaphore could return `EINVAL` like other POSIX methods do when the object id is invalid.

I’m just offering options within the space of the POSIX standard. The second seems like a cleaner direct solution to your problem. This is a counting semaphore and there is no concept of a “holder” as with a mutex. Besides threads waiting on a resource, do not hold the resource.

Hoping others will chime in.

Author: Trac Migrate 2020-05-07T18:25:05.000Z

Original author: andrei.lupas

Indeed, behavior is according to POSIX spec, but in the “undefined” area “The effect of destroying a semaphore upon which other threads are currently blocked is undefined.” In this case, the “undefined” behavior changed from `SUCCESS` to `error:EBUSY`, and this impacts some existing apps. On short term, I suppose I need to move to classic API semaphores. Thanks a lot for the prompt feedback. Andrei.

Author: Joel Sherrill 2020-05-07T18:29:42.000Z

Original author: andrei.lupas

Replying to [andrei.lupas](#):

Indeed, behavior is according to POSIX spec, but in the “undefined” area “The effect of destroying a semaphore upon which other threads are currently blocked is undefined.” In this case, the “undefined” behavior changed from `SUCCESS` to `error:EBUSY`, and this impacts some existing apps.

Can you cite where you found that undefined behavior citation? I looked at the Change History section for the methods I thought this would be in and don’t see it.

Knowing when the behavior changed and being able to cite something would lend strength to providing a way to get the alternative behavior. I lean to it changing on a per semaphore instance basis rather than a single flag changing it for all.

On short term, I suppose I need to move to classic API semaphores. Thanks a lot for the prompt feedback.

No problem.

Andrei.

Author: Trac Migrate 2020-05-08T04:51:39.000Z

Original author: andrei.lupas

The “The effect of destroying a semaphore upon which other threads are currently blocked is undefined.” is the current `sem_destroy()` description. The POSIX semaphores are now self-contained. This means the storage space is provided and maintained by the user. Destruction of a semaphore in use could indicate that someone is trying to use an object while it is destroyed (e.g. deallocated).

What we could do (since “The effect of destroying a semaphore upon which other threads are currently blocked is undefined.”) is to flush the semaphore so that callers get woken up with `EINVAL`, we destroy the object and return `EBUSY`.

Author: Trac Migrate 2020-05-08T06:09:57.000Z

Original author: andrei.lupas

Replying to [Sebastian Huber](#): ...

What we could do (since “The effect of destroying a semaphore upon which other threads are currently blocked is undefined.”) is to flush the semaphore so that callers get woken up with `EINVAL`, we destroy the object and return `EBUSY`.

Sounds good to me. Thanks.

Original author: Lou.Woods

Problem description

When the RTEMS ticker test, possibly others, is started with the `--console=/dev/com1` command line argument the output to COM1 using the pc386 BSP on real hardware the console output is invalid/garbage characters instead of the expected ticker output. The serial output looks like a baud rate mismatch.

Ticker works as expected when left to output to the VGA console.

Test configuration

1.5.1.73.2.1 Hardware tested

Winsystems EBC-855 (Intel® Celeron-M ZC Dothan 1GHz) Dell Optiplex 755 (Intel Core 2 Duo)

1.5.1.73.2.2 Hardware configuration

*The PC386 target COM1 is connected to a Raspberry Pi 3 with a Keyspan RS232 serial to USB converter. (This hardware combination works with other boards) *The PC386 is connected via a network to the Raspberry Pi 3 running a TFTP server that provides the boot images.

1.5.1.73.2.3 Software configuration

- RTEMS Master e22554535796fc29a7ed7c5e2338128e324a621d
- RTEMS configuration

```
1 ./rtems/configure --target=i386-rtems5 --enable-rtemsbsp=pc386 IDE_USE_PRIMARY_
  ↳ INTERFACE=0 --prefix=/home/woods/pc386/bsp-install/ --disable-networking --
  ↳ enable-posix --disable-smp --disable-multiprocessing --enable-tests --enable-
  ↳ cxx --enable-maintainer-mode
```

- The BSP defaults COM1 to 9600bps 8-N-1 with no flow control.
- The Raspberry Pi serial host is running Debian (Raspian) Stretch
- The executable is booted from the Raspberry Pi TFTP host by chain loading RTEMS via IPXE

1.5.1.73.2.4 General Notes

The test setup's serial connection was verified to work using the Optiplex 755 running Windows and the same hardware components with a simple Foxterm serial session.

1.5.1.73.2.5 Things attempted one at a time

- sweeping the baud rate on the serial host while holding the board at 9600 8N1
- trying different baud rates in lock-step, target and serial host.
- various combination of hardware flow control, parity, word size, stop bits.
- Winsystems board talking to a Windows PC running Foxterm.
- Running RTEMS 4.11 branch with current i386 toolchain – exe hangs; currently haven't tracked down the error.
- COM2 port on the Winsystems board.
- Changing the clock rate for the baud-rate divisor in RTEMS
- 3 wire serial communications with RX, TX, and GND

Review of the Software Requirements Engineering chapter for the RTEMS Software Engineering manual suggested that we should take the [FAA AC 20-148 - Reusable Software Components](#) into account:

<https://lists.rtems.org/pipermail/devel/2019-November/056027.html>

```

1 +Resources and Performance
2 +-----
3 +
4 +Normally, resource and performance requirements are formulated like this:
5 +
6 +* The resource U shall need less than V storage units.
7 +
8 +* The operation Y shall complete within X time units.
9 +
10 +Such statements are difficult to make for a software product like RTEMS which
11 +runs on many different target platforms in various configurations. So, the
12 +performance requirements of RTEMS shall be stated in terms of benchmarks. The
13 +benchmarks are run on the project-specific target platform and configuration.
14 +The results obtained by the benchmark runs are reported in a human readable
15 +presentation. The application designer can then use the benchmark results to
16 +determine if its system performance requirements are met. The benchmarks shall
17 +be executed under different environment conditions, e.g. varying cache states
18 +(dirty, empty, valid) and system bus load generated by other processors. The
19 +application designer shall have the ability to add additional environment
20 +conditions, e.g. system bus load by DMA engines or different system bus
21 +arbitration schemes.
22 +
23 +To catch resource and performance regressions via test suite runs there shall be

```

(continues on next page)

(continued from previous page)

24 +a means to specify threshold values **for** the measured quantities. The threshold
 25 +values should be provided **for** each validation platform. How this can be done
 26 +**and if** the threshold values are maintained by the RTEMS Project **is** subject to
 27 +discussion.

28

29 We focused on big-O **and** whether methods were constant time, bounded, **or** $O(n)$
 30 when designing. Perhaps the focus could be there. But this **is** a design goal **for**
 31 **↪all**
 32 of RTEMS **and** something we would document. Nothing to do **except** a general
 33 design goal.

34 This section also sounds like part of what **is** required by a systems integrator
 35 when leveraging what the FAA calls a Reusable Software Component:

36

37 [https://www.faa.gov/regulations_policies/advisory_circulars/index.cfm/go/document.
 38 ↪information/documentID/22207](https://www.faa.gov/regulations_policies/advisory_circulars/index.cfm/go/document.information/documentID/22207)

39 You get credit **for** what's common and have to fill in details for your system.

When following the instructions in:

<https://docs.rtems.org/branches/master/user/start/bsp-test.html> the last command fails:

```
1 $rtems-test --rtems-bsp=erc32 --rtems-tools=$HOME/quick-start/rtems/5 .
```

This could (should?) be replaced by:

```
1 $rtems-test --rtems-bsp=erc32-sis --rtems-tools=$HOME/quick-start/rtems/5 .
```

Further discussion & information found here:

Terminal should block in default config case

expected behaviour

Open terminal without configure over tcsetattr. read block until new line ICANON is in termios.c_lflag set in default case.

undesired behaviour

Open terminal without configure over tcsetattr. read return with return value 0. After reset the default settings with tcgetattr and tcsetattr read shown expected behavior (see Example Code).

target hardware

TMS570 with bugfixes see Bug [#3789](#)

toolchain version

Modified GCC, binutils and gdb build script to build armeb compiler build with RTEMS Source Builder master(see patches for RTEMS Soucre Builder) I need a ARM Compiler with Big Endian Support as default for TMS570 see Bug [#3789](#)

configuration options for bsp

```
../rtems/configure      '-prefix=[bsp      path]/bsp/armeb-rtems5'      '-host=arm-rtems5'
'-target=arm-rtems5'    '-enable-posix'    '-enable-rtems-debug'    '-disable-tests'    '-disable-
networking'            '-enable-rtemsbsp=tms570ls3137_hdk'            'CC_FOR_TARGET=armeb-
rtems5-gcc'            'CXX_FOR_TARGET=armeb-rtem5-gcc'            'AR=armeb-rtems5-ar'

Original author: andy89.org

I am not sure if default Termios settings are specified by POSIX or Linux. Do you have a reference?

Attaching patches should work. What was the error message?

Author: Trac Migrate 2019-08-26T07:49:55.000Z

Original author: andy89.org

Yes the default terminal settings are not defined but is defined the terminal must be initialized. If your Implementation set a default settings this settings should work.

At section 11.1.1 of POSIX Spec[1] is defined: Opening a modem or similar piece of equipment connected by a serial line. In this case, the terminal parameters (see Section 11.2, on page 205) may be initialized to default settings by the implementation in between the last close of the device by any process and the next open of the device, or they may persist from one use to the next. The terminal parameters can be set to values that ensure the terminal behaves in a conforming manner by means of the `O_TTY_INIT` open flag when opening a terminal device that is not already open in any process, or by executing the `stty` utility with the operand `sane`. In the Linux kernel every read check the settings and configure the timeout[2]. The default settings in Linux kernel are defined here[3] and differiert to your settings. There was no error message the read call return with 0. For a normal file this mean End-of-file. A return value of 0 is not specified in Canonical mode by POSIX for spezial files.

[1] IEEE Std. 1003.1 Standard for Information Technology—Portable Operating System Interface (POSIX) - 2016 Edition [2] https://elixir.bootlin.com/linux/v5.2.10/source/drivers/tty/n_tty.c#L2132 [3] https://elixir.bootlin.com/linux/v5.2.10/source/drivers/tty/tty_io.c#L121

Author: Trac Migrate 2019-08-27T05:02:38.000Z

Original author: andy89.org

I am not sure if I understood the report correctly. The bug is that you open the device and ICANON is set, but it doesn't behave like this?

Author: Trac Migrate 2019-08-27T07:42:55.000Z

Original author: andy89.org

Yes, it behave like the device is in polling mode (`~ICANON`, `VMIN=0`, `VTIME=0`). Start my small test Application after setting the default setting again read wait until newline or the buffer is full (Canonical mode).

Author: Trac Migrate 2019-08-27T07:48:40.000Z

Original author: andy89.org

I have little time to take care of this ticket. I think the first step would be to add a generic test case to the testsuites/libtests/termios* tests or add a new test program which reproduces the problem on a simulator BSP, e.g. `sparc/erc32`.

Original author: xispa

Hi,

I am currently trying to install and test RTEMS on an ATMEL SAMV71Q21 chip. In order to do so, I carefully followed the instructions provided in the user manual (<https://docs.rtems.org/branches/master/user/start/host.html>).

The doc aims at running RTEMS on a SPARC architecture, whereas in my case, I try to run it on an ARM. Considering this, all commands featuring “sparc” were replaced by “arm” while installing the tool suite.

After bootstrapping RTEMS’s sources, I configured the BSP using the command :

```
$HOME/quick-start/src/rtems/configure --prefix=$HOME/quick-start/rtems/5 --enable-maintainer-mode --target=arm-rtems5 --enable-rtemsbsp=atsamv --enable-tests
```

then built and installed the BSP. These stages seem to work properly as I do not get any errors or warnings.

I am stuck when testing the BSP using the command :

```
rtems-test --rtems-bsp=? --rtems-tools=$HOME/quick-start/rtems/5 .
```

What should I specify in --rtems-bsp option considering that I want RTEMS to run on a SAMV71Q21 ? Is there anything else that I have to do before testing the BSP ?

Kind regards,

Author: Trac Migrate 2019-06-14T09:28:04.000Z

Original author: xispa

- **Milestone** changed from %”4.11.3” to %”Indefinite”
- **Owner** set to Needs Funding
- **Priority** changed from ~”high” to ~”normal”
- **Status** changed from *new* to *assigned*

- **Summary** changed from *Running RTEMS on SAMV71Q21* to *Add rtems-test support for atsam BSP*
- **Version** changed from ~"4.11" to ~"5"

There is no support for this BSP in rtems-test. You need a debugger or other tools to load the application to the target.

Original author: sebastian.huber

The current memory allocator in RTEMS uses a first fit strategy. This is an excellent allocator if you only allocate memory and never free it. However, for real dynamic workloads which allocate and free memory throughout the application run-time this strategy is subject to

- unpredictable allocation times (linear search through free blocks),
- memory fragmentation.

The global lock delivers bad performance on SMP systems. RTEMS applications run on a broad range of targets, from uniprocessor 64KiB RAM to SMP systems with more than 4GiB of RAM. So, the allocator should be configurable. Link-time configuration should take into account that some applications never free memory. They should not be forced to link in the free support.

Alternative allocator implementations are:

- [Original TLSF](#)
- [BSD licensed TLSF](#)
- [jemalloc](#)
- `kernel malloc based on UMA <../wikis/FreeBSD>`_ (https://github.com/freebsd/freebsd/blob/master/sys/kern/kern_malloc.c)

Author: Chris Johns 2022-06-14T06:36:23.000Z

Original author: sebastian.huber

- **Version** ~”5” deleted

Author: Chris Johns 2022-06-14T07:11:14.000Z

Original author: sebastian.huber

The allocator has to provide an aligned allocation call. This can also be called a `_boundary` **constrained** call.

Merges	0

Original author: jollp

RTEMS provides a version of the CBS scheduler which does not include the following features:

- Ability to attach more than one task to a Server;
- Budget (allowed computation time) replenishment when a task exceeded its previous budget;
- The served task is assigned with the ongoing server's priority.

This ticket presents a new CBS version where all the rules described by Abeni and Buttazzo are correctly implemented. This new version differs from the original CBS implementation on the following aspects:

1. A server can now serve several tasks; 1. When a served task exceeds its reserved capacity, its budget is replenished and the server's deadline updated and assigned as the new task priority; 1. The callback function is removed due to the modification performed on the CBS behavior when a served task exceeds its reserved computational time; 1. A task is killed when detached from a server since this new version only allows soft real-time tasks to run under Reservation-Based Context.

New Test Cases were developed and are directly included in the patch that will soon be attached.

If separate object files have the same local symbol and are incrementally linked libdl only uses the first symbol found.

The issue has been raised by Peter in a post to devel:

<https://lists.rtems.org/pipermail/devel/2019-April/025623.html>

The issue can be shown with:

```

1 $ cat foo.c
2 #include <stdio.h>
3
4 extern void foo(void);
5 void foo(void)
6 {
7     printf("FOO %s\n", "Foo 1");
8 }
9 $ cat bar.c
10 #include <stdio.h>
11
12 extern void bar(void);
13 void bar(void)
14 {
15     printf("BAR %s\n", "Bar 1");
16 }
17 $ arm-rtems5-gcc -march=armv7-a -mthumb -c foo.c
18 $ arm-rtems5-gcc -march=armv7-a -mthumb -c bar.c
19 $ arm-rtems5-ld -r -o fubar bar.o foo.o
20 $ arm-rtems5-readelf -s fubar
21
22 Symbol table '.symtab' contains 20 entries:

Author: Chris Johns 2019-04-26T21:10:02.000Z

I have updated dl01 adding the example code and build PowerPC and ARM bsps. The PowerPC BSP works while the ARM BSP does not work.

The results for the psim BSP is:

```

1 $ rtems-run --rtems-bsp=psim `find . -name dl01.exe`
2 RTEMS Testing - Run, 5.0.not_released
3 Command Line: /opt/work/rtems/5/bin/rtems-run --rtems-bsp=psim ./
   ↪ powerpc-rtems5/c/psim/testsuites/libtests/dl01.exe

Unless someone can point to a failure I am missing, I think this should be closed. I would appreciate Chris or Peter closing this if my testing below demonstrates this is no longer an issue.

Since Chris says this test case has been added to dl01. dl01 passes on xilinx_zynq_a9_qemu with results posted at <https://lists.rtems.org/pipermail/build/2019-September/003639.html>

For reference, this is the Zynq output which I think is correct:

```

Can this be closed?

Author: Trac Migrate 2019-09-29T02:02:40.000Z

no, it still has a failure, not libtests/dl01, but the test example in the mail <https://lists.rtems.org/pipermail/devel/2019-April/025623.html>

I think I have found the bug, but no one notice the mail I ever wrote. Would you please have a look at the mail <https://lists.rtems.org/pipermail/devel/2019-September/055590.html>

Thank you for updating the ticket. If you could create a patch for the code and the test case and attach it here it would be a great help.

I complite test case use the follow command

```

1 arm-rtems5-gcc -march=armv7-a -mthumb -mfp=neon -mfloat-abi=hard -
  ↪mtune=cortex-a9 -mlong-calls -Wall -I. -O2 -c -o wsp/build/dl-o2.o
  ↪src/dl-o2.c
2 arm-rtems5-gcc -march=armv7-a -mthumb -mfp=neon -mfloat-abi=hard -
  ↪mtune=cortex-a9 -mlong-calls -Wall -I. -O2 -c -o wsp/build/dl-o1.o
  ↪src/dl-o1.c
3 arm-rtems5-ld -r -o wsp/build/dl.out wsp/build/dl-o2.o wsp/build/dl-o1.o

```

output message:

```

1 handle: 0x2207620 loaded
2 dl_o1_func
3 dl_o1_func
4 handle: 0x2207620 closed

```

The right output should be:

```

1 handle: 0x2207620 loaded
2 dl_o1_func
3 dl_o2_func
4 handle: 0x2207620 closed

```

Author: Trac Migrate 2019-09-29T08:33:08.000Z

I change the condition from STT_NOTYPE to STB_GLOBAL. It runs OK on my z7000 board, and I try it in my project(original use RAP format), it works too.

Author: Trac Migrate 2019-09-29T08:35:12.000Z

- **Attachment** [0001-fix-rtems_rtl_elf_find_symbol-bug-when-use-dynamic-l.patch](#) added

patch

Author: Chris Johns 2019-09-29T22:16:59.000Z

Thank you for the patch. I am not sure we can remove the check for STT_NOTYPE so should the change be ...

```

1 if (ELF_ST_BIND(sym->st_info) == STB_GLOBAL ||
2 ELF_ST_TYPE(sym->st_info) == STT_NOTYPE ||
3 sym->st_shndx == SHN_COMMON)
4 {
5 ...

```

I am concerned removing STT_NOTYPE may break other architectures.

Author: Trac Migrate 2019-10-08T01:57:11.000Z

This does not work on arm. From IHI0044E_aaelf.pdf section 4.5.2 , STT_NOTYPE does not mean a global symbol.

The function if(...) is to make a distinction between GLOBAL symbols and LOCAL symbols, so use (ELF_ST_TYPE(sym->st_info) == STT_NOTYPE) is wrong on ARM architectures. BTW: (ELF_ST_TYPE(sym->st_info) == STT_FUNC) works too on ARM.

But your concern is reasonable, I think we should test on different architectures.

Author: Trac Migrate 2019-11-20T16:22:21.000Z

I've successfully run jameszsj's patch and example code on these architectures/BSPs: Arm/xilinx_zynq_a9_qemu, PowerPC/psim, SPARC/erc32, and i386/pc386. I also ran tests DL01-09 on each stated BSP with and without the fix and ensured that the fix didn't break any of these tests.

Replying to [Lou Woods](#):

dl06 failed on all. dl09 only failed on erc32, also dl05 failed on pc386.

Thanks.

Was the result the same without the patch? I suspect it was, as we do not have a test that incrementally links object files. I think it would be good to have one.

I am fine with this patch being push on condition a test is added. If you cannot add a test, that is fine, however I would prefer the patch remains here until we have one.

A complication is this is a change to the build system and would effect Sebastian. I would like his input as well.

Yes

OK this means we need a test.

I suspect it was, as we do not have a test that incrementally links object files. I think it would be good to have one. I am fine with this patch being push on condition a test is added. If you cannot add a

test, that is fine, however I would prefer the patch remains here until we have one.

I don't think it will be too hard to convert what jameszxj provided into an automated test. I don't think it is a problem to do that.

Thanks. I would add it to dl01 unless you think it is best in another test. I do not see a need for a new test.

A complication is this is a change to the build system and would effect Sebastian. I would like his input as well.

I can hold off until Sebastian has weighed in as well.

Great, we need to know if we can change the current build system.

Author: Trac Migrate 2019-12-06T20:01:50.000Z

- **Attachment** 0001-dl01-Added-incrementally-linked-object-test-case.patch added

Added incrementally linked object test case to dl01 that works with rtems-tester

Author: Trac Migrate 2019-12-06T20:10:08.000Z

The above test case patch uses the current build system. Once the new build system is settled it can be converted and hopefully merged along with the fix.

Hello, version 5 of RTEMS crashes on a mvme2100 CPU board.

Here are details of the RTEMS version:

```

1 repository : git://git.rtems.org/rtems.git
2 branch      : master
3 version     : cbfc3415607a6943823e8fc47c38408dcc7dbd90
4 last commit : Thu Mar 14 08:20:54 2019 +0100

```

build commands:

```

1 ./bootstrap
2 mkdir -p build
3 cd build
4 ../configure --target=powerpc-rtems5 --enable-tests --enable-rtemsbsp="mvme2100_
↪beatnik" --prefix /home/pfeiffer/rtems/rtems/5
5 make -sj
6 make install

```

Booted File:

```

1 build/powerpc-rtems5/c/mvme2100/testsuites/libtests/dl10.exe

```

An exception also occurs when I build the examples-v2 project and load

```
1 examples-v2/hello/both_hello/o-optimize/both_hello.ralf
```

The exception with “hello.ralf” does not occur when I use branch “examples-v2-4-10-branch” of examples-v2 and RTEMS 4.10.

Author: Trac Migrate 2019-03-29T12:32:48.000Z

Original author: goetzpf

It seems that *.exe files cannot be loaded from the mvme2100 CPU anyway, but *.ralf files do.

So, in order to reproduce the bug you have to check out examples-v2 (<https://git.rtems.org/examples-v2>), build it and load “both_hello.ralf”.

On the mvme2100 cpu this still gives an exception.

The command

```
1 hexdump both_hello.ralf | less
```

shows that the file starts with “.ELF” in ASCII representation, so it is an probably an ELF file. This is probably not the format the CPU bootloader can load.

I verified that for the “beatnik” board support, the file “both_hello.ralf” does not start with “.ELF”, and there the hello world example works.

Author: Joel Sherrill 2019-03-29T13:22:00.000Z

Original author: goetzpf

The transformation step on linked executables (.exe) to downloadable images (.ralf) was dropped from the build system between 4.11 and 5. This is now something that should be done manually.

Specifically the bsp-post-link step is no longer performed. For BSPs that had one, the bsp-post-link definition is still present but not used in the RTEMS build tree. I am unsure offhand if it is used when building applications against the installed RTEMS image like the examples-v2 do with the rtems_waf build system (assuming waf is what you used there)

https://git.rtems.org/rtems/tree/bsps/powerpc/motorola_powerpc/config/mvme2100.cfg

I think this may be what you are seeing.

Author: Chris Johns 2019-03-29T22:33:47.000Z

Original author: goetzpf

Replying to [Joel Sherrill](#):

I am unsure offhand if it is used when building applications against the installed RTEMS image like the examples-v2 do with the rtems_waf build system (assuming waf is what you used there)

It will depend on the build system used to build examples-v2. The 4.10 would be Makefile.inc based and if the internal change to drop the post link conversion is exposed to the make build of examples-v2 it would also be dropped. The waf build does not support any post link conversions because there is no clean way this information could be captured. The work to add this type of support in a uniform way is complex and large given the number of BSPs we have.

1.5.1.87 3721 - Doxygen param “in/out” attributes not matching function behavior (opened)

Id	3721
State	opened
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-03-08T15:00:34.000Z
Updated	2025-09-19T01:45:40.949Z
Milestone	5.4
Labels	priority::normal, tickettype::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3721
Merges	0

Original author: JSchweikhardt

It would seem that a number of doxygen comments in the source code do not match the function's behavior.

Example: /cpukit/include/rtems/rtems/message.h

```

1 171 /**
2 172 * @brief RTEMS Message Queue Receive
3 173 *
4 174 * This routine implements the rtems_message_queue_receive directive.
5 175 * This directive is invoked when the calling task wishes to receive
6 176 * a message from the message queue indicated by ID. The received
7 177 * message is to be placed in buffer. If no messages are outstanding
8 178 * and the option_set indicates that the task is willing to block,
9 179 * then the task will be blocked until a message arrives or until,
10 180 * optionally, timeout clock ticks have passed.
11 181 *
12 182 * @param[in] id is the queue id
13 183 * @param[in] buffer is the pointer to message buffer
14 184 * @param[in] size is the size of message receive
15 185 * @param[in] option_set is the options on receive
16 186 * @param[in] timeout is the number of ticks to wait
17 187 *
18 188 * @retval This method returns RTEMS_SUCCESSFUL if there was not an
19 189 * error. Otherwise, a status code is returned indicating the
20 190 * source of the error.
21 191 */

```

(continues on next page)

(continued from previous page)

```

22 192 rtems_status_code rtems_message_queue_receive(
23 193     rtems_id      id,
24 194     void          *buffer,
25 195     size_t         *size,
26 196     rtems_option    option_set,
27 197     rtems_interval timeout
28 198 );

```

Since the parameters “buffer” and “size” are output parameters, the comment should say

```

1 183 * @param[out] buffer is the pointer to message buffer
2 184 * @param[out] size is the size of message receive

```

There are other functions where this is inconsistent, so a look at all functions taking pointer parameters is likely a good idea.

Author: Joel Sherrill 2019-03-08T15:10:30.000Z

Original author: JSchweikhardt

This method was not the best example to pick to back up your case. The size parameter is used as **size* for the size of the caller’s buffer and filled in on output with the size of the message actually received.

<https://git.rtems.org/rtems/tree/cpukit/score/src/coremsgsize.c#n46>

This particular case is indeed in/out.

Others may indicate the thinking that the pointer was an input and **pointer* was the output.

Author: Trac Migrate 2019-03-08T15:36:17.000Z

Original author: JSchweikhardt

OK, from the description it was not clear that size is actually [inout]. Maybe there’s room for improvement as well.

As for “Others may indicate” I would argue that in that case “in” is redundant, or even pointless, since in C parameters are always passed by value, so can only be “in” by language definition.

Nit-pick: the coremsgsize.c you reference says “@brief Size” where it meant “Seize”. :-)

Author: Joel Sherrill 2019-03-08T19:02:36.000Z

Original author: JSchweikhardt

Replying to [Jens Schweikhardt](#):

OK, from the description it was not clear that size is actually [inout]. Maybe there's room for improvement as well.

I think this may be the only case in the Classic API where the value of a **argument* is expected to have a value set by the caller.. So I was picking a bit at the unlucky choice for an example. :)

The fact you landed on this one as an example without realizing that may indicate the documentation could be improved. :(

This still doesn't answer the question of how an output parameter via pointer should be annotated. The pointer has a value on input (e.g. in) but the **pointer* is where the output goes.

And the Doxygen for this method doesn't indicate that the buffer and **size* will be set on success. :(

As for "Others may indicate" I would argue that in that case "in" is redundant, or even pointless, since in C parameters are always passed by value, so can only be "in" by language definition.

Yes. This is true. But the personality of the people who did this are anal about consistency. If you say out or inout for some, what is the output for those where nothing is said in the input? Does it look like a mistake not to include in annotation? It is redundant but makes things consistent.

Nit-pick: the coremsgsize.c you reference says "@brief Size" where it meant "Seize". :-)

Got it. I fixed that locally and will push a commit when I catch my next round of patches.

Interestingly, Seize breaks the rule of "i before e except after c"

Author: Trac Migrate 2019-03-11T06:07:44.000Z

Original author: JSchweikhardt

The use of these [in], [out] and [in,out] specifiers is inconsistent and no clear guideline exists yet for the project. See also #3704 and <https://lists.rtems.org/pipermail/devel/2019-February/024988.html>.

Author: Trac Migrate 2019-03-11T09:05:27.000Z

Original author: JSchweikhardt

If I had to devise a (rough?) guideline:

- 1) only pointer parameters are annotated (since scalars are [in] by language definition)
- 2) [in] indicates that the pointer must point to an initialized object (it may be dereferenced by the directive)

3) [out] indicates that the object pointed to may be written by the directive

4) [inout] If both 2) and 3) apply.

This is basically how I interpret these annotations from the Interface Definition Languages from a past life where I used CORBA with a C binding. Word-smithing suggestions welcome.

changed the description

1.5.1.88 3700 - Add `rtems_rate_monotonic_deadline()` (opened)

Id	3700
State	opened
Type	ISSUE
Author	Trac Migrate
Created	2019-02-26T09:50:42.000Z
Updated	2025-09-19T01:45:40.855Z
Milestone	5.4
Labels	priority::normal, qualification, tickettype::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3700
Merges	0

Original author: sebastian.huber

Depending on the scheduler selection, the `rtems_rate_monotonic_period()` behaves differently. In case the EDF scheduler is configured, then tasks using a rate-monotonic object have a higher priority (based on deadline) than the fixed priority background tasks. This is quite bad for applications which want to use the periods with a fixed priority just to get statistics and a deadline miss detection. The default SMP scheduler provides EDF functionality, so this is an issue while porting applications to SMP systems. To give applications more control, add a new function:

```

1 /**
2  * @brief Starts a deadline and period.
3  *
4  * This routine starts a deadline and period. In case Earliest Deadline First
5  * (EDF) scheduling is available, then the priority of the executing task is
6  * adjusted according to the specified deadline. The next activation of the
7  * executing task is specified by the period parameter.
8  *
9  * @param id The rate monotonic object identifier.
10 * @param deadline The deadline in ticks. Must be positive.
11 * @param period The period in ticks. Must be greater than or equal to the
12 ↪ deadline.
13 *
14 * @retval RTEMS_SUCCESSFUL Successful operation.
15 * @retval RTEMS_INVALID_ID No period objects exists for the specified object

```

(continues on next page)

(continued from previous page)

```

15 * identifier.
16 * @retval RTEMS_NOT_OWNER_OF_RESOURCE The period object belongs to another task.
17 * @retval RTEMS_INVALID_NUMBER The deadline is zero or the period is less than
    ↳ the deadline.
18 * @retval RTEMS_TIMEOUT The previous deadline was missed.
19 */
20 rtems_status_code rtems_rate_monotonic_deadline(
21 rtems_id id,
22 rtems_interval deadline,
23 rtems_interval period
24 );

```

The new function uses two timing parameters to allow constrained deadlines and not only implicit deadlines.

The `rtems_rate_monotonic_period()` function should be changed to not alter the task priority depending on the implicit deadline. This avoids surprises while changing the scheduler to EDF in existing applications (especially while porting to an SMP system).

    ↳ applications (especially while porting to an SMP system).

```

Author: Trac Migrate 2019-02-26T12:40:41.000Z

Original author: sebastian.huber

What complicates the interface a bit is that `rtems_rate_monotonic_deadline()` is called after the current job is done (like `rtems_rate_monotonic_period()`) with parameters for the next job. This means that the constraint `period >= deadline` for the parameters makes no sense. The period should specify the time from the last activation to the next activation. The deadline should specify the time from the next activation to the deadline time point. The function checks that you have met the last deadline.

Original author: sebastian.huber

- **Milestone** changed from %”5.1” to %”6.1”

Pushing to 6.1. This is a recent ticket requesting an enhancement and should not block a 5 release.

Author: Trac Migrate 2020-06-29T21:18:44.000Z

Original author: sebastian.huber

We are seeing a behavior with EDF enabled in SMP mode that we see a hang under load. The test stimulus that we have isolated this to is now very simple.

```
for(uint32_t j = 0; j < test_iterations; j++) { sc = pthread_mutex_lock(&mx);  
rtems_test_assert(sc == RTEMS_SUCCESSFUL); NOP; sc =  
pthread_mutex_unlock(&mtx); rtems_test_assert(sc == RTEMS_SUCCESSFUL); }
```

When we run this pretty much basic unit test all OK. Then we run more and more threads in parallel and we see RTEMS lock up. When we go to the simple round-robin scheduler we can run these loops forever with as many threads as we want and don't see a lock-up.

Apologies if I am posting the question in the wrong place - I want to avoid creating spam. Sebastian seems to be the expert on EDF and we are wondering if this is a known issue with a lock-up under load with EDF enabled.

Current RSB master builds qemu a while on MSYS2 before failure as follows:

```

1 libtool: link: x86_64-w64-mingw32-gcc -O2 -pipe -I/c/msys64/home/jrs007/rtems-
  ↳source-builder/bare/build/tmp/sb-jrs007/d/c/msys64/home/jrs007/tools/include -
  ↳shared .libs/iconv.o .libs/localcharset.o .libs/relocatable.o .libs/iconv-
  ↳exports.o .libs/libiconv.res.o -L/c/msys64/home/jrs007/rtems-source-builder/
  ↳bare/build/tmp/sb-jrs007/d/c/msys64/home/jrs007/tools/lib -O2 -Wl,--export-all-
  ↳symbols -O2 -o .libs/libiconv-2.dll -Wl,--enable-auto-image-base -Xlinker --
  ↳out-implib -Xlinker .libs/libiconv.dll.a
2 .libs/iconv.o: In function `libiconv_open':
3 C:\msys64\home\jrs007\rtems-source-builder\bare\build\l1xwm1\build\lib\..
  ↳./libiconv-1.14/lib/iconv_open1.h:176: undefined reference to `aliases2_lookup
  ↳'
4 .libs/iconv.o: In function `libiconv_open_into':
5 C:\msys64\home\jrs007\rtems-source-builder\bare\build\l1xwm1\build\lib\..
  ↳./libiconv-1.14/lib/iconv_open1.h:176: undefined reference to `aliases2_lookup
  ↳'

```

This is a known issue and the workarounds are at <https://savannah.gnu.org/bugs/?47953>

Which of the two alternatives is best to incorporate into the RSB?

1.5.1.97 3582 - Remove dedicated support for boundary constraint in heap allocator (opened)

Id	3582
State	opened
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-11-07T11:02:37.000Z
Updated	2025-09-19T01:45:39.960Z
Milestone	5.4
Labels	old-indefinite, priority::normal, rtems::score, tickettype::task, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3582
Merges	0

Original author: sebastian.huber

Some time ago a dedicated support for a boundary constraint was added to the first fit heap allocator. The use case for this is the libbsd (new network stack) which needs this for the bus space allocator:

https://www.freebsd.org/cgi/man.cgi?query=bus_dma

It turned out that this feature is rarely used. It makes the first fit heap allocator implementation considerably more complex. It is also not a standard allocator feature which makes it more difficult to replace the first fit heap allocator with something else, e.g. TLSF.

The boundary constraint can be also satisfied by an allocator which supports only the alignment constraint via:

```

1 if (boundary > alignment) {
2   assert(alignment == 0 || boundary % alignment == 0);
3   alignment = boundary;
4 }

```

Author: Trac Migrate 2019-12-19T08:07:34.000Z

- **Milestone** changed from %"5.1" to %"6.1"

Author: Chris Johns 2022-06-14T06:46:19.000Z

Original author: sebastian.huber

TLSF provides `tlsf_memalign()`. I think this ticket can be closed and the requirement for an aligned allocation call for any new allocators be made.

Author: Chris Johns 2022-06-14T06:46:52.000Z

Original author: sebastian.huber

This ticket refers to the first fit allocator. Removing the boundary support would simplify the implementation a bit. We should replace the first fit allocator with TLSF, so this ticket is probably obsolete.

Author: Chris Johns 2022-06-20T07:41:33.000Z

Original author: sebastian.huber

Replying to **Sebastian Huber**:

This ticket refers to the first fit allocator. Removing the boundary support would simplify the implementation a bit. We should replace the first fit allocator with TLSF, so this ticket is probably obsolete.

I agree and thanks and that was my view. Please close if you think it would be covered in the other ticket.

1.5.1.99 3534 - Reduce uses of `rtems_event_transient_send()` (opened)

Id	3534
State	opened
Type	ISSUE
Author	Trac Migrate
Created	2018-10-01T06:16:28.000Z
Updated	2025-09-19T01:45:39.752Z
Milestone	5.4
Labels	device, priority::normal, tickettype::task, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3534
Merges	0

Original author: sebastian.huber

The transient event predates the self-contained binary semaphores available now via `<rtems/threads.h>` and is used as workaround to avoid explicit synchronization objects. There are two issues with the transient event.

1. It is a per-thread resources and using it for different components makes debugging/development difficult. Issues noticed in one component may be caused by another component.
2. The diagnostic information (e.g. “task” shell command) is poor.

Replace the transient event with a binary semaphore if possible.

The performance test `tmonetoone`:

```

1 *** BEGIN OF TEST TMONETOONE ***
2 *** TEST VERSION: 6.0.0.4ac51046e0cd6d22d4c89f6d0bbea2383898d698
3 *** TEST STATE: EXPECTED_PASS
4 *** TEST BUILD: RTEMS_SMP
5 *** TEST TOOLS: 10.0.1 20200406 (RTEMS 6, RSB_
↳ b69f54d51740810dc54a50662f5da4d4ba0ddd18, Newlib ece49e4)
6 yield
7 a 25425
8 b 25424
9 event
10 a 14082
11 b 14082
12 self-contained binary semaphore
13 a 12449
14 b 12449
15 Classic binary semaphore (FIFO)
16 a 12525
17 b 12524
18 Classic binary semaphore (priority)
19 a 11649
20 b 11649
21
22 *** END OF TEST TMONETOONE ***

```

shows that the events performing slightly better than the binary semaphores. However, the yield count is about two times the binary semaphore count.

This raises the question if we have to offer a better synchronization primitive for the request and wait for response type actions. This pattern is quite common in device drivers.

Original author: sebastian.huber

Currently the only the boot processor calls system initialization handlers in `rtems_initialize_executive()`. Add a second set of handlers which are called by secondary processors in `_SMP_Start_multitasking_on_secondary_processor()` after the CPU state change to `PER_CPU_STATE_READY_TO_START_MULTITASKING`.

The use case for this are device drivers and extensions such as the stack checker.

1.5.1.104 3448 - Add GCC, Binutils+GDB, Newlib mirrors to RTEMS github (opened)

Id	3448
State	opened
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-06-07T07:30:17.000Z
Updated	2025-09-19T01:45:39.283Z
Milestone	5.4
Labels	old-indefinite, priority::normal, tickettype::task, tool, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3448
Merges	0

Original author: sebastian.huber

Sometimes it is necessary to use a snapshot of GCC, Binutils+GDB or Newlib. The snapshot archives of GCC and Binutils+GDB are only available for a certain time (e.g. half a year).

<https://lists.rtems.org/pipermail/devel/2018-June/021907.html>

The sourceware.org Git services do not provide snapshots.

One option would be to use github since it provides snapshots. However, no official mirrors at github exist.

Add mirrors for GCC, Binutils+GDB and Newlib to <https://github.com/rtems>.

Author: Trac Migrate 2018-06-11T08:31:19.000Z

Original author: sebastian.huber

- **Owner** set to sebastian.huber

My first step is to add

- <https://github.com/rtems/binutils-gdb>
- <https://github.com/rtems/gcc>
- <https://github.com/rtems/newlib-cygwin>

repositories, starting with the master branches only.

The second step is to add a cron job to dispatch.rtems.org to synchronize the repositories once per day with the upstream repositories.

Do we want to mirror all branches of the upstream repositories?

Author: Chris Johns 2018-06-11T09:29:49.000Z

Original author: sebastian.huber

What is practical?

The servers are on a fast backbone and so I do not see a big issue here.

Author: Trac Migrate 2018-06-11T09:51:22.000Z

Original author: sebastian.huber

The least maintenance overhead has probably an automated mirroring of all branches since there are standard Git commands to do this.

Author: Trac Migrate 2018-06-11T09:56:25.000Z

Original author: sebastian.huber

How are is the Git mirroring done for the RTEMS repositories? Can we use the same Git user account for this?

Author: Gedare Bloom 2018-06-11T14:17:40.000Z

Original author: sebastian.huber

This account <https://github.com/rtems-updater> is used from dispatch to push commits in a git hook. I don't know who has the rtems-updater credentials, probably Amar set it up. I would guess its private key should be on dispatch though.

Author: Chris Johns 2018-06-12T01:48:22.000Z

Original author: sebastian.huber

Can the repos please be under something like 'misc' or 'gnu' or 'fsf' and not at the top level.

I am concerned being at the top level will imply this is what users need to use.

Thanks

Author: Trac Migrate 2018-06-12T05:35:32.000Z

Original author: sebastian.huber

I added the repositories.

I don't know you can add subdirectories in Github. Is this possible at all?

We could use some sort of prefix, e.g. mirror-gcc, mirror-binutils-gdb, mirror-newlib-cygwin.

Author: Trac Migrate 2018-06-12T05:37:34.000Z

Original author: sebastian.huber

The git clone -mirror checkout of the three repository need 2.5G of space on my disk. On dispatch.rtems.org we have currently:

```
df -h Filesystem Size Used Avail Capacity Mounted on /dev/gpt/root0 88G 80G 1.4G
98% /
```

Author: Chris Johns 2018-06-12T07:07:06.000Z

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

I don't know you can add subdirectories in Github. Is this possible at all?

I thought you could but I must have not understood what I was looking at. I see there are pinned repos which might help us if we pin our ones so they are at the top.

We could use some sort of prefix, e.g. mirror-gcc, mirror-binutils-gdb, mirror-newlib-cygwin.

That is a good idea. fsf-mirror-gcc?.

Nice. That makes sense to me.

Author: Trac Migrate 2018-06-13T05:33:44.000Z

Original author: sebastian.huber

I have now the following setup on a local machine:

```
1 git clone --mirror git://sourceware.org/git/binutils-gdb.git
2 cd binutils-gdb
3 git remote add github git@github.com:RTEMS/sourceware-mirror-binutils-
  ↪gdb.git
```

```
1 git clone --mirror git://sourceware.org/git/newlib-cygwin.git
2 cd newlib-cygwin
```

(continues on next page)

(continued from previous page)

```
3 git remote add github git@github.com:RTEMS/sourceware-mirror-newlib-
  ↪cygwin.git
```

```
1 git clone --mirror git://gcc.gnu.org/git/gcc.git/git/binutils-gdb.git
2 cd gcc
3 git remote add github git@github.com:RTEMS/gnu-mirror-gcc.git
```

Synchronization is quite easy:

```
1 git fetch
2 git push --mirror github
```

I will set up a cron job on my local machine for now. It runs during work days. To set it up on dispatch.rtems.org we need more disk space (I suggest 4G) and someone with enough privileges on this server.

Author: Chris Johns 2018-06-13T05:58:49.000Z

Your local ftp directory under your personal area is on the NAS and should have enough space. Note, the NAS's FTP may not appear in the `du` list.

You can `chmod` the work space to stop it being scanned by search bots.

Author: Trac Migrate 2018-06-18T06:38:44.000Z

Original author: [sebastian.huber](#)

I have at least two problems to set this up on dispatch.rtems.org:

1. I cannot add a user cron job:

```
1 dispatch:~ # crontab -u sebh -e
2 crontab: must be privileged to use -u
3 dispatch:~ # sudo crontab -u sebh -e
4 -bash: sudo: command not found
```

2. The Git mirror script forwards the request to a local server on port 8003 (`/data/support/git-support/hooks/github-cmd-send.py`). This server probably needs to have access to the local Git clone. I cannot set this up.

The covoar tool is capable of processing multiple sets from a single ini file. But it creates a single report for all the symbols/subsystems, e.g, if covoar is run for score and rtems then it will generate a single symbolSymmary.txt report. It needs to be updated to generate separate report for all the symbols.

The actual code for the `zynq_uart_write_polled` has a while loop inside. What could happen if a hw fault occurs? If TX buffer is always full, lower priority tasks may remain in a blocked state. The objective is to use the UART communication directly by RS232/RS422 protocol without any console.

Why is this function codified different than `zynq_uart_read_polled()`? With the `zynq_uart_read_polled` codification the blocking risks disappear if hw fails and a byte is never put in RX Buffer. I suggest to apply the same if struct to `zynq_uart_write_polled`.

The RTEMS Tester works quite well if it can run the tests step by step. I have a board where I can run reliably all tests at once with a custom script. I cannot run tests individually due to an instability in the debug support. This produces a large text file with the test output of all tests.

It would be nice to have an option to simply feed this file to the rtems-test program and generate the report (optionally send it via e-mail).

I am wondering if the lines in the log should have a timestamp prefixed to them.

Are there any requirements for the test harness obtaining the log? For example timeouts, crash recovery and tests running too long?

Original author: Christian Mauderer

Sporadically the rtems source builder fails with a error message like the following:

```

1 ...
2 package: rtems-tools-HEAD-1
3 git: reset: git://git.rtems.org/rtems-tools.git
4 git: fetch: git://git.rtems.org/rtems-tools.git -> sources/git/rtems-tools.git
5 error: git command failed (/usr/bin/git): 128
6 Build FAILED
7 See error report: rsb-report-rtems-tools-HEAD-1.txt
8 error: git command failed (/usr/bin/git): 128

```

(continues on next page)

(continued from previous page)

```

9 Build Set: Time 0:28:42.787936
10 Build FAILED

```

The error report in rsb-report-rtems-tools-HEAD-1.txt isn't really useful in that case:

```

1 ...
2 script: 81: build_top=$(pwd)
3 script: 82: rtems_tools_source="rtems-tools.git"
4 script: 83: source_dir_rtems_tools=${rtems_tools_source}
5 source setup: rtems-tools-HEAD-1: source rtems-tools -q -n ${rtems_tools_source}
6 making dir: /home/EB/christian_m/Projekte/grisp-software/rtems-source-builder/
  ↳ rtems/sources/git
7 git: reset: git://git.rtems.org/rtems-tools.git
8 git: fetch: git://git.rtems.org/rtems-tools.git -> sources/git/rtems-tools.git
9 error: git command failed (/usr/bin/git): 128

```

I assume that the git fetch went wrong for some reason. That's really annoying because it happens after the quite time consuming build of gcc.

Please correct me if I'm wrong but as far as I know, a download in advance wouldn't do this git command. Therefore this bug can't be triggered before the build.

I'm not that familiar with that step of the RSB but would it be possible to to download a tar.bz2-snapshot of the correct commit from our git server instead of doing a git clone? The git web interface shows a URL like the following for every commit: <https://git.rtems.org/rtems-tools/snapshot/rtems-tools-9f34b38edf2a235e8d41c3265b146b0b1a4da252.tar.bz2>

With that it would be possible to do all downloads in advance and then do the build without the risk that some download goes wrong during the build.

Is this to support a bisect?

I always intended to have the RSB be part of the RTEMS Tools repo however it is a lot of work for me to merge the changes in the RSB config and some other parts into the rtemstoolkit version of the modules. Another issue is all the related documentation and work flows that now exist. It is just something that got away on me and I am sorry for that.

Yes, this is one use case.

As pointed out on the devel list newlib breaks bisecting now.

The ticket is about a git issue which is valid and stopping rtems-tools being fetched by git does not fix that issue, it just hides it. I welcome any patches related to fixing this git issue.

Original author: stavros.passas

We face some issues with TERMIOS, when used on slow UART devices when running on RTEMS master. This was not happening before the last big refactoring of TERMIOS.

Even when the tty is blocking, `rtems_termios_write_tty` function is calling `doTransmit` with

```

1 wait = true
2 nextWait = false.

```

However in doTransmit, wait is over-written with nextWait at the end of each loop, so after one loop wait becomes false regardless if a write is blocking or non-blocking, and the function may return before writing all the characters.

I think what it is intended to be done there is to do `wait |= nextWait`, so if wait is already true, it remains true for the entire function.

proposed fix attached.

Author: Trac Migrate 2017-11-02T10:16:19.000Z

Original author: stavros.passas

- **Cc** added @sebastian.huber, @peerst

We implemented this behaviour for the select() support. In case select() indicates a ready write to a Termios file descriptor, then it is guaranteed that we can transmit at least one character. You can use a loop around write() to transfer everything in on rush.

Author: Trac Migrate 2017-11-02T11:37:30.000Z

Original author: stavros.passas

You are right. I was hoping there is a way to differentiate between select(), and blocking and non-blocking write() calls. This way we break existing applications, even though I guess we can easily port them.

Author: Trac Migrate 2017-11-02T11:47:37.000Z

Original author: sebastian.huber

The `_RTEMS Porting Guide` is out of date and in its current state not helpful to ease the porting of RTEMS to a new architecture. Perform the following steps:

1. Enable build of the `_RTEMS Porting Guide`.
2. Disable existing content and start with a nearly empty document.
3. One step of the porting is the update of the `_RTEMS CPU Architecture Supplement`. Mentions this in the guild and move the `_PORT SPECIFIC INFORMATION` chapter to the guide.
4. Remove the `_no_cpu_` directories form the RTEMS sources and transfer the content to the guide. Mention useful example implementations.

https://devel.rtems.org/wiki/TBR/Website/Board_Support_Packages is linked to from the top of the Wiki and horribly out of date.

I am not sure what to do about this page. We need a master list of BSPs somewhere. It could be updated or we have to find a way to generate an equivalent page. Given this has some historical information, automatically generating it seems hard.

Author: Chris Johns 2017-10-25T22:21:24.000Z

Release [README.txt](#) files contain a list of BSPs in that release (scroll down). It is generated automatically using the `rtems-bsp` script when the release is created.

The current definitive BSP definition is the `rtems-bsp` which learns from the source tree and:

<https://git.rtems.org/rtems-tools/tree/tester/rtems/rtems-bsps.ini>

For me a BSP only formally exists if it is in the INI files under the `rtems-tester`.

A list of BSPs is nice, a list based on the Tier structure would be nicer and a list based on the Tier structure with valid test results even better.

My hope is users of RTEMS will put pressure on those providing services to them to get their architecture and BSP moved up the tier ranks by publishing test results on build@rtems.org.

There is also Amar's django [website](#) that has support for managing BSPs however that effort needs work to straighten out some schema issues on the relationship of arch, processors and BSP that resulted from Amar and I talking at cross purposes. I am not sure what is involved and how much work is required to make this production quality. I am also not sure how we maintain this data long term if this database become active.

Author: Joel Sherrill 2017-10-25T22:25:13.000Z

I would be happy to see that page link to a list of BSPs generated for each branch. Not have the table itself.

But every time we branch, we have to add a link. I was hoping to find something that would stay accurate on its own. Generated from code. Perhaps part of the release process to have a file in the release directory? We could back populate that file and link to those.

We don't have tiers for anything beyond the next release. Could we run the script for 4.10 and 4.11 and link to that? From where to where?

Author: Chris Johns 2017-10-25T22:32:42.000Z

Replying to [Joel Sherrill](#):

We don't have tiers for anything beyond the next release. Could we run the script for 4.10 and 4.11 and link to that? From where to where?

You could `./rtems-bsp > rtems-4.11.2.txt` for the 4.11 releases and I can update the release procedure to do this automatically and have the `README.txt` link to it.

For 4.10 I suggest you copy the `rtems-bsp` to the source tree and run it. In theory you should be able to do this on a number of the older releases.

Your `sh _foo_` is better than mine so a compact list of archs before the BSP list might be a nice addition :)

Author: Trac Migrate 2017-10-26T05:40:39.000Z

I would move this information together with the BSP READMEs to the RTEMS CPU Architecture Supplement. Then I would delete this wiki page.

Author: Trac Migrate 2017-11-09T06:27:14.000Z

64-bit PowerPC.

What do you propose?

We can probably fix the warnings with a small amount of work, however, a real 64-bit support is probably some more work.

Fixing the warning is a good idea. Yes there are some spots that need to be fixed. The host side for 64bit and 32bit support needs some changes and the RAP format would need some work.

FreeBSD has a recovery support for the I2C bus. Port this to RTEMS and use it in the I2C bus drivers.

https://svnweb.freebsd.org/base/head/sys/dev/iicbus/iic_recover_bus.c?view=markup

Author: Chris Johns 2017-10-03T05:26:12.000Z

Original author: sebastian.huber

Looks good. I am not sure how this could be down with the Xilinx I2C controller.

How or when is this invoked?

Author: Trac Migrate 2017-10-03T06:18:48.000Z

Original author: sebastian.huber

Its invoked by the bus driver in case of timeouts or after arbitration problems. You need control over the lines via GPIO.

I have no plans to implement this now, but it might be useful for some applications.

A recent build sweep with RTEMS debug enabled shows a number of BSPs which fail to build all tests which do when RTEMS debug is disabled. The stance by the RTEMS Project to these failures needs to be formally decided. I see a few options:

- Do nothing
- Add them to .tcfg
- Add a special mode for “fails in debug mode” to .tcfg

I hate to see us with BSPs not building. This is just a bad thing to do.

I hate to add them to .tcfg when they do link in normal build mode since this would reduce testing.

The third option is the best but it would require adding another keyword to the .tcfg syntax and require modifying the processing of those files. But it seems like the best option.

Comments welcomed.

Author: Joel Sherrill 2017-09-21T23:35:56.000Z

- **Summary** changed from *Shuold Tests Be Added to .tcfg file Which Only Fail to Link with RTEMS Debug is Enabled?* to *Should Tests Be Added to .tcfg file Which Only Fail to Link with RTEMS Debug is Enabled?*

Author: Chris Johns 2017-09-22T00:15:53.000Z

It would mean some attribute, tag or grouping would need to be added to the .tcfg files. The .tcfg processing is now in Python so this makes that side of things easier to implement. I suggest we add groupings. For example:

```

1 [default]
2 exclude: fileio
3 exclude: cdtest
4 exclude: iostream
5 exclude: flashdisk01
6
7 [debug]
8 exclude: jffs2_fspermission
9 exclude: jffs2_fsrdwr
10
11 [smp]
12 exclude: pppd
13
14 [smp-debug]
15 exclude: utf8proc01

```

There are some issues we need to decide on or solve:

1. Which build options do we create variants for? We should formalize these.
2. How would combinations of variant options be handled? For example is a test in the debug group not built for any //debug// variant such as smp-debug? 2. How do we perform the make level processing in [testsuites/automake/subdirs.am](https://git.rtems.org/rtems-tools/tree/tester/rtems/rtems-bsps.ini#n138) to create a suitable list of variants?

Author: Chris Johns 2017-09-22T00:18:26.000Z

I should also point out the rtems-bsp-builder has a concept of //variants// here <https://git.rtems.org/rtems-tools/tree/tester/rtems/rtems-bsps.ini#n138>.

Works on erc32 and psim Fails on jmr3904 and xilinx_zynq_a9_qemu

The two failures are difference. On the MIPS, the issue is that `_ISR_Get_level()` is not returning the value that was set immediately above. I am guessing that the `_ISR_Set_level()` for the mips and arm ports translates the requested level into a register setting and then doesn't reverse the translation on the `_ISR_Get_level()`.

The code in question is around line 130 with a `printf()` added to show the value:

```

_ISR_Level current = 0; _ISR_Level last_proper_level;

_ISR_Set_level( current ); printf( "_ISR_Get_Level()=0x%08x current=0x%08xn",
_ISR_Get_level(), current ); rtems_test_assert( _ISR_Get_level() == current );

```

jmr3904 output

```

** BEGIN OF TEST SP 37 *** _ISR_Get_Level()=0x0000007f cur-
rent=0x00000000 ../../../rtems/c/src/../../testsuites/sptests/sp37/init.c:
133 _ISR_Get_level() == current

```

On the ARM, it is failing calling the body version of `rtems_interrupt_disable()` in `rtems/src/intr.c`. No obvious failure looking at the code.

Original author: sebastian.huber

The mmap() implementation contains too many conditionals. It doesn't follow the object oriented design of the file system layer. The mmap() is basically a factory. The mmap_h handler should construct a mapping object. A destructor is currently missing. Maybe the mmap_h handler should use a flag to deal with construction and destruction.

As a first step, pass the flags to the mmap_h handler and add a special flag to indicate an unmap. Use it in unmap() to destroy the mapping.

```
1 #define RTEMS_FILESYSTEM_MAP_UNMAP 0x8000
```

Add a static assert to ensure that RTEMS_FILESYSTEM_MAP_UNMAP is distinct to all other MAP flags used by RTEMS.

The comments in ctype.h indicate that the argument to methods like isdigit() should be an integer containing a char. These warnings indicate that a char is directly being passed. This

warning is only showing up on the or1k and epiphany but both have the current newlib.

The following files are ARM-specific:

- freebsd/crypto/openssl/crypto/arm_arch.h
- freebsd/crypto/openssl/crypto/armcap.c

Are this the only architecture-specific files? Do they work on RTEMS? How to test this?

In case a rate monotonic or timer object is deleted and the corresponding timer handler executes currently on another processor, then this may lead to a use after free condition. This could lead to a corrupt watchdog handler state with unpredictable effects.

Original author: dinsdale

The RTEMS source build fails when run on FBSD 12-CURRENT as of July 17. I cannot seem to provide more resolution in the build number as this is rolling release TrueOS (I'll work on that).

gcc 7.1 fails to build when running 12-CURRENT kernel and userland. The issue is in the file options.h (I THINK the file is ./rsb/rtems/build/sparc-rtems4.12-gcc-7.1.0-newlib-2.5.0.20170623-x86_64-freebsd12.0-1/build/gcc/options.h). An example of the issue is (full report attached):

```
./options.h:5541:3: error: redefinition of enumerator 'OPT_d' OPT_d = 123, /* -d / ^ ./options.h:5539:3: note: previous definition is here OPT_d = 121, / -d */ ^
```

When run in a jail of 11.0-RELEASE on 12-CURRENT host, the build still thinks it's in 12 (pulls info from kernel) but builds SUCCESSFULLY.

rsb report from failed build of gcc 7.1 on FreeBSD 12-CURRENT

Author: Trac Migrate 2017-07-23T21:24:58.000Z

Original author: dinsdale

I thought I had added this comment already, but I don't see it. There was some resolution to this issue on the FreeBSD forum:

<https://forums.freebsd.org/threads/54172/>

I tried setenv LC_COLLATE C ...

and tried sudo env LC_COLLATE="C" ...

both with the same failed result as building without attempting to set this.

Not sure where to go with this issue. It seems to have “suddenly appeared” in my 11-release jail that I had *thought* previously worked.

Original author: dinsdale

Hi, I'm going through the documentation and trying to build rtems. I'm having difficulty understanding the section on Prefixes. Chris Johns created a follow up email to my questions on the mailing list which clarifies why that section is difficult to document. Upon retrospect with his explanation in mind, the section makes sense???

I'm going to read it again tomorrow morning. However, my feeling tonight is that perhaps it should say “tldr; setting the -prefix sets the output directory for the RSB” and then have a link to something more elaborate like what CJ said.

Thanks for listening! Russell

PowerPC/qemuprep bsp fails to boot as no boot partition can be found tried with:

```
qemu-system-ppc -no-reboot -monitor null -serial stdio -nographic -net
none -M prep -kernel $HOME/development/rtems/qemuprep/powerpc-
rtems4.12/c/qemuprep/testsuites/samples/hello/hello.exe
```

and also tried to boot from floppy:

```
qemu-system-ppc -boot a -fda ./rtems-boot.img -m 20MB -append "console=/dev/com1"
-serial stdio -no-reboot -kernel $HOME/development/rtems/qemuprep/powerpc-
rtems4.12/c/qemuprep/testsuites/samples/hello/hello.exe
```

seems to ignore this boot option, also hangs at the end and does not exit

Original author: qwertyspark

I am attempting to build the RTEMS 5.3 toolset on Windows using MSYS2 with mingw64. I have been following the quick-start guide in the 5.3 user guide.

I have included a source builder error report for reference.

```

1 I entered the following command to initiate the build:
2 {{{#!python
3 ../source-builder/sb-set-builder --prefix=C:/msys64/home/<REDACT>/quick-start/
  ↪ rtems/5 5/rtems-sparc
4 }}}

```

The build progressed as expected until building gdb-9.1.

```

1 The error report indicated the following error:
2 {{{#!python
3 ../../gdb-9.1/gdb/completer.c: In function 'char* gdb_completion_word_break_
  ↪ characters_throw()':
4
5 ../../gdb-9.1/gdb/completer.c:1933:10: error: invalid conversion from 'const char*
  ↪ ' to 'char*' [-fpermissive]
6

```

(continues on next page)

(continued from previous page)

```

7 1933 |   return rl_completer_word_break_characters;
8
9 |           ^~~~~~
10
11 |           |
12
13 |           const char*
14 }}}

```

Here is the referenced section of code from completer.c. Specifically “return rl_completer_word_break_characters;”

```

1 const char *
2 gdb_completion_word_break_characters_throw ()
3 {
4 /* New completion starting. Get rid of the previous tracker and
5 start afresh. */
6 delete current_completion.tracker;
7 current_completion.tracker = new completion_tracker ();
8
9 completion_tracker &tracker = *current_completion.tracker;
10
11 complete_line_internal (tracker, NULL, rl_line_buffer,
12 rl_point, handle_brkchars);
13
14 if (tracker.use_custom_word_point ())
15 {
16 gdb_assert (tracker.custom_word_point () > 0);
17 rl_point = tracker.custom_word_point () - 1;
18
19 gdb_assert (rl_point >= 0 && rl_point < strlen (rl_line_buffer));
20
21 gdb_custom_word_point_brkchars[0] = rl_line_buffer[rl_point];
22 rl_completer_word_break_characters = gdb_custom_word_point_brkchars;
23 rl_completer_quote_characters = NULL;
24
25 /* Clear this too, so that if we're completing a quoted string,
26 readline doesn't consider the quote character a delimiter.
27 If we didn't do this, readline would auto-complete {b
28 'fun<tab>} to {b 'function()}', i.e., add the terminating
29 '\\', but, it wouldn't append the separator space either, which
30 is not desirable. So instead we take care of appending the
31 quote character to the LCD ourselves, in
32 gdb_rl_attempted_completion_function. Since this global is
33 not just completer-specific, we'll restore it back to the
34 default in gdb_rl_attempted_completion_function. */
35 rl_basic_quote_characters = NULL;
36 }
37

```

(continues on next page)

(continued from previous page)

```

38 return rl_completer_word_break_characters;
39 }
40
41 char *
42 gdb_completion_word_break_characters ()
43 {
44     /* New completion starting. */
45     current_completion.aborted = false;
46
47     try
48     {
49         return gdb_completion_word_break_characters_throw ();
50     }
51     catch (const gdb_exception &ex)
52     {
53         /* Set this to that gdb_rl_attempted_completion_function knows
54            to abort early. */
55         current_completion.aborted = true;
56     }
57
58     return NULL;
59 }

```

RTEMS Tools Project - Source Builder Error Report

Author: Joel Sherrill 2024-01-30T23:40:08.000Z

Original author: qwertyspark

Is gdb configured with `--disable-werror` (or similar)? This might be in the `-log` file if you configured with that.

This type of thing is generally an issue as the host OSes get newer and newer tools and releases of RTEMS and other distributions tend to be tested with older packages.

Merges	0

Original author: okleinke

On branch: 5, tag: 5.3, commit: 9144a4a

Tried to build using the following command line on a fresh Debian testing:

```
../source-builder/sb-set-builder --prefix=[...]/rtems/bin 5/rtems-sparc
```

Fails with:

```
error: shell macro failed: [...]/rtems/rsb/source-builder/sb/rtems-build-dep -c gcc
-l : 2: error: no library (-l) provided
```

The trace log reveals that a check in gdb-common-1.cfg has the wrong outcome, thus not using the --embed argument when calling python3-config:

```
1 config: source-builder/config/gdb-common-1.cfg: 112:>%if %{gdb-python-ver-mm} < 3.
  ↳8 [True]
2 config: source-builder/config/gdb-common-1.cfg: 112:  _if[1]: ['3.11', '<', '3.8']
3 config: source-builder/config/gdb-common-1.cfg: 112:  _if: numeric value check
4 config: source-builder/config/gdb-common-1.cfg: 112:  _if[2]: ('3.11', '<', '3.8
  ↳') True none True

1.5.1.142 4886 - Build of gdb-9.1 fails on mingw64 (opened)

Id	4886
State	opened
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2023-03-22T11:08:05.000Z
Updated	2023-03-22T11:08:05.000Z
Milestone	5.4
Labels	priority::high, tickettype::defect, tool::gdb, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4886
Merges	0

Original author: Fantomas96

The building of the rtems-gdb-9.1 fails due to a feature which is considered deprecated by the late model gcc in mingw. The solution is to update the gdb to version 12.1 by putting the gdb-12.1.cfg file inside the rtems-source-builder/rtems/config/tools directory and update the rtems-default.bset file in rtems-source-builder/rtems/config/5 by changing the gdb version to 12.1

1.5.1.143 4877 - sptests/spsysinit01 sem_open call only has 3 parameters with O_CREAT flag (opened)

Id	4877
State	opened
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2023-03-13T09:26:17.000Z
Updated	2023-03-13T14:29:09.000Z
Milestone	5.4

Merges	0

Original author: lsilistr

When calling sem_open with the O_CREAT flag the sem_open function requires 4 parameters. It will: value = va_arg(args, unsigned int); so the “value” argument will be randomly chosen.

sem_open can fail if the random value is not a valid semaphore value, failing the test.

Author: Joel Sherrill 2023-03-13T13:31:05.000Z

Original author: lsilistr

- **Resolution** set to ~”invalid”

- **Status** changed from *new* to *closed*

This is an error on the caller's part. Per https://pubs.opengroup.org/onlinepubs/9699919799/functions/sem_open.html, the fourth argument is required if you include `O_CREAT`. Since you did not explicitly pass a value, the result is undefined.

```

1 O_CREAT
2 This flag is used to create a semaphore if it does not already exist.
  ↳ If O_CREAT is set and the semaphore already exists, then O_CREAT has
  ↳ no effect, except as noted under O_EXCL. Otherwise, sem_open()
  ↳ creates a named semaphore. The O_CREAT flag requires a third and a
  ↳ fourth argument: mode, which is of type mode_t, and value, which is
  ↳ of type unsigned. The semaphore is created with an initial value of
  ↳ value. Valid initial values for semaphores are less than or equal to
  ↳ {SEM_VALUE_MAX}.

```

Author: Trac Migrate 2023-03-13T13:35:06.000Z

Original author: lsilistr

It's the RTEMS test `spstests/spsysinit01` that calls `sem_open` with only 3 arguments (line 911 in `init.c` - master branch on github right now).

Author: Trac Migrate 2023-03-13T14:28:50.000Z

Original author: lsilistr

- **Milestone** set to %"5.4"
- **Resolution** ~"invalid" deleted
- **Status** changed from *closed* to *reopened*

Thanks, you found the reason for a sporadic test failure which is on my TODO list for a long time.

1.5.1.144 4742 - Deadlock risk of Immediate Ceiling Priority Protocol (ICPP) with nested resource sharing (opened)

Id	4742
State	opened
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2022-10-19T09:54:00.000Z
Updated	2023-01-31T22:44:38.000Z
Milestone	5.4
Labels	priority::normal, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4742
Merges	0

Original author: JJShi

In the current implementation of Immediate Ceiling Priority Protocol (ICPP), the task's base priority is assumed to be lower or equal to the requested resource's ceiling after a successful ceiling check.

However, we notice that the resource's ceiling is not checked against the thread's (task's) base priority but against its current dynamic priority derived from the task's priority aggregation. According to the definition of priority ceiling, a resource's ceiling is required to be set as the highest base priority of all tasks that are requesting it.

This mismatch may lead to a deadlock by erroneously denying legitimate nested resource access if resources are requested with descending order of priority ceilings. We give an example to elaborate such a case: Consider two tasks t_1 and t_2 , t_1 has higher priority than t_2 and two resources R_1 (used by both tasks) and R_2 (used by t_2 only) with $\text{Ceiling}(R_1) = \text{Priority}(t_1)$ and $\text{Ceiling}(R_2) = \text{Priority}(t_2)$. If t_2 acquires R_1 , it inherits its priority ceiling and executes with the promoted dynamic priority $\text{Priority}(t_1)$. If it requests the second resource R_2 , its dynamic priority is higher than $\text{Ceiling}(R_2)$, which leads to a denial of the resource access by the implemented ceiling check. The consequence of this is a deadlock, i.e., t_2 holds R_1 but cannot successfully lock semaphore R_2 due to the implemented ceiling check, whilst t_1 cannot enter the critical section guarded by R_1 .

Such execution behavior with a deadlock can also be demonstrated by a running example in RTEMS, which has been attached.

To correct the mismatch, an adaption to the priority ceiling check is proposed in the attached patch for `coremuteximpl.h`. Instead of checking the potentially already increased dynamic priority, it uses the thread's base priority for the comparison to the newly requested resource's priority ceiling.

After applying the correction, the aforementioned counterexample can be successfully executed.

I would like to move this to 5.4 at least. I believe this bug is avoidable by common practice, and deterministically triggered if it will occur. I would isolate the fix to a later dot release to avoid unexpected impacts on other applications.

Rocky 9 does not provide pax. Searching PowerTools and CRB repos does not report pax or spax as available. RPM websites do not report the RPM available.

Change libdl tests to use tar if pax is not available. Update the options to map pax functionality to GNU tar. BSD tar is not supported but this should not be an issue because BSD systems should maintain pax.

Note, RTEMS 6 uses waf and Python’s tarfile support.

Author: Chris Johns 2022-09-22T22:18:39.000Z

It is simpler to support BSD tar so it will also be supported.

Merges	0

Summary

On multiple host OSes with newer GCC or LLVM, the gdb used in the RTEMS 5 tools no longer builds. The failure varies based on the RTEMS target and host. On some hosts, the build failure is in a simulator while others fail elsewhere.

- FreeBSD 14 fails <<https://lists.rtems.org/pipermail/build/2024-June/053075.html>> with this:

```
In file included from ../../gdb-9.1/gdb/defs.h:56: ../../gdb-9.1/gdb/gdbsupport/
enum-flags.h:85:52: error: integer value -1 is outside the valid range of values
[0, 15] for the enumeration type 'ui_out_flag' [-Wenum-constexpr-conversion] 85 |
integer_for_size<sizeof (T), static_cast<bool>(T (-1) < T (0))>::type
```

- FreeBSD 13 fails with this:

```
1 /usr/bin/cc -O2 -pipe -fbracket-depth=1024 -I/usr/home/tester/rtems-cron-5/rtems-
↪source-builder/rtems/build/tmp/sb-1003/5/rtems-v850/home/tester/rtems-cron-5/

Merges	0

Summary

For some unknown reason, the `_chmod_` has begun to fail on Cygwin. This is done after untaring the source files and results in all Cygwin RSB builds failing.

Steps to reproduce

Build any target on Cygwin. The generated do-build script is run with “sh -ex” which will exit on any command returning non-zero. The following shows the results of manually “sh -ex do-build ; echo \$?”

```
1 + tar_exit=0
2 + cd sourceware-mirror-newlib-cygwin-7947581
3 + chmod -R a+rX,g-w,o-w .

assigned to @opticron

Author: Kinsey Moore 2025-07-07T22:33:37.440Z

I am currently running a full build of 5/rtems-all and devel/qemu to prove this out.

Author: Kinsey Moore 2025-07-07T22:33:37.440Z

It looks like SIS tarball reproduction isn't quite right. I'll figure that out this evening sometime.

Author: Kinsey Moore 2025-07-07T22:33:37.440Z

The issues with SIS has been resolved. Builds are still running, but the only remaining issues thus far have been: * Unable to build bfin/epiphany due to local GCC being too modern (generates build errors in the toolchain) * Unable to build mips due to python being too new (APIs appear to have changed or GCC is too strict where it hasn't been historically)

Author: Kinsey Moore 2025-07-07T22:33:37.440Z

v850 tools build has similar problems

Author: Joel Sherrill 2025-07-07T22:33:37.440Z

It will need discussion but perhaps our recommendation is to use older host OSes for these cases. I don't think updating gcc on 5 would be a wise decision.

Author: Amar Takhar 2025-07-07T22:33:37.440Z

We've discussed this a lot over the years. Trying to get old code on modern tools is a bad idea it's easy to install older OSes and tools even if you have to build from source anyone going down this road should have the experience to do that much otherwise they'll have to find someone to do it for them.

We're far more likely to break something by updating.

Author: Joel Sherrill 2025-07-07T22:33:37.440Z

We are almost guaranteed to break something by upgrading GCC. GCC and newlib are mated to the RTEMS version by at least being the three sources of header files.

I am prone to say this should just be discussed in the release notes. It will be necessary to cover the URL changes so covering that in the unlikely event someone wants to use RTEMS 5 on mips or epiphany they should stick to an older host OS version.

Author: Kinsey Moore 2025-07-07T22:33:37.440Z

I was in no way suggesting that we update GCC on 5 branch. I was merely stating that I don't have the proper system configuration to test builds for bfin/epiphany/mips/v850.

Author: Joel Sherrill 2025-07-07T22:33:37.440Z

@opticron I understood that. I'm ok with adding info to the release notes. I'll see if my CentOS 7 VM can provide some feedback.

Author: Joel Sherrill 2025-07-07T22:33:37.440Z

@opticron @amar I have built bfin/epiphany/mips/v850 and qemu from the 5 branch on CentOS 7. I am resolving this comment.

Commit	28fa89dd5dbd5b6a866a08ed8febc4919829aa82

Summary

Update gdb to 14.2 for rtems 5 branch

This was necessary as the previously used gdb version (9.x) could no long be compiled by a more recent gcc. This caused problems when attempting to use rtems5 on newer OS distributions.

Closes [#14](#).

Summary

Update gdb to 14.2 for rtems 5 branch

This was necessary as the previously used gdb version (9.x) could no longer be compiled by a more recent gcc. This caused problems when attempting to use rtems 5 on newer OS distributions.

Closes [#14](#).

requested review from @chris

Author: Chris Johns 2024-07-18T00:13:16.767Z

Does this change mean users need to move to python 3 devel support?

Author: Amar Takhar 2024-07-18T00:13:16.767Z

Wasn't 2.x being dropped after %6.1 anyway so does it matter since it's the 5 branch?

Author: Chris Johns 2024-07-18T00:13:16.767Z

Because 14.2 requires python 3 development libraries which means any environment a user has for their 5 project will need a change. We need to understand this, agree to it and then document it.

Author: Amar Takhar 2024-07-18T00:13:16.767Z

Agreed on the documentation but my thought process is anyone using RTEMS 5 will be using modern machines. If they are in a situation where they have to carefully maintain an already active instance of RTEMS 5 then they will want to keep their build environment the same. We are only a year or two away from every major UNIX system killing Python 2. FreeBSD already has and some Linux distributions.

If your system is that critical you'll be hand applying patches to RTEMS and not updating your build environment anyway.

I'm of the mind we should support users who work on modern systems but need older versions of RTEMS. Also killing Python 2 across the board will be a `_massive_` help to us.

Author: Chris Johns 2024-07-18T00:13:16.767Z

We cannot assume anything about the environments users have. The machine could be isolated and under configuration control. This update changes the understood requirements for building RTEMS 5.

The 5 RSB works with python 2 and 3 and I do not understand what your concern is or how it relates? The change requires a configuration change to move to python 3 devel libs so gdb builds and my comment is nothing more than making this fact public.

Author: Amar Takhar 2024-07-18T00:13:16.767Z

Well, you did format your comment as a question .. so I thought you were asking one if you weren't then nevermind. :)

Yes I understand how it works but some projects would take the approach of not upgrading it at all and stopping at the last version(s) we could use with Python 2. That's what I thought you were asking. To be clear I agree with the upgrade.

Summary

There were multiple issues preventing any tool builds on Cygwin. The Merge Request includes three patches which are independent of one another.

- Disable chmod on Cygwin (also needed on main)
- Back port DTC patch from main to 5
- Update gdb to 14.2 for rtems 5 branch to have a version that compiles with recent compilers

Loading the VERSION file in a release references bad path code. It looks like the code from taken from the RSB which has special host management.

Original author: chenjin_zhong

Hi, I find when close editor in shell console.some errors will occur. I check and analyse the source code of medit.c. the code fragment is listed as follows.

```
if defined(__rtems__)
```

```
case ctrl('w'): ed = ed->env->current; close_editor(ed); break;
```

```
else
```

```
case ctrl('w'): close_editor(ed); ed = ed->env->current; break;
```

endif

```
static void close_editor(struct editor *ed) { struct env *env = ed->env; if (ed->dirty) { display_message(ed, "Close %s without saving changes (y/n)? ", ed->filename); if (!ask()) { ed->refresh = 1; return; } }
```

```
delete_editor(ed);
```

```
ed = env->current; if (!ed) { ed = create_editor(env); new_file(ed, ""); } ed->refresh = 1; }
```

```
static void delete_editor(struct editor ed) { if (ed->next == ed) { ed->env->current = NULL; } else { ed->env->current = ed->prev; } ed->next->prev = ed->prev; ed->prev->next = ed->next; if (ed->start) free(ed->start); clear_undo(ed); * free(ed);** }
```

as seen above, if the macro `__rtems__` is defined. the `delete_editor` function will free `ed` pointer. Therefore, after the next loop, the `ed` is an invalid pointer. I have checked the code of <https://github.com/ringgaard/sanos/blob/master/src/utils/edit/edit.c>. the code is as follows. **case** `ctrl('w')`: `close_editor(ed); ed = ed->env->current; break;`

The original code is wrong and the change made by Joel due to Coverity is also wrong because the `ed` passed into `close_editor()` is the next editor and not the one we want closed.

Original author: chenjin_zhong

Hi, when I use `ln -s /tmp/file` in shell. I think the meaning of this instruction is to create a symbolic link, which points to `/tmp/file` in current directory. But I find that the code implements this function is `**exit(linkit(globals, argv[0], ".", 1))`. The src code of `linkit` function is listed as follows.

```
int linkit(rtems_shell_ln_globals* globals, const char source, const char *target, int isdir).
if (isdir || (!lstat(source, &sb) && S_ISDIR(sb.st_mode)) || (!hflag && !lstat(source, &sb)
&& S_ISDIR(sb.st_mode))) { if ((p = strrchr(target, '/')) == NULL) p = target; else ++p;
(void)snprintf(path, sizeof(path), "%s/%s", source, p); **source = path;* } if ((*linkf)(target,
source)) { warn("%s", source); return (1); } As shown in black bold, variable source is a
directory. Therefore, I think the target is argv[0]. the source is ".". Therefore, the code
exit(linkit(globals, argv[0], ".", 1)) should be replaced with exit(linkit(globals, ".", argv[0],
1)).
```

Original author: tigrant

Dear RTMES OS devel team,

The RTEMS ARM latest toolchain (based on v5.1 release) supports cortex-m7 which is using armv7-m architecture.

Are you planning to upgrade your toolchain version and add support for cortex-m33 and cortex-m55 CPUs which are using armv8.0-m and armv8.1-m architectures ?

Thank you.

Best Regards, Tigran

Author: Joel Sherrill 2021-05-12T14:52:52.000Z

Original author: tigrant

If you need a newer toolchain, you should use rtems6 (e.g. git master). It is using gcc 10.

We tend to not update the toolchains for release branches. And newer architecture versions would also be added to master, not the release branch.

Are there specific deficiencies on the master and its tool chain?

Author: Trac Migrate 2021-05-12T16:04:48.000Z

Original author: tigrant

Hi Joel,

Thank you very much for your response.

As far as I understand “git master” contains only RTEMS kernel source code, but not a toolchain. (please correct me if I wrong)

Would you please clarify where from can I get the newer RTEMS GCC 10 based toolchain ? For example, for release 5.1.0 I have used RTEMS v5 RSB to build the toolchain. How can I build newer GCC 10 based toolchain without having corresponding RTEMS v6 RSB ? (As I know RTEMS using customised version of toolchain based on GCC and I have to compile RTEMS kernel using RTEMS toolchain).

Would you please advise ? Thank you.

Best Regards, Tigran

Author: Joel Sherrill 2021-05-12T16:35:42.000Z

Original author: tigrant

There is no GCC 10 RSB recipe for RTEMS 5. You could modify the arm gcc version in your **local** 5 branch based on what is in 6. You will need to keep the newlib version the same, but the gcc should be able to be changed.

I don't know what it would be called but a more bleeding edge gcc might be nice for a release branch. For rtems master, we refer to that as rtems7.

For sure, updating GCC past 7 on rtems5 will break some BSPs. At least some PowerPC BSPs need SPE support which was dropped after 7 and I think the ARM changed some compiler flags. But, in theory, there isn't anything wrong with having a newer GCC as an alternative. But it would have to be disclaimed that all testing for the release was done with GCC 7 and anything newer would be at some risk of breakage. And I don't know what the toolchain would be called. It isn't 6 and isn't 5.

Author: Trac Migrate 2021-05-12T17:03:40.000Z

Original author: tigrant

Hi Joel,

Thanks a lot. I will change the GCC version in rtems-source-builder-5.1 to gcc 10.x and will try to build the new toolchain. After that will try to compile the latest “git master”.

May I ask you please to clarify the sentence: “You could modify the arm gcc version in your local 5 branch based on what is in 6.” ?

Best Regards, Tigran

Original author: chenjin_zhong

I find malloc function is called by move_gap function in medit.c. The returned value does not check. At least 32KB of memory is allocated at each time, maybe more than. The returned value “start” should be check to avoid malloc failure. The move_gap function should return immediatelly when malloc failure. the code frament is listed as follows.

```
static void move_gap(struct editor *ed, int pos, int minsize) { int gapsize = ed->rest - ed->gap;
unsigned char *p = text_ptr(ed, pos); if (minsize < 0) minsize = 0; if (minsize <= gapsize)
{ if (p != ed->rest) { if (p < ed->gap) { memmove(p + gapsize, p, ed->gap - p); } else {
memmove(ed->gap, ed->rest, p - ed->rest); } ed->gap = ed->start + pos; ed->rest = ed-
>gap + gapsize; } } else { int newsize; unsigned char *start; unsigned char *gap; unsigned
char *rest; unsigned char *end;
```

```

if (gapsize + MINEXTEND > minsize) minsize = gapsize + MINEXTEND; newsize = (ed->end
- ed->start) - gapsize + minsize; ** start = (unsigned char ) malloc(newsize);* // TODO check
for out of memory gap = start + pos; rest = gap + minsize; end = start + newsize;

if (p < ed->gap) { memcpy(start, ed->start, pos); memcpy(rest, p, ed->gap - p); memcpy(end
- (ed->end - ed->rest), ed->rest, ed->end - ed->rest); } else { memcpy(start, ed->start, ed-
>gap - ed->start); memcpy(start + (ed->gap - ed->start), ed->rest, p - ed->rest); mem-
cpy(rest, p, ed->end - p); }

free(ed->start); ed->start = start; ed->gap = gap; ed->rest = rest; ed->end = end; }

#ifdef DEBUG

memset(ed->gap, 0, ed->rest - ed->gap);

#endif
}

```

Cloned from [#4710](#):

The expansion of the `dir` type macros is not done correctly. Macro replacement only appends the file part to the last element of a path list. For example:

```
1 %{mydir}/abc.cfg
```

with a path of:

```
1 %define mydir x:y:z
```

results in:

```
1 x:y:z/abc.cfg
```

The config load code handles this but it is wrong. The expansion of `dir` type macro variables should handle path separators (`:`) so you get:

```
1 x/abc.cfg:y/abc.cfg:z.abc.cfg
```

This has not been a problem in the RSB because the `_configdir` has only had two elements and the last one only ever had subdirectories.

Cloned from [#4732](#):

Setting the top lets the code be used in deployment to get the version of the RSB being used. An RSB version lets a user track the exact tools being built and version numbers reported by the tools can match the packaged build, eg an rpm name and version info.

Original author: Christian Mauderer

Cloned from [#4730](#):

Like discussed in the following mailing list thread, the rtems-source-builder doesn't generate tar archives for all packages anymore:

<https://lists.rtems.org/pipermail/devel/2022-September/073369.html>

All RTEMS tools build sets 6/rtems-* work fine except for 6/rtems-microblaze. devel/qemu and devel/dtc do not generate a tar archive. If the patch

<https://git.rtems.org/rtems-source-builder/commit/?id=6205068c5a429e9ee1b471f4c8a3a119bb6757b2>

is reverted, the tar files are generated just like before.

Back port the changes from the development branch. The get sources tool is used during the release to collect the sources so they are hosted on <https://ftp.rtems.org>

The changes exposes a number of configuration file issues on the 5 branch.

RTEMS 5 added `-ffunction-sections` `-fdata-sections` to the target flags for BSPs in an architecture that supports code and data sections.

Some EPICS code such as the **NTP** have code the linker does not link into the final executable. The data sections means the done variable is not linked into the executable when a function in the module is referenced.

RTEMS 6 only exports the ABI flags and any internal build flags are not exported.

EPICS should also review this type of code because it excludes potential optimizations.

Author: Chris Johns 2022-07-21T05:52:08.000Z

- **Description** changed

```

1 RTEMS 5 added `--function-sections -fdata-sections` to the target flags.
  ↳ for BSPs in an architecture that supports code and data sections.
2
3 - Some EPICS code such as the [NTP have code](https://github.com/epics-
  ↳ base/epics-base/blob/7.0/modules/libcom/src/osi/os/RTEMS-score/
  ↳ osdTime.cpp#L148). The data sections means the `done` variable is not
  ↳ linked into the executable when a function in the module is
  ↳ referenced.
4 ?
  ↳
  ↳
  ↳
5
6 + Some EPICS code such as the [NTP](https://github.com/epics-base/epics-
  ↳ base/blob/7.0/modules/libcom/src/osi/os/RTEMS-score/osdTime.cpp#L148)
  ↳ have code the linker does not link into the final executable. The

11
12 EPICS should also review this type of code because it excludes
  ↳ potential optimizations.

```

Author: Joel Sherrill 2022-07-21T14:26:42.000Z

This is not a good code pattern to use if per item sectioning is used. There is no reference to the variable done at all and no reason for it to be included. Why not just call an explicit initialization method?

Author: Chris Johns 2022-11-09T22:39:30.000Z

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

This topic has been discussed in an EPICS github issue [#288](#) and Michael thinks the flags are fine. Further testing has shown no real issue. I will set this ticket to invalid and close it. It can be reopened if it is a problem.

The source is not present any longer. I think the simplest solution maybe using the source in the 5.1 release and pointing the RSB 5 freetype URL to that file.

Any updates would be a change in the code and functionality.

The Net-SNMP configuration references a patch that is missing. I cannot find it.

Update to 5.9.3 and for the libbsd stack.

Cloned from #4760:

The time has come to raise a fatal error if a hash is missing rather than a warning. This will stop missing checksums being present when releasing.

It also makes it simpler to test releases for no missing checksums.

Original author: soja

Cloned from [#4184](#):

The function `arm_cp15_start_set_translation_table_entries` rounds the end address of a section up to 1 MiB even if small 4kiB pages are used (i.e. `ARM_MMU_USE_SMALL_PAGES` enabled).

Will submit a patch which only rounds the end address to 4kiB boundary.

Labels	cpukit::shell, priority::normal, resolution::fixed, rtems::shell, ticket-type::defect
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/4096
Merges	1

Original author: frank_k

This patch fixes a tiny bug in the command line editing of the RTEMS shell. Typing CTRL-U in the shell should remove all characters left of the cursor. After pressing CTRL-U, the current implementation does wrongly place the cursor at the end of the line instead at its beginning.

To reproduce the bug, start the shell and type 'abc123' (no <RETURN>):

```
{{{ ~/src/rtems $ qemu-system-arm -net none -nographic -M realview-pbx-a9 -m 256M
-kernel build/arm/realview_pbx_a9_qemu/testsuites/libtests/dl10.exe * BEGIN OF TEST
libdl (RTL) 10 * * TEST VERSION: 6.0.0.d9bdf166644f612dd628fe4951c12c6f8e94ba5f
```

```
* TEST STATE: USER_INPUT * TEST BUILD: RTEMS_DEBUG RTEMS_NETWORKING
RTEMS_POSIX_API RTEMS_SMP * TEST TOOLS: 10.2.1 20200904 (RTEMS 6, RSB
31f936a7b74d60bda609a9960c6e1a705ba54974, Newlib a0d7982) RTL (libdl) commands: dl,
rtl
```

RTEMS Shell on /dev/foobar. Use 'help' to list commands. SHLL [/] # abc123 }}

Then move the cursor onto the '1' by hitting three times the <ARROW-LEFT> key. Next type <CTRL>-U:

```
{{{ SHLL [/] # 123 }}}}
```

Note that the cursor is at the end of the line (after '3') instead of correctly at the beginning (on the '1'), now.

Continuing typing 'echo ' incorrectly results in the output:

```
{{{ SHLL [/] # 123echo 123 }}}}
```

The patch changes this behavior so that the cursor in the second last step will be on the '1' and typing 'echo ' will then correctly reflected as:

```
{{{ SHLL [/] # echo 123 }}}}
```

Original author: sebastian.huber

Cloned from [#4358](#):

The priority queues in clustered scheduling configurations use a per scheduler priority queue rotation to ensure FIFO fairness across schedulers. This mechanism is implemented in the thread queue surrender operation. Unfortunately some semaphore and message queue directives use wrongly the thread queue extract operation.

Author: Chris Johns 2022-11-09T23:25:23.000Z

Original author: sebastian.huber

- **Resolution** set to ~"wontfix"
- **Status** changed from *assigned* to *closed*

Please use RTEMS 6 for SMP. Please reopen if this is to be fixed on the RTEMS 5 branch.

3.1.1.32 4119 - rtems-bsp-tester: Off By One for Completed Jobs

Id	4119
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Chris Johns
Created	2020-10-02T17:36:58.000Z
Updated	2022-11-09T23:17:29.000Z
Milestone	5.2
Labels	priority::normal, resolution::wontfix, tickettype::defect, tool, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/4119
Merges	0

Looking at <https://lists.rtems.org/pipermail/build/2020-September/019154.html>, you can see that the completed number of jobs doesn't match up with the number for the last build:

```

1 Total Time           : 2:05:13.725904 for 1696 completed job(s)
2 Average BSP Build Time: 0:00:04.430262
3
4 .....
5
6 1695 profiling v850/v850sim build:
7 configure: /home/joel/rtems-cron-6/rtems/configure\
8 --target=v850-rtems6 --enable-rtemsbps=v850sim --prefix=/home/joel\
9 /rtems-cron-6/tools/6/bsps --enable-profiling --disable-smp

```

I think there are 1695 jobs completed not 1696. :)

Author: Chris Johns 2022-11-09T23:17:29.000Z

- **Resolution** set to ~"wontfix"
- **Status** changed from *assigned* to *closed*

Please reopen if this is still valid and important for the 5 branch.

3.1.1.33 4102 - rtems-pairs includes invalid BSP

Merges	0

Recent Linux distros may not provide a python command by default. This breaks building any waf based tools such as the rtems-tools and rtems-libbsd.

Provide support for waf builds by check for a suitable Python executable and using it to directly invoke waf. For example:

```
1 /usr/local/bin/python3.7 ./waf configure --prefix=/blah/blah
```

Author: Chris Johns 2022-11-09T23:14:51.000Z

- **Resolution** set to ~"fixed"

Merges	0

Original author: Kevin Gordon

The source file discdevs.c contains logic error with regard to a rtems_disk_device.uses member, in that the .uses value can underflow and wrap-around because this member is unsigned and the implementation does not check for a current value of 0.

Case in point, see `diskdevs.c` line 373:

```
physical_disk->uses -= deleted_count;
```

If `deleted_count` is greater than `physical_disk->uses`, e.g. `physical_disk->uses` is 0 and `deleted_count` is 1, `physical_disk->uses` will underflow. There are other references to the `uses` member that can result in errors, e.g., line 448:

```
uses = -dd->uses;
```

We discovered this bug via a unit-test that creates multiple RAM disks and then attempts to delete them, without any `uses`, resulting in RTEMS errors because the `uses` member had wrapped around. To circumvent this bug, we had to force the `uses` member to a value of 1 prior to calling `rtems_disk_release()`, which then successfully deleted the RAM disks via `rtems_disk_delete()`, otherwise the results cascaded into error situations that were undesirable.

Author: Trac Migrate 2018-11-12T06:21:35.000Z

Original author: Kevin Gordon

This API is deprecated in RTEMS 5.1 and will be removed in RTEMS 6.1.

Author: Trac Migrate 2019-01-29T08:06:16.000Z

Original author: Kevin Gordon

- **Milestone** changed from %”5.1” to %”5.2”

If you want to get this fixed, then please send a patch to devel@rtems.org. I would avoid this API and use `rtems_blkdev_create()` and `rtems_blkdev_create_partition()` instead.

Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2020-09-06T22:19:37.000Z
Updated	2022-11-09T22:31:38.000Z
Milestone	5.2
Labels	priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4071
Merges	0

Original author: kgardas

Using 5.1 RTEMS release and RSB to build the beast I've found out it's not able to pass BSP options correctly using `--with-rtems-bspopts` option:

```
1 ../source-builder/sb-set-builder
2 --prefix=$HOME/sfw/rtems/5.1-smp2-vga80x50-key-to-reset 5/bsps/pc
```

(continues on next page)

(continued from previous page)

```

3 --with-rtems-tests --with-rtems-smp
4 --with-rtems-bspopts="BSP_VIDEO_80x50=1 BSP_PRESS_KEY_FOR_RESET=1"

```

command fails with:

```

1 Build Set: Time 0:00:28.975685
2 Build Set: Time 0:03:36.556012
3 installing: 5/bsps/pc ->
4 /export/home/karel/sfw/rtems/5.1-smp2-vga80x50-key-to-reset
5 clean staging: 5/bsps/pc
6 Staging Size: 4.271GB
7 Build Set: Time 0:24:53.756984
8 Build Set: BSP_PRESS_KEY_FOR_RESET=1
9 error: no build set file found: BSP_PRESS_KEY_FOR_RESET=1.bset
10 Build Set: Time 0:00:00.000420
11 Build FAILED

```

It looks like even if I use just one BSP options, it's still not passed to the BSP, but build is built fine at least.

Original author: sebastian.huber

This error occurs when the python locale environment is not set correctly. I got this for an compile error message when rtems-source-builder failing to building expat on MacOS.

ensuring LANG and LC_ALL are set fixed the problem writing the error log

export LANG='en_US.UTF-8' LC_ALL='en_US.UTF-8'

LANG is generally set correctly on macos.

if one is setting one of the LC_* variables to a different locale (I use LC_TIME="de_DE.UTF-8")

then python assumes the encoding is ascii only.

setting LC_ALL overrides this and python happily uses utf-8 again.

Original author: sebastian.huber

According to POSIX

<https://pubs.opengroup.org/onlinepubs/9699919799/functions/sync.html>

we have

```
1 The sync() function shall cause all information in memory that updates file_
  ↳ systems to be scheduled for writing out to all file systems.
```

Currently, the RTEMS sync() implementation synchronizes only the file descriptors associated with a FILE object. This should be changed to call fsync() and fdatasync() for all file descriptors.

Fix for the BSP timer initialization when GPTIMER is used as the cpucounter. Without restarting in HW the cpucounter would stop after some time.

Author: Trac Migrate 2021-03-07T15:57:16.000Z

Original author: daniel

In [changeset:"cb8379dc0915c10960a0923a9869e98869e410bd/rtems"cb8379d/rtems]:

```

1 leon: restart and load timer counter at initialization
2
3 Without this smp05 and smpthreadlife01 tests may fail
4 depending on how the boot loader initialized the GPTIMER.
5 Before the time counter stopped counting when reaching
6 zero, but tests could work since it could take 2^32 us
7 before stopping.
8
9 The timer driver will potentially overwrite this, but it
10 happens later due to the initialization order having
11 RTEMS_SYSINIT_CPU_COUNTER very early.
12
13 Update #4312.
```

Merges	0

Original author: daniel

The new GRCAN_FD IP supports CAN FD standard and is mostly backwards compatible with GRCAN SW interface. It introduces support for CAN-FD frames and a new bit-rate timing registers for new baud-rate.

The GRCAN driver have been extended to support the GRCANFD IP using the same API. Device IP-core specific functions are split into different files (grcanstd.c and grcanfd.c).

Original author: daniel

There is no point in having two different implementations specific per GRLIB CAN device driver (OCCAN and GRCAN). Instead we can use the common CAN timing definitions and translate that into the device specific parameters using a new common calculation function.

The change to support code and data sections has broken creating net boot images for the MVME 2700 (mvme2307) BSP. The linker command file ppcboot.lds does not handle the per function text sections.

Author: Trac Migrate 2021-02-24T21:50:13.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"3824960f24304eec051fdc59121ba9ba8a8346da/rtems" 3824960/rtems]:

```

1 powerpc/motorola_power: Link all text sections into the executable image
2
3 - The change to building all code with code and data sections means
4 we have a section per function. Make sure all functions are
5 placed in the text section.
6
7 Closes #4266

```

Author: Chris Johns 2021-02-26T04:19:33.000Z

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

The change does not resolve the issue. I am not sure what happened in my testing.

The bootloader linked executable has the .text.* sections present. I am wondering if the Motorola debug monitor is not capable of loaded this type of ELF file. As a result the card information is not found and boot process fails. You can observe this

by running `readelf -a` on the `rtems.img.elf` file created when making the image file. This is the RTEMS 5 executable linked with the RTEMS 6 bootloader:

1	Section Headers:							
2	[Nr]	Name	Type	Addr	Off	Size	ES Flg	Lk_
		↪ Inf Al						
3	[0]		NULL	00000000	000000	000000	00	0_

		↪ 698 4						
13	[10]	.strtab	STRTAB	00000000	042a70	00616c	00	0_
		↪ 0 1						
14	[11]	.shstrtab	STRTAB	00000000	048bdc	00005e	00	0_
		↪ 0 1						

The RTEMS 6 executable has more code than the RTEMS 5. I tried a number of combinations in the linker command script but could not find a suitable result.

I have now looked into fixing the building of the bootloader in the RTEMS 5 automake build system and there are some fundamental issues present and I am yet to decide how this is to be resolved.

The bootloader Makefile has a variable `BOOTLOADER_CPU_FLAGS`: https://git.rtems.org/rtems/tree/c/src/lib/libbsp/powerpc/motorola_powerpc/bootloader/Makefile.am?h=5#n22 This is empty because `CPU_FLAGS` is not exported into this file:

```
1 $ grep CPU_FLAGS powerpc-rtems5/c/mvme2307/lib/libbsp/powerpc/motorola_
↪ powerpc/bootloader/Makefile
2 $
```

The CPU flags are being provided the globally set `CFLAGS` and this includes the text and data segment flags which is causing the problem. Adding:

```
1 CFLAGS =
2 CPPFLAGS =
3 CCASFLAGS =
```

Results in no valid CPU flags being set.

I am reluctant to add exporting the CPU flags to a high level in the build process because it will be seen by all BSPs and it is very difficult to know if there are possible side effects in another BSP.

I cannot only see a couple of solutions:

1. Remove the problem flags from the build
2. Find a way to include the config with the flags

Author: Chris Johns 2021-02-26T07:14:46.000Z

I have isolated the issue to the building of `zlib.c` by the RTEMS 5 gcc. If I build just this file with the RTEMS 6 gcc the board boots.

Author: Chris Johns 2021-02-26T19:04:37.000Z

Comparing the `zlib.o` ELF sections for RTEMS 5 and 6 the `.bss` size is almost 0:

1	Section Headers:							
2	[Nr]	Name	Type	Addr	Off	Size	ES Flg Lk	
		↪ Inf Al						
3	[0]		NULL	00000000	000000	000000	00	0
		↪ 0 0						
4	[1]	.text	PROGBITS	00000000	000034	003cb8	00 AX	0
		↪ 0 4						
5	[2]	.rela.text	RELA	00000000	004890	000444	0c I	16
		↪ 1 4						
6	[3]	.data	PROGBITS	00000000	003cec	00027c	00 WA	0
		↪ 0 4						
7	[4]	.bss	NOBITS	00000000	003f68	000008	00 WA	0
		↪ 0 4						

and `zlib` has a set of tables it generates. The RTEMS 6 or gcc-10 ELF sections are:

1	Section Headers:							
2	[Nr]	Name	Type	Addr	Off	Size	ES Flg Lk	
		↪ Inf Al						
3	[0]		NULL	00000000	000000	000000	00	0
		↪ 0 0						
4	[1]	.text	PROGBITS	00000000	000034	003c7c	00 AX	0
		↪ 0 4						
5	[2]	.rela.text	RELA	00000000	005014	000444	0c I	18
		↪ 1 4						
6	[3]	.data	PROGBITS	00000000	003cb0	00027c	00 WA	0
		↪ 0 4						
7	[4]	.bss	NOBITS	00000000	003f2c	0010a8	00 WA	0
		↪ 0 4						

An inspection of the generated assembler shows the data being allocated using the `.comm` directory placing the data in the common section. Adding `-f-no-common` to the building of the bootloader has it working.

Author: Chris Johns 2021-02-26T19:06:17.000Z

GCC 10 defaults to `-fno-common` ...

https://gcc.gnu.org/bugzilla/show_bug.cgi?id=85678

Author: Chris Johns 2021-02-26T19:21:14.000Z

The preferred solution is to add `*(COMMON)` to the `.bss` section in the linker command file used to link the boot loader. This will work with any gcc version and default they decide on.

Author: Trac Migrate 2021-03-03T19:58:04.000Z

Maybe worthwhile looking into the `-orphan-handling=MODE` argument for `ld` in newer `binutils`? At least “warn” if not “error” seems like it would have made this situation more obvious.

<https://sourceware.org/binutils/docs/ld/Orphan-Sections.html>

3.1.1.63 4248 - PowerPC shared ISA IRQ support is broken (cloned)

Cloned from [#4239](#):

The PowerPC shared ISA IRQ management in `i8259s.c` is broken. It fails to handle:

- Interrupt acknowledgements for the slave controller when the master has a lower priority pending interrupt acknowledge the slave and the master controllers
- The nesting support to suspend and resume an interrupt does not correctly handle the enable/disable
- The initialise of an interrupt does not handle any pending request
- Locks up when using with the IRQ server which is executing the handler in a task context

All these issues have been fixed in the i386 BSP however the code between is not shared as the i386 BSP has BSP specific IRQ management code as well.

Author: Trac Migrate 2021-02-16T20:30:07.000Z

The explanation is taken from André on the user list:

Hello,

after some digging I think I found the problem and at least a workaround.

As a disclaimer, I do not know if this really counts as a general fix. I have not invested enough time to dig through the original mkimage U-Boot source to figure this out. But I have attached my workaround patch if anyone might face the same problems.

The source of the problem are eight bytes between the header and the actual input file which are missing when using mkimage.py. Also the input size and input crc are wrong which is a result of the missing bytes.

These eight bytes always reflect the actual size of the input file (first four bytes) with four bytes zeros following. Within the original mkimage tool these eight bytes are considered part of the input file section in the output file. Therefore the calculated input size is eight bytes higher and the input crc differs.

As a workaround the mkimage.py script will add these eight bytes to the output file and the input crc calculation and adjusts the input size. This only happens when the type script was selected.

Best regards André

Original author: soja

When using libpci in a custom BSP we experienced linking problems for C++ test (e.g. spcxx01).

The reason is the missing extern C include guards for confdefs/libpci.h. Therefore, the reference to pci_config_lib_init is mangled.

A patch fixing this problem is provided here: <https://lists.rtems.org/pipermail/dev/2020-October/062981.html>

Throwing a `std::runtime()` exception locks up.

The lock up is in the exception clean up handler where the exception object is destructed. The destructor loops destructing the `std::string` object. The path ends up in `libstdc++-v3/include/ext/atomicity.h` line 48 or `__exchange_and_add`.

At a guess it would seem like the C++ atomics on i386 is broken or fragile.

UPDATE: This was broken when gcc i386 eliminated `-mcpu` in favor of `-march/-mtune`. The multilibs were built with `-mtune` and not `-march`.

Author: Trac Migrate 2020-09-10T20:24:40.000Z

I’m observing a hang with RTEMS 5.1 with i386/pc686 which may be this issue, though it does not looks to me to be in an exception class ctor. This is a test case I’m running in QEMU w/ 1 virtual CPU.

It’s on exit from an `catch(...){` block. The actual hang appears to be a tight loop in the `__atomic_fetch_add_4` builtin. Specifically, these three instructions.

```
1 => 0x3f1780 <libat_fetch_add_4>:      mov     $0x5,%eax
2 0x3f1785 <libat_fetch_add_4+5>:      mov     %eax,0xc(%esp)
3 0x3f1789 <libat_fetch_add_4+9>:      jmp     0x3f1780 <libat_fetch_add_4>
```

The stack trace is:

Author: Trac Migrate 2020-09-11T04:51:16.000Z

If this BSP uses libatomic to load a 32-bit value, then it uses an obsolete instruction set.

Author: Trac Migrate 2020-09-11T16:56:14.000Z

I've not come across 'libatomic' before. I guess this is some compatibility glue for older x86?

From some playing around, it looks like the toolchain gcc is defaulting to '-march=i386' if no other option is provided. Maybe not surprising given that the toolchain name is 'i386-rtems5'. '<prefix>/make/custom/pc686.cfg' has '-mtune=pentiumpro -march=pentium'. Passing this to a short test seems to result in the intrinsic actually being used. So I guess the RTEMS kernel config/build is ok?

Starting from the linker map of epicsTimeTest, I see that the symbol `__atomic_fetch_add_4` (aka. 'libat_fetch_add_4') is undefined in `<prefix>/lib/gcc/i386-rtems5/7.5.0/mpentiumpro/libstdc++.a`. So I guess this means that the (multilib?) build of libstdc++ is not being done correctly?

My knowledge of GCC internals doesn't extend beyond `./configure` arguments. So I don't know where to look next.

Author: Joel Sherrill 2020-09-11T22:07:20.000Z

Could someone please try this test case with `-march=i486` as the compiler selection?

I think we need to move the base uniprocessor x86 CPU model up from vanilla i386 w/FPU but what the new floor needs to be is TBD. If I understand things correctly, i486 is the minimum with any atomic instructions but you have to get into the pentium II era to get the earliest SMP support.

I'm not sure if going beyond i486 is needed for uniprocessor but that may be sufficient. For SMP, you probably need to go to at least pentium II. On Qemu, I used core2duo long ago to test SMP.

If we move the floor to greater than or equal to Pentium, there is more opportunity to remove a small bit of code. But I'd like to know the bare technical minimums first.

So what is the lowest architecture (`-march=XXX`) that appears to solve this for you?

Author: Trac Migrate 2020-09-11T23:18:34.000Z

I may have answered part of my question with a lucky grep of the gcc source. I found '`gcc/config/i386/t-rtems`' which seems to show that the different multilib versions are built with '`-mtune=...`', and presumably defaulting to '`-march=i386`'. RTEMS itself in '`<prefix>/make/custom/pc686.cfg`' has '`-march=pentium`'. What is the logic here?

```

1 MULTILIB_OPTIONS = mtune=i486/mtune=pentium/mtune=pentiumpro msoft-float
2 MULTILIB_DIRNAMES= m486 mpentium mpentiumpro soft-float
3 MULTILIB_MATCHES = msoft-float=mno-80387
4 MULTILIB_MATCHES += mtune?pentium=mtune?k6 mtune?pentiumpro=mtune?athlon
5 MULTILIB_EXCEPTIONS = \
6 mtune=pentium/*msoft-float* \
7 mtune=pentiumpro/*msoft-float*

```

Author: Trac Migrate 2020-09-12T07:47:29.000Z

We have two different issues:

1. The i386 BSPs use probably obsolete instruction sets which lead to the use of libatomic.
2. If libatomic is used, then there is some broken behaviour.

The libatomic seems to work fine on other architectures, e.g. it is also used by the sparc/erc32 BSP. Here the cdtest.exe test program runs successfully and executes a similar context:

```

1 Breakpoint 2, libat_fetch_add_4 (mptr=0x203d798, opval=4294967295,

Replying to [Michael Davidsaver](#):

It's on exit from an `catch(...){` block. The actual hang appears to be a tight loop in the `__atomic_fetch_add_4` builtin. Specifically, these three instructions. `{{{ => 0x3f1780 <libat_fetch_add_4>: mov $0x5,%eax 0x3f1785 <libat_fetch_add_4+5>: mov %eax,0xc(%esp) 0x3f1789 <libat_fetch_add_4+9>: jmp 0x3f1780 <libat_fetch_add_4> }}}}`

From this code it is clear, that this is a libatomic configuration issue on i386. We have a recursive call here. We probably use instruction sets which are not really tested these days by someone else.

Author: Joel Sherrill 2020-09-12T14:54:58.000Z

The bug goes back to when gcc replaced `-mcpu=` with `-march=` and `-mtune=`. We used to generate code specifically compatible with and optimized for a CPU model. `-march` is now the compatibility level flag and `-mtune` is an optimization indication. We are generating i386 compatible code which is tuned based on say an i686 instruction weighting.

The multilib `-mtune` needs to change to `-march`.

Since `-march` is the first x86 option described, it is at the top of this page in the GCC manual:

<https://gcc.gnu.org/onlinedocs/gcc-7.5.0/gcc/x86-Options.html#x86-Options>

A quick search browsing `gcc/config/i386/t-*` shows RTEMS seems to be the only i386 target building multilibs which are cpu model based. Others use m32/m64 or other things.

Author: Trac Migrate 2020-09-18T21:36:49.000Z

Is there agreement on a path forward for this issue? Is it as simple as replacing 'mtune' with 'march' in `gcc/config/i386/t-rtems`? If so, who will do/test this? This change seems simple enough that I would just try it myself, but I'm not sure where/how to add a patch in the RSB recipes.

Author: Joel Sherrill 2020-09-18T21:53:00.000Z

I think that's the extent of the source changes which we think will resolve the issue. Someone may point to documentation but it is Friday and I am going to point to an example of adding a patch and talk you through it. This assumes the 5 branch

because we won't get a patch merged into gcc 7. We can address RTEMS master after 5 is fixed. The patch for gcc should be the same. We just have more latitude to merge it to gcc master and newer release branches.

How to generate a patch: <https://devel.rtems.org/wiki/Developer/Coding/GenerateAPatch> which should also be in the Software Engineering Guide.

The easiest example I saw was in `rtems/config/5/rtems-lm32.bset` which adds a gdb patch only for lm32 builds. You would be adding a gcc patch to `rtems/config/5/rtems-i386.bset`.

For merging, a patch needs an Internet home (attaching to a ticket gives you a URL) but for testing, you can just drop the diff into the patches subdirectory `config/rtems/patches`. The RSB will see it there and not try to fetch it. But you need an sha checksum.

After that, it is build as normal for testing purpose. If this gives you a toolset that works, we can address changing the URL. But attaching it to this ticket and getting the URL for the "raw" attachment should work just fine.

This looks like the same name was accidentally used. Without knowing the architecture, you can't know what was intended:

CTF integration

CTF is really neat and brings to RTEMS a range of features we really need. The format is good and applicable to RTEMS and the post processing and real-time monitoring tools are valuable.

The CTF has a range of tools and parts and this task is to bring those together and into the RTEMS Trace Linker. The goal is to encapsulate what is needed to use CTF and what it provides with the functionality of the RTEMS Trace Linker to build an application for a user that uses CTF. The `rtems-tld` tool knows about RTEMS and function signatures (see task 1) and it can be taught to internally invoke the CTF tools to create a required configuration files and target code to integrate with the CTF post processing tools. Being able to use the Capture Engine is considered an advantage.

A key part is **barectf**. This accepts a YAML configuration and generates suitable C code for integration into the application. This tool can be wrapped inside the `rtems-tld` and used transparently to the user. The `rtems-tld` can build any **barectf** generated code for a target because it already knows the compiler and flags required by the target. The user's code is wrapped by the GNU ld and that creates the dependencies to the `rtems-tld` generated code and in turn to the **barectf** generated code. No user code is touched at the source or even the object file level and this is an important requirement.

What follow is mostly guess work on my part and needs to be clarified, corrected and cleaned up as we learn more. I base what is written on the current wrapping of trace calls is controlled by `rtems-tld` and so it can generate the `barectf` configuration file. The `barectf` generated code takes in the trace data and returns CTF format records suitable for buffering. The Capture Engine is used because it provides safe concurrent buffering of data. The project is bring all this together.

The task can be divided up into:

1. Investigate how `barectf` works and what code is generated.
2. Determine how the trace wrapped calls created by `rtems-tld` integrate to the `barectf` trace support. I suspect this is a matter of assigning event ids in the `barectf` configuration file to match the `rtems-tld` generated ids.
3. Create an `rtems-tld` generator to generate C code to bind to the `barectf` calls.
4. Integrate the `barectf` output support to the Capture Engine so it performs the buffering. This assumes the `barectf` code generated is sequential and event processing is sequential and contains no code to update global variables. The concurrent activity is the buffering and this is handled by the Capture Engine.
5. Determine how to add extra special features such as CPU number.

The final part of this task is transport to the host machine. How this happens has not been determined yet and is open to suggestions and innovation.

Original author: Spencer

Excellent write up.

The capture engine has buffering support as well as filtering and triggering support to limit the data captured and to focus the trace to the specific area of interest. Is filtering and triggering handled by `barectf` and the YAML config file?

The idea for the transport is to have a function call handler struct that is registered for each transport, ie a transport API. What the struct looks like and so the needed calls is unknown and I feel will be defined more and more over time. The simplest transport is a buffer in memory that can be written to a file when the trace run has finished. It would be nice to have a transport framework even if the detail is limited to simplest case.

Issues Summary

5188 - Backport 5.4: *bsps/shared: NS16550 driver updates the line control register during operation* (page 494)
 4940 - Fix cache support for ARM926EJ-S processor (page 611)
 4914 - libbsd/ipsec-tools: Problems with more than 64 open files (cloned) (page 612)
 4692 - Python 3.8 introduces new warning about using operator “is” with a literal (page 613)
 4678 - System initialization time increased compared to RTEMS 4.11 (page 614)
 4676 - incorrect handling of “inactive_per_block” from “Objects_Information” structure (page 618)
 4669 - clock_nanosleep() uses the wrong clock to determine the start time point (page 621)
 4660 - Spike failing to build with RSB 5 on Ubuntu 21.04 (page 623)
 4654 - pfctl: Fix global state initialization (cloned) (page 625)
 4653 - pfctl: Fix global state initialization (page 626)
 4652 - if_atsum: Fix checksum offload, add multicast and VLAN support (cloned) (page 627)
 4651 - if_atsum: Fix checksum offload, add multicast and VLAN support (page 637)
 4650 - tcpdump: Fix dumping to file and reading from file (cloned) (page 642)
 4649 - tcpdump: Fix dumping to file and reading from file (page 646)
 4644 - wkspc “failed allocations” increase with heap protection enabled (cloned) (page 649)
 4643 - wkspc “failed allocations” increase with heap protection enabled (page 650)
 4638 - Error in imfs memfile when device is full (page 651)
 4627 - Multitasking start is broken on SMP targets which do not restore the interrupt state during context switch (page 652)
 4611 - BSP/atsum: UART driver sends data with a small gap (page 654)
 4609 - support for DMA access (page 655)
 4608 - Added support for Intel 82580 (page 656)
 4606 - TFTP server protocols (page 656)
 4605 - TFTP client protocols (page 657)
 4604 - Telnet client protocols (page 1067)
 4603 - Added support for Intel I210 (page 658)
 4602 - support commands such as rename (page 659)
 4601 - support for 64KB clusters DOSFS (page 659)
 4600 - non-alignment exception (page 660)
 4599 - support pmu under MIPS platform (page 661)
 4598 - about MIPS architecture support (page 662)
 4591 - BSP/Atsum: I2C driver doesn’t return errors on NACK (page 663)
 4577 - arm/atsumv: UART loses receive characters when the system has a high interrupt load (page 664)
 4562 - Bump dtc on rtems5 to match rtems6 (page 666)
 4561 - Fix build issue with qemu4 on Ubuntu (page 667)
 4556 - rtems_shell_main_mmove problem (page 668)
 4554 - Adapt improved mailer.py for RSB 5 branch (page 669)
 4553 - Adapt improved mailer.py for rtems-tools 5 branch (page 670)
 4552 - untar: problems with existing directories (page 673)
 4551 - Workaround for GRLIB-TN-0011 required for sparc/leon3 BSPs in SMP configuration (page 675)
 4549 - Timecounter: Add NTP support (cloned) (page 677)
 4546 - A thread restart does not update the priority of related threads (page 678)
 4545 - The SMP EDF scheduler can only support more restricted affinity sets of a thread (page 681)
 4544 - The last processor must not be removed if it is owned by a helping scheduler (page 683)
 4541 - rtems_jffs2_rmnode function problem (page 685)

Table 1 – continued from previous page

4028 - i386: SMP-System hangs with non-consecutive APIC IDs (page 1079)
4021 - PowerPC for libbsd does not build (page 1091)
4017 - RSB -host and -target option trigger the bset tarball (page 1102)
4016 - shm_unlink uses uninitialized obj_err on successful return from _POSIX_Shm_Get_by_name (page 1102)
4015 - Sqlite has stopped http access (page 1103)
4014 - RSB RTEMS 5 Post Branch Clean (page 1090)
4010 - Update mDNSResponder to Apple version v878.30.4 (page 1104)
4006 - rtems-test target_exe_filter fails when there is no filter (page 1105)
4005 - Remove RTEMS_MP_NOT_CONFIGURED error condition (page 779)
4002 - Beaglebone and PC BSP stacks do not build (page 1106)
3995 - Release doxygen support is broken (page 1116)
3992 - Release URL path with sources is wrong (page 1117)
3987 - ARMv7-M Exception handler does not store the SP (page 1120)
3976 - Released RSB qemu4 source download fails. (page 1115)
3974 - Deprecate ephipany port in rtems5 and remove in rtems6 (page 1139)
3973 - Add rtems_get_copyright_notice() and deprecate _Copyright_Notice (page 780)
3972 - Deprecate <rtems/system.h> (page 781)
3971 - Deprecate use of RTEMS_MAXIMUM_NAME_LENGTH (page 782)
3970 - Deprecate use RTEMS_version at API level (page 783)
3969 - dl06 fails on all libdl supported architectures (page 1140)
3968 - symlinks in RTEMS source tree (page 1137)
3967 - Release source package list is out of date (page 1138)
3966 - RSB bare version number if wrong. (page 1138)
3961 - bsps/arm: CPU counter based on arm generic timer doesn't work correctly (page 1171)
3960 - Add to FreeBSD host setup information (page 1156)
3956 - RSB BSP build with tests does not keep a copy (page 1154)
3953 - rtems_extensions_create() accepts a NULL pointer table (page 784)
3949 - clock_settime() can lead to a failed _Assert() (page 1178)
3945 - Update DTC example on rtems-docs/user/rsb/configuration.rst (page 1152)
3944 - qorIQ e500 BSP bset fails (page 1148)
3938 - Many (~40) BSPs Fail to Link all Tests (page 1184)
3936 - C++ thread-local storage broken on sparc64 (page 1188)
3927 - tcsh required to build sqlite – makes all BSP bsets fail (page 1199)
3921 - QorIQ clock tick interval is off by one hardware clock tick (page 1207)
3919 - RSB may not download source of pkconfig checked packages (page 1214)
3914 - Spike has hard-coded path to DTC (page 1216)
3911 - Remove gdbarmsim (page 1217)
3909 - rtems_waf with python2 needs to handle unicode strings with waf (page 1211)
3907 - Update Getting Started Instructions (page 785)
3904 - Add methods to dump the event records in base64 encoding (optionally zlib compressed) (page 1178)
3903 - raspberrypi2 libbsd 5-freebsd-12 does not build (page 1196)
3901 - New template for configuration options with a value (page 786)
3900 - New template for boolean feature defines (page 788)
3898 - Remove CONFIGURE_MAXIMUM_DEVICES (page 791)
3896 - RSB option -source-only-download does not work with releases (page 1222)
3895 - Add a migration to RTEMS 5 chapter to User Manual (page 1177)
3894 - Replace the device filesystem with a specialization of the IMFS (page 1200)
3893 - RSB staging changes have broken building a 3rd party package (page 1228)
3888 - Update rtems_waf in libbsd (page 1077)

Table 1 – continued from previous page

3887 - Do not report remotes in RSB build log if -mail is used (page 1190)
3885 - Context switch extension is broken in SMP configurations (page 792)
3882 - Add POSIX user environment pointer to TCB (page 1235)
3881 - Add API functions to map a task priority to/from a POSIX thread priority (page 1230)
3876 - Remove CONFIGURE_DISABLE_SMP_CONFIGURATION (page 798)
3875 - Split up confdefs.h in component based header files (page 800)
3874 - Remove CONFIGURE_POSIX_HAS_OWN_INIT_THREAD_TABLE (page 816)
3873 - Remove CONFIGURE_HAS_OWN_INIT_TASK_TABLE (page 818)
3871 - Remove rtems_configuration_get_posix_api_configuration() (page 821)
3868 - newlib links breaks mingw build (page 1236)
3865 - Fix linker set item declarations for small data area targets (page 822)
3864 - rtems-tester does not work with gdb simulators (page 1212)
3863 - Remove support for the BSP_ZERO_WORKSPACE_AUTOMATICALLY BSP option (page 823)
3862 - Canonicalize CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY (page 825)
3861 - Add CONFIGURE_VERBOSE_SYSTEM_INITIALIZATION (page 826)
3859 - No output from joel scripts in telnet (page 752)
3857 - Use EAGAIN for POSIX mq wait in ISR error (page 1250)
3856 - posix_devctl - Add support for SOCKCLOSE (page 827)
3849 - Fix PSIM memory map (page 1219)
3848 - Libdebugger test in libbsd should depend on libdebugger.a (page 1221)
3845 - Remove Ada-specific configuration options (page 828)
3844 - Remove CONFIGURE_HAS_OWN_DEVICE_DRIVER_TABLE (page 830)
3843 - Add CONFIGURE_DIRTY_MEMORY (page 831)
3842 - RSB RTEMS version message string is fixed to the git hash (page 1321)
3841 - Add rtems_object_get_local_node() (page 833)
3840 - Add CONFIGURE_IMFS_ENABLE_MKFIFO (page 834)
3839 - RTEMS revision does not handle - (page 1322)
3838 - Rework work area initialization (page 835)
3837 - Rename CONFIGURE_LIBIO_MAXIMUM_FILE_DESCRIPTOR (page 842)
3836 - Specify the application configuration options (page 843)
3835 - Support statically allocated threads (page 856)
3834 - Simplify clock driver (page 868)
3833 - Simplify RTEMS semaphore configuration (page 870)
3831 - Duplicate description of Tiers and Rules (page 1316)
3830 - Build problems with user names which contain space characters (page 1322)
3826 - top on SMP shows invalid priorities (page 762)
3823 - Untar_family doesn't handle nested directories (page 1326)
3822 - Release created VERSION file in rtems-tools-*.tar.xz is wrong (page 1215)
3821 - Port NVMe support from FreeBSD to libbsd (page 1275)
3817 - RSB fails on FreeBSD 12.0 (32bit and 64bit) (page 1157)
3815 - Improve SMP EDF scheduler configuration (page 1174)
3814 - Releasing creates 2 copies of the kernel and tools. (page 1328)
3813 - RSB does not handle -rsb-file in releases (page 1147)
3812 - Released RSB has no source set for rtems-tools (page 1232)
3811 - Release source path on ftp.rtems.org is wrong (page 1329)
3810 - Use the release details in the release build docs (page 1156)
3809 - Fix epiphany-rtems5-gdb-7.8 RSB download file name (page 1313)
3808 - Fix qemu-couverture-git RSB download file name (page 1297)
3806 - Add fatal error for heap errors (page 1333)

Table 1 – continued from previous page

3805 - libdebugger build error on atsamv (page 1335)
3804 - sb-get-sources: Error repo_mail referenced before assignment (page 1194)
3803 - RSB ssl context error fetching qemu patches (page 1192)
3802 - RSB Build of Spike Fails on Second Time (bug in upstream spike) (page 1296)
3800 - termios - Add Capability to Generate SIGINTR and SIGQUIT (page 872)
3798 - Add socketmark to libbsd (page 878)
3797 - Add LLVM as a package (page 1306)
3796 - docs/develenv directory structure bitrot (page 1310)
3794 - Initial POSIX Signals Mask Incorrect (page 772)
3793 - trace record tool does not build on Windows (page 1320)
3792 - RSB fails to build on MSYS2 (page 1338)
3789 - TMS570 applciation build error (page 494)
3785 - Add RISC-V BSP with support for the Freedom E310 Arty A7 FPGA (page 1172)
3783 - MSYS2 RSB build error (page 1337)
3781 - RSB crashes in case the host as an unreadable directory in “/” (page 1323)
3777 - libdl object unload debugger delete support is broken (page 1343)
3776 - libdl ARM does not support ARM mode trampolines. (page 1343)
3775 - libdl does not handle ARM mode reloc tramp parsing (page 1345)
3774 - RPi2 SMP does not build (page 1344)
3773 - RPi fails to boot (page 1346)
3770 - RSB 3rd party packages failing to build (page 774)
3769 - RSB BSP Buildsets (page 1349)
3768 - Add staging support to Makefile.inc (page 1350)
3763 - RSB SIS build fails on FreeBSD (page 1347)
3762 - Return the current handler from ARM cp15 set exception call (page 1351)
3760 - BBB MMU update crashes (page 1341)
3756 - Condition codes in PSR are destroyed by lazy FP context switch (page 1351)
3754 - Users Guide Ubuntu Instructions Have Typo (page 1340)
3753 - Rename CONFIGURE_LIBIO_MAXIMUM_FILE_DESCRIPTOR (page 1285)
3751 - No documentation on Region Get Information Directives (page 1313)
3748 - libdl uses a linear symbol search on object file symbols (page 1352)
3747 - Address Cortex-M3 Errata 602117 (page 1356)
3746 - libdl test dl05.exe failing (page 1358)
3743 - RSB os and arch config logic is broken (page 1359)
3742 - T_config conflicting type qualifiers for ‘config’ (page 1361)
3741 - libdl loading ELF objects from libbsd NFS file system ends in a deadlock (page 878)
3736 - PowerPC Beatnik BSP C++ exceptions broken (page 1331)
3735 - Remove CONFIGURE_HAS_OWN_MULTIPROCESSING_TABLE (page 1287)
3734 - Add RTEMS_CONST attribute (page 886)
3733 - Add general reg support to libdebugger (page 1365)
3732 - Add rtems_scheduler_get_processor_maximum() (page 887)
3731 - Add rtems_scheduler_get_processor() (page 889)
3728 - Set small data seciton to max size for mvme5500 and motorola_powerpc BSPs (page 1369)
3725 - bsp/lpc24xx: Convert I2C driver to Linux API (page 1360)
3724 - bsp/lpc24xx: Convert SSP driver to Linux API (page 1370)
3720 - mfill shell command uses the wrong arguments for the memset() (page 764)
3708 - Remove Doxygen comments from confdefs.h (page 890)
3699 - Wrong system register specified for ARM virtual timer value retrieval (page 892)
3694 - shm_open has logically unreachable code (Coverity ID: 1399706, 1399714) (page 893)

Table 1 – continued from previous page

3693 - libdl incorrectly handles MIPS16hi/lo relocs (page 895)
3692 - libdl does not honour write unlock/lock for sections (page 1378)
3688 - rtems-docs fails to build with python3 (page 1317)
3687 - Add architecture section support to libdl and support PowerPC's small data. (page 1233)
3686 - Add library searching and loading to libdl (page 1117)
3685 - Add large memory support to libdl (page 1252)
3684 - rtems_print_buffer is broken (page 1379)
3683 - Git clone via HTTPS does not give much interactive feedback (page 1318)
3682 - Add BSP for Xilinx Zynq UltraScale+ MPSoC platform (page 1283)
3678 - Add RISC-V BSP with support for the grlib (page 1289)
3677 - ARM BSP contains ARM code in THUMB only build (page 1383)
3675 - RSB: Change default prefix to OS prefix + "rtems" + \$rtems_version (page 769)
3674 - Raspberry Pi Fails to Build (page 1412)
3673 - xilinx_zynq_a9_qemu - fails to link psxconfig01 (page 1411)
3672 - No i386 BSP can link all tests after cache manager changes (page 1384)
3670 - examples-v2 uses deprecated or obsolete RTEMS interfaces (page 1444)
3667 - Support data cache disable on ARMv7-AR (page 1413)
3666 - Add support for C++17 std::aligned_alloc (page 896)
3665 - Add low level event recording infrastructure (page 1260)
3664 - RSB config parsing slow on python3 (page 897)
3651 - Sphinx 1.8 PDF (latex) on FreeBSD does not build (page 898)
3637 - Fix rtems_task_restart() argument type (page 899)
3636 - Add rtems_scheduler_get_maximum_priority() (page 900)
3630 - Build of rtems-tools fails with i686-w64-mingw32 (page 1167)
3629 - Add RSB reporting section to the documentation. (page 1191)
3626 - sigtimedwait() needed when POSIX is disabled (page 1472)
3625 - RTL Allows Unloading a Module other Modules Depend Upon (cloned) (page 1483)
3624 - MSYS2 builds appear to ignore tcfg file (page 1330)
3622 - Remove cache routines working with a processor set (page 1474)
3621 - Statically initialize object information structures (page 901)
3612 - RTL unresolved compaction does not update string indexes after removing a string (page 1484)
3609 - Update Spike Version in RSB (RISC-V simulator) (page 1208)
3605 - RTL Allows Unloading a Module other Modules Depend Upon (cloned) (page 1314)
3604 - RTL Unresolved Symbols from common section on i386/pc686 (cloned) (page 1485)
3603 - Remove support for 16-bit object identifiers (page 907)
3602 - Update or1k tool chain to use the upstream GCC (page 1489)
3600 - Update or1k tools to use GCC master (page 1309)
3599 - Remove m32c architecture port (page 1486)
3598 - Move internal types of API objects to separate header file (page 908)
3595 - Deprecate rtems_rate_monotonic_period_time_t (page 922)
3593 - Deprecate rtems_thread_cpu_usage_t (page 923)
3591 - Deprecate region_information_block (page 924)
3589 - Deprecate rtems_context_fp (page 925)
3587 - Deprecate rtems_context (page 926)
3585 - Deprecate proc_ptr (page 928)
3583 - Add rtems_malloc() and rtems_calloc() (page 933)
3579 - testsuite's rtems-test-check.py python version support (page 1491)
3577 - Avoid CLoog and ISL host dependencies for target GCC (page 1491)
3576 - gdb 8.0.1 sis does not build on Cygwin (page 1488)

Table 1 – continued from previous page

3569 - <i>waf version in various rtems-repositories incompatible with python 3.7</i> (page 934)
3568 - <i>RSB: UnboundLocalError: local variable 'build_max_size_human' referenced before assignment</i> (page 934)
3562 - <i>Use a short paths for the RSB temporary build path on Windows</i> (page 1492)
3554 - <i>rtems-libbsd README.waf Needs an Update Sweep</i> (page 1409)
3553 - <i>rtems-libbsd Missing waf in Top Directory</i> (page 937)
3552 - <i>cpu usage error in SMP mode</i> (page 765)
3551 - <i>Move default configuration to separate library</i> (page 938)
3549 - <i>Obsolete powerpc/virtex BSP</i> (page 1524)
3547 - <i>Support O_CLOEXEC open() flag</i> (page 1495)
3546 - <i>Support O_NOFOLLOW open() flag</i> (page 1494)
3545 - <i>Support O_DIRECTORY open() flag</i> (page 1496)
3543 - <i>Change Telnet server to allocate most resources during initialization</i> (page 1542)
3542 - <i>Remove keep_stdio feature from Telnet service</i> (page 1544)
3539 - <i>Remove CPU_PROVIDES_IDLE_THREAD_BODY</i> (page 940)
3538 - <i>Classic API Barrier Wait Section Title Has Wrong Name</i> (page 1549)
3537 - <i>RSB and RTEMS Tools Support for python2 and python3</i> (page 1447)
3536 - <i>Move RTEMS configuration data to a common config directory</i> (page 1550)
3535 - <i>Remove stdin, stdout, stderr convenience routines for CEXP</i> (page 1549)
3533 - <i>Add rtems_task_exit()</i> (page 941)
3532 - <i>RSB source only download is host specific</i> (page 1353)
3531 - <i>Add POSIX Attribute Reports for More Than Scheduler (examples-v2)</i> (page 1545)
3530 - <i>Fix issues raised by Coverity Scan for FTP server</i> (page 1223)
3529 - <i>Fix issues raised by Coverity Scan for Telnet server</i> (page 1519)
3528 - <i>Remove undocumented and untested CONFIGURE_MAXIMUM_PTYS</i> (page 1552)
3526 - <i>Convert PTY driver to new Termios API</i> (page 1551)
3525 - <i>Add MMC/SDCard support for i.MX 7Dual BSP</i> (page 1555)
3523 - <i>Add FEC network interface driver for TQM8XX</i> (page 1565)
3522 - <i>Update mDNSResponder to Apple version v878.30.4</i> (page 1566)
3520 - <i>Remove CONFIGURE_HAS_OWN_FILESYSTEM_TABLE</i> (page 943)
3519 - <i>RSB does not strictly check args</i> (page 1580)
3518 - <i>RSB MacOS Nits</i> (page 1564)
3517 - <i>RSB Ubuntu Host Requirements Missing Some</i> (page 1563)
3516 - <i>sb-set-builder should report disk usage of build</i> (page 1558)
3513 - <i>Convert tqm8xx console driver to new Termios API</i> (page 1578)
3512 - <i>sb-check:No python command with Python 2 and Python 3 installed</i> (page 1534)
3511 - <i>int/pointer size warnings in powerpc-qoriq_e6500_64</i> (page 1587)
3510 - <i>ATA driver uses deprecated rtems_blkdev services</i> (page 1586)
3508 - <i>Add support for thread to processor pinning</i> (page 1582)
3507 - <i>Add flexible per-CPU data</i> (page 1372)
3506 - <i>waf for building RTEMS applications needs updating</i> (page 1516)
3505 - <i>powerpc/virtex redefined warning</i> (page 1525)
3504 - <i>Warning and formatting in bsp/powerpc/mpc55xxevb/dev/dspi.c</i> (page 1585)
3503 - <i>PDF Documentation is missing an index</i> (page 1593)
3502 - <i>PL111_LCD_CONTROL_LCD_BPP_16 Redefined</i> (page 1599)
3501 - <i>MSR_RI defined multiple places</i> (page 1602)
3500 - <i>Change rtems_waf's RTEMS path check from bin to share/rtems<version>`</i> (page 944)
3499 - <i>The "Index" chapter is empty</i> (page 1600)
3498 - <i>Command and Variable Index is empty</i> (page 1601)
3496 - <i>Remove superfluous interrupt enable in _Thread_Dispatch_enable()</i> (page 1598)

Table 1 – continued from previous page

3491 - Align <code>mprotect()</code> prototype with POSIX (page 1588)
3490 - Remove <code>CONFIGURE_HAS_OWN_CONFIGURATION_TABLE</code> (page 945)
3489 - Obsolete <code>CONFIGURE_HAS_OWN_CONFIGURATION_TABLE</code> (page 946)
3488 - Remove <code>CONFIGURE_HAS_OWN_MOUNT_TABLE</code> (page 948)
3486 - Use <code>uintptr_t</code> and <code>size_t</code> instead of <code>uint32_t</code> in <code>rtems_partition_create()</code> (page 949)
3484 - RFS: Remove stray call of <code>rtems_disk_release()</code> in <code>rtems_rfs_buffer_sync()</code> (page 1603)
3482 - Relax the buffer alignment required by <code>rtems_partition_create()</code> (page 951)
3480 - <code>CONFIGURE_MINIMUM_TASK_STACK_SIZE</code> may affect <code>CONFIGURE_INTERRUPT_STACK_SIZE</code> (p
3478 - RISC-V BSP Tester Cleanup Needed (page 1589)
3475 - Add <code>RTEMS_PREDICT_TRUE()</code> and <code>RTEMS_PREDICT_FALSE()</code> for static branch prediction hints (p
3472 - Update of <code>libbsd</code> to a version close to the FreeBSD 12 release (page 1399)
3471 - Update <code>libfdt</code> as of date 2018-07-09 (page 1667)
3465 - Integrate all changes from Linux v3.11 to v4.17 made in the JFFS2 sources (page 1546)
3463 - Convert <code>covoar</code> to use DWARF function data (page 1533)
3461 - Canadian cross compilation of RTEMS tools not supported for <code>x86_64-w64-mingw32</code> (page 1675)
3460 - GDB 8 SIS LEON2 LEON3 Patches (page 1380)
3459 - Rework initialization and interrupt stack support (page 955)
3458 - <code>rtems-test</code> should not use the env <code>PATH</code> to find <code>covoar</code> (page 968)
3455 - Remove <code>install-if-change</code> script (page 1676)
3454 - Tracing Framework Documentation in User Manual (page 1371)
3453 - Add RISC-V GDB (page 1688)
3452 - Update RISC-V tool chain to support standard 64-bit chips (page 1594)
3451 - Remove <code>size_rtems</code> script (page 1687)
3447 - Remove <code>rtems-testsuite-autostuff</code> script (page 1680)
3446 - Remove <code>cvsignore-add.sh</code> script (page 1681)
3445 - Remove <code>multigen</code> script (page 1682)
3444 - Remove <code>nios2gen</code> program (page 1672)
3443 - Remove <code>shgen</code> program (page 1689)
3437 - Replace use of <code>printf()</code> in <code>free()</code> with a fatal error (page 1698)
3436 - Remove clock driver <code>Clock_driver_support_shutdown_hardware()</code> hook (page 969)
3435 - Add test case for <code>CONFIGURE_BSP_PREREQUISITE_DRIVERS</code> configuration option (page 1583)
3434 - Add <code>CONFIGURE_MINIMUM_POSIX_THREAD_STACK_SIZE</code> configuration option (page 1604)
3433 - Add SMP support for RISC-V (page 1415)
3432 - Remove Simple SMP Priority Scheduler (page 1573)
3426 - Babeltrace formula for conversion to CTF (page 499)
3425 - <code>examples-v2</code> : PowerPC fails to build <code>fat_ramdisk</code> (page 1690)
3424 - <code>examples-v2</code> : no MIPS BSPs pass configuration step (page 1526)
3423 - <code>examples-v2</code> : m68k/powerpc BSPs undefined reference to <code>_Thread_Life_action_handler</code> (page 1705)
3421 - New Trac components for Coverage and Trace (page 1541)
3419 - Always build network services (<code>tftps</code> , <code>ftps</code> , <code>ftpd</code> , <code>telnetd</code> , <code>libdebugger</code>) (page 1700)
3418 - Remove <code>diffest</code> and <code>sorttimes</code> test tools (page 1705)
3417 - Add <code>libdwarf</code> to <code>elftoolchain</code> and provide a C++ wrapper (page 1517)
3416 - Update Ubuntu RSB Instructions for 17.10 (page 1311)
3415 - Add examples and tests as components (page 1541)
3413 - <code>examples-v2</code> both <code>hello</code> and <code>triple_period</code> fail to build (page 1258)
3411 - <code>qemuppc</code> does not install <code>linkcmds.base</code> (page 1708)
3410 - Remove <code>bin2boot</code> program used by i386 BSPs (page 1707)
3409 - Strip down configure checks to the bare minimum (page 1276)
3407 - Move Gaisler.org and Gaisler.se hosted RSB patches to <code>rtems.org</code> (page 1493)

Table 1 – continued from previous page

3403 - RSB RTEMS tool set build is irreproducible (page 1709)
3402 - dl06: mips hurricane Mixed Endian Error (page 1529)
3401 - dl06: tms570* Mixed LSB/MSB Error (page 1531)
3397 - The register keyword is deprecated in C++11 (page 1710)
3396 - rtems-ld does not handle R_ARM_V4BX relocation records (page 1711)
3395 - rtems-ld does not remove executable when there is an output error (page 1712)
3392 - infinite loop in RSB's path when a prefix path is not writable (page 1713)
3391 - or1k TLS and GCC version (page 500)
3390 - NFS: Remove support for cexp (page 1716)
3389 - Warning flags have disappeared with recent autoconf changes (page 1535)
3388 - rtems-tester: possible parsing error for qemuprep-altivec on exclude SMP configuration (page 1189)
3387 - Add subdir-objects to automake flags (page 1279)
3385 - Generate an error if RTEMS's gcc is not found when the user runs configure (page 1730)
3384 - Prefer int for int32_t (page 1303)
3383 - Require --enable-rtemsbsp with --enable-smp or --enable-multiprocessor (page 1730)
3382 - Testsuite Makefile merge to one per group of tests (page 1512)
3381 - rtems-test command line documentation appears to be out of date (page 1153)
3380 - Move rtems-bin2c program to rtems-tools (page 1685)
3379 - Remove packhex program (page 1678)
3378 - Remove unhex program (page 1682)
3377 - Remove eolstrip program (page 1683)
3376 - Remove cklength program (page 1684)
3375 - Remove command line pre-processor defines (page 1520)
3374 - rtems-test does not honor --mail-from argument (page 1532)
3373 - add confstr() method (page 501)
3358 - Deprecate rtems_disk_create_phys(), etc. (page 1476)
3354 - PowerPC BSPs duplicate PAGE_MASK, etc redefinition (page 1731)
3352 - Warning in all lpc176x variants (page 1759)
3351 - libbsd: Introduce buildsets that allow to enable or disable parts of libbsd to get for example smaller
3350 - sptimecounter02 warning due to defining _KERNEL and disabling part of <sys/time.h> (page 177)
3349 - pc386 edid.h invalid macro names (page 1773)
3348 - beatnick:spaces needed around quote in macro definitions in bsp.h (page 1772)
3346 - bf533.h (page 1772)
3345 - mvme3100 spaces needed around quote in macro definitions in bsp.h (page 1771)
3344 - mcf5272/mcf5272.h Timer3 Duplicate Definition (page 1770)
3343 - pthread_mutex_getprioceiling() has incorrect prototype (page 1664)
3342 - pthread_setschedparam() has incorrect prototype (page 1666)
3341 - sparc64: Macro Redefined (page 1732)
3340 - gen83xx warning for macros redefined (page 1774)
3339 - Several PowerPC linker commands do not support constructors/destructors with priority (page 125)
3334 - deadlock in _once() (page 1375)
3328 - bootstrap uses non-POSIX compliant echo -e (page 1779)
3327 - Eliminate score/cpu/*./.../types.h (page 1757)
3325 - Simplify clustered scheduler configuration (page 1777)
3323 - mhttpd's http etag can result in invalid caching in a browser. (page 1717)
3320 - Add a simple task console driver (page 1673)
3318 - Improve INTERNAL_ERROR_THREAD_EXITTED to show the id and thread name (page 1781)
3315 - Move expat's home site to github from SF. (page 1782)
3312 - RSB macro calls such as define fail on unicode keys. (page 1783)

Table 1 – continued from previous page

3309 - <i>rtems_task_create's initial_mode SMP update</i> (page 1532)
3307 - <i>PowerPC linkcmds.base missing wildcards on some sections</i> (page 1571)
3306 - <i>Add paravirtualization support to PowerPC</i> (page 1777)
3305 - <i>Add paravirtualization support to ARM</i> (page 1776)
3298 - <i>dlerror non-conformance</i> (page 1378)
3294 - <i>gcc version report for released tools is wrong.</i> (page 1810)
3290 - <i>Add device tree support to Altera/Intel Cyclone V BSP</i> (page 1811)
3285 - <i>Reorganize BSP source directory</i> (page 1606)
3284 - <i>RSB uses hard coded GCC binary paths</i> (page 1826)
3283 - <i>Bad URL in OpenOCD/Xilinx_Zynq Wiki Page</i> (page 1829)
3281 - <i>Add epiphany support to GDB 8.0.0</i> (page 1813)
3278 - <i>bsp-builder has incorrect print (%s in output)</i> (page 1828)
3277 - <i>QorIQ: Add MAC-less DPAA driver to libbsd</i> (page 1813)
3270 - <i>Remove unused support for MPC505</i> (page 1812)
3268 - <i>PowerPC BSP include naming mess.</i> (page 1833)
3267 - <i>rtems/status-checks.h calls printf without including the needed header.</i> (page 1758)
3266 - <i>cpukit/libpci references BSP headers.</i> (page 1838)
3265 - <i>Use second one based uptime for CLOCK_MONOTONIC for FreeBSD compatibility</i> (page 1825)
3264 - <i>Add monotonic watchdog based on uptime</i> (page 1820)
3261 - <i>A couple of documentation typos</i> (page 1446)
3260 - <i>libpci depends on BSP-specific header files</i> (page 1834)
3256 - <i>Ada run-time needs support for self-contained POSIX synchronization objects</i> (page 1852)
3255 - <i>Warnings on 64-bit targets</i> (page 1857)
3254 - <i>Reorganize header files to avoid "make preinstall"</i> (page 1450)
3249 - <i>imx7 does not link getentropy01 test on master</i> (page 1877)
3248 - <i>Add BSP_VERBOSE_FATAL_EXTENSION to RTEMS_BSP_CLEANUP_OPTIONS</i> (page 1853)
3247 - <i>Remove BSP-specific defaults for RTEMS_BSP_CLEANUP_OPTIONS()</i> (page 1874)
3246 - <i>Remove _BSP_Fatal_error()</i> (page 1875)
3245 - <i>Replace BSP_panic() with rtems_panic()</i> (page 1876)
3244 - <i>Change rtems_panic() implementation and document this function</i> (page 1699)
3243 - <i>Simplify global construction</i> (page 1553)
3242 - <i>Workarounds for UT699, UT700, and GR712RC errata</i> (page 1839)
3240 - <i>cpukit/libmisc/stackchk/check.c stack addresses formatted incorrectly.</i> (page 1844)
3239 - <i>Add getentropy() implementation provided by each BSP</i> (page 1878)
3237 - <i>Fix priority ceiling updates</i> (page 1884)
3236 - <i>Fix thread queue owner priority update in _Thread_queue_Flush_critical()</i> (page 1885)
3235 - <i>Fix rtems_semaphore_flush() for priority inheritance semaphores</i> (page 1886)
3234 - <i>Quick Start Instructions Inconsistent</i> (page 1894)
3232 - <i>Use of .. include:: in the User Manual should be changed.</i> (page 1899)
3231 - <i>RTEMS Top level README needs updating.</i> (page 1170)
3229 - <i>Add index to all documents.</i> (page 1539)
3228 - <i>aarch64 missing from 5/rtems-all build set</i> (page 971)
3227 - <i>sb-check fails on Msys2 64-bit</i> (page 1847)
3226 - <i>gdb: pr 16827, fix sim on Mavrick</i> (page 1900)
3225 - <i>Upgrade m32c to GDB 8.0.1</i> (page 1901)
3224 - <i>Upgrade or1k and m32c to Binutils 2.29</i> (page 1902)
3221 - <i>RSB wiki page duplicates documentation</i> (page 1195)
3220 - <i>Change RTEMS release number scheme from 4.12 to 5</i> (page 1748)
3219 - <i>Zynq BSP missing linker option -gc-sections</i> (page 1573)

Table 1 – continued from previous page

3218 - <i>Termios canonical mode (ICANON) does not return input line by line</i> (page 1906)
3217 - <i>Add RTEMS version, build and tools details to tests</i> (page 1725)
3216 - <i>Replace vprintk() implementation</i> (page 1907)
3215 - <i>Configuring a System Still Includes Notepads and Has Wrong Heading</i> (page 1908)
3213 - <i>Move erc32, leon2, leon3, psim and jmr3904 to Tier 2</i> (page 1292)
3212 - <i>Qemu Fails to Build, RSB Gives Odd Traceback</i> (page 1307)
3211 - <i>Fix pthread_create() with user provided stack</i> (page 1909)
3210 - <i>Improve the RSB build email message</i> (page 972)
3209 - <i>RSB should fail on this error</i> (page 1717)
3207 - <i>Supported Architectures Page is out of date</i> (page 1846)
3205 - <i>Relative timespec timeouts are subject to integer overflows</i> (page 1910)
3204 - <i>Exception in rtems-test</i> (page 1298)
3202 - <i>or1k tools build error</i> (page 1911)
3201 - <i>epiphany tools checksum error</i> (page 1912)
3200 - <i>m32c tests don't build – test_context too large</i> (page 1913)
3198 - <i>Add lazy update of line control and baud divisor to NS16550 serial driver</i> (page 1914)
3191 - <i>RTEMS Tester covoar dies with no arguments.</i> (page 1836)
3190 - <i>RTEMS Tester covoar does not link on MacOS</i> (page 1915)
3189 - <i>MUTEX_INITIALIZER missing braces warning</i> (page 1904)
3188 - <i>Add C11 Threading Examples</i> (page 1916)
3187 - <i>smptests/Makefile.am Issues</i> (page 1917)
3185 - <i>Change uptime seconds to int32_t</i> (page 1903)
3182 - <i>CLOCK_REALTIME timeout implementation is not POSIX compliant</i> (page 1733)
3181 - <i>Various cc1plus warnings for “valid for C/ObjC but not for C++”</i> (page 1918)
3180 - <i>ar warning: ‘u’ modifier ignored since ‘D’ is the default (see ‘U’)</i> (page 1498)
3179 - <i>New warnings from Time Changes</i> (page 1919)
3178 - <i>Update sh-rtems4.12 bset to use rtems-default (using old gcc)</i> (page 1921)
3177 - <i>Replace/update POSIX Compliance Guide</i> (page 1922)
3176 - <i>__getreent in libc.a and generated by confdefs.h</i> (page 1574)
3175 - <i>Merge FreeBSD timecounter changes from 2015-01-20 to now</i> (page 1499)
3174 - <i>Remove rtems_pthread_attribute_compare()</i> (page 1923)
3173 - <i>Xilinx AXI I2C driver IP race condition causes clock glitch.</i> (page 1827)
3172 - <i>i386 PC BSP does not reset when bsp_reset is called.</i> (page 973)
3171 - <i>RSB GCC does not build on High Sierra and APFS</i> (page 974)
3170 - <i>Use BSP_output_char via RTEMS printer or simple console driver for test output by default</i> (page 9)
3168 - <i>Simplify POSIX_API_Control</i> (page 1924)
3167 - <i>Internal status codes must not depend on RTEMS_POSIX_API</i> (page 1926)
3166 - <i>New default ticket assignee: NeedsReview</i> (page 1927)
3165 - <i>Rework components of the ticket system</i> (page 511)
3163 - <i>Add I2C device driver for temperature sensor LM75A</i> (page 1928)
3160 - <i>Trace linker score support is broken</i> (page 1929)
3159 - <i>Examples v2 trace linker ini files reference non-existing dump-on-error</i> (page 1933)
3158 - <i>Examples v2 does not build</i> (page 1935)
3157 - <i>PowerPC tools don't build on 32-bit hosts</i> (page 1939)
3153 - <i>Accept PTHREAD_PROCESS_SHARED for POSIX rwlocks</i> (page 1947)
3152 - <i>Beaglebone Black crashes on u-boot master build.</i> (page 987)
3148 - <i>PSXRDWRV Test failure on Beaglebone Black</i> (page 989)
3142 - <i>POSIX: Reduce size of pthread_once_t and make it zero-initialized</i> (page 1948)
3141 - <i>Change the BSP Howto's name to something smaller.</i> (page 1949)

Table 1 – continued from previous page

3140 - CPU Kit broken with <code>-enable-rtems-debug</code> (page 1950)
3139 - Remove old ISR parameter from <code>Clock_driver_support_install_isr()</code> and make it optional (page 1950)
3137 - Accept <code>PTHREAD_PROCESS_SHARED</code> for POSIX condition variables (page 1954)
3136 - Use FIFO for file descriptor free list (page 1955)
3135 - Devel mailing list doesn't work and Git push impossible due to disk full (page 1956)
3134 - Remove <code>LIBIO_FLAGS_CREATE</code> (page 1957)
3133 - Remove <code>rtems_libio_t::driver</code> (page 1959)
3132 - Add reference counting to file descriptors (page 1887)
3130 - RTEMS Doxygen.in latex output does not build (page 1960)
3129 - RTEMS Tools covoar build fails on Windows (page 1850)
3128 - RTEMS Tools corvar does not build on Windows. (page 1961)
3127 - MIPS tool build on Darwin (MacOS) fails. (page 1538)
3126 - Accept <code>PTHREAD_PROCESS_SHARED</code> for POSIX barriers (page 1962)
3125 - Accept <code>PTHREAD_PROCESS_SHARED</code> for POSIX mutexes (page 1963)
3124 - Ignore pshared attribute for POSIX semaphores (page 1964)
3123 - GDB 8.0.1 is broken on FreeBSD 11 (page 1965)
3122 - Simplify and unify <code>BSP_output_char</code> (page 1363)
3121 - <code>clock()</code> implementation in Newlib is broken (page 1968)
3117 - score: Optimize <code>_Thread_queue_Enqueue()</code> timeout handling (page 1741)
3116 - POSIX: Make <code>sem_t</code> self-contained (page 1969)
3115 - POSIX: Make <code>pthread_rwlock_t</code> self-contained (page 1860)
3114 - POSIX: Make <code>pthread_barrier_t</code> self-contained (page 1863)
3113 - POSIX: Make <code>pthread_cond_t</code> self-contained (page 1871)
3112 - POSIX: Make <code>pthread_mutex_t</code> self-contained (page 1867)
3111 - Newlib: Change <code>time_t</code> and <code>clock_t</code> integer types to 64-bit (page 1830)
3109 - Add RISC-V support (page 1590)
3103 - rtems-tools on CentOS 7 Build Failure (page 1972)
3102 - rtems-exeinfo does not decode ARM static constructors. (page 1975)
3101 - Add I2C Drivers for LM25066A, TMP112, ADS1113 and ADS1115 (page 1976)
3100 - Add Xilinx AXI I2C driver (page 1977)
3099 - Add RTEMS FDT wrapper and shell command to libmisc (page 1978)
3097 - i386 libdebugger build failure (page 529)
3096 - Shell internal commands should be public. (page 766)
3091 - Core Dump in powerpc-rtems4.12-ld (page 1979)
3090 - Add BSP for i.MX 7 (page 1791)
3089 - Inconsistent blocking addressing in RFS (page 1722)
3088 - shell test in testsuitessamplesfileio many COMMANDs is Lost (page 767)
3087 - RSB rtems-gdb-7.12-1.cfg MD5 value is ERROR (page 991)
3086 - Remove Edison BSP (page 530)
3085 - Add hypervisor support for QorIQ BSPs (page 1761)
3084 - Makefile recipe override warning has returned (page 1980)
3083 - parallel make not working (page 1728)
3082 - Add 64-bit support for PowerPC (page 1385)
3080 - Infinite loop in SPARC <code>rtems_invalidate_multiple_instruction_lines()</code> (page 1981)
3079 - Ada tests do not build (page 1982)
3077 - SPARC: Add lazy floating point context switching (page 1985)
3076 - Test suite failures due to floating point usage (page 1987)
3073 - Improve configuration of interrupt servers (page 531)
3072 - Declaration of global functions in driver source files (page 1990)

Table 1 – continued from previous page

3071 - Create an interrupt server for every processor in the system (page 1991)
3070 - Add <code>rtems_scheduler_ident_by_processor_set()</code> (page 1994)
3069 - Add <code>rtems_scheduler_ident_by_processor()</code> (page 1997)
3063 - Make the EDF scheduler the default SMP scheduler (page 1998)
3061 - including 'unistd.h' in C++ does not build. (page 2000)
3059 - Add a simple processor affinity support to the EDF SMP scheduler (page 2004)
3057 - Add a workaround for the LEON3FT store-store errata (page 777)
3056 - Add EDF SMP scheduler (page 2011)
3054 - gdb 7.12.1 on RSB 4.12 branch fail to build on Archlinux (page 2014)
3052 - RSB: powerpc GDB build broken on Apple Darwin (page 2016)
3051 - warning in mpc55xxevb BSP (page 532)
3049 - Warnings in libdebugger (page 1536)
3047 - Remove docs directory from the RSB (page 2028)
3046 - 4.12/rtems-moxie missing release number. (page 2029)
3043 - 4.11/rtems-nios2 does not build on Windows. (page 2030)
3038 - QEMU cannot initialize audio driver bsp: lm32/milkymist (page 533)
3037 - QEMU fails to exit after test, 4 BSPS (page 534)
3036 - CPU_CMP() implementation is not in line with FreeBSD (page 2031)
3032 - CPU_NAND_S() implementation is not in line with FreeBSD (page 2032)
3027 - RTEMS source builder fails when building gcc documentation with newer versions of gcc (page 992)
3025 - m32c/m32csim does not build linpack-pc.c (page 2033)
3023 - Parameter of CPU_COPY() are in wrong order (page 2034)
3022 - compiling with DDB defined yields error (page 540)
3021 - libbsd cannot compile with -O0 option (page 541)
3020 - Review tests using CONFIGURE_DISABLE_SMP_CONFIGURATION (page 1101)
3018 - RSB cannot compile tool chain in CentOS 7. (page 2035)
3017 - improvement in pci.h (page 2037)
3016 - missing a couple register names + a #ifndef __ASM__ around serial.h inclusion (page 2038)
3015 - Add support for IBM PPC 750 chip (page 2040)
3014 - interrupt vector indexing is assuming BSP_INTERRUPT_VECTOR_MIN = 0 for this code. (page 2041)
3012 - Global C++ IO streams are broken (cout, cin, cerr) (page 2047)
3011 - Error compiling xilinx_zynq_zedboard. (page 995)
3010 - src/cpukit/posix/src/mmap.c:189]: (style) Suspicious condition (page 2052)
3009 - Provide invalid link handler for docs.rtems.org so old docs can be removed. (page 2053)
3008 - missing pax causes install failures (page 2054)
3007 - ARM caching issues (page 998)
3006 - SPARC LEON3 BSP SMP build is broken. (page 2055)
3003 - FAT does not support clusters bigger than 32K (page 2056)
3001 - SMP build of RTEMS Testsuite does not set CONFIGURE_MAXIMUM_PROCESSORS (page 2058)
3000 - Setting interrupt level in the mode arg on SMP returns RTEMS_UNSATISFIED (page 1438)
2999 - sb-check on Cygwin (page 2060)
2998 - RTEMS User Manual Quick Start does not cover releases. (page 1218)
2997 - Monitor config command does not handle unlimited objects. (page 2062)
2995 - Missing bsets (page 2063)
2994 - tar01 XZ error (page 2065)
2993 - SMP assert in _Thread_Executing in libdebugger (page 2066)
2992 - Long path crashes the RSB when listing a directory. (page 1003)
2991 - improvement in smp capability (page 543)
2990 - RTEMS Source Builder Fails on Windows Builds (page 1006)

Table 1 – continued from previous page

2986 - Convert Coding Style to Sphinx Document (page 544)
2983 - Create <code><rtems/inttypes.h></code> to consolidate extensions to <code><inttypes.h></code> (page 2069)
2982 - LibBSD broken with GCC+RTEMS changes (page 2071)
2981 - testdata excludes on included tcfg files does not work (page 2075)
2980 - pc586-sse does not compile fsjffs2gc01 (page 2077)
2977 - warnings in Dhystone Benchmark (page 2078)
2976 - warnings in rtems-debugger-server.c (page 2079)
2972 - Add ndbm.h support (page 546)
2970 - Add ftw.h to newlib (page 547)
2969 - qoriq BSPs depend on mkimage which is not always available (page 2080)
2968 - newlib inttypes.h is missing some methods (page 1013)
2967 - ARM: Change ABI to not use short enums (page 2082)
2965 - bootstrap sort inconsistent with sb-bootstrap for acinclude (page 2084)
2963 - Add a testsuite top level configuration file that is common to all tests. (page 1015)
2962 - Set test configurations to reflect test results. (page 1020)
2959 - arm/libdl: C++ exception index tables may not be ordered correctly (page 1023)
2958 - Add some popular benchmark programs to the testsuite (page 2085)
2957 - Shared memory support internal locking is broken (page 2087)
2954 - ARM: Optimize context switch (page 2090)
2951 - Error path in rtems-gcc-6.3.0-newlib-2.5.0.20170228-1.cfg (page 1024)
2949 - Questionable patch organization in RTEMS tools and RSB (page 1895)
2946 - Add a top level global testsuite configuration file (.tcfg) and a 'user-input' test state. (page 2091)
2945 - Many failures on LEON3 with SMP disabled (page 2092)
2943 - rtems building error (page 2094)
2942 - rtems building error (page 2095)
2941 - building rsb freezes (page 2101)
2935 - Termios task driven mode not compatible with SMP (page 1025)
2930 - Coverity Reports Out of Bounds Read in drvmgr_print.c (page 2104)
2925 - Warnings in rtl-obj-cache.c on some targets (page 1537)
2924 - Warnings in SPARC BSPs (page 2105)
2923 - Questionable Code in resource_snapshot.c (page 2107)
2922 - libdl unresolved externals that use more than one block or multiple entries corrupts. (page 1484)
2921 - libdl assumes constructors in ELF are a ".ctors" section. (page 549)
2917 - termios: Make write POSIX compatible (page 2109)
2916 - termios: Change receive callback invocation to enable select() and poll() support (page 2110)
2912 - libdebugger: control reaches end of non-void function (page 2111)
2909 - xz: Support for 64-bit CRC is build although XZ_USE_CRC64 is not defined (page 2112)
2906 - rtems-doc waf configure does not detect sphinxcontrib.bibtex status (page 2114)
2897 - Update termios.h to match the latest FreeBSD definitions (page 2115)
2896 - RSB requirements are missing pax (page 2119)
2895 - Prefix the confdefs.h internal defines with an underscore (page 2120)
2894 - Rename CONFIGURE_SMP_MAXIMUM_PROCESSORS to CONFIGURE_MAXIMUM_PROCESSORS (page 2121)
2893 - Remove CONFIGURE_SMP_APPLICATION (page 2122)
2890 - _RBTree_Initialize_node generates warnings (page 2124)
2889 - RTEMS_STACK_CHECKER_EXTENSION has incomplete definition (page 2125)
2885 - Fix rtems_rate_monotonic_postponed_job_count() prototype (page 2126)
2883 - src/c/src/lib/libbsp/arm/tms570/console/tms570-sci.c:248: strange expression ? (page 2128)
2880 - src/cpukit/libfs/src/jffs2/src/readinode.c:189: faulty logic (page 2130)
2879 - src/cpukit/libdebugger/rtems-debugger-server.c: four problems (page 2131)

Table 1 – continued from previous page

2878 - <i>src/c/src/lib/libbsp/sparc/shared/can/occan.c:1573: broken error checking ?</i> (page 2135)
2877 - <i>DHCP client fails on complex networks</i> (page 2136)
2874 - <i>src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt_timer.c: 4 * pointless check ?</i> (page 2138)
2873 - <i>src/c/src/lib/libbsp/arm/raspberrypi/i2c/i2c.c:320: defective error checking ?</i> (page 2139)
2868 - <i>src/c/src/lib/libbsp/arm/smdk2410/smc/smc.c: 3 * pointless local variables ?</i> (page 2141)
2867 - <i>Fix exclude rule in rtems-test-check</i> (page 2142)
2865 - <i>Coverpage installed when building the docs repeats catalogue.xml entries</i> (page 2145)
2864 - <i>docs.rtems.org Automatic update of branches content when a rtems-doc.git change is made.</i> (page 2146)
2863 - <i>Update POSIX 1003.1 Compliance Guide for ReST</i> (page 2151)
2862 - <i>docs.rtems.org Add support to ReST format releases.</i> (page 2152)
2860 - <i>docs.rtems.org does not work on iPhones or iPads</i> (page 550)
2859 - <i>Implement POSIX Shared Memory Objects</i> (page 1027)
2858 - <i>Add user defined thread names</i> (page 2153)
2855 - <i>Next generation of RTEMS documentation</i> (page 552)
2853 - <i>Driver manual covers non-existent Non-Volatile Memory Driver</i> (page 2157)
2851 - <i>Driver manual covers non-existent Discrete Driver</i> (page 2158)
2850 - <i>Driver manual covers non-existent Analog Driver</i> (page 2159)
2849 - <i>ATA/IDE support in RTEMS is out-dated</i> (page 2160)
2845 - <i>Add I2C framework documentation</i> (page 2161)
2844 - <i>JFFS2: Add IO controls to get filesystem instance information and force a garbage collection</i> (page 2162)
2843 - <i>Use self-contained objects instead of Classic API for drivers and support libraries</i> (page 1799)
2842 - <i>Change C11 threads support to use Classic tasks instead of POSIX threads</i> (page 1088)
2841 - <i>Add NXP SC16IS752 serial device driver</i> (page 2165)
2840 - <i>Use self-contained mutexes for Termios framework</i> (page 1784)
2839 - <i>Add new interrupt server driven Termios mode</i> (page 2166)
2838 - <i>Termios task driven mode should use mutex for device operations</i> (page 2167)
2836 - <i>Add posix_devctl()</i> (page 1031)
2835 - <i>Ada support is broken on SMP configurations</i> (page 2169)
2829 - <i>xz git URL in README is broken</i> (page 2170)
2826 - <i>arm_cp15_get_translation_table_base_control_register warning.</i> (page 2171)
2825 - <i>Improve the fatal error handling chapter of the user manual</i> (page 2172)
2824 - <i>arm/lpc23xx_tli800 no longer links tar01</i> (page 2174)
2823 - <i>Nearly all m68k BSPs do not Build on Master</i> (page 2175)
2822 - <i>m32csim does not build on master</i> (page 2176)
2821 - <i>No BSPs Build on Master</i> (page 2177)
2820 - <i>All SPARC64 BSPs do not Build on master</i> (page 2179)
2819 - <i>powerpc-ss555 does not compile on master</i> (page 2180)
2818 - <i>NIOS2 Does Not Compile on Master</i> (page 2182)
2817 - <i>All Blackfin BSPs do not Compile on Master</i> (page 2183)
2816 - <i>Many ARM BSPs have Static Assert</i> (page 2184)
2811 - <i>More robust thread dispatching on SMP and ARM Cortex-M</i> (page 2185)
2810 - <i>Remove sparc/sis BSP variant</i> (page 2197)
2809 - <i>Reduce interrupt latency on SMP configurations during thread dispatch</i> (page 2198)
2808 - <i>Conditionally provide rtems_interrupt_frame</i> (page 2202)
2806 - <i>Undocumented confdefs.h Configure Options</i> (page 1206)
2805 - <i>Use SPRG0 on PowerPC for current per-CPU control (SMP only)</i> (page 2203)
2804 - <i>Add http(s) paths to git.rtems.org repos</i> (page 561)
2803 - <i>Get rid of CPU_BIG_ENDIAN and CPU_LITTLE_ENDIAN</i> (page 2204)
2802 - <i>Test “libdl (RTL) 5” fails on SPARC targets</i> (page 2206)

Table 1 – continued from previous page

2800 - qoriq variants failing to build (page 2209)
2798 - Fix POSIX timer interval (page 2211)
2797 - Add ability to add/remove processors to/from a scheduler instance (page 2212)
2795 - Overrun Handling for general real-time models (page 2215)
2790 - Linker sets broken with GCC 7 (page 2225)
2788 - RTEMS I2C API only defines Standard-mode (Sm) speed as a default. (page 2226)
2784 - Add function to get the current priority of a task by scheduler instance (page 2228)
2777 - Remove librtems++ (page 2230)
2776 - SPI Framework (page 2231)
2775 - ARM CP15 arm_cp15_set_translation_table_entries fails if TTB in read-only memory (page 1033)
2771 - Empty C++ file with just <rtems.h> does not compile with HEAD. (page 2232)
2770 - Missing documentation for RTEMS_LINKER_ROSET_CONTENT and RTEMS_LINKER_RWSET_CON
2769 - rtems-syms does not clean up temp files. (page 1714)
2768 - untar does not keep permissions correctly. (page 2239)
2765 - Application level deadlocks may lead to SMP lock level deadlocks (page 2240)
2754 - no .strtab section (page 496)
2752 - Relax execution enviroment for thread begin extensions (page 2242)
2751 - Thread dispatch via interrupt is broken at least on ARM and PowerPC (page 1668)
2750 - Compile Error When Multiprocessing Enabled (page 2244)
2749 - rtems_task_set_scheduler() has insufficient parameters (page 2245)
2748 - Move RTEMS-specific socket wake-up to RTEMS-specific <rtems/rtems_bsdnet.h> (page 2249)
2745 - Use clock from pthread_condattr in pthread_cond_timedwait (page 2250)
2742 - New warning in SHM driver (page 2251)
2741 - New warning from printf plugin changes (page 2252)
2740 - Suboptimal type for Timestamp_Control (page 2253)
2737 - Add CLOCK_DRIVER_USE_ONLY_BOOT_PROCESSOR (page 2255)
2736 - pthread_getschedparam() returns wrong priority values (page 2256)
2735 - pthread_setschedparam() sets the priority not according to POSIX (page 2257)
2734 - pthread_setschedprio() is missing (page 1035)
2732 - Add clock_nanosleep() (page 1036)
2729 - TFTP client uses wrong semaphore for mutual exclusion (page 2258)
2728 - Pipes use wrong semaphore for mutual exclusion (page 2259)
2727 - FAT file systems use wrong semaphore for mutual exclusion (page 2260)
2726 - grasc.c: Questionable use of binary semaphore (page 2262)
2725 - Classic binary semaphores without a locking protocol can be released by everyone (page 2263)
2723 - CPUINFO command to report per-processor information (page 2266)
2722 - SEM_VALUE_MAX is unusually small on RTEMS (page 2268)
2718 - Blocking _CORE_message_queue_Submit() may lead to unpredictable results (page 2269)
2714 - A pthread_detach() does not lead to a resource reclamation (page 2270)
2707 - Unsafe use of current processor index in capture engine (page 2271)
2706 - Buffer allocation of capture engine is broken on SMP configurations (page 2272)
2702 - Remove descriptor objects for POSIX message queues (page 1843)
2700 - cpukit/libfs/src/nfsclient/src/rpcio.c:524]: (style) Suspicious condition (page 2273)
2698 - GCC 6.1 is broken for microblaze (page 2274)
2696 - Unpredictable errno value returned by sem_wait() in case of semaphore deletion (page 2276)
2695 - Add libatomic for RTEMS (page 2278)
2694 - linking issue for htonl, etc when using -std=c99 (page 770)
2693 - Update doc to reflect obsoleting rtems_clock_get() (page 1175)
2692 - User extensions execution order must be clarified (page 2280)

Table 1 – continued from previous page

2689 - POSIX key destructors must be called during thread restart (page 2281)
2686 - ICE with epiphany (page 562)
2685 - <i>c/src/lib/libbsp/arm/atsam/network/if_atsam.c:409: possible bad if statement</i> (page 2282)
2684 - <i>rtems/c/src/lib/libbsp/sparc/leon3/clock/ckinit.c:122: duplicate if</i> (page 2284)
2683 - Configuration table's <i>smp_enabled</i> conditional on <i>RTEMS_SMP</i> (page 1209)
2680 - Add <i>pthread_setconcurrency()</i> and <i>pthread_getconcurrency()</i> (page 2285)
2676 - Obsolete <i>clock_get()</i> directive (page 1859)
2675 - Remove unused <i>libchip</i> configuration parameters (page 563)
2674 - CORE spinlock implementation is next to be useless (page 2286)
2672 - After latest patches with <i>Objects_Get_by_name</i> <i>rtems-master</i> not compiling without <i>-enable-posix</i> (page 2286)
2669 - Update OpenRISC toolchain in 4.12 (page 2290)
2664 - <i>spclock_err02</i> (page 2291)
2663 - <i>pc386</i> BSP has complex dependencies (page 2293)
2649 - RSB remove 4.11, 4.10 and 4.9 from the master branch. (page 1038)
2644 - <i>sis</i> does not run on <i>gdb</i> 7.11 but does on <i>gdb</i> 7.9 (page 2295)
2641 - <i>configure: enable-rtemsbsp</i> doesn't warn if <i>bsp</i> does not exist (page 1720)
2638 - <i>pc386: ld -r</i> issue with <i>per function sections</i> (page 2299)
2634 - New warning in <i>pc386</i> VESA driver (page 2300)
2633 - <i>waf</i> build failed for <i>rtems-libbsd</i> (page 2303)
2632 - <i>rtems-tester</i> failure (page 2305)
2631 - Use an ISR lock to protect the state of Classic Rate Monotonic objects (page 2306)
2628 - Avoid home-grown condition variable implementation in the Classic Regions (page 1858)
2627 - Fix CPU time used for threads on SMP (page 2307)
2626 - Unify thread cancel/join and delete (page 2309)
2625 - Use one lookup tree per-thread for the POSIX keys (page 2313)
2624 - Fix the year 2038 problem (page 1575)
2620 - Setup Buildbot (page 564)
2617 - <i>rtems_heap_allocate_aligned_with_boundary()</i> body and prototype inconsistent (page 2314)
2608 - POSIX Condition Variables Clock Attribute Support (page 1039)
2606 - <i>alarm()</i> uses seconds watchdog and thus is affected by clock changes (page 2315)
2577 - Complete per-function section addition sweep (page 565)
2576 - <i>arm/lpc176x</i> : linker script update (add <i>KEEP()</i> sections) (page 1580)
2575 - <i>m68k/uC5282</i> : linker script update (add <i>KEEP()</i> sections) (page 579)
2574 - <i>m68k/av5282</i> : linker script update (add <i>KEEP()</i> sections) (page 581)
2573 - <i>m68k/gen68340</i> : linker script update (add <i>KEEP()</i> sections) (page 583)
2572 - <i>m68k/mcf5206elite</i> : linker script update (add <i>KEEP()</i> sections) (page 585)
2571 - <i>m68k/mcf5235</i> : linker script update (add <i>KEEP()</i> sections) (page 587)
2570 - <i>m68k/mcf52235</i> : linker script update (add <i>KEEP()</i> sections) (page 589)
2569 - <i>m68k/mcf5329</i> : linker script update (add <i>KEEP()</i> sections) (page 590)
2568 - <i>m68k/mcf5225x</i> : linker script update (add <i>KEEP()</i> sections) (page 592)
2567 - <i>m68k/mrm332</i> : linker script update (add <i>KEEP()</i> sections) (page 594)
2566 - <i>m68k/gen68360</i> : linker script update (add <i>KEEP()</i> sections) (page 596)
2565 - <i>powerpc/mpc8260ads</i> : linker script update (add <i>KEEP()</i> sections) (page 598)
2564 - <i>powerpc/qemuppc</i> : linker script update (add <i>KEEP()</i> sections) (page 600)
2563 - <i>powerpc/ss555</i> : linker script update (add <i>KEEP()</i> sections) (page 602)
2562 - RSB Docs Quick Start version number (page 1040)
2561 - <i>powerpc/haleakala</i> linker script update (add <i>KEEP()</i> sections) (page 604)
2560 - <i>smdk2410</i> is broken due to <i>gp32</i> removal (page 2316)
2559 - Delete the <i>EXTERN</i> pattern (page 1142)

Table 1 – continued from previous page

2556 - Implement the <i>O(m)</i> Independence-Preserving Protocol (OMIP) (page 2317)
2555 - Eliminate the Giant lock (page 724)
2554 - New watchdog handler implementation (page 2335)
2553 - [mvme3100] boot_card() broken by 37030e38 (page 2344)
2546 - Obsolete idp BSP (page 2346)
2545 - Obsolete mbx8xx BSP (page 2347)
2544 - Obsolete m68k/ods68302 (page 2348)
2543 - Obsolete gen68302 BSP (page 2349)
2542 - Review cxx_iostream size change per function-section changes (page 2350)
2537 - Use Newlib exec*() variants and remove RTEMS versions (page 2353)
2536 - RSB allows use of insecure hash algorithms like MD5 and SHA1 (page 2354)
2529 - BSP for the Atmel SAM V71/V70/E70/S70 chip platform (page 2355)
2527 - Move pc386/tools/bin2boot to rtems-tools (page 2356)
2515 - i386 score/libcpu API Layering Violation (page 1043)
2514 - Make POSIX API mandatory (except signals and the sporadic server) (page 1121)
2513 - Remove m68k/idp BSP (page 1044)
2509 - Should “ https://devel.rtems.org/wiki/TBR/Delete/BSP_Template ” be replaced? (page 2357)
2503 - mvme5500 BSP: Exception Handler uses deprecated Notepads. (page 2358)
2494 - Remove task variables (page 2359)
2493 - Remove notepads (page 1854)
2490 - RSB: Use SHA512 instead of MD5 (page 1724)
2488 - Vagrant Scripts (page 2361)
2487 - Should https://devel.rtems.org/wiki/TBR/Delete/SpecBuilder be Deleted? (page 2363)
2483 - raspberrypi: i2c driver can block task forever if compiled with <code>#if I2C_IO_MODE == 1</code> (page 606)
2477 - Remove <rtems/debug.h> (page 2363)
2468 - Add Thread Local Storage (TLS) support on x86 (page 775)
2464 - RSB: Tool patches use the RTEMS version (page 2365)
2459 - Add rtems_chain_get_first_unprotected() to chain API (page 2366)
2458 - Remove powerpc/score603e BSP (page 1045)
2457 - Remove powerpc/ep1a BSP (page 1046)
2455 - Warning in spsimplsched02 (page 2367)
2454 - Warning in threadqops.c (page 2368)
2453 - Remove h8300/h8sim BSP (page 1047)
2452 - Remove H8300 Architectural Port (page 1075)
2451 - Remove arm/gp32 BSP (page 1049)
2450 - Remove arm/nds (page 1050)
2449 - Remove arm/gba BSP (page 1051)
2448 - Remove mips/mongoose BSP (page 1052)
2447 - Remove m32r/m32rsim (page 1053)
2446 - Remove M32R Architectural Port (page 2369)
2445 - Remove m68k/sim68000 BSP (page 1058)
2444 - Remove m68k/mvme136 BSP (page 1060)
2443 - Remove AVR Architectural Port (page 2370)
2442 - Remove avrtest BSP (page 1062)
2441 - lpc1768 variants fail to build with error in gpio.c (page 2372)
2428 - Add 4.12 Tool Target Configurations to RSB (page 2373)
2423 - rtems_iterate_over_all_threads lacks user callback private pointer pass through (page 2375)
2420 - RSB %source file fails (page 1294)
2412 - Improved priority inheritance implementation (page 745)

Table 1 – continued from previous page

2408 - Linker set based initialization (page 1237)
2407 - Enable function and data sections (page 2377)
2385 - Warning from commit “bsps/arm: Do not use __ARM_ARCH_7A__” (page 2379)
2377 - rtems_waf: Tools without a version are not supported (page 2380)
2367 - Documentation of User Extensions needs more information (page 2384)
2366 - Create a Public API for the Atomic Operations (page 2386)
2363 - SPARC: Silent FP context corruption possible (page 1824)
2355 - SPARC: Several shared drivers are not SMP ready (page 1880)
2354 - Replace red-black tree implementation, change API (page 2387)
2350 - One watchdog ticks header per scheduler instance (page 2388)
2344 - Second argument of ualarm() is ignored (page 2390)
2325 - Broken console driver infrastructure for SPARC (page 2391)
2308 - Change uniprocessor INIT task mode to preempt. (page 2393)
2306 - powerpc/mvme5500/vectors/exceptionhandler.c uses task variables (page 2394)
2305 - sp07 needs to be split into an user extensions and a notepad test (page 2395)
2289 - rtems_ada_self is broken on SMP (page 2396)
2284 - h8300 gets error linking dl0* tests (page 2400)
2266 - Move bsp_pretasking_hook() into files named bsppretaskinghook.c (page 2401)
2261 - Add coverage report generation support to rtems-tools (page 2402)
2213 - Decreased performance for whetstone benchmark using GCC >=4.5 (page 2404)
2207 - RTEMS tar does not overwrite. (page 2406)
2198 - Automate doxygen build (page 1063)
2176 - fishy behavior in termios tx task mode (page 2408)
2173 - Potential integer overflow problem in EDF scheduler (page 2413)
2135 - times() and _times() are subject to integer overflows (page 2419)
2133 - <rtems/score/basedefs.h> superfluously includes <string.h> (page 2421)
2132 - <rtems/score/basedefs.h> superfluously includes <limits.h> (page 2425)
1971 - Memory leak in tmpfile() (page 1787)
1747 - Heap extend allows discontinuous memory regions. (page 2429)
1662 - termios.c: semaphore not deleted, consequently resulting in failure of rtems_termios_open (page 18)
1638 - tar01/tar02 tarballs contain non-deterministic uids/gids + permissions (page 1065)
1394 - scandir() fails due to MAXNAMELEN is incorrect (page 2432)
1247 - RTEMS does not implement locks needed by multithreaded newlib (page 2437)

Merge Requests Summary

4.2.1 Issues

4.2.1.1 3789 - TMS570 applciation build error

Original author: andy89.org

expected behaviour

Build without errors and without runtime errors

undesired behaviour

bsp_start_hook_0_done is undefined CPACR Register is not setup

target hardware

Hercules Safety MCU development Kit TMS570 MCU

toolchain version

Modified GCC, binutils and gdb build script to build armeb compiler build with RTEMS Source Builder master(see patches for RTEMS Soucre Builder) I need a ARM Compiler with Big Endian Support as default for TMS570.

configuration options for bsp

```
../rtems/configure --prefix=[bsp path]/bsp/armeb-rtems5 --host=arm-rtems5
--target=arm-rtems5 --enable-posix --enable-rtems-debug --disable-tests --disable-
networking --enable-rtemsbsp=tms570ls3137_hdk --CC_FOR_TARGET=armeb-
rtems5-gcc --CXX_FOR_TARGET=armeb-rtem5-gcc --AR=armeb-rtems5-ar
--TMS570_USE_HWINIT_STARTUP=1
```

Test on master commit RTEMS (4a9a58ea8ad75248af5876c01ef654f9bc59c312)

Bug Fix

define simbol bsp_start_hook_0_done in start.S add if defined(__ARM_ARCH_7R__) see patches

Original author: andy89.org

- **Milestone** set to %"5.1"
- **Owner** set to sebastian.huber
- **Status** changed from *new* to *accepted*

The problem is triggered by the TMS570_USE_HWINIT_STARTUP=1 BSP option. In bspstarthooks-hwinit.c we have:

```
1 #if 1
2 /*
3  * Do not depend on link register to be restored to
4  * correct value from stack. If TCRAM self test is enabled
5  * the all stack content is zeroed there.
6  */
7 bsp_start_hook_0_done();
8 #endif
```

Leading to:

```
1 bsp/arm/tms570/start/bspstarthooks-hwinit.c:375: undefined reference_
  ↳ to `bsp_start_hook_0_done'
```

mentioned in issue [#3790](#)

4.2.1.2 2754 - no .strtab section

Id	2754
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Chris Johns
Created	2016-07-11T00:11:57.000Z
Updated	2025-09-19T01:36:03.596Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, version::4.11
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2754
Merges	0

Original author: pggauvin

dlopen on the object generated by libfoo.cpp in the attached test case fails and results in the error no .strtab section. readelf shows that the section is present, though:

```

1 readelf -S libfoo.o | grep strtab
2 (standard input):97: [92] .shstrtab          STRTAB          00000000 001fb0
   ↪00040c 00          0  0  1
3 (standard input):99: [94] .strtab           STRTAB          00000000 0018b0
   ↪00019e 00          0  0  1

```

Steps to Reproduce (you may have to edit BSP_DIR in the Makefile):

```

1 make clean all
2 qemu-system-arm -m 256M -M xilinx-zynq-a9 -serial null -serial mon:stdio \
3 -nographic -no-reboot -kernel libdl-strtab-test.exe

```

Expected Output:

```

1 TEST BEGIN
2 dlopen: no .strtab section
3 assertion "handle != NULL" failed: file "libdl-strtab-test.c", line 46, function:
   ↪POSIX_Init

```

Development Environment: * **RTEMS Version:** 4.11 (Branch “4.11”, commit 3f72dda6ee518d3ea04341ad4df079ecb1895ef7) with the dlerror patches from [#2747](#), and the attached ARM PREL31 support patch (I will be making a separate ticket for this with test code soon). * **System Type:** ARM Cortex-A9, xilinx_zynq_a9_qemu BSP * **GCC Version:**

arm-rtems4.11-gcc (GCC) 4.9.3 20150626 (RTEMS 4.11, RSB 1675a733536d1aec2020011e5e522497a442561a (HEAD, origin/4.11, 4.11), Newlib 2.2.0.20150423) * **RTEMS Configure Options:**

```
-target=arm-rtems4.11 -enable-rtemsbsp="xilinx_zynq_a9_qemu xilinx_zynq_zedboard
xilinx_zynq_csp_cots xilinx_zynq_csp_hybrid" -enable-tests=samples -enable-posix -pre-
fix=$HOME/development/rtems/4.11 -disable-networking
```

workaround for this issue

Author: Trac Migrate 2016-07-20T20:26:35.000Z

Original author: pggauvin

I've narrowed down the problem to a corrupted section name for .strtab being retrieved by `rtems_rtl_obj_cache_read` in `rtems_rtl_elf_parse_sections`. The offset to the name in the file was correct, but garbage was returned. The attached patch effectively disables the caching functionality of `rtems_rtl_obj_cache_read`, allowing the test to load the object successfully and generate this output:

```
1 TEST BEGIN
2 dlopen:
3 TEST END
```

Is this to be fixed on the 4.11 branch as well?

Author: Joel Sherrill 2016-08-12T15:58:59.000Z

Original author: pggauvin

Patrick should answer from their perspective. But I think it should.

But from what I know of Patrick's application, we would strongly encourage them to move to the master to get greater stability on the SMP and maturity on rtems-libbsd.

Author: Trac Migrate 2016-08-13T18:07:54.000Z

Original author: pggauvin

[comment:2 chrisj]:

Is this to be fixed on the 4.11 branch as well?

It is desirable, especially if the patches for master don't apply cleanly to 4.11.

[comment:3 joel.sherrill]:

Patrick should answer from their perspective. But I think it should. But from what I know of Patrick's application, we would strongly encourage them to move to the master to get greater stability on the SMP and maturity on rtems-libbsd.

This project is likely locked to 4.11, but I will recommend it.

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

In changeset 35edf82463f33d30e6bbbbbbafe3aadd80acffbb:

libdl: Fix cache corruption bugs. This patch fixes a number of bugs in the cache when requests are made to read close to the end of the file and the data is copied from the top of the cache buffer to the bottom of the buffer. This was compounded by attempting to read past the end of the file. Closes [#2754](#).

As of today, or1k is using gcc 4.9.x and it does not compile the TLS tests because it doesn't have the `thread_local` keyword.

This ticket is to track that I have disabled the tls tests for the or1k BSP and they need to be re-enabled when the or1k gcc is updated.

Original author: Christian Mauderer

I'll start in the next few days to add IPsec (client) support to the libbsd. Because IPsec is quite deeply integrated into some parts of the network stack it would have quite a performance impact on every system and not only the ones using IPsec. Therefore it is necessary to compile this support only conditionally.

From my point of view that means that the build system needs two new capabilities:

1. For IPsec the whole stack has to be compiled with certain defines. If I understood the FreeBSD build system correctly these defines would be set via generated header files. In RTEMS we have static files for that (like `rtemsbsd/include/rtems/bsd/local/opt_inet6.h`). I see two possibilities: a. Generate the headers depending on a configure option. b. Use empty headers like we already do it for a lot of options. Depending on a configure option then add a `'DSOME_OPT=1'` to the modules that need it. That one would be my preferred way.
2. IPsec adds a number of source files that most likely only work if the rest of the stack is compiled with the correct configuration. We already have modules in the `libbsd.py`. But currently they are added or removed by commenting the matching line in `libbsd.py`. My approach would be to make it possible to enable or disable the modules depending on a command line switch during configure.

I'm open for any suggestions regarding better solutions.

Author: Chris Johns 2018-03-19T08:57:53.000Z

Original author: Christian Mauderer

Do we have a single build which creates variant libraries and a user selects which variant they want or do we have a single library built for a specific purpose?

I feel building variant libraries is better solution because every build by a developer checks all variants, and it aids deployment because you do not have users needing to manage specific build instances.

If we can establish how we want to package libbsd in light of this change and the need to have a difference the details will be must easier to manage.

Author: Trac Migrate 2018-03-19T09:39:54.000Z

Original author: Christian Mauderer

If we build multiple variants in one go we might have a lot of different variants soon because every option would double the variants.

The IPsec is one option but we already had an application where we disabled IPv6 for one specific use case due to size reasons. Another option could be WiFi or no WiFi (which adds quite some code which isn't used by many applications). So it would be already eight different versions.

My long-time direction would be to provide options via a configuration file (for example some ini). With that it would be possible to use different default configuration for some BSPs (for example the ones with / without WiFi). A user could provide his own config that matches his application. I still have to have a more detailed look over the option parser used in waf but I would expect that it can be somehow convinced to read options via a file too.

Author: Trac Migrate 2018-03-19T13:14:23.000Z

Original author: Christian Mauderer

Just noted: A partial support for setting defines via a waf-option is already there: The `--freebsd-option` switch for the waf configure call. That one can already set a define. Most likely it would be useful to extend or replace that.

Author: Chris Johns 2018-03-20T02:00:14.000Z

Original author: Christian Mauderer

Replying to [Christian Mauderer](#):

If we build multiple variants in one go we might have a lot of different variants soon because every option would double the variants.

Yes. A way to configure and build does not diminish the obligation on all developers making changes to build all possible variants or at least an agreed number. Over the years we have added options to RTEMS's configure and has become a problem. If you add on to the possible configure options the possible BSP_OPTS we have something we can never ever test build not even once. I am attempting to control the issue with the `rtems-bsp-builder` and it's 1600+ lines of Python. If you review a recent build from Joel (1) you will see the minimal set of 13 build variants I could come up with generates over 1500 build jobs or separate builds of RTEMS. I would like to avoid this as much as possible but recognize it is difficult or impossible to do without limiting the features we want.

- (1) <https://lists.rtems.org/pipermail/build/2018-March/000553.html>

The IPsec is one option but we already had an application where we disabled IPv6 for one specific use case due to size reasons. Another option could be WiFi or no WiFi (which adds quite some code which isn't used by many applications). So it would be already eight different versions.

Yes, and while we have used options for this I feel that method may not scale. It has been useful up to now but I think we need to consider something else.

My long-time direction would be to provide options via a configuration file (for example some ini). With that it would be possible to use different default configuration for some BSPs (for example the ones with / without WiFi). A user could provide his own config that matches his application. I still have to have a more detailed look over the option parser used in waf but I would expect that it can be somehow convinced to read options via a file too.

I would prefer this be a near-term direction and we develop Python code and support so we can define a set of agreed “variant builds” . I see a “variant” consisting of compile options, ie -Os etc, specific defines and specific sets of files. The base build would be a bare stack, for example no IPv6, SSL, etc, and an IPV6 with SSL would be IPV6-SSL = base + IPV6 + SSL.

I am OK with INI files because it is built into Python. YAML would be nice but it requires extra host packages and that creates user support issues. Please take a look at `tester/rt/check.py` and `rtemstoolkit/configuration.py` in the `rtems-tools` repo. It is fine to copy down to this project the configuration file support from the `rtemstoolkit`.

I think it would be best to leave `libbsd.py` as it is for now. I would like to move that configuration to an INI format and remove the intermediate step of generating `libbsd_waf.py`. There is no real need to generate the file other than the former support of Makefile builds. This means we work on a top level INI design and we can flesh out the migration from `libbsd.py` later. The `rtemstoolkit/configuration.py` supports includes which allows a tree structure to be formed letting us clip below the needed file sets when that change happens.

The key requirement I would like to have is being able to configuring a build for `libbsd` that builds all variants we agree are important before submitting a patch. I do not want to have to write another `rtems-bsp-builder`, I would like that functionality built in.

Author: Trac Migrate 2018-03-20T09:37:37.000Z

Original author: Christian Mauderer

Thanks for the input. Let me summarize how I understood you.

1. We try to find an officially supported set of build variants for the library. That list should ideally not grow to more than 20 to 30 variants over time. At the moment I would see the following three (of course we can discuss the exact variants but maybe we should keep that for later (see also note at the end regarding SSL and WiFi)): * Size optimized with about the same functions as the classic stack: no IPv6, no IPsec, maybe no <something else>; -Os * Normal functionality that should cover most use cases: basically everything that is available now; -O2 * IPsec: Normal + IPsec; -O2 * Debug build: Everything; -Og or -O0

2. We want to use ini files for configuring the variants.

3. The system should be build in a way that if the user really wants to build an unsupported variant, he can use some own configuration file.

If that's what you meant I would be OK with this direction. Otherwise please correct me.

Now some more guesswork about the implementation:

4. The top configuration files would include the following information: * The modules to include into the build. That would replace the part that is currently done in `libbsd.py` in the `def sources(mm)` with the `mm.addModule(...)` lines. * Extra compiler flags (like `-DINET6` or `-Og`) that should be added to the ones already used for the modules. Some of them would have to be removed from the modules and put here instead (`INET6, ...`)

5. Later the rest of the `libbsd.py` should be migrated to a ini too. But that is not necessarily in the scope of this ticket.

6. When I'm already busy with changing the build process, it would be good to remove the generated `libbsd_waf.py` completely (which most likely needs quite some thought).

Is that about what you have thought?

How should we deliver the variants? Install them all and tell the user to use `-lbsd_small` or `-lbsd_ipsec` when he links?

Note for the build variants:

Regarding SSL: I hope that this does not influence how other code is built in `libbsd`. So it should be OK to put it into the base set. It would be only linked in if some application uses it. Of course the installed headers might have an influence on the user application.

Regarding WiFi: Maybe it's possible to deactivate it by default without an extra build variant. I have already removed quite some big parts by re-defining mainly the `_bsd_ifconfig_ieee80211_ctor()` as an empty function. If that doesn't work another variant might could be useful.

Author: Chris Johns 2018-03-22T23:46:18.000Z

Original author: Christian Mauderer

Nice summary, thank you.

Yes to 1, 2, and 3. The variants will evolve and I suspect will be driven by user demands. Your initial list is really nice. I really like the first one as an easy step for those migrating from the legacy stack.

I think the 4, 5, and 6 sum up what I was thinking. I am currently swinging between the build details being in an INI file or in a waf script and so Python. I am concerned moving all the build to INI format creates a new build system based on INI files which I would consider a mistake. The configuration management of the parts can be an INI file.

I will take a look at moving the current build to just waf and to remove the generate stage and then report back on how this looks and what I find. I feel time invested in

doing this will benefit how we proceed.

Author: Chris Johns 2018-03-23T06:02:50.000Z

Original author: Christian Mauderer

Should libbsd.py we split up into multiple files?

Author: Chris Johns 2018-03-23T06:52:11.000Z

Original author: Christian Mauderer

I think the simplest solution is to:

1. Leave libbsd.py as is for now. I feel this file can be split into parts after an initial refactoring has been completed.
2. Create waf_libbsd.py which is a copy of libbsd_waf.py and convert all the `self.add('')` calls into actual code. I think `freebsd-to-rtems.py` can use the `builder.py` base class because all it needs to call is `processSource()` which is all in `builder.py`.
3. Add class methods to match the required waf functions: a. `init` b. `options` c. `bsp_configure` d. `configure` e. `build`
4. Update `wscript` to create a `Modules` instance and hold globally. It then uses it for each of its calls.
5. Update `freebsd-to-rtems.py` to use `waf_libbsd.py` and remove the generate code.

This conversion is not too difficult. The INI configuration support can be built on top of this. The result is:

- a. List of modules to build
- b. Defines
- c. Compile flags

Author: Trac Migrate 2018-03-23T07:07:16.000Z

Original author: Christian Mauderer

Thanks for the feedback. I had a look at that yesterday and had a similar course of action in mind. Good to know that you have about the same idea about it. Also I didn't expect that on my initial estimation for that work, removing the generated script will simplify the task a lot so I agree that it is a good idea. It will also make it simpler to understand the build system for anyone looking at it and future adaptations will be easier.

Author: Chris Johns 2018-03-26T01:44:57.000Z

Original author: Christian Mauderer

I have posted a patch to devel for review. It has a couple of issues:

1. No changes to libbsd.txt
2. The headers need to all be parse for @CPU@ as bld.env['RTEMS_CPU'] was taken out and replaced with @CPU@.

If you are happy with the direction I can clean up these two issues and push to master.

Note, I have moved a range of configuration pieces from builder.py to waf_libbsd.py._defaults to form the basis of the configuration data. After loading the configuration is updated to reflect the variant being built.

The next step is to add a module level enable control and to default it to True then un-comment the modules which are commented defaulting them to disabled. This will give us 2 more entries in the configuration dict, modules and modules-enabled and by default modules-enabled is copied to modules-build and that list is the modules to build. If we add 'archive-name' and defines you are close to supporting build variants. It becomes a simple matter of looping over a config creating a 'builder' instance for each variant to build a number of variants. All this is done before the first build job is run.

Author: Chris Johns 2018-03-26T03:06:15.000Z

Original author: Christian Mauderer

Enable control requires all the functions in libbsd.py are converted to classes.

Author: Trac Migrate 2018-03-26T08:17:14.000Z

Original author: Christian Mauderer

Thanks for the work. I had started with a similar patch on Friday and most likely would have posted a first version today if you wouldn't have been faster. So I'm quite OK with that direction. I'll take a more detailed look at your patches and write some more feedback on the mailing list in a few hours.

```
1 waf: Add configurations with different modules.
2
3 Update #3351
```

Author: Trac Migrate 2018-04-27T11:47:21.000Z

Original author: Christian Mauderer

- **Summary** changed from *libbsd: Add support for conditional compilation of modules and compiler flags* to *libbsd: Introduce buildsets that allow to enable or disable parts of libbsd to get for example smaller or faster configurations*.

To make things more user friendly I dropped the original intent to allow to set the compiler flags with the configuration. Otherwise a user would have to know that he has to drop for example the `netinet6` module `_and_` remove the `INET6` compiler flag.

Instead, I now generate a header file that has defines for all enabled modules. That also allows to (for example) simply switch off the constructor for `wifi` in `ifconfig`. Without the header, it would have been necessary to enable a “`no_wifi`” module that provides an empty implementation of that constructor when the `wifi`-modules are disabled.

FYI it's possible for us to create custom ticket fields which may be a nice place to put 'target'.

Author: Chris Johns 2017-10-04T23:50:53.000Z

Original author: sebastian.huber

Replying to **Amar Takhar**:

FYI it's possible for us to create custom ticket fields which may be a nice place to put 'target'.

What do you mean by target, a BSP or something else?

Author: Trac Migrate 2017-10-05T04:59:57.000Z

Original author: sebastian.huber

Ok, "target" alone makes probably no sense. The "target/X" should catch anything which is related to a particular target architecture, e.g. CPU port and BSPs.

Author: Chris Johns 2017-10-05T05:20:02.000Z

Original author: sebastian.huber

Replying to **Sebastian Huber**:

Ok, "target" alone makes probably no sense.

Agreed.

The "target/X" should catch anything which is related to a particular target architecture, e.g. CPU port and BSPs.

Could you please expand on this? It is not clear to me what this means.

Author: Trac Migrate 2017-10-05T05:28:50.000Z

Replying to **Chris Johns**:

Replying to **Sebastian Huber**:

The "target/X" should catch anything which is related to a particular target architecture, e.g. CPU port and BSPs.

Could you please expand on this? It is not clear to me what this means.

Bugs in a BSP, the CPU port (cpukit/score/cpu/X). Bugs that are only present for arm-rtems4.12, but not for powerpc-rtems4.12, etc.

Author: Chris Johns 2017-10-05T05:31:09.000Z

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

Bugs in a BSP, the CPU port (cpukit/score/cpu/X). Bugs that are only present for arm-rtems4.12, but not for powerpc-rtems4.12, etc.

I understand purpose, the implementation is not clear to me and what X means.

Do you propose target/arm, target/arm/zedboard, or something else?

Author: Trac Migrate 2017-10-05T05:32:29.000Z

Original author: sebastian.huber

Just, target/arm. We should not have too many components.

Author: Trac Migrate 2017-10-05T05:37:07.000Z

Original author: sebastian.huber

Maybe we should reduce

- lib
- lib/block
- lib/dl
- lib/drvmgr

to just

- lib

Also

- fs
- fs/fat
- fs/ftpfs
- fs/imfs
- fs/jaffs2
- fs/nfs
- fs/rfs
- fs/tftpfs

to

- fs
- fs/fat
- fs/jaffs2
- fs/rfs

Author: Chris Johns 2017-10-05T05:38:22.000Z

Original author: sebastian.huber

Replying to **Sebastian Huber**:

Just, target/arm. We should not have too many components.

Then I propose arch/arm and not target. I have been attempting to make consistent the way to address a specific BSP as //arch/bsp// and so I would prefer we attempt to limit our usage to arch and bsp. A target could be defined as //arch/bsp//.

Author: Chris Johns 2017-10-05T05:39:03.000Z

Original author: sebastian.huber

Replying to **Sebastian Huber**:

Maybe we should reduce

Yes, this is better. It help management and the milestone report is simpler.

Merges	0

Intel has discontinued the Edison. The BSP is only partially complete and the pc386 BSP has hacks to make it run. It should be removed.

Author: Joel Sherrill 2017-07-28T15:40:02.000Z

- **Owner** set to @joel
- **Status** changed from *new* to *assigned*

Author: Gedare Bloom 2017-07-28T17:03:26.000Z

Anything you can do to clean up pc386 a bit in the process will be good...

Author: Joel Sherrill 2017-07-28T18:07:27.000Z

I am just removing the Edison. No further clean up. :(

Original author: sebastian.huber

Currently, one interrupt server is created for each processor in the system. This should be more configurable by the user, e.g. add an alternative initialization routine that uses a configuration table with various options. The interrupt server API uses a server index to identify a particular server, this can be mapped to the configuration table index.

I have seen this on other qemu, it appears to be a benign warning and not a failure. You can make it disappear by providing an env variable: QEMU_AUDIO_DRV=none
qemu-system-lm32 ...

Author: Chris Johns 2017-07-03T04:42:07.000Z

Original author: cpod

You can also build qemu without audio support. If building qemu I find this lowers the number of dependencies you need removing unwanted driver support.

Replying to [Cillian O'Donnell](#):

Qemu tests time out as it fails to exit after test is run. Hello.exe hangs on the line 'end of test hello world' and requires manual exit (ctrl+C)

The `rtems-tester` can be conditionally made to stop a simulator after a test if we finally decide the issue is in the simulator. We need to be careful not to kill the test if the problem is in the shutdown of the BSP due of a lack of a suitable shutdown, a bug or some issue in the tool set up. Ok, any tips on how to determine which of these problems I have?

```
* BEGIN OF TEST HELLO WORLD *
Hello World * END OF TEST HELLO
WORLD * qemu: terminating on sig-
nal 2 The BSPs affected are ARM:
lm3s6965_qemu i386: PC386 (Current
RSB-Qemu hangs before test output and
Couverture-Qemu is as described)
```

This anomaly has disappeared with a slight change of Qemu options. i386 PC386 now behaves like the rest for both Qemu variants

What is the change to the options? It would be nice to document here what they are. Yes I should've mentioned this. Using the following 3 sets of options, which are more in line with what had worked previously, the tests hangs before the output

```
qemu-system-i386 -m 128 -boot b -hda path_to/rtems-
boot.img -no-reboot -monitor null -serial stdio -nographic -
append "-console=com1;boot;" -kernel hello.exe
```

or

```
qemu-system-i386 -no-reboot -serial null -serial mon:stdio -
nographic -kernel hello.exe (in this case 'kill pid' must be is-
sued)
```

or

```
qemu-system-i386 -no-reboot -monitor null -serial stdio -
nographic -kernel hello.exe
```

and with a simpler set of options suggested by Sebastian it hangs after the output and behaves like the others as detailed above

```
qemu-system-i386 -monitor null -nographic -serial stdio -
nodefaults -kernel hello.exe
```

Replying to **Cillian O'Donnell**:

Qemu tests time out as it fails to exit after test is run. Hello.exe hangs on the line 'end of test hello world' and requires manual exit (ctrl+C)

The rtems-tester can be conditionally made to stop a simulator after a test if we finally decide the issue is in the simulator. We need to be careful not to kill the test if the problem is in the shutdown of the BSP due of a lack of a suitable shutdown, a bug or some issue in the tool set up.

Ok, any tips on how to determine which of these problems I have?

You need to examine each BSP:

1. Does the BSP have suitable reset logic? This could be a hardware register that generate a power on reset (POR) or a power down, or a call to target resident ROM code that does this. It may mean looking into any technical reference detail about the specific target hardware looking for something that we could use, for example watch dogs.
2. Does QEMU support the functionality to match the BSP? If not what does QEMU support and does the BSP support it? It may also pay to ask the qemu community to see if there is something we are missing.
3. If QEMU and the BSP cannot be made to align so qemu exits please come back so we can discuss possible support in the tester to kill qemu. Killing qemu when a test passes is something we can support however what happens on failures is more difficult. Further timeouts are hard when running parallel qemu jobs because the load on the host changes the targets view of real-time vs the hosts view.

```
* BEGIN OF TEST HELLO WORLD *
Hello World * END OF TEST HELLO
WORLD * qemu: terminating on sig-
nal 2 The BSPS affected are ARM:
lm3s6965_qemu i386: PC386 (Current
RSB-Qemu hangs before test output and
Couverture-Qemu is as described)
```

This anomaly has disappeared with a slight change of Qemu options. i386 PC386 now behaves like the rest for both Qemu variants

What is the change to the options? It would be nice to document here what they are.

Yes I should've mentioned this. Using the following 3 sets of options, which are more in line with what had worked previously, the tests hangs before the output qemu-system-i386 -m 128 -boot b -hda path_to/rtems-boot.img -no-reboot -monitor null -serial stdio -nographic -append

“-console=com1;boot;” -kernel hello.exe or qemu-system-i386 -no-reboot -serial null -serial mon:stdio -nographic -kernel hello.exe (in this case ‘kill pid’ must be issued) or qemu-system-i386 -no-reboot -monitor null -serial stdio -nographic -kernel hello.exe

This aligns to the settings in the rtems-test tool:

<https://git.rtems.org/rtems-tools/tree/tester/rtems/testing/qemu.cfg#n51>

and with a simpler set of options suggested by Sebastian it hangs after the output and behaves like the others as detailed above qemu-system-i386 -monitor null -nographic -serial stdio -nodefaults -kernel hello.exe

Just to be clear, what do you mean by “others”? Is this systems that hang or the systems that exit qemu to finish the test?

Killing qemu when a test passes is something we can support however what happens on failures is more difficult. Further timeouts are hard when running parallel qemu jobs because the load on the host changes the targets view of real-time vs the hosts view.

That's great, thanks Chris. I'll dig into this.

```
* BEGIN OF TEST HELLO
WORLD * Hello World * END
OF TEST HELLO WORLD *
qemu: terminating on sig-
nal 2 The BSPs affected are
ARM: lm3s6965_qemu i386:
PC386 (Current RSB-Qemu
hangs before test output and
Couverture-Qemu is as de-
scribed)
```

This anomaly has disappeared with a slight change of Qemu options. i386 PC386 now behaves like the rest for both Qemu variants

What is the change to the options? It would be nice to document here what they are.

Yes I should've mentioned this. Using the following 3 sets of options, which are more in line with what had worked previously, the tests hangs before the output `qemu-system-i386 -m 128 -boot b -hda path_to/rtems-boot.img -no-reboot -monitor null -serial stdio -nographic -append "-console=com1;boot;" -kernel hello.exe` or `qemu-system-i386 -no-reboot -serial null -serial mon:stdio -nographic -kernel hello.exe` (in this case 'kill pid' must be issued) or `qemu-system-i386 -no-reboot -monitor null -serial stdio -nographic -kernel hello.exe`

This aligns to the settings in the `rtems-test` tool: <https://git.rtems.org/rtems-tools/tree/tester/rtems/testing/qemu.cfg#n51>

and with a simpler set of options suggested by Sebastian it hangs after the output and behaves like the others as detailed above `qemu-system-i386 -monitor null -nographic -serial stdio -nodefaults -kernel hello.exe`

Just to be clear, what do you mean by “others”? Is this systems that hang or the systems that exit qemu to finish the test?

The ‘others’ is referring to systems that hang. With that change in options all 4 bsp's hang after ‘hello world’ output and require manual exit (ctrl+c) for both the current RSB-Qemu and Couverture-Qemu.

Author: Joel Sherrill 2024-12-24T22:03:34.080Z

If this still is occurring, someone will file a new issue. This is old enough where at least one of the architectures has been obsoleted.

Currently the symbol `swi_remove` is `#ifdef`'ed out in `rtems (kern_intr.c)`. However, there are places that were referencing `swi_remove` without `#ifdef` around it. I am new to `libbsd` and I currently do not have expertise to determine if the actual `swi` test itself needs to be removed or just `ifdef`'ed out where `swi_remove` symbol is referenced or anything in between. Attached is a screenshot showing `swi_remove` is referenced.

One last note, compiling with `-O2` is ok.

Which BSP did you use? I use `-O0` sometimes and it works well.

Author: Trac Migrate 2017-05-22T16:41:30.000Z

Original author: phongvanpham

Replying to [Sebastian Huber](#):

Which BSP did you use? I use -OO sometimes and it works well.

The issue has to do with a lack of the following additional compiler (and linker) options

`-ffunction-sections -fdata-sections -Wl,-gc-sections`

when compiling with -OO.

Since some of compiler+linker options are partially taken from BSP settings, are you mandating that the above options to be in the BSP in order to use libbsd?

Personally, I don't think it is a good idea. If you need them to compile libbsd, you should explicitly state them in the waf compiling environment (assuming you don't want to fix the `swi_remove` symbol issue directly) by modifying the `libbsd_waf.py` (or wherever the input to the tool that autogenerate `libbsd_waf.py`). In this way, you're removing the dependency from BSP compiling options.

Author: Trac Migrate 2017-05-23T05:57:30.000Z

Original author: phongvanpham

Every BSP should use these options. Yes, its not obvious and setting these options explicitly in every BSP is bad.

Author: Trac Migrate 2017-05-23T16:41:35.000Z

Original author: phongvanpham

Replying to [Sebastian Huber](#):

Every BSP should use these options. Yes, its not obvious and setting these options explicitly in every BSP is bad.

From your comment, I couldn't figure out what your plan of action is.

If it is a mandate that every BSP is required to have those compiler/linker options in order to use `rtems-libbsd`, then this ticket is no longer valid and pls. feel free to close it as "wont fix".

From my end, there is nothing else to do for this ticket.

The RTEMS Coding Style should be in a Sphinx document so it is included in the formal documentation set. This is a document expected for certification and qualification efforts.

There are still various pages in the wiki which can be found by using this search URL which require merging into the Software Engineering Guide or otherwise updating.

<https://devel.rtems.org/search?q=Developer%2FCoding&noquickjump=1&wiki=on>

All Doxygen guidance should be in the Guide. GCI instructions may remain in the wiki. Was at wiki Developer Coding Conventions. Now at <https://docs.rtems.org/branches/master/eng/coding-conventions.html>

As a specific starting point, <https://devel.rtems.org/wiki/Developer/Coding/Doxygen> needs further review against the Doxygen Guidelines at <https://docs.rtems.org/branches/master/eng/coding-doxxygen.html#>.

Author: Chris Johns 2017-04-09T00:22:44.000Z

- **Milestone** changed from %”4.12” to %”4.12.0”

I think we need a document that contains all the processes and procedures for the project. There are a number of elements we have that need to be formalised and documented.

What should we call this document, “RTEMS Project Development Procedures”?

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2972
Merges	0

POSIX defines the functionality included in the ndbm.h file here:

<https://pubs.opengroup.org/onlinepubs/9699919799/basedefs/ndbm.h.html>

This functionality is not required by any FACE profile.

It is likely the best way to add this capability is as an add-on library via the RSB.

Author: Trac Migrate 2017-04-05T05:26:00.000Z

I would simply import this from FreeBSD into Newlib.

Author: Trac Migrate 2019-08-12T05:34:29.000Z

Support got added in Newlib. The testsuite is added in conditional way in RTEMS.

Author: Joel Sherrill 2019-09-25T17:06:53.000Z

- **Resolution** set to ~”fixed”
- **Status** changed from *new* to *closed*

This has been completed.

Add functionality from the ftw.h POSIX file per <http://pubs.opengroup.org/onlinepubs/9699919799/basedefs/ftw.h.html>

This adds the methods ftw() and nftw().

Note that ftw() was declared obsolete by POSIX-2008 but should be added anyway for back-wards compatibility.

FreeBSD implementation of both can be found here:

<https://github.com/freebsd/freebsd/tree/master/lib/libc/gen>

When these methods are added, modify testsuites/psxtests in the psxhdrs section to add the ftw API Compliance tests which are already in place.

Author: Trac Migrate 2018-12-06T15:52:25.000Z

I downloaded the <https://docs.rtems.org> website with a website downloader and made a local web server to be able to test the changes I make from the computer in an iPad. I used an iPad 2 from 2011 with iOS 9.3.5 to test it so it should work on newer iPhones and iPads too.

Basically what happens is that the code is correct (this is why it works in every other web browser), but relies only on the `data-target` and `data-toggle` attributes, which for iPad's and iPhone's Safari web browser don't work very well. Other iOS web browsers (Chrome, Firefox, etc. for iOS) are probably also affected by this bug because Apple only permits to use the Safari browser engine in iOS applications. Just by adding some CSS (`cursor: pointer;`) to the element works as expected. This change also shows a pointer cursor when hovering over the accordion you have to click when using a computer which makes it more intuitive instead of just an arrow.

I think that the source code of <https://docs.rtems.org> is not in any public repository so I can't make a patch, but the code to add is really short and simple. Just add this code at the end of <https://docs.rtems.org/static/rtems/css/rtems.css>:

```
1 [data-toggle~="collapse"] {
2   cursor: pointer;
3 }
```

The code adds the required CSS to all elements which have the attribute `data-toggle="collapse"`, so it fixes every element and everything works as expected.

Author: Chris Johns 2018-12-09T23:44:12.000Z

This is awesome.

The docs web site is held in this repo <https://git.rtems.org/chrisj/rtems-admin.git/>.
If you could please make a patch against this repo I can apply it and push it.

Thank you for taking a look and providing a solution.

Author: Trac Migrate 2018-12-10T19:17:15.000Z

Ok, patch done! (attached and sent to devel@)

Author: Trac Migrate 2018-12-10T19:18:06.000Z

- **Attachment** [0001-docs.rtems.org-fix-website-in-iPhones-and-iPads.patch](#) added

Patch to fix the bug

Author: Chris Johns 2018-12-13T22:06:58.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *accepted* to *closed*

Pushed the patch to the repo and uploaded the change to docs.rtems.org so it is now live. I have tested the change on IOS and all is working. Thank you for looking into this and fixing it.

4.2.1.22 2855 - Next generation of RTEMS documentation

Id	2855
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2016-12-21T14:07:00.000Z
Updated	2025-09-19T01:32:51.353Z
Milestone	5.1
Labels	doc, old-indefinite, priority::normal, resolution::invalid, ticket-type::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2855
Merges	0

Original author: sebastian.huber

The RTEMS documentation is inconsistent, confusing and outdated. This is the master ticket to define the next generation of RTEMS documentation. Individual work packages should be done in separate tickets.

Documentation audience

Who are the consumers of RTEMS documentation?

Users:: People developing applications with RTEMS.

Developers:: People doing RTEMS development, e.g. add/maintain BSPs, CPU ports, tools, etc.

Standards:: Some documentation must be provided simply because some standard may require it.

Reviewers:: People that review RTEMS to figure out if documentation, source code and executed test programs harmonize and meet certain conditions.

Existing documentation

4.2.1.22.2.1 README files

2854

4.2.1.22.3.1 Documents

What to do with the following documents?

- Getting Started with RTEMS
- RTEMS Applications C User's Guide
- RTEMS POSIX API User's Guide
- RTEMS TCP/IP Networking Supplement
- RTEMS Shell User's Guide
- RTEMS Applications Ada User's Guide
- RTEMS BSP and Device Driver Development Guide
- RTEMS CPU Architecture Supplement
- RTEMS Development Environment Guide
- RTEMS Porting Guide
- RTEMS POSIX 1003.1 Compliance Guide
- RTEMS Filesystem Design Guide

4.2.1.22.3.2 Wiki

Purpose?

4.2.1.22.3.3 Doxygen

Purpose?

Duplicates with user manual?

Availability

Where is the documentation available?

Provide automatic documentation generation?

Standard compliance

How do deal with standard compliance, e.g. [ECSS|md_0_8208|E|md_0_8208|ST|md_0_8208|40C?](#)

Some standards require an excessive amount of documents. One option to simplify this would be a XML file which defines and documents the RTEMS interfaces (data types, functions, defines, macros, etc.) and then use a generator to produce header (maybe even with Doxygen comments) files, documentation files and also test cases.

Author: Chris Johns 2016-12-22T00:34:09.000Z

Original author: sebastian.huber

In regards to the ESA link, the license needs some clarification. We have ECSS members and non-members and it is not clear to me what the actual intent of the license is. Also accessing the docs needs a login and password and I am not sure what is involved in getting them, however RTEMS is open source so should we reference “behind a wall” docs? I would prefer we do not if that can be done.

The wiki needs to be general and contain information not version or release specific information. We cannot snapshot the wiki and provide it as part of a release. Take for example the removal of the SIS BSP in 4.12, that BSP still exists in 4.11, 4.10 etc, so if the BSP documentation, generated, post processed or otherwise is in the wiki do you delete all references to the SIS in the wiki so the content is valid for 4.12 or do we leave the information in the wiki for those 4.11, 4.10, etc users who still have that BSP. A wiki great for developer documentation and workflows, or fluid things like a step through of booting a PC with PXE, iPXE, etc to RTEMS.

Doxygen. I do not agree with formal API documentation being generated from the source for users. A user manual for a formal API needs to be user focused with all error, conditions of use, and real examples. An API interface is a formal contract between the developers of RTEMS and users that these interfaces are stable and do not change. There will be duplication for API functions however I do not see this as a problem because the churn on these interfaces should be almost nothing. For internal or developer documentation doxygen is great, there are others such as Linux Kernel Cross-Reference (LXR). I use <http://fxr.watson.org/> from time to time.

Finally I would like say how excited I am by the chat, tickets and focus on the documentation. If getting the docs with what ever content into Sphinx has helped start this process then I am happy.

Replying to [chrisj](#):

In regards to the ESA link, the license needs some clarification. We have ECSS members and non-members and it is not clear to me what the actual intent of the license is. Also accessing the docs needs a login and password and I am not sure what is involved in getting them, however RTEMS is open source so should we reference “behind a wall” docs? I would prefer we do not if that can be done.

I think everyone can get access to this site. You are probably not allowed to redistribute the documents without permission.

Other standards are more difficult to access, e.g. IEC 61508 or DO-178B.

The wiki needs to be general and contain information not version or release specific information. We cannot snapshot the wiki and provide it as part of a release. Take for example the removal of the SIS BSP in 4.12, that BSP still exists in 4.11, 4.10 etc, so if the BSP documentation, generated, post processed or otherwise is in the wiki do you delete all references to the SIS in the wiki so the content is valid for 4.12 or do we leave the information in the wiki for those 4.11, 4.10, etc users who still have that BSP. A wiki great for developer documentation and workflows, or fluid things like a step through of booting a PC with PXE, iPXE, etc to RTEMS.

Ok, so the BSP pages from the wiki should move into BSP README files.

Doxygen. I do not agree with formal API documentation being generated from the source for users. A user manual for a formal API needs to be user focused with all error, conditions of use, and real examples. An API interface is a formal contract between the developers of RTEMS and users that these interfaces are stable and do not change. For internal or developer documentation doxygen is great, there are others such as Linux Kernel Cross-Reference (LXR). I use <http://fxr.watson.org/> from time to time.

It would be really nice to generate the header files with Doxygen comments and the sphinx parts from one common file, e.g. in XML. This could be also used to contain the specification and test cases.

Finally I would like say how excited I am by the chat, tickets and focus on the documentation. If getting the docs with what ever content into Sphinx has helped start this process then I am happy.

Including BSP README files from the source directory in a sphinx document seems to be a bit hard:

<http://stackoverflow.com/questions/10199233/can-sphinx-link-to-documents-that-are-not-located-in-d>

Author: Trac Migrate 2016-12-23T09:04:23.000Z

Original author: sebastian.huber

What are the hard technical reasons to have a separate documentation repository?

Author: Trac Migrate 2016-12-23T09:52:29.000Z

Original author: sebastian.huber

I propose to do the following:

1. Move the documentation back into the RTEMS sources.
2. Move the BSP README files to the documentation directory into the CPU Supplement.

Author: Chris Johns 2017-01-04T23:16:51.000Z

Original author: sebastian.huber

Replying to [sebastian.huber](#):

I propose to do the following: 1. Move the documentation back into the RTEMS sources.

Please do not. There is more to the project's documentation than the kernel and doing this would result in commit churn.

How a user uses the RSB or Eclipse is valid user documentation and it is not related to the kernel. Having this type of documentation in the unrelated kernel source repo would cause 2-way commit churn where user doc changes unrelated to the kernel would require buildbot rebuilds of the kernel and kernel changes would require documentation rebuilds.

For me having the documentation source in the kernel source tree so a specific part of the documentation could be automatically updated is a questionable small gain at a larger cost. I question any formal user API documentation we have being automatically generated this way for a few reasons. It becomes difficult to audit changes because you need to de-reference the location in the documentation source to the location in the kernel source tree and I feel formal user API interfaces should be fixed and cannot change without careful consideration rather than being seen as kernel source file changes. Second, we have more than

one place documentation can be located which means more complexity in how we maintain the documentation, and finally we would need to find a suitable format for use because there is no tool I know of that can do a suitable doxygen type extraction to ReST.

2. Move the BSP README files to the documentation directory into the CPU Supplement.

I wonder if we should have a single document for BSPs and this be a chapter. I do not see a need for lots of separated manuals.

Author: Trac Migrate 2017-01-05T09:31:14.000Z

Original author: sebastian.huber

Having this type of documentation in the unrelated kernel source repo would cause 2-way commit churn where user doc changes unrelated to the kernel would require buildbot rebuilds of the kernel and kernel changes would require documentation rebuilds.

Is this a hard buildbot limitation? Why can't you teach buildbot that there are separate build systems/components in different directories? We don't have that many commits per second. Is this a real problem?

I would even consider to move all parts that are required to work with RTEMS and that are maintained by the RTEMS project into one repository, e.g. the RSB and the RTEMS Tools.

For me having the documentation source in the kernel source tree so a specific part of the documentation could be automatically updated is a questionable small gain at a larger cost. I question any formal user API documentation we have being automatically generated this way for a few reasons. It becomes difficult to audit changes because you need to de-reference the location in the documentation source to the location in the kernel source tree and I feel formal user API interfaces should be fixed and cannot change without careful consideration rather than being seen as kernel source file changes. For the space qualification of RTEMS SMP we have to produce a lot of different documents. I didn't spend much time to this topic so far, but I guess that without automatic generation from a common source (XML documents) this will be infeasible to deliver.

2. Move the BSP README files to the documentation directory into the CPU Supplement.

I wonder if we should have a single document for BSPs and this be a chapter. I do not see a need for lots of separated manuals.

Yes, we definitely have to reduce the amount of different documents. Maybe we should move the BSP stuff into the getting started guide. Somewhere there should be a list of supported chips/boards (section) grouped by architecture (chapter). The quirks, build options, and so on (subsections) should be available for each BSP.

Is this a hard buildbot limitation? Why can't you teach buildbot that there are separate build systems/components in different directories? We don't have that many commits per second. Is this a real problem?

Currently yes it is. This adds extra complexity to something we have not got working and I am concerned about adding extra complexity.

I would even consider to move all parts that are required to work with RTEMS and that are maintained by the RTEMS project into one repository, e.g. the RSB and the RTEMS Tools.

I suppose you mean creating a **world** repo. I can see this being possible once the autotools build system goes and we have switched to waf. Doing so before that happens would create a level of complexity I would not like to consider. As you say we could move the RSB, RTEMS Tools, examples into a single repo. I am not sure about networking, ie the legacy and libbsd stacks, plus third party packages. They would need some sort of ports database.

I would like to add moving to an **RTEMS world** is a different topic and bringing the docs repo into a single “world” repo makes more sense. I see doing this now as premature.

For me having the documentation source in the kernel source tree so a specific part of the documentation could be automatically updated is a questionable small gain at a larger cost. I question any formal user API documentation we have being automatically generated this way for a few reasons. It becomes difficult to audit changes because you need to de-reference the location in the documentation source to the location in the kernel source tree and I feel formal user API interfaces should be fixed and cannot change without careful consideration rather than being seen as kernel source file changes. Second, we have more than one place documentation can be located which means more complexity in how we maintain the documentation, and finally we would need to find a suitable format for use because there is no tool I know of that can do a suitable doxygen type extraction to ReST.

For the space qualification of RTEMS SMP we have to produce a lot of different documents.

It is difficult to discuss something like qualification documentation when we do not know what is needed. I doubt qualification documentation requires a suitable Getting Started Guide or how to use Eclipse, these are user focused. In relation to qualification artifact generation we should endeavor to build into our processes and tools support to generate the data the artifacts need, for example the XML reports created by the RSB.

I didn't spend much time to this topic so far, but I guess that without automatic generation from a common source (XML documents) this will be infeasible to deliver.

Sorry, I do not know what you mean by a common source and XML documents. I do not know what the requirements are you are considering here.

If qualifying requires extra information that is internal then it can be automatically generated from source. Again I would like to make a clear distinction between user API documentation and anything internal. They are not the same thing and do not or even should not be grouped together.

2. Move the BSP README files to the documentation directory into the CPU Supplement.

I wonder if we should have a single document for BSPs and this be a chapter. I do not see a need for lots of separated manuals.

Yes, we definitely have to reduce the amount of different documents. Maybe we should move the BSP stuff into the getting started guide. Somewhere there should be a list of supported chips/boards (section) grouped by architecture (chapter). The quirks, build options, and so on (subsections) should be available for each BSP.

Should BSPs be a section in the User Manual?

I am currently adding a Host Tools section to cover `rtems-ld`, `rtems-exeinfo`, `rtems-syms`, and `rtems-tld`. Then I will be adding a section on Applications to cover that topic.

This ticket hasn't had a comment in approaching four years. A lot of documentation work has been done. This doesn't appear to have a specific goal which would allow it to ever close.

What to do with it?

Author: Trac Migrate 2021-04-22T05:20:40.000Z

Original author: sebastian.huber

- **Resolution** set to ~"invalid"
- **Status** changed from *assigned* to *closed*

The goals of the ticket are too unspecific.

Original author: claudiocsilva

The git:// protocol used in RTEMS git repositories is blocked by most corporate firewalls. As a result, institutional RTEMS users need to resort to access RTEMS repositories through github or to hack a way around to access git://. A preferred solution would be to have http(s):// paths for cloning RTEMS repositories in git.rtems.org. This would greatly simplify RTEMS users' lives.

BuildBot needs to be running for milestone:4.12

I will implement it using:

- RSB for parallel bootstrap
- Create a tarball from this bootstrapped code.
- Upload to a central area
- Build ‘5’ reference BSPs that should always build
- Once the 5 clear the rest of the BSPs will start building to do a full run.

Mutex will be used for this purpose. No real ETA yet but I am working on it. I will be running this on a separate master instance of BuildBot as this will be an LTS setup.

4.2.1.27 2577 - Complete per-function section addition sweep

Id	2577
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2016-02-06T16:45:48.000Z

Merges	0

As part of the GCI task described at <https://devel.rtems.org/wiki/GCI/Coding/AddPerSectionSupportToBSPs>, most BSPs were reviewed for the addition of per function section compilation and linking. This ticket is to complete that sweep.

Use [#2572](#) as a guide for the new ticket. Just copy the contents and change the title to reflect the different BSP. Use the commented out lines for the mcf5206elite BSP make/custom file as a guide. Short version:

- Do the GCI task for each BSP family listed below. Follow the format for the commit message.
- If the BSP has KEEP sections and `cxx_iostream` does not drop a suspiciously large amount, then the modification should be OK to be merged.
- If the BSP does NOT have KEEP sections, then a BSP specific ticket should be filed and the per-function section build lines commented out in the `.cfg` file with a `FIXME` line and the ticket number.

- When done, update the associated ticket for the BSP family as needed. It should be closed as a side-effect of committing any fixes so do NOT manually close them.

Follow the instructions in that GCI task with the addition that you should be EXTREMELY cautious in reviewing the size drop and whether the BSP linker script has KEEP sections. If the BSP does not have KEEP sections file a ticket to track it.

Be very careful to follow the existing patterns for tickets, commit messages, and code changes such as [#2579](#) for the powerpc/motorola_powerpc. At the bottom of this text is a current list of “BSP families” which an automated search shows as missing per-function section linking.

Some of these may already be implemented and just need to be reviewed and closed. Close this ticket when they are all done

The following tickets are for BSPs which still need per function sections:

[\[keywords=~KEEP|~function+sections,order=priority\)\]](#)

NONE

The full set of BSPs impacted by this ticket is:

[\[TicketQuery\(keywords=~KEEP|~function+sections,order=priority\)\)\]](#)

changed the description

4.2.1.28 2575 - m68k/uC5282: linker script update (add KEEP() sections)

Id	2575
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2016-02-06T16:20:56.000Z
Updated	2025-09-19T01:32:50.675Z
Milestone	5.1
Labels	bsp, old-indefinite, priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/2575
Merges	0

This BSP's linker script does not include KEEP() directives and thus cannot have per-function and per-data element section support enabled.

The preferred solution is to convert the BSP to use a shared base linker script. The acceptable solution is to add the proper KEEP directives to the existing linker script(s).

Shared linker scripts for the arm, m68k, and sparc have the proper KEEP sections and can serve as examples.

changed the description

4.2.1.30 2573 - m68k/gen68340: linker script update (add KEEP() sections)

Id	2573
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2016-02-06T16:03:20.000Z
Updated	2025-09-19T01:32:50.476Z
Milestone	5.1

Link	https://gitlab.rtems.org/rtems/rtems/-/issues/2573
Merges	0

This BSP's linker script does not include KEEP() directives and thus cannot have per-function and per-data element section support enabled.

The preferred solution is to convert the BSP to use a shared base linker script. The acceptable solution is to add the proper KEEP directives to the existing linker script(s).

Shared linker scripts for the arm, m68k, and sparc have the proper KEEP sections and can serve as examples.

This BSP's linker script does not include KEEP() directives and thus cannot have per-function and per-data element section support enabled.

The preferred solution is to convert the BSP to use a shared base linker script. The acceptable solution is to add the proper KEEP directives to the existing linker script(s).

Shared linker scripts for the arm, m68k, and sparc have the proper KEEP sections and can serve as examples.

This BSP's linker script does not include KEEP() directives and thus cannot have per-function and per-data element section support enabled.

The preferred solution is to convert the BSP to use a shared base linker script. The acceptable solution is to add the proper KEEP directives to the existing linker script(s).

Shared linker scripts for the arm, m68k, and sparc have the proper KEEP sections and can serve as examples.

4.2.1.42 2483 - raspberrypi: i2c driver can block task forever if compiled with `#if I2C_IO_MODE == 1`

Id	2483
State	closed
Type	ISSUE
Author	Trac Migrate

Merges	0

Original author: soja

If the i2c driver is compiled with `#if I2C_IO_MODE == 1` it uses a transient event send by an ISR to wait for space in the TX FIFO.

The transient event is sent to the taskid which is stored in the structure for the corresponding bus (bus->task_id). However, this field is only set once in the `rpi_i2c_register_bus`-function. That means if a task other than the one which registered the bus wants to access it, it will block forever because the event is sent to the wrong one (the one which registered the bus).

- [0001-Store-task_id-of-the-current-thread-for-the-ISR-befo.patch](#)

Author: Trac Migrate 2015-12-02T11:29:13.000Z

Author: Trac Migrate 2015-12-02T11:30:42.000Z

Original author: soja

The added patch should fix the problem. It simply writes the task_id of the current thread to the bus structure before waiting for the transient event. Then, the ISR should send the event to the correct task.

4.2.1.43 4534 - SMP EDF scheduler violates priority group ordering

Id	4534
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2021-10-27T07:40:13.000Z

Original author: sebastian.huber

The SMP EDF scheduler supports one-to-one and one-to-all thread to processor affinities. The one-to-one thread to processor affinity introduces a constraint on the ordering of threads. The implementation uses one ready queue for threads which have a one-to-all affinity and one for each one-to-one affinity group. To order threads across the ready queues, a generation number is used. However, the approach to update the generation number each time a thread is inserted into a ready queue is wrong. The generation number need to be updated only in the enqueue and enqueue scheduled operations where an insert priority is available. The scheduled chain needs to take the generation number into account.

An example scenario which shows the bug is this. Let T be a high priority task affine to processor X. Let A be a lower priority task affine to processor X. Let B be a lower priority task with no affinity to a particular processor which executes on processor Y. Let B be in the same priority group than A and after A. Let T set the affinity to all processors. Now A (higher priority relative to B) should execute on X and T (high priority) should execute on Y.

Backport of <https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5179>

Summary

Calling `tcsetattr` even with only changes to the timeout conditions will reset the line control register temporary which can corrupt ongoing data transfers.

Steps to reproduce

- Continuously write data to the serial port (ideally with high baud rates like 921600 bps).
- Change the timing settings like `VMIN` or `VTIME`
- Receive corrupted data

Expected behaviour

- Data transfer is not corrupted.

4.2.1.44.3.1 Pre-set options

Original author: sebastian.huber

Fix the CP15 cache support so that it works on ARMv5T processors such as the ARM926EJ-S. This processor has different cache maintenance operations compared to ARMv6 processors such as the ARM1176JZF-S. The current support leads to undefined instruction exceptions.

Original author: konrad.schwarz

Python 3.8 introduces a new warning: using the “is” operator as an equality operation is incorrect (although it works by chance on CPython). To compare for equality, the “==” operator must be used.

Warnings popped up when I called rtems-tester.

Attached please find patches for this case.

Original author: sebastian.huber

Since RTEMS 5, the objects based on `Objects_Control` are statically allocated in the `.bss` sections. The zero-initialization is unnecessary since each object is fully initialized after allocation by an object-specific initialization routine. The memory for objects is statically allocated or allocated from the workspace if the unlimited objects configuration option is used. Workspace memory is uninitialized by default. Optimize the static allocation to place the object controls, local tables, and thread queue heads into a `.noinit` section.

The longer system initialization time compared to RTEMS 4.11 may lead to hardware watchdog problems.

4.2.1.49 4676 - incorrect handling of “inactive_per_block” from “Objects_Information” structure

Id	4676
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2022-07-12T06:45:56.000Z

Merges	1

Original author: avarlan

The inactive_per_block for block 1 is not handled correctly. For the first object in the second block, the inactive_per_block value is not decremented. As a consequence, the block might be deleted when the second to last object from block 1 is deleted. This is only valid when the application is configured with “CONFIGURE_UNLIMITED_OBJECTS”.

The reason is the following:

in function “_Objects_Activate_unlimited” from “objectimpl.h”

```

——snip snip snip—— block = _Objects_Get_index( the_object->id ) - OB-
JECTS_INDEX_MINIMUM;

```

```

if ( block > objects_per_block ) { block /= objects_per_block;

```

```

information->inactive_per_block[ block ]--; information->inactive--; } ——snip snip
snip——

```

in a block with 8 objects per block, when creating the 9th object, _Objects_Get_index(the_object->id) returns 9. Therefore, “block” will be 8 (9 - 1). The next “if” will not be taken (8 > 8 ? No) and the inactive_per_block will not be decremented to 7 and remains at 8. This means that block 1 is a candidate for “_Objects_Shrink_information” function although object id 9 is still valid.

Steps to reproduce: -assuming 8 objects per allocation block -using semaphores as objects

1. create 17 “RTEMS_SIMPLE_BINARY_SEMAPHORE” semaphore objects id’s 1 -> 17.
2. delete semaphores 11, 12, 13, 14, 15, 16, 17 (order is important)
3. lock semaphore 9
4. delete semaphore 10 -> at this point, block 1 is freed although semaphore 9 is still active
5. unlock semaphore 9 -> this can lead to errors. In my case due to the free the semaphore object was altered and changed from a “SEMAPHORE_VARIANT_SIMPLE_BINARY” to “SEMAPHORE_VARIANT_MUTEX_INHERIT_PRIORITY” resulting in a return value of “RTEMS_NOT_OWNER_OF_RESOURCE”.

Simple fix: the condition for the “if” should be “>=” instead of “>”.

Thanks for the detailed bug report. Do you would like to add a test case for this? If not, then I can do it.

I think the bug was introduced by:

```

1 commit 21275b58a5a69c3c838082ffc8a7a3641f32ea9a
2 Author: Sebastian Huber <sebastian.huber@embedded-brains.de>
3 Date: Thu Nov 22 19:14:51 2018 +0100
4
5 score: Static Objects_Information initialization
6
7 Statically allocate the objects information together with the initial
8 set of objects either via <rtems/confdefs.h>. Provide default object
9 informations with zero objects via librtemscpu.a. This greatly
10 simplifies the workspace size estimate. RTEMS applications which do not
11 use the unlimited objects option are easier to debug since all objects
12 reside now in statically allocated objects of the right types.
13
14 Close #3621.

```

40  This looks like a bug in RTEMS or the BSP for the test platform. I would first
    ↪ investigate this and then change the test which looks all right to me.

```

```

41  This is a problem in RTEMS. RTEMS uses the FreeBSD timecounters to maintain
    ↪ CLOCK_REALTIME and provides two methods to get the time in a coarse and fine
    ↪ resolution. The std::chrono::system_clock::now() uses the fine resolution
    ↪ (higher overhead). The clock_nanosleep() uses the coarse resolution which may
    ↪ give a time before now().

4.2.1.55 4651 - if_atsam: Fix checksum offload, add multicast and VLAN support

Id	4651
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2022-05-11T06:48:30.000Z
Updated	2025-09-19T01:11:09.892Z
Milestone	5.1
Labels	libbsd, priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4651
Merges	0

Original author: sebastian.huber

The if_atsam network interface driver has several issues. Do not disable the FCS if the checksum offload is disabled. Make sure the interface capabilities are enabled. Add multicast and VLAN support. Use the interface transmit method instead of the interface start approach. Correct a potential receive starvation error. Fix the interface up/down.

Cloned from [#4649](#):

When dumping to file, the file needs to be closed at program exit. When reading from file, we do not need the loop monitor. Do not use signals, since they are not cleaned up at program exit.

Original author: sebastian.huber

When dumping to file, the file needs to be closed at program exit. When reading from file, we do not need the loop monitor. Do not use signals, since they are not cleaned up at program exit.

Original author: mfletcher

Cloned from [#4643](#):

Investigating the “Total number of failed allocations:” from the wkspc cmd i see that;

```
/* Statistics */ ++stats->failed_allocs;
```

Are incremented when `_Heap_Allocate_aligned_with_boundary` fails, however it seems this will routinely fail due to;

`_Heap_Protection_free_all_delayed_blocks` seemingly on purpose creating an impossibly large allocation.

```
uintptr_t large = 0 * (uintptr_t) HEAP_BLOCK_HEADER_SIZE * (uintptr_t)
HEAP_ALLOC_BONUS * (uintptr_t) 1;
```

```
void *p = _Heap_Allocate( heap, large );
```

This makes it difficult to place a breakpoint on `failed_allocs` to investigate true low memory situations with heap protection enabled.

The problem from [#2353](#) still exists in 5 and 6:

Original description:

From the reporter ([<skruglov@nm.ru>](mailto:skruglov@nm.ru)):

- First bug I detect with attempt write file to full device (zero empty blocks).
- And after I send too many files, disk overflow and system not responding (receive and write to disk have high priority). A test, and found block=0, after – = too big value.
- In imfs_memfile.c

function IMFS_memfile_extend block declared: unsigned int block, and after block— work incorrect (if block = 0). for (; block>=old_blocks ; block–) { IMFS_memfile_remove_block(memfile, block); }

Must be declare int block;

Author: Trac Migrate 2022-04-07T08:29:40.000Z

- **Resolution** set to ~”fixed”

In [\[changeset:”fc89cc76804499eba3f3bc4097b795a84f07571a/rtems”fc89cc7/rtems\]](#):

```

1 imfs: Fix index underrun when extending empty file
2
3 Currently the following sequence causes a endless loop when extending an
4 IMFS file:
```

(continues on next page)

(continued from previous page)

```

5
6 - Create a file with zero length and close it.
7 - Make sure nearly no allocatable memory is left.
8 - Open the file and write enough data into it that more than the
9 remaining memory will be used.
10
11 In that case when extending the IMFS file, the file currently need zero
12 blocks. If allocating enough new blocks fails, the already allocated new
13 blocks will be freed again.
14
15 The comparison of block>=old_blocks that has been used prior to this
16 patch compared two unsigned numbers. If old_blocks was zero, the
17 comparison of these two numbers always evaluated to true.
18
19 This patch frees the last block in a separate step to avoid this
20 problem.
21
22 Fixes #4638

```

Original author: sebastian.huber

The current SMP multitasking start assumed that the initial heir thread of a processor starts execution in `_Thread_Handler()` which sets the interrupt state explicitly by `_ISR_Set_level()`. Under certain timing conditions processors may perform an initial context switch to a thread which already executes its thread body. In this case, interrupts are disabled after the context switch on targets which do not save/restore the interrupt state during a context switch (for example arm and riscv).

Original author: Christian Mauderer

Cloned from [#4610](#):

The ATSAM UART waits for data to be completely send before queuing the next character. Due to that there is a small gap between two characters. This is only notable if the UART is 100% busy. For example if received data should be echoed back at maximum data rate the software buffer fills till it is full and then starts to loose characters.

Author: Trac Migrate 2022-02-15T13:38:26.000Z

Original author: Christian Mauderer

- **Resolution** set to ~"fixed"

Original author: Christian Mauderer

At the moment the I2C driver of the ATSAM doesn't return an error if a message is not acknowledged by the I2C device. The expected behavior would be to return a EIO.

Author: Trac Migrate 2022-02-11T07:38:44.000Z

Original author: Christian Mauderer

The UART/USART of the ATSAM doesn't have any FIFO buffer. Therefore every received character has to be processed before the next one arrives. In situations with a high interrupt load or during long interrupt locks, this might not work reliable and the UART/USART can loose characters.

Author: Trac Migrate 2022-01-18T08:11:58.000Z

Original author: Christian Mauderer

Original author: chenjin_zhong

Hi, I think **mmove** command in shell means that the memory can be overlapped when copy happens. but I find that when implementing this function, the **memcpy** is used in RTEMS4.13/RTEMS5.1. Should the **memcpy** be replaced with **memmove** ? The src code is listed as follows. static int rtems_shell_main_mmove(int argc, char *argv[]) { unsigned long tmp; void *src; void *dst; size_t length;

```
if ( argc < 4 ) { fprintf(stderr,"%s: too few argumentsn", argv[0]); return -1; }
```

```
/* * Convert arguments into numbers */ if ( rtems_string_to_pointer(argv[1], &dst, NULL) ) {
printf( "Destination argument (%s) is not a numbern", argv[1] ); return -1; }
```

```
if ( rtems_string_to_pointer(argv[2], &src, NULL) ) { printf( "Source argument (%s) is not a
numbern", argv[2] ); return -1; }
```

```
if ( rtems_string_to_unsigned_long(argv[3], &tmp, NULL, 0) ) { printf( "Length argument (%s)
is not a numbern", argv[3] ); return -1; } length = (size_t) tmp;
```

```
/* * Now copy the memory. / **memcpy(dst, src, length)*;
```

```
return 0; }
```

4.2.1.80 4552 - untar: problems with existing directories

Id	4552
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2021-11-29T08:28:43.000Z

Merges	1

Original author: Christian Mauderer

Our current implementation of untar in cpukit/libmisc/untar/untar.c has problems if a directory in the archive already exists. Note that this is no problem, if the archive contains only a file.

The problem exists on 5 and master.

Example: If I have a targz file which contains a file and directories l1/l2/x.txt and call `Untar_FromGzChunk_Print` twice, the first attempt will print

```
1 untar: dir: l1
2 untar: dir: l1/l2
3 untar: file: l1/l2/x.txt (s:12,m:0644)
```

After that the directories l1 already exists. So if I re-try to extract the archive, I'll get the following:

```
1 untar: dir: l1
2 untar: mkdir: l1: (17) File exists
```

My expectation would have been that the files are just integrated into an existing directory structure. If a file exists, it should be overwritten.

We have multiple references for expected behavior. GNU or BSD tar or POSIX pax. In my experience tar is the better known tool so my suggestion would be to use the default behavior of tar as a reference.

GNU or BSD *tar*

I tested the default behavior of GNU tar and BSD tar. It seems to be the same for both:

- If a directory structure exists, the files from the archive will be integrated. Existing files are overwritten.
- If a file exists and the archive contains a directory with the same name, the file is removed and a directory is created. In the above example: if l1/l2 is a file it will be overwritten with a new directory.
- If a directory exists and the archive contains a file with the same name, the directory will be replaced if it is empty. If it contains files, the result is an error.

- An archive also can contain only a file without the parent directories. If in that case one of the parent directories exists as a file extracting the archive results in an error. In the example: if 11/12 is a file and the archive doesn't contain the directories but only the file 11/12/x.txt that would be an error.

In case of an error, it is possible that the archive has been partially extracted.

Note: GNU tar has options to change the behavior (like `-recursive-unlink`). I'm sure there are similar options in BSD tar. From my point of view we should adapt to the default behavior, so I ignored these options.

The POSIX *pax* utility

<https://pubs.opengroup.org/onlinepubs/9699919799/utilities/pax.html>

Default behavior is described as follows:

If an attempt is made to extract a directory when the directory already exists, this shall not be considered an error. If an attempt is made to extract a FIFO when the FIFO already exists, this shall not be considered an error.

From some quick tests pax has a similar behavior like tar. The only difference I noted is that empty directories are not overwritten with files from the archive.

The SMP EDF scheduler supports a one-to-one and one-to-all thread to processor affinity. Currently it accepts affinity sets which are a proper subset of the online processors containing at least two processors owned by the scheduler. In this case it sets a one-to-one thread to processor affinity. This leads to undefined behaviour if a processor is removed since the higher level check in `rtems_scheduler_remove_processor()` does not account for this implementation detail.

Original author: chenjin_zhong

Hi, when the macro `** CONFIGURE_APPLICATION_DISABLE_FILESYSTEM**` is defined, `rtems_filesystem_table` is undefined during linking process.

Author: Joel Sherrill 2021-10-29T13:34:40.000Z

Original author: chenjin_zhong

Do you have a simple test case to let us see what is happening for you? There are 6 tests in the RTEMS Test Suite which use `CONFIGURE_APPLICATION_DISABLE_FILESYSTEM` so I suspect you have used something which implicitly requires a file system. Perhaps your application needs a minimal file system for device nodes.

Author: Trac Migrate 2021-11-02T06:38:37.000Z

Original author: chenjin_zhong

I just compile `sp01` with `CONFIGURE_APPLICATION_DISABLE_FILESYSTEM`. I rechecked the source code in RTEMS5.1. I found that `rtems_filesystem_table` is only be defined in `confdefs/libio.h`. the global variable `rtems_filesystem_table` is used by `rtems_filesystem_iterate` in `libcsupport/src/mountmgr.c`. Therefore, the undefined error may be caused by `CONFIGURE_APPLICATION_DISABLE_FILESYSTEM`.

Original author: chenjin_zhong

Hi, I have found when call jffs2_read_inode to read inode. the f->sem is not initiliazed and locked, but it is be unlocked. The peice of source code is as follows: static int jffs2_read_inode (struct_inode *inode) { struct jffs2_inode_info *f; struct jffs2_sb_info *c; struct jffs2_raw_inode latest_node; int ret;

```
D1(printk(KERN_DEBUG "jffs2_read_inode(): inode->i_ino == %lun", inode->i_ino));
```

```
f = JFFS2_INODE_INFO(inode); c = JFFS2_SB_INFO(inode->i_sb);
```

```
jffs2_init_inode_info(f); ret = jffs2_do_read_inode(c, f, inode->i_ino, &latest_node);
```

```
if (ret) { mutex_unlock(&f->sem); return ret; }
```

```

Hi, I have found when access global structure without mutex or spinlock about JFFS2 may cause indetermination. The peice of source code in RTEMS5.1 are listed as follows: `fs-rtems.c`: 1) `// Add to the icache for (cached_inode = sb->s_root; cached_inode != NULL; cached_inode = cached_inode->i_cache_next) { if (cached_inode->i_cache_next == NULL) { cached_inode->i_cache_next = inode; // Current last in cache points to newcomer inode->i_cache_prev = cached_inode; // Newcomer points back to last break; } }`

2) `// Check for this inode in the cache for (inode = sb->s_root; inode != NULL; inode = inode->i_cache_next) { if (inode->i_ino == ino) { inode->i_count++; break; } }`

when multi-tasks or threads access `sb->s_root` simultaneously, The behavior is unknown.

Original author: sebastian.huber

While a thread is scheduled on a helping scheduler, while it does not own a MrsP semaphore, if it obtains a MrsP semaphore, then no scheduler node using an idle thread and the ceiling priority of the semaphore is unblocked for the home scheduler. This could lead to priority inversion issues and is not in line with the MrsP protocol.

Author: Trac Migrate 2021-11-23T13:35:53.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"

In [changeset:"3d6ebde1acab61e7c8fce1a1ed51517f7c2bf7c6/rtems" 3d6ebde1/rtems]:

```

1 score: Add SMP scheduler make/clean sticky
2
3 This patch fixes the following broken behaviour:
4
5 While a thread is scheduled on a helping scheduler, while it does not
6 own a MrsP semaphore, if it obtains a MrsP semaphore, then no
7 scheduler node using an idle thread and the ceiling priority of the
8 semaphore is unblocked for the home scheduler.
9
10 This could lead to priority inversion issues and is not in line
11 with the MrsP protocol.
12
13 Introduce two new scheduler operations which are only enabled if
14 RTEMS_SMP is defined. The operations are used to make the scheduler
15 node of the home scheduler sticky and to clean the sticky property.
16 This helps to keep the sticky handing out of the frequently used
17 priority update operation.
18
19 Close #4532.

```

1 score: Rework idle handling in SMP schedulers
2
3 This patch fixes an issue with the idle thread handling in the SMP
4 scheduler framework used for the MrsP locking protocol. The approach to
5 use a simple chain of unused idle threads is broken for schedulers which
6 support thread to processor affinity. The reason is that the thread to
7 processor affinity introduces another ordering indicator which may under
8 certain conditions lead to a reordering of idle threads in the scheduled
9 chain. This reordering is not propagated to the chain of unused idle
10 threads. This could lead to use an idle thread for a sticky scheduler
11 node which is already in use. This locks up the system in infinite
12 loops in the thread context switch procedure.
13
14 To fix this, the SMP scheduler implementations must now provide
15 callbacks to get and release an unused idle thread.
```

4.2.1.94 4523 - gdb 9.1 no longer builds on Cygwin (thread local error)

Id	4523
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2021-10-06T14:22:54.000Z
Updated	2025-09-19T01:11:03.203Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4523
Merges	0

The Cygwin link error is:

```

1 cp-support.o: in function `gdb_demangle(char const*, int)':
2 /home/Christian/binutils-gdb/obj/gdb/../../gdb/cp-support.c:1619:(.text+0x6472):
↪relocation truncated to fit: R_X86_64_PC32 against undefined symbol `TLS init
↪function for thread_local_segv_handler'
3 /home/Christian/binutils-gdb/obj/gdb/../../gdb/cp-support.c:1619:(.text+0x648b):
↪relocation truncated to fit: R_X86_64_PC32 against undefined symbol `TLS init
↪function for thread_local_segv_handler'
4 collect2: error: ld returned 1 exit status

```

The issue appears to be that Cygwin changed their base address for executables and there are multiple approaches to fixing this on the Internet. None of these applied cleanly to a vanilla gdb 9.1. I adapted the patch presented at <https://stackoverflow.com/questions/61984974/failed-to-build-avr-and-arm-gdb-9-1-under-cygwin-relocation-truncated-to-fit>

This patch avoids using a thread-local extern variable, which causes link errors on some platforms, notably Cygwin. The poster through this was a better pattern even outside of working around linker bugs because it encapsulates direct access to the variable inside the class, instead of having a global extern variable.

It should be noted that gdb 10.1 builds cleanly on Cygwin but discussions leaned against bumping the gdb on the 5 branch. Hence we end up with a Cygwin specific patch for gdb 9.1 on Cygwin.

The RTEMS implementation of `posix_devctl()` from POSIX 1003.26 does not return error codes as required by the standard.

“Upon successful completion, `posix_devctl()` shall return zero; otherwise an error number shall be returned to indicate the error. The value returned via the `dev_info_ptr` argument is driver dependent.”

It should return the `errno` value and not -1 and set the `errno` variable. The current behavior is wrong but understandable because the implementation is a wrapper for `close()` and `ioctl()` which do set `errno` and return -1.

Author: Joel Sherrill 2021-08-24T18:35:37.000Z

- **Description** changed

Original author: Christian Mauderer

On the 5 branch of the rtems-source-builder, rtems-tools can't be build if the llvm on the host is (for example) version 10 or newer. Reason is that the llvm headers use a newer C++ standard starting from that version.

On the 6 branch there already is a patch for that:

<https://git.rtems.org/rtems-tools/commit/?id=37ad446d9dce3438d6d32e1caf56d3fdccdd2ad0>

Original author: Christian Mauderer

Cloned from [#4493](#):

The current implementation of ppp assumes (in ppp_tty.c:pppstart) that sending characters via the termios device write function will send buffers of any length. That is not true for most drivers.

Devices that can only send one character at a time won't work with that at all. Devices that have a big enough FIFO might work most of the time. Devices that use a DMA for transmitting might work without problems.

Why is the termios driver a factor here?

How do you see this being solved?

Author: Trac Migrate 2021-08-17T06:36:23.000Z

Original author: Christian Mauderer

I posted a patch set here: <https://lists.rtems.org/pipermail/devel/2021-August/068890.html>

The problem is that our pppd installs a line discipline that basically ignores all buffering of termios. Instead it directly uses the raw console driver write. There it just assumes that a write can write any number of characters without problems:

https://git.rtems.org/rtems-libbsd/tree/rtemsbsd/sys/net/ppp_tty.c?id=02373194fe0be1ef82db419bedbf9d6ffd31dc93#n646

Our device write doesn't return how many characters it was able to handle. Instead it provides that info to termios via the `rtems_termios_dequeue_characters()` function. But this information never reaches the `pppstart` function. Therefore I adapted the interface so that the information is passed to the `pppstart` and `pppstart` can process it.

The alternatives would have been to let the driver write return the number of characters (which would touch all drivers and maybe would be a problem sometimes) or completely rewrite the pppd to not use any line discipline functions (which would have touched a lot of code with so much edge cases that I'm definitively not able to test it thoroughly).

Author: Trac Migrate 2022-02-11T07:38:40.000Z

Original author: Christian Mauderer

In `[changeset:"9942ff80c46d5658f22dc5ac9fae4dcaba4f9966/rtems"9942ff80/rtems]`:

```

1  termios: Pass number of sent chars to l_start
2
3  At the moment the line discipline start function (l_start) has no
4  possibility to get feedback about the number of characters that have
5  been sent. This patch passes that information via an additional
6  parameter.
7
8  The change might trigger a warning on existing code because of a pointer
9  mismatch but it shouldn't break it. An existing function with the old
10 API will just ignore the additional parameter.
11
12 Update #4494
```

In [changeset:"2ce166bd372320702c27b2c3980ca9192a60b159/rtems-libbsd" 2ce166bd/rtems-libbsd]:

```

1 ppp: Fix transmitting data
2
3 The pppstart expected that a driver write would somehow magically
4 process all data passed to the write function. Because ppp disables all
5 buffering that originally has been in termios, that assumption is not
6 true for all but polled drivers.
7
8 With this patch, the pppstart now gets and processes the feedback that
9 is returned from the driver via rtems_termios_dequeue_characters.
10
11 Fixes #4494

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4456
Merges	1

Original author: soja

Cloned from [#4455](#):

The current implementation of the TSC calibration during startup yields inaccurate results.

There are 2 issues:

1. Rounding error:

The `calibrate_tsc` function calibrates for 1s by waiting for `rtems_clock_get_ticks_per_second()` ticks via the PIT.

The PIT has a frequency of 1193182 Hz. For a rtems tick of 1ms this yields 1193. Waiting for 1s means then waiting for 1193000 PIT ticks (instead of the full 1193182). For a 1 GHz TSC clock this would yield already ~150 kHz less then the correct TSC frequency.

2. Waiting for the first loop at begin of timer period

```

1 for (i = rtems_clock_get_ticks_per_second() * pc386_isrs_per_tick;
2 i != 0; --i) {
3 /* We know we've just completed a tick when timer goes from low to high */
4 then_lsb = then_msb = 0xff;
5 do {                                     <== First loop does not start at begin of clock_
   ↳period
6 READ_8254(now_lsb, now_msb);
7 if ((then_msb < now_msb) ||
8 ((then_msb == now_msb) && (then_lsb < now_lsb)))
9 break;
10 then_lsb = now_lsb;
11 then_msb = now_msb;
12 } while (1);
13 }
```

This can yield deviations of several MHz for the TSC frequency. For example, for a tested CPU with a TSC frequency of 19167.1 MHz yields a calibration result of 1912.3 MHz.

Proposed solution

- Just wait 1193182 PIT ticks for 1 s instead of a number of rtems ticks
- Use the raw timer value instead of waiting for clock ticks.

Original author: sebastian.huber

Background

The standard approach to turn a uni-processor operating system into an SMP-capable operating system is to encapsulate virtually the complete operating system state and protect it by one global recursive lock - the Giant lock. Thus, at most one processor can modify the operating system state at a time. Under Giant lock protection interrupt disable/enable critical sections still work. This approach is easy to realize and leads to something that runs on SMP with a minimal effort. Unfortunately, such an operating system does not scale with the processor count and offers very poor performance. It is quite useless for real applications.

The first steps to get rid of the Giant lock are tackled with the introduction of fine grained locking for the scheduler, watchdog handler, timestamps, thread queues, events, semaphores and message queues. The Giant lock is still used in a couple of places, e.g. all other objects using thread queues, thread life cycle changes (termination, restart) and scheduler changes. It is a straight forward task to eliminate it entirely, but it is also somewhat labour intensive since a lot of code must be changed.

Implementation

Eliminate all remaining code areas that use `* _ISR_Disable()`, `* _ISR_Enable()`, and `* _ISR_Flash()`. Direct users of these macros are `* _Chain_Append()`, `* _Chain_Extract()`, `* _Chain_Get()`, `* _Chain_Insert()`, and `* _Chain_Prepend()`. Each spot must be dealt with individually. Once this is done, delete these macros since they are now superfluous. Rename `_ISR_Disable_without_giant()` into `_ISR_Locale_disable()`. Rename `_ISR_Enable_without_giant()` into `_ISR_Locale_enable()`.

Eliminate all remaining code areas that use `* _Thread_Disable_dispatch()` and `* _Thread_Enable_dispatch()`. A prominent user of this functions is `_Objects_Get()`. The following components are affected by these functions `* Classic barrier handler`, `* Classic dual-ported memory handler`, `* Classic message queue handler`, `* Classic partition handler`, `* Classic rate-monotonic handler`, `* Classic region handler`, `* Classic semaphore handler`, `* Classic timer handler`, `* extension handler`, `* IO manager`, `* multi-processing management`, `* objects management`, `* POSIX barrier handler`, `* POSIX condition handler`, `* POSIX key handler`, `* POSIX message queue handler`, `* POSIX mutex handler`, `* POSIX rwlock handler`, `* POSIX semaphore handler`, `* POSIX spinlock handler`, `* POSIX timer handler`, `* signals`, `* thread cancellation`, `* thread life-cycle changes`, and `* thread scheduler changes`. Once this is done, delete `_Thread_Disable_dispatch()` and `_Thread_Enable_dispatch()`. As a side-effect the Giant lock will be removed.

Problem

The RTEMS mutexes implement only a very simple approximation of the priority inheritance protocol. The real priority of a thread is only restored once it releases its last mutex. Lets consider this scenario. We have a file system instance protected by one mutex (e.g. JFFS2) and a dynamic memory allocator protected by another mutex. A low priority thread performs writes some log data into a file, thus it acquires the file system instance mutex. The file system allocates dynamic memory. Now a high priority thread interrupts and tries to allocate dynamic memory. The allocator mutex is already owned, so the priority of the low priority thread is raised to the priority of the high priority thread. The memory allocation completes and the allocator mutex is released, since the low priority thread still owns the file system instance mutex it continues to execute with the high priority (the high priority thread is not scheduled). It may now perform complex and long file system operations (e.g. garbage collection, polled flash erase and write functions) with a high priority.

Functional requirements

- The mutex shall use the priority inheritance protocol to prevent priority inversion. On SMP configurations OMIP shall be used.
- The mutex shall allow vertical nesting (a thread owns multiple mutexes).
- The mutex shall allow horizontal nesting (a thread waits for ownership of a mutex those owner waits for ownership of a mutex, and so on).
- Threads from one scheduler instance shall wait in priority order. The highest priority thread shall be dequeued first.
- The highest priority waiting thread of each scheduler instance shall wait in FIFO order.
- The mutex shall provide an acquire operation with timeout.
- In case a mutex is released, then the previous owner shall no longer use the priorities inherited by this mutex.
- In case a mutex acquire operation timeout occurs, then the current owner of the mutex shall no longer use the priorities inherited by the acquiring thread.

- The order of the mutex release operations may differ from the order of the mutex acquire operations.
- Priority changes not originating due to the priority inheritance protocol shall take place immediately.
- Deadlock shall be detected. In case a deadlock would occur an error status shall be returned or a fatal error shall be generated.
- Deadlocks at application level shall not lead to a deadlock at operating system level.

Performance requirements

- The mutex acquire operation shall use only object-specific locks in case the mutex is not owned currently.
- The mutex release operation shall use only object-specific locks in case no threads wait for ownership of this mutex.

Invariants

- A mutex shall be owned by at most one thread.
- A thread shall wait for ownership of at most one mutex.

Possible implementation

Use a recursive data structure to determine the highest priority available to a thread for each scheduler instance, e.g.

```

1 typedef struct Thread_Priority_node {
2   Priority_Control current_priority;
3   Priority_Control real_priority;
4   struct Thread_Priority_node *owner;
5   RBTNode Node;
6   RBTControl Inherited_priorities;
7 } Thread_Priority_node;
8
9 typedef struct {
10  ...
11  Thread_Priority_node *priority_nodes; /* One per scheduler instances */
12  ...
13 } Thread_Control;
```

Initially a thread has a priority node reflecting its real priority. The `Thread_Priority_node::owner` is `NULL`. The `Thread_Priority_node::current_priority` is set to the real priority. The `Thread_Priority_node::Inherited_priorities` is empty.

In case the thread must wait for ownership of a mutex, then it enqueues its priority node in `Thread_Priority_node::Inherited_priorities` of the mutex owner.

In case the thread is dequeued from the wait queue of a mutex, then it dequeues its priority node in `Thread_Priority_node::Inherited_priorities` of the previous mutex owner (ownership transfer) or the current mutex owner (acquire timeout).

In case the minimum of `Thread_Priority_node::real_priority` and `Thread_Priority_node::Inherited_priorities` changes, then `Thread_Priority_node::current_priority` is updated. In case the `Thread_Priority_node::owner` is not NULL, the priority change propagates to the owner, and so on. In case `Thread_Priority_node::current_priority` changes, the corresponding scheduler is notified.

The biggest issue is the locking on SMP configurations in case of recursive minimum updates.

Somehow we must connect this to the scheduler helping protocol for OMIP. We may have to replace the return value based scheduler operations with a pre-context-switch action. Due to some recent implementation changes the run-time of the `_Thread_Dispatch()` function is no longer average-case performance critical.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3859
Merges	1

Running a joel script in a telnet session results in the output being sent to the global stdout. For example:

```

1 $ telnet 1.2.3.4
2 Trying 1.2.3.4...
3 Connected to 1.2.3.4.
4 Escape character is '^]'.
5
6 RTEMS Shell on /dev/pty0. Use 'help' to list commands.
7 [/] # cat j
8 #! joel
9 ls -las /
10 [/] # ./j
11 [/] #
```

The bug is a new shell main loop task will default to the global stdout, stdin etc and has no information about the parent’s std handles. A joel script runs in it’s own work task and does not know the telnet’s std handles.

There are a related set of issues in the handling of the shell_env variable, POSIX key handling and the use of the external call rtems_shell_main_loop.

The telnet example in libbsd has:

```

1 static void
2 telnet_shell(char *name, void *arg)
```

(continues on next page)

(continued from previous page)

```

3 {
4 rtems_shell_env_t env;
5
6 memset(&env, 0, sizeof(env));
7
8 env.devname = name;
9 env.taskname = "TLNT";
10 env.login_check = NULL;
11 env.forever = false;
12
13 rtems_shell_main_loop(&env);
14 }

```

This is problematic as control of the env has been lost and this make backwards comptatable changes difficult. Control of this struct needs to be brought back under the shell code.

Currently the posix key is set in the parent task only when the run entry point is used. The run's created shell_env is then passed to the shell's main loop task as an argument from which it is cloned. This means an env is ``malloc``ed in each run call and again in the main loop of the shell.

The current code leaks memory as repeated calls to a joel script in a shell will set the key over and over. The destructor is only called when the task is deleted. We have to assume the cleanup of any shell_env allocated externally to the shell code has to be handled externally.

Setting the key in the main loop task is problematic because telnet code such as the example in libbsd uses a local stack shell_env and the key has a destructor that blindly free's the key's memory when a task is released.

Changes:

1. Add parent_stdout, parent_stdin, and parent_stderr to the shell_env and set to the parent's std handles.
2. Add a managed flag to shell_env and only set when allocated by rtems_shell_init_env. Change rtems_shell_env_free to only free the shell_env if managed.
3. Remove all key sets and have only one in the shell's main loop code.
4. Change rtems_shell_init_env to get the current tasks key and clone that before cloning the global env.
5. Update rtems_shell_dup_current_env to set the parent std handles.
6. Have the main loop use the parent std handles rather than the global handles.
7. Check the magic field has been set in the shell's main loop and raise an error if not set. The only code to set this field should reside in shell.c. Code such as libbsd will need to call rtems_shell_dup_current_env.

Author: Trac Migrate 2020-02-04T16:25:01.000Z

Sounds that it is currently pretty broken.

What about changing the managed member into a destroy handler which is initialized by the constructor?

Author: Chris Johns 2020-02-05T02:14:46.000Z

Replying to [Sebastian Huber](#):

Sounds that it is currently pretty broken.

There seems to be a few overlapping issues that make things a little confusing.

What about changing the managed member into a destroy handler which is initialized by the constructor?

Yes, my patch I am testing does this. I have an issue on 4.11 where a printf line in changes what happens and I am not sure why. I need to resolve this. I will then create a 4.11 clone of this ticket and post a patch for that branch.

Author: Chris Johns 2020-02-10T21:59:43.000Z

Replying to [Chris Johns](#):

I have an issue on 4.11 where a printf line in changes what happens and I am not sure why. I need to resolve this. I will then create a 4.11 clone of this ticket and post a patch for that branch.

I have chased the issue down to how we set up the re-entrant struct newlib uses in our threads. My changes follow what exists ...

```
1 FILE *input = fopen(shell_env->input, "r");
2 if (input == NULL)
3 error(...);
4 stdin = input;
```

The only calls on stdin before the assignment are fileno(stdin) and this does not touch the re-entrant struct so the first call to libc after the assignment is setvbuf(stdout, NULL, _IONBF, 0); and newlib performs it's lazy initialisation and resets the re-entrant struct.

This issue is present on 4.11 and 5 as far as I can see.

Author: Chris Johns 2020-02-17T04:51:50.000Z

It is not easy making a joel test because of the way we have used the linker mapped printf to printk.

Author: Trac Migrate 2020-02-17T06:42:57.000Z

Only printf(), puts(), and putchar() are wrapped. The shell related code should use fprintf() etc. Using printf() would be a bug.

Author: Chris Johns 2020-02-17T20:51:46.000Z

A test is not easy as a shell test cannot use any standard commands, eg echo because these call printf. The post test patch provides a command that uses fprintf and this works enough to test the shell start, main loop, and input and output support.

Author: Trac Migrate 2020-02-18T06:06:14.000Z

It is a bug that the echo command uses putchar(). It should use fputc(c, stdout).

Author: Chris Johns 2020-02-18T06:55:17.000Z

Replying to [Sebastian Huber](#):

It is a bug that the echo command uses putchar(). It should use fputc(c, stdout).

Could you please explain why?

Other commands like ls use printf.

Author: Trac Migrate 2020-02-18T07:02:47.000Z

Every shell related code which uses printf(), puts(), putchar(), etc. which work on file descriptors is broken. The file descriptors are global. Only the stdin, stdout, and stderr file pointers are thread-specific.

Author: Chris Johns 2020-02-18T07:09:20.000Z

But ls works nicely with telnet, actually all commands I know of work well with the redirection we implement. I am sorry you have lost here with your bug comment.

My comments relate to our test suite and the hack we have to switch printf via the linker to keep the tests as small as possible.

Author: Trac Migrate 2020-02-18T07:27:06.000Z

Sorry for the confusion. I checked the Newlib code and it actually uses stdout for printf(). I thought it uses directly a file descriptor, but this is not the case. I vaguely remember that Ralf changed some printf() to fprintf(stdout, ...) for whatever reason.

Author: Chris Johns 2020-04-09T00:21:41.000Z

I have found the default command handler in libbsd needs updating ...

<https://git.rtems.org/rtems-libbsd/tree/rtemsbsd/telnetd/telnetd-service.c#n72>

The input and output fields needs have strings. I will change the shell's handling of NULL to reference the parent descriptors to catch user's code.

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"d007cc2ceef48ce47c157512370c1bf2c45596f3/rtems"d007cc2/rtems]:

```

1 libmisc/shell: Fix the handling of joel scripts in telnet
2
3 - Fix the passing of std[in/out] to child threads
4 - Fix deleting of managed memory in the key destructor
5 - Only set the key in the main loop thread
6 - Only allocate a shell env outside of the main loop
7 - Fix memory leak if the task start fails
8 - Remove error level from shell env, it cannot be returned this way. Add
9 exit_code but the API is broken so it cannot be returned.
10
11 Closes #3859

```

Author: Trac Migrate 2020-08-06T06:47:29.000Z

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

The telnet shell

```

1 static void
2 telnet_shell(char *name, void *arg)
3 {
4     rtems_shell_env_t env;
5
6     memset(&env, 0, sizeof(env));
7
8     env.devname = name;
9     env.taskname = "TLNT";
10    env.login_check = NULL;
11    env.forever = false;
12
13    rtems_shell_main_loop(&env);
14 }

```

used in the libbsd test code is now broken:

```

1 telnet 169.254.140.254
2 Trying 169.254.140.254...
3 Connected to 169.254.140.254.

```

(continues on next page)

(continued from previous page)

```

4 Escape character is '^]'.
5 invalid shell environment passed to the main loop)
6 Connection closed by foreign host.

```

How should the code be instead?

Author: Trac Migrate 2020-08-06T06:51:07.000Z

There should be an advice in the migration section in the user manual.

Author: Chris Johns 2020-08-06T10:42:21.000Z

The example code provided is broken and has always been broken. I only know it exists because libbsd had it. The ticket describes the situation and item 7) in the list says how it is to be resolved and that interface has always been there for just this situation.

Please unblock this ticket. Thanks.

Author: Trac Migrate 2020-08-06T11:17:13.000Z

I have to fix the code in libbsd. This code was also copied to applications which are now also broken. This is definitely something for the migration section.

Author: Chris Johns 2020-08-06T11:51:15.000Z

Thanks and yes something should be added. I will take a look.

Author: Trac Migrate 2020-08-06T11:58:17.000Z

Replying to [Chris Johns](#):

Thanks and yes something should be added. I will take a look.

<https://lists.rtems.org/pipermail/devel/2020-August/061166.html>

I already fixed libbsd (the commits don't show up in the tickets).

Author: Trac Migrate 2020-08-06T17:22:46.000Z

The proposed fix doesn't work. If you close a telnet session and try to connect again the target crashes with a NULL pointer access:

```

1 #0  fileno (f=0x0) at ../../../../../../gnu-mirror-gcc-c72a1b6/
  ↪newlib/libc/stdio/fileno.c:69
2 #1  0x0042e866 in rtems_shell_main_loop (shell_env=0x0) at ../../../../

```

```

What is the purpose of this code?

Author: Chris Johns 2020-08-07T07:18:44.000Z

A thread instance that inherits the std* file handles does not close them, for example a joel script would close the parents session's handles.

Author: Trac Migrate 2020-08-07T07:25:05.000Z

Setting the stdin and stdout to NULL pointers doesn't look like a good idea to me. I still don't understand what you want to do with this. Which code reads the stdin and stdout pointers and checks them for NULL?

Author: Chris Johns 2020-08-07T07:28:25.000Z

Nothing more than what was in the code before .. <https://git.rtems.org/rtems/tree/>

[cpukit/libmisc/shell/shell.c#h=4.11#n242](https://github.com/rtems/cpukit/blob/master/libmisc/shell/shell.c#h=4.11#n242) Something else must have changed. I had tested it on RTEMS 5.

Author: Trac Migrate 2020-08-07T07:31:24.000Z

I have this problem on the RTEMS 5 branch using RTEMS 5 tools.

Author: Chris Johns 2020-08-07T07:33:38.000Z

Yes I am seeing it as well. I am a little confused.

I am not sure why the closing of a previous session would effect a new session as the parent (telnetd) should be handling this. The new session should have a new set of std* handles?

Author: Trac Migrate 2020-08-07T07:42:18.000Z

For my taste the shell code tinkers too much with the std* handles. I lost track who is responsible for set up and tear down. What is the purpose of the

```
1 FILE *parent_stdin;
2 FILE *parent_stdout;
3 FILE *parent_stderr;
```

Who is the parent?

Author: Chris Johns 2020-08-07T07:49:21.000Z

I have a pretty good handle (hah pun intended) on these handles. I will try and take a look.

The parent handles are the wrapper of the shell env. For example they are global handles for a console shell. With telnetd they are the session handles. If you run a joel script they are ones used:

```
1 [/] # cat j
2 #! joel
3 ls -las /
4 cat /j
5 [/] # ./j
6 total 6
7 0 drwxr-xr-x  1 root  root   6160 Jan  1  1988 dev
8 0 drwxr-xr-x  1 root  root   2240 Jan  1  1988 etc
9 0 -rwxrwxrwx  1 root  root    31 Jan  1  1988 j
10 1 drwx--x--x  3 root  root    512 Jan  1  1988 ram
11 0 drwxr-xr-x  1 root  root     0 Jan  1  1988 tmp
12 0 drwxr-xr-x  1 root  root    280 Jan  1  1988 var
13 #! joel
```

(continues on next page)

(continued from previous page)

```

14 ls -las /
15 cat /j

```

The threads that run the joel script inherit the telnet session handlers.

Author: Chris Johns 2020-08-08T07:45:29.000Z

I have looked into the issue and the reuse of the telnetd session thread is clashing with the way the shell's environment is currently being cleaned up. The telnetd software creates a number of sessions and it reuses these sessions for the incoming connections. This means the pty file handles assigned to each session are reused. Clearing these file handles corrupts the telnetd session.

Setting of stdin, stdout and also stderr to NULL when cleaning up a shell environment is important because thread termination closes those files if present and open and if the file pointers have been inherited from the parent thread the parent can be left without a valid stdin, stdout and stderr. This happens with a joel script. It could also happen with a command that is placed in the background (if we supported this) or a command that dispatches a worker thread.

This ticket was originally about a bug where joel script output was not redirected to the parent thread's stdout. They happened to work for the console because the console shell's standard handles are the global ones. A new thread inherits the global handles and the clean up also manages the closing of those, or the lack of it. However a joel script with telnet was broken.

The solution is to move the setting of stdin, stdout and stderr out of clearing the environment and to only do this when the rtems_shell_task exits the rtems_shell_main_loop.

For the record a debug trace from shell.c running a joel script is:

```

1 shell[0a010001]: run: env: 0x62accd0
2 shell[0a010001]: run out: 1 (0xbeb028)
3 shell[0a010001]: run in: 0 (0xbeafa8)

Running top on a Zynq zc706 gives ...

1	ID	NAME	RPRI	CPRI	TIME	TOTAL
2	↪ CURRENT					
3	0x0a010008	IRQS	4611686018427388000	4611686018427388000		
	↪ 2.437559		0.000	0.022		

The code in question is ... <https://git.rtems.org/rtems/tree/cpukit/libmisc/cpuuse/cpuusagetop.c#n447>

What is best API to show a priority that makes this code robust?

Author: Joel Sherrill 2019-11-24T23:54:50.000Z

What do you mean by robust?

It is showing score priority so that is clearly confusing for POSIX threads. But a mixed system is also co fusing.

Author: Chris Johns 2019-11-25T00:04:38.000Z

Replying to [Joel Sherrill](#):

What do you mean by robust?

One that returns “a” priority we can document and is not effected by implementation changes.

It is showing score priority so that is clearly confusing for POSIX threads. But a mixed system is also confusing.

Yes but that I feel that is a property of top's implementation. For example we could add options to show the score view or we show API priorities etc.

Author: Trac Migrate 2019-11-25T06:39:23.000Z

It shows the correct score priority. If you want to show priorities mapped to a specific API, then you have to add this on top of it.

Author: Chris Johns 2019-12-12T17:57:14.000Z

The code is <https://git.rtems.org/rtems/tree/cpukit/libmisc/cpuuse/cpuusagetop.c#n451>.

It seems `_Thread_Get_unmapped_real_priority` is not clearing the new extra bits used in the priority.

Author: Trac Migrate 2019-12-12T18:57:51.000Z

The `Priority_Control` contains 64 bits. The least significant bit is used to indicate if the priority is appended or prepended to its priority group. This bit is removed by the `_Thread_Get_unmapped_real_priority()`. The other 63 bits are defined by a particular scheduler algorithm. The only invariant is the lower values indicate a higher priority (importance).

Author: Chris Johns 2019-12-12T21:03:19.000Z

How do we take that value and get the actual priority?

Author: Chris Johns 2019-12-12T21:55:00.000Z

A few of the functions held in `cpukit/libmisc/shell/internal.h` are useful in building system. For example `rtems_shell_register_monitor_commands()` and `rtems_shell_execute_cmd()`.

The shell commands are important and systems may provide other scripting mechanisms, for example sequences in YAML files. Providing public access lets users know the functions are supported.

Author: Joel Sherrill 2017-08-13T15:45:14.000Z

Hard to argue against. The shell evolved and this is just an artifact. We now have a different opinion. Change it.

Author: Chris Johns 2017-08-13T23:23:14.000Z

I have found there is currently no way to have the commands registered unless you start a shell. The POSIX once call used to add the shell's configured commands is buried inside the main loop of the shell task.

I would like this change to be back ported to 4.11 to make applications compatible between 4.11 and 4.12 and beyond.

Original author: sebastian.huber

The user manual contains this about prefixes:

“A further reason not to use the standard prefix is to allow more than one version of RTEMS to exist on your host machine at a time. The autoconf and automake tools required by RTEMS are not versioned and vary between the various versions of RTEMS. If you use a single prefix such as the standard prefix there is a chance parts from a package of different versions may interact. This should not happen but it can.

For POSIX or Unix hosts, the RTEMS Project uses /opt/rtems as it’s standard prefix. We view this prefix as a production level path, and we prefer to place development versions under a different prefix away from the production versions. Under this top level prefix we place the various versions we need for development. For example the version 4.11.0 prefix would be /opt/rtems/4.11.0. If an update called 4.11.1 is released the prefix would be /opt/rtems/4.11.1. These are recommendations and the choice of what you use is entirely yours. You may decide to have a single path for all RTEMS 4.11 releases of /opt/rtems/4.11.”

The default prefix selected by the RSB should take this into account. Use OS prefix + “rtems” + \$rtems_version, e.g. on Linux for RTEMS 5: “/opt/rtems/5”.

When -std=c99 is on the compile line, there is a linking error for undefined references to __htonl, __htons, __ntohl, and __ntohs. This test case is just for htonl but others should be similar.

This likely impacts the 4.11 branch of rtems-libbsd as well but I was testing on master.

Test case

```

1 #include <arpa/inet.h>
2
3 int main(
4 int argc,
5 char **argv
6 )
7 {
8 uint32_t v = (uint32_t) argc;
9 uint32_t rc = htonl(v);
10 return v;
11 }

```

This script was what I used to find what caused the linking error to go away.

```

RTEMS initial signal mask for the “process” does not match the behavior of Linux, FreeBSD, and Cygwin.

There are some subtle rules which need to be followed for the value of the created thread’s signal mask. Because signals are part of C99 and enhanced by POSIX, both Classic API tasks and POSIX threads have to have them enabled.

1. Internal system threads should have no signals enabled. They have no business executing user signal handlers – especially IDLE.
2. The initial signal mask for other threads needs to follow the implication of a pure C99 environment which only has the methods `raise()` and `signal()`. This implies that all signals are unmasked until the thread explicitly uses a POSIX methods to block some. This applies to both Classic tasks and POSIX threads created as initalization tasks/threads (e.g. before the system is up).
3. After the initial threads are created, the signal mask should be inherited from the creator. This can be done based on system state.

RTEMS behavior was incorrect by blocking all signals initially and for Classic API tasks.

Notes:

- The default signal mask does not matter for any application that does not use POSIX signals.

- It is assumed that Classic API tasks should provide a compliant C run-time environment. Hence the default signal mask state matters.

Impact on Applications and Tests

In general, an application should always explicitly block or unmask any signals that it intends to process. If there is concern about which thread may process it, then it should be blocked in all threads that are not intended to process it. The following code can be used to block all signals. This method can be used in the initialization task/thread to mimic historical behavior:

```

1 static void block_all_signals(void)
2 {
3     int          sc;
4     sigset_t      mask;
5
6     sc = sigfillset( &mask );
7     // check sc == 0
8
9     sc = pthread_sigmask( SIG_BLOCK, &mask, NULL );
10    // check sc == 0
11 }

```

The following packages do not build or have issues and will be removed if they are not updated:

1. ntp 1. microwindows 1. nxlib 1. lwip

The lwip patch used by this package needs to be updated. The install target for the Makefile does not support DESTDIR and cannot be staged. It is being built however a lack of DESTDIR is not compatible with the requirements of the RSB for staged builds. The package installs directly to the prefix which is not suppose to happen.

The packages will need to be fixed or removed before 5.1. There is no point releasing the RSB with packages that are broken.

Author: Chris Johns 2019-12-12T17:05:47.000Z

- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

I am going to close this ticket and these packages will not be available with the RSB. With no RSB support I do not know who builds these packages and if they are valid?

The x86 is one of the architectures which does not support Thread Local Storage. Each architecture requires target architecture specific support to provide this standard language feature.

Details on the implementation by the compiler may be found at http://wiki.osdev.org/Thread_Local_Storage.

Based on this information, I think a segment register needs to be added to the thread context and some hooks to the TLS implemented.

Architecture information on TLS implementation should be added to the CPU Supplement document as this is part of the ABI and context switch.

As part of effort, the documentation for the general procedure of adding target specific TLS support should be added to the porting guide or reviewed.

Author: Trac Migrate 2015-11-16T06:36:48.000Z

For documentation see for example:

Some objects can be created with a local or global scope in a multiprocessing network. In non-multiprocessing configurations setting the scope to local or global had no effect since such a system can be viewed as a multiprocessing system with just one node. One and all nodes is the same in such a system. However, if multiprocessing was configured, creation of a global object in a single node system resulted in an RTEMS_MP_NOT_CONFIGURED error. Remove this error condition for symmetry with the non-multiprocessing setup. This is in line with the task affinity behaviour in SMP systems.

In [changeset:"1b2468c5c6bfa6c893287b6918b2d88835f7a087/rtems-docs" 1b2468c/rtems-docs]:

```

1 c-user: Remove RTEMS_MP_NOT_CONFIGURED error
2
3 Some objects can be created with a local or global scope in a
4 multiprocessing network. In non-multiprocessing configurations setting
5 the scope to local or global had no effect since such a system can be
6 viewed as a multiprocessing network with just one node. One and all
7 nodes is the same in such a network. However, if multiprocessing was
8 configured, creation of a global object in a single node network
9 resulted in an RTEMS_MP_NOT_CONFIGURED error. Remove this error
10 condition for symmetry to the non-multiprocessing setup. This is in line
11 with the task affinity behaviour in SMP systems.
12
13 Close #4005.

Change the documentation template for configuration options with a value to:

```
1 .. _CONFIGURE_XYZ:
2
3 CONFIGURE_XYZ
4 -----
5
6 CONSTANT:
7 ``CONFIGURE_XYZ``
8
9 OPTION TYPE:
10 This configuration option is an integer define.
11
```

(continues on next page)

(continued from previous page)

```

12 VALUE CONSTRAINTS:
13 The specified value must be greater than or equal to X and less than or
14 equal to Y.
15
16 DEFAULT VALUE:
17 The default value is Z.
18
19 DESCRIPTION:
20 This configuration option defines the ABC.
21
22 NOTES:
23 Notes for XYZ.

```

Use OPTION TYPE instead of DATA TYPE since we have to characterize the option and not just the value of an option. This is in line with [#3900](#).

Use VALUE RANGE instead of RANGE to be more specific.

4.2.1.141 3885 - Context switch extension is broken in SMP configurations

Id	3885
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2020-02-25T17:40:26.000Z
Updated	2024-04-25T20:47:48.252Z
Milestone	5.1
Labels	priority::normal, qualification, resolution::fixed, rtems::score, ticket-type::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3885
Merges	0

Original author: sebastian.huber

The context switch extensions are called during `_Thread_Do_dispatch()`:

```

1 void _Thread_Do_dispatch( Per_CPU_Control *cpu_self, ISR_Level level )
2 {

```

(continues on next page)

(continued from previous page)

```

3 Thread_Control *executing;
4
5 executing = cpu_self->executing;
6
7 ...
8 do {
9   Thread_Control *heir;
10
11   heir = _Thread_Get_heir_and_make_it_executing( cpu_self );
12   ...
13   _User_extensions_Thread_switch( executing, heir );
14   ...
15   _Context_Switch( &executing->Registers, &heir->Registers );
16   ...
17 } while ( cpu_self->dispatch_necessary );
18 ...
19 }

```

In uniprocessor configurations, the context switch extensions are called for all thread switches except the very first thread switch to the initialization thread. However, in SMP configurations, the context switch may be invalidated and updated in the low-level `_Context_Switch()` routine. See:

https://docs.rtems.org/branches/master/c-user/symmetric_multiprocessing_services.html#thread-dispatch-details

In case such an update happens, a thread executes on the processor which was not visible to the context switch extensions. This can confuse for example event record consumers which use events generated by a context switch extension.

Fixing this is not straight forward. The context switch extensions call must move after the low-level context switch. The problem here is that we may end up in `_Thread_Handler()`. Adding the context switch extensions call to `_Thread_Handler()` covers now also the thread switch to the initialization thread. We also have to save the last executing thread of the processor. Registers or the stack cannot be used for this purpose. We have to add it to the per-processor information. Existing extensions may be affected, since now context switch extensions use the stack of the heir thread.

Calling the thread switch extensions in the low level context switch is difficult since at this point an intermediate stack is used which is only large enough to enable servicing of interrupts.

Author: Joel Sherrill 2020-02-25T18:34:30.000Z

Original author: sebastian.huber

As I recall, doing this in `_Thread_Handler` is similar to having to restore FPU. Are there other actions with this characteristic?

Author: Chris Johns 2020-02-26T02:55:06.000Z

Original author: sebastian.huber

Is this an issue that needs to be fixed for RTEMS 5?

Author: Trac Migrate 2020-02-26T08:47:44.000Z

Original author: sebastian.huber

Replying to [Chris Johns](#):

Is this an issue that needs to be fixed for RTEMS 5? Yes, I think that the thread switch extensions should work in SMP configurations.

Author: Trac Migrate 2020-02-26T08:49:11.000Z

Original author: sebastian.huber

Moving the thread switch extension calls into the context of the heir thread breaks for example the stack checker. It checks that the current stack pointer is in the stack area of a thread.

Author: Trac Migrate 2020-02-26T08:51:14.000Z

Original author: sebastian.huber

↳ services.html#thread-dispatch-details
27
28 In case such an update happens, a thread executes on the processor
↳ which was not visible to the context switch extensions. This can
↳ confuse for example event record consumers which use events generated
↳ by a context switch extension.
29
30 Fixing this is not straight forward. The context switch extensions call
↳ must move after the low-level context switch. The problem here is
↳ that we may end up in _Thread_Handler(). Adding the context switch
↳ extensions call to _Thread_Handler() covers now also the thread
↳ switch to the initialization thread. We also have to save the last
↳ executing thread of the processor. Registers or the stack cannot be
↳ used for this purpose. We have to add it to the per-processor
↳ information. Existing extensions may be affected, since now context
↳ switch extensions use the stack of the heir thread.
31 +
32 + Calling the thread switch extensions in the low level context switch
↳ is difficult since at this point an intermediate stack is used which
↳ is only large enough to enable servicing of interrupts.

```

Author: Chris Johns 2020-02-27T00:23:43.000Z

Replying to [Sebastian Huber](#):

Moving the thread switch extension calls into the context of the heir thread breaks for example the stack checker. It checks that the current stack pointer is in the stack area of a thread.

Is a patch to fix the stack checker being worked on?

I know of applications that have this running during development.

Is a patch to fix the stack checker being worked on? I know of applications that have this running during development.

This was easy to fix:

<https://lists.rtems.org/pipermail/devel/2020-February/057759.html>

I just wanted to highlight that this change can easily break existing extensions.

Original author: sebastian.huber

The CONFIGURE_DISABLE_SMP_CONFIGURATION configuration option and rtems_configuration_is_smp_enabled() were added during the SMP support development cycle as a workaround to fix some testsuite failures in SMP configurations. Replace this configuration option with tests for specific conditions. The configuration option was undocumented.

4.2.1.143 3875 - Split up confdefs.h in component based header files

Id	3875
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2020-02-14T13:13:44.000Z
Updated	2024-04-25T20:47:46.835Z
Milestone	5.1
Labels	priority::normal, qualification, resolution::fixed, rtems::config, ticket-type::task, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3875
Merges	0

Original author: sebastian.huber

The confdefs.h header file is large, complex, and hard to review. Split it up into component header files to make it easier to maintain and review.

The general approach is to place the default configuration of things in librtemscpu.a. The benefit is that the application configuration object file will only include data structures which have a user-defined value.

The component based header files include their dependencies explicitly. It should be possible to include component based header files separately to ease testing. For example we could use this template:

```

1 #ifndef _RTEMS_CONFDEFS_FOOBAR_H
2 #define _RTEMS_CONFDEFS_FOOBAR_H
3
4 #ifndef __CONFIGURATION_TEMPLATE_h
5 #error "Do not include this file directly, use <rtems/confdefs.h> instead"
6 #endif
7
8 #if defined(CONFIGURE_INIT) && \
9 defined(CONFIGURE_FOOBAR_STUFF) && \
10 defined(CONFIGURE_MORE_FOOBAR_STUFF)
11
12 /* Foobar includes */
13
14 #ifdef __cplusplus
15 extern "C" {
16 #endif /* __cplusplus */
17
18 /* Configure foobar. */
19
20 #ifdef __cplusplus
21 }
22 #endif /* __cplusplus */
23
24 #endif /* CONFIGURE_INIT */
25
26 #endif /* _RTEMS_CONFDEFS_FOOBAR_H */

```

In case CONFIGURE_INIT is not defined, then including <rtems/confdefs.h> should expose nothing to the C compiler.

Here is a first proposal to group the configuration in components:

```

1 rtems/
2 confdefs.h
3 This file just includes the component based header files listed below.
4 confdefs/
5 bdbuf.h
6 classicobj.h
7 Classic API objects
8 classictasksinit.h
9 Classic initialization task

```

(continues on next page)

(continued from previous page)

```

10 driverclock.h
11 Clock driver and related configuration, e.g. CONFIGURE_MICROSECONDS_PER_TICK
12 driverconsolesimple.h
13 Simple console driver configuration
14 driverlegacy.h
15 Legacy IO driver configuration table
16 extensions.h
17 User extensions, internal extensions
18 filesystem.h
19 Filesystem configuration
20 general.h
21 Basic stuff which is mandatory to configure, e.g. ISR stacks, per-CPU information
22 libpci.h
23 PCI library configuration
24 malloc.h
25 Malloc configuration
26 mpci.h
27 MPCI specific configuration options
28 msgq.h
29 General message queue configuration
30 obsolete.h
31 Warning about the use of obsolete configure options
32 posixkeys.h
33 POSIX keys
34 posixobj.h
35 POSIX objects
36 posixthreadsinit.h
37 POSIX initialization threads
38 scheduler.h
39 Scheduler configuration
40 support.h
41 Support macros for confdefs header files
42 threads.h
43 General thread configuration (e.g. thread control block)
44 unlimited.h
45 Unlimited objects configuration

Merges	0

Original author: sebastian.huber

The `CONFIGURE_HAS_OWN_INIT_TASK_TABLE` and `CONFIGURE_POSIX_HAS_OWN_INIT_THREAD_TABLE` are the last `_HAS_OWN_` configuration options. These two options are probably unused, see also:

<https://lists.rtems.org/pipermail/users/2019-April/033129.html> <https://lists.rtems.org/pipermail/users/2019-April/033130.html>

Removing them simplifies the configuration. If there is a real user need which shows up after the removal, we can resurrect them on demand.

Using `CONFIGURE_POSIX_HAS_OWN_INIT_THREAD_TABLE` would have required the use of the undocumented `CONFIGURE_POSIX_INIT_THREAD_TABLE_NAME` and `CONFIGURE_POSIX_INIT_THREAD_TABLE_SIZE` configuration options.

Original author: sebastian.huber

Some targets (e.g. 32-bit PowerPC) have a small-data area. Linker set items are not in the small data area. We have to tell this the compiler, otherwise linker error may occur due to a mismatch of relocations. There are two options to do this.

1. We can declare items as an array of unspecified size and define items as an array with one element. The problem with this is that it breaks existing code, e.g. an item initializer would have to change.
2. We add the section to the declaration. The problem is that in this case we need a dedicated declaration macro for the ordered items.

Since item declarations are rarely used, we select option 2.

Original author: sebastian.huber

BSPs had the option to enable the `CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY` via the `BSP_ZERO_WORKSPACE_AUTOMATICALLY` BSP option. There is no BSP which defines this option. In addition, it makes no sense that a BSP can influence this high level system configuration.

Original author: sebastian.huber

The CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY configuration option is documented to be a boolean feature macro (is defined or undefined). However, in confdefs.h it uses the values TRUE and FALSE. It is the only configuration option implemented like this. Change it to use defined/undefined instead like the other options. This affects existing application configurations which use:

```
1 #define CONFIGURE_ZERO_WORKSPACE_AUTOMATICALLY FALSE
```

An unintentional zero of the workspace has an effect on the system boot time. This is an acceptable trade-off for the more canonical configuration.

4.2.1.152 3845 - Remove Ada-specific configuration options

Id	3845
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-12-17T13:47:37.000Z

Original author: sebastian.huber

We have currently three Ada related configuration options:

- `CONFIGURE_GNAT_RTEMS`
- `CONFIGURE_MAXIMUM_ADA_TASKS`
- `CONFIGURE_MAXIMUM_FAKE_ADA_TASKS`

The `CONFIGURE_MAXIMUM_FAKE_ADA_TASKS` option has no effect. The `CONFIGURE_GNAT_RTEMS` is mandatory to use the `CONFIGURE_MAXIMUM_ADA_TASKS` option. So, if you just use

```
define CONFIGURE_MAXIMUM_ADA_TASKS 123
```

then you get a re-definition warning and hopefully pay attention to it. This is not very user friendly from point of view.

The `CONFIGURE_MAXIMUM_ADA_TASKS` just adds the configured count to `CONFIGURE_MAXIMUM_POSIX_THREADS`.

The original purpose of these was to:

`CONFIGURE_GNAT_RTEMS` - add in resources required by Ada run-time independent of the number of Ada tasks (e.g. POSIX threads)

`CONFIGURE_MAXIMUM_ADA_TASKS` - add in POSIX threads, condition variable, and mutex required for each Ada task

`CONFIGURE_MAXIMUM_FAKE_ADA_TASKS` - add in condition variables and mutex required by Ada run-time for a task/thread created outside the Ada run-time which invokes Ada code and is thus a user of the run-time.

Given that you can turn on unlimited threads now and condition variables and mutexes are static, I don't think they have a need any longer. Plus it sounds like they bit rotted. If we needed them still, they would have to be fixed.

We still need documentation that Ada tasks are POSIX threads and must be accounted for in configuring the system. So when moving documentation around, please make that point clear in the `CONFIGURE_MAXIMUM_POSIX_THREADS` description.

Original author: sebastian.huber

Remove the CONFIGURE_HAS_OWN_DEVICE_DRIVER_TABLE configuration option. The RTEMS configuration should be done via explicit configuration options to allow more freedom for implementation changes. The CONFIGURE_HAS_OWN_DEVICE_DRIVER_TABLE configuration option had no test case. There was an attempt to get user feedback about this option:

Merges	0

Original author: sebastian.huber

The work area initialization is done by the BSP through `bsp_work_area_initialize()`. This approach predates the system initialization through the system initialization linker set. The

workspace and C program heap are unconditionally initialized. With the availability of statically initialized threads a system without workspace and C program heap is feasible. Change the work area initialization so that components are initialized on demand. To achieve this:

1. Add a Memory Handler which provides support for low level handling of memory areas which are handed over to the higher level Heap Handler.
2. Add an implementation of `_Memory_Get()` to each BSP (basically a restructuring of the `bsp_work_area_initialize()` implementations).

See optimization opportunity in [#3925](#).

Author: Chris Johns 2019-12-11T16:01:24.000Z

Original author: sebastian.huber

This needs to be explained in more detail.

What happens to BSPs that are not in the tree?

Author: Trac Migrate 2019-12-11T16:31:41.000Z

Original author: sebastian.huber

I am not sure what needs to be explained in more detail. This is mostly a mechanical change which just rearranges existing things a bit differently.

As usual, maintainers of BSPs which are not in the mainline RTEMS source have to pay a price and have to update their BSPs by themselves. With an updated documentation, this shouldn't be an issue.

Author: Chris Johns 2019-12-12T18:08:47.000Z

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

I am not sure what needs to be explained in more detail. This is mostly a mechanical change which just rearranges existing things a bit differently.

I think there are some things, for example take "components are initialized on demand", what is a "component" and what does "initialized on demand" mean?

I am OK with working through the detail but this will have to wait until I find the time. If you do not mind waiting let me know.

As usual, maintainers of BSPs which are not in the mainline RTEMS source have to pay a price and have to update their BSPs by themselves. With an updated documentation, this shouldn't be an issue.

A number of users cannot submit their BSPs and we have attempted to maintain a BSP API. Maybe we should define a

formal BSP interface that cannot be touched without careful consideration?

I am not sure what needs to be explained in more detail. This is mostly a mechanical change which just rearranges existing things a bit differently.

I think there are somethings, for example take “components are initialized on demand”, what is a “component” and what does “initialized on demand” mean?

The two components are the workspace and the C program heap. On demand means that they are only initialized if functions of these components are used by the application.

I am OK with working through the detail but this will have to wait until I find the time. If you do not mind waiting let me know.

As usual, maintainers of BSPs which are not in the mainline RTEMS source have to pay a price and have to update their BSPs by themselves. With an updated documentation, this shouldn't be an issue.

A number of users cannot submit their BSPs and we have attempted to maintain a BSP API. Maybe we should define a formal BSP interface that cannot be touched without careful consideration?

I do this with careful consideration. This change request is the result of a multi year work consisting of lots of small steps to make it possible to fully statically initialize RTEMS. Yes, it breaks the API, but adopting an existing BSP can be done easily in less than one hour. Also if you use a standard linker command file, then you can use the default implementation in your external BSP.

```

1 bsp: Rework work area initialization
2
3 The work area initialization was done by the BSP through
4 bsp_work_area_initialize(). This approach predated the system
5 initialization through the system initialization linker set. The
6 workspace and C program heap were unconditionally initialized. The aim
7 is to support RTEMS application configurations which do not need the
8 workspace and C program heap. In these configurations, the workspace
9 and C prgram heap should not get initialized.
10
11 Change all bsp_work_area_initialize() to implement _Memory_Get()
12 instead. Move the dirty memory, sbrk(), per-CPU data, workspace, and
13 malloc() heap initialization into separate system initialization steps.
14 This makes it also easier to test the individual initialization steps.
15
16 This change adds a dependency to _Heap_Extend() to all BSPs. This
17 dependency will be removed in a follow up change.
18
19 Update #3838.

- **Description** changed

1 The work area initialization is done by the BSP through `bsp_work_area_`
 ↪ `initialize()`. This approach predates the system initialization_
 ↪ through the system initialization linker set. The workspace and C_
 ↪ program heap are unconditionally initialized. With the availability_
 ↪ of statically initialized threads a system without workspace and C_
 ↪ program heap is feasible. Change the work area initialization so that_
 ↪ components are initialized on demand. To achieve this:
 2
 3 1. Add a Memory Handler which provides support for low level handling_
 ↪ of memory areas which are handed over to the higher level Heap_
 ↪ Handler.
 4
 5 2. Add an implementation of `_Memory_Get()` to each BSP (basically a_
 ↪ restructuring of the `bsp_work_area_initialize()` implementations).
 6

(continues on next page)

(continued from previous page)

```

7 + See optimization opportunity in #3925.
8 - 3. Add a _Memory_Get_workspace_handler_initialize() implementation to_
   ↳ each BSP which returns a workspace handler initialization function_
   ↳ which can initialize the workspace (A) from one memory area or (B)_
   ↳ multiple memory areas (needs _Heap_Extend()). Only two BSPs need (B).
9 -
10 - 4. Add a _Memory_Get_malloc_initialize() implementation similar to 3.

```

4.2.1.160 3835 - Support statically allocated threads

Id	3835
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-12-09T09:09:11.000Z
Updated	2024-04-25T20:47:31.156Z
Milestone	5.1
Labels	priority::normal, qualification, resolution::fixed, rtems::score, ticket-type::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3835
Merges	0

Original author: sebastian.huber

In some applications it is desirable to have statically allocated resources for all operating system objects.

In addition to the thread control block, up to four memory areas are currently allocated by a thread:

1. stack area
2. TLS area
3. FP context
4. thread queue heads

Currently the FP context and the TLS area are separately allocated from the workspace. This complicates the workspace size estimate. Add the FP context and TLS size to the stack size and place them in the stack area. This makes it also possible to move the stack area allocation out of `_Thread_Initialize()`. Use a hook to get the thread queue heads which is configured depending on the unlimited objects option of the configuration.

Statically allocate the stacks for internal threads (e.g. idle and MPCIE receive server) in a dedicated linker section (similar to the interrupt stacks). Mention this in the Classic API Guide configuration chapter.

Author: Chris Johns 2019-12-09T11:47:18.000Z

Original author: sebastian.huber

Does this assume TLS is a fixed size? I would need to revisit how TLS support would be managed in the dynamic loading situation. At a guess I suspect it will break possible solutions and that concerns me. I would prefer we do not wedge libdl in to a corner with change for a use case I do not fully understand. Maybe a detailed use case would help.

Author: Trac Migrate 2019-12-09T11:55:41.000Z

Original author: sebastian.huber

Nothing stops you from reallocating the TLS area on demand. In the worst case you waste a bit of memory. I don't think this change here will add constraints to libdl.

Author: Trac Migrate 2019-12-09T11:58:24.000Z

Original author: sebastian.huber

For clarification, the pointer to the TLS area in the thread control block will remain as is.

Author: Chris Johns 2019-12-09T12:24:02.000Z

Original author: sebastian.huber

Great, that helps. Thanks.

Author: Joel Sherrill 2019-12-09T12:38:58.000Z

Original author: sebastian.huber

In at least two applications I have helped with that had custom allocators, this sounds like it might not work. They had special mmu permissions on their stack memory.

Author: Trac Migrate 2019-12-09T12:51:01.000Z

Original author: sebastian.huber

I would consider the FP context and the thread-local storage of a thread to be in the same access domain. These data areas should be private to a thread.

Author: Joel Sherrill 2019-12-12T18:09:46.000Z

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

I would consider the FP context and the thread-local storage of a thread to be in the same access domain. These data areas should be private to a thread.

I don't know if this was intended to respond to my concern with custom stack allocators or not. In the systems I know have used this, the memory is not available (mapped dynamically) or known statically (RTEMS runs in virtual address space).

How does this work with custom stack allocators?

Author: Trac Migrate 2019-12-12T18:54:18.000Z

I would consider the FP context and the thread-local storage of a thread to be in the same access domain. These data areas should be private to a thread.

I don't know if this was intended to respond to my concern with custom stack allocators or not. In the systems I know have used this, the memory is not available (mapped dynamically) or known statically (RTEMS runs in virtual address space). How does this work with custom stack allocators?

The availability of statically initialized threads doesn't mean that everyone has to use them. They are optional. I also have no intention to remove the custom stack allocator. What changes is that the memory area allocated for the stack is used also to contain the thread-local storage and the FP context. These memory areas are private to a thread and non-executable. I really don't know what a potential problem could be with a custom allocator.

I plan to statically initialize the stacks for the idle threads and the MPCIE receive server thread. They will reside in special linker sections so that a BSP or application can control the placement in memory.

Original author: sebastian.huber
Use a system initialization handler to initialize the clock driver instead of using a legacy IO driver. This makes the system initialization more modular and removes a bit of overhead introduced by the legacy IO driver dependency.

In SMP configurations, the maximum count of MrsP semaphores must be configured via `CONFIGURE_MAXIMUM_MRSP_SEMAPHORES`. The MrsP semaphore implementation predates the addition of self-contained synchronization objects. At this time, the potential memory reduction was justified considering the more complex configuration and additional use of the workspace. With the availability of self-contained synchronization options, e.g. POSIX mutexes, this is no longer justified. Memory constrained applications should use the self-contained synchronization objects. Remove the `CONFIGURE_MAXIMUM_MRSP_SEMAPHORES` configuration option. This has only an impact on applications which use SMP and a large number of scheduler instances.

4.2.1.163 3800 - termios - Add Capability to Generate SIGINTR and SIGQUIT

Id	3800
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill

Merges	0

Currently the RTEMS termios implementation does not examine the ISIG setting in the termios attributes and thus does not examine input for the INTR (ctl-C) and QUIT (ctl-) characters. As a consequence, it cannot return -1/EINTR.

The proposed solution implements a point at which a default handler can do nothing like currently or the application can use the following new method which allows them to register the RTEMS provided method `rtems_termios_posix_isig_handler()`.

```

1 rtems_termios_isig_status_code rtems_termios_register_isig_handler(
2 rtems_termios_isig_handler handler
3 );

```

The method `rtems_termios_posix_isig_handler()` is provided and has the POSIX compliant behavior of generating SIGINTR for the VINTR character and SIGQUIT for the VQUIT character.

The user also can register `rtems_termios_default_isig_handler()` to return to the default behavior.

The tests `termios10` (polled IO) and `termios11` (interrupt driven IO) are added to exercise this behavior.

Author: Joel Sherrill 2019-10-07T21:39:22.000Z

12
13 Closes #3800.

```

Author: Trac Migrate 2020-02-01T14:03:08.000Z

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

The implementation breaks the canonical input mode as shown by test case `termios09`.

Author: Trac Migrate 2020-02-01T14:11:27.000Z

The implementation introduced a new enum:

```

1 /**
2  * @brief Type returned by all input processing (isig) methods
3  */
4 typedef enum {
5  /**
6   * This indicates that the input character was processed
7   * and possibly placed into the buffer.
8   */
9   RTEMS_TERMIOS_ISIG_WAS_PROCESSED,
10 /**
11  * This indicates that the input character was not processed and
12  * subsequent processing is required.
13  */
14   RTEMS_TERMIOS_ISIG_WAS_NOT_PROCESSED,
15 /**
16  * This indicates that the character was processed and determined
17  * to be one that requires a signal to be raised (e.g. VINTR or
18  * VKILL). The tty must be in the right termios mode for this to
19  * occur. There is no further processing of this character required and
20  * the pending read() operation should be interrupted.
21  */
22   RTEMS_TERMIOS_ISIG_INTERRUPT_READ
23 } rtems_termios_isig_status_code;

```

What was the rationale for the two status codes `RTEMS_TERMIOS_ISIG_WAS_PROCESSED` and `RTEMS_TERMIOS_ISIG_WAS_NOT_PROCESSED`?

What should a handler do if it returns RTEMS_TERMIOIS_ISIG_WAS_PROCESSED?
The default handler just returns RTEMS_TERMIOIS_ISIG_WAS_NOT_PROCESSED.

Ping?

Author: Trac Migrate 2020-05-04T14:55:44.000Z

Joel, I have no idea what you had in mind with the rtems_termios_isig_status_code, see my comment #4. Is this part of the API which applications may implement? The

```
1 rtems_termios_isig_status_code rtems_termios_posix_isig_handler(
2 unsigned char c,
3 struct rtems_termios_tty *tty
4 )
5 {
6 if (c == tty->termios.c_cc[VINTR]) {
7 raise(SIGINT);
8 return RTEMS_TERMIOIS_INTERRUPT_READ;
9 }
10
```

(continues on next page)

(continued from previous page)

```

11 if (c == tty->termios.c_cc[VQUIT]) {
12     raise(SIGQUIT);
13     return RTEMS_TERMIOS_ISIG_INTERRUPT_READ;
14 }
15
16 return RTEMS_TERMIOS_ISIG_WAS_NOT_PROCESSED;
17 }

```

doesn't use RTEMS_TERMIOS_ISIG_WAS_PROCESSED for example. The “unsigned char” should be probably cc_t.

Author: Joel Sherrill 2020-05-04T15:30:41.000Z

I added the enum for readability. This is a very odd path and having a real name versus a boolean seemed to me to make the code clearer. We could add a debug assert before the return RTEMS_TERMIOS_IPROC_CONTINUE and then the enum RTEMS_TERMIOS_ISIG_WAS_NOT_PROCESSED would be used.

I was leaning to improving the readability with the enum names. It was also not 100% clear to be that there would not end up ever being a third case.

```

1 static rtems_termios_iproc_status_code
2 iproc (unsigned char c, struct rtems_termios_tty *tty)
3 {
4     /*
5      * If signals are enabled, then allow possibility of VINTR causing
6      * SIGINTR and VQUIT causing SIGQUIT. Invoke user provided isig handler.
7      */
8     if ((tty->termios.c_lflag & ISIG)) {
9         if ((c == tty->termios.c_cc[VINTR]) || (c == tty->termios.c_cc[VQUIT]))
10             ↪{
11                 rtems_termios_isig_status_code rc;
12                 rc = (*termios_isig_handler)(c, tty);
13                 if (rc == RTEMS_TERMIOS_ISIG_INTERRUPT_READ) {
14                     return RTEMS_TERMIOS_IPROC_INTERRUPT;
15                 }
16             }
17         return RTEMS_TERMIOS_IPROC_CONTINUE;
18     }
19 }

```

Author: Chris Johns 2020-05-05T02:28:14.000Z

I am attempting to follow the flow of this ticket to see what the issue is. Sebastian, Joel pushed the patch on 2 Oct 2019, then you updated the ticket with comment:4 around Feb 1 2020 plus a patch to fix the change Joel pushed removing references to one of the enum values. The change only updated the ticket. It was confusing for me to determining the status and action that needs to happen. I have now taken the time to do this.

In regards to enum's one of the fixes for ticket [#3969](#) highlights a subtle issue with bool as a return type then changing code to need more return values. There is no upgrade path I consider **clean** or **safe** (?) if there is a need to add more return states than a bool's true and false. The libdl ticket shows what happens if you move to an enum from bool as compilers, coverity etc cannot see enough to know any code that was if (!returned_bool_now_enum()) ... maybe wrong. In the case of libdl the true or 1 became `.*_no_error` and 0 so a valid or no error result was incorrectly handled in code not updated. I think in important interfaces an enum should be considered desirable even if there is only two states and even if only one state is currently being used, i.e. what we now have.

I agree the documentation should indicate how to use the enum results returned. Can someone please update the enum's comments so a user knows how to handle them if returned?

Thanks

Original author: dufault

For ELF files the run-time loader calls this chain: `* _rtems_rtl_elf_file_load() *`
`_rtems_rtl_alloc_lock() * _rtems_rtl_alloc_heap() * __RTEMS_Lock_allocator()`

`__RTEMS_Lock_allocator()` locks all heap operations. RTL then calls `_read()` and for NFS file systems the NFS threads try to use the heap, locking up the system.

Author: Chris Johns 2019-04-28T01:44:02.000Z

Original author: dufault

Author: Chris Johns 2019-04-30T07:25:22.000Z

Original author: dufault

The default RTL allocator (heap) uses the file system while holding the heap allocator lock and if the file system uses the heap we end up in a deadlock. LibBSD's NFS implementation uses the heap.

The allocator lock/unlock logic was added when the trampoline changes were added. Trampolines provide large memory support and is documented in the User Manual (<https://docs.rtems.org/branches/master/user/exe/loader.html#large-memory>). The trampoline table needs to be close to the code using it or it may be out of range. If something allocates a large piece of memory between allocating the text memory and the trampoline table the relocation to the trampoline will be out of range.

There are two unknowns until the memory is allocated and code is loaded. The first is the location in memory and the second is the instruction the relocation record is pointing too. The location lets us determine the distance from the instruction to the target address and if it is in range and the instruction lets the arch back-end know determine the range the instruction has.

The ELF loader can be split into a finer set of stages to do as much processing before allocating memory however as stated above the two unknowns need to be resolved.

The most robust solution is to add code to build a table of relocation records that could require trampolines. While the allocator lock is being held:

- Lock the allocator
- Allocate the sections
- Locate the symbols
- Determine the number of trampolines using the cached relocation records
- Allocate the trampoline table
- Unlock the allocator

The number of trampolines can be determined using the relocation table data held in memory. The relocation table could be implemented in a similar way the unresolved externals is done with a common pool of blocks that grows and shrinks based on demand. A block allocation should aid the heap with fragmentation.

Author: Chris Johns 2019-05-02T01:45:27.000Z

Original author: dufault

- **Summary** changed from *libdl load of ELF objects on NFS file system lock up to libdl loading ELF objects from libbsd NFS file system ends in a deadlock*

I have:

1. Implemented caching any reloc record that could result in a trampoline using the unresolved table. This table is suitable for the purpose. I have not refactored the unresolved code to relabel the code to be common to unresolved and trampolines at this point in time, I have simply added the trampoline code to the unresolved code with a separate RTL internal header to isolate the interface. 1. Increased the block size for the unresolved table from 64 to 256 and a block is allocated when in the resolved table is opened and one block is always held. It is not clear to me how many tramp reloc records a large object file or an incrementally link object file could have. 1. Added per object file trampoline stats to help track what is happening.

The output for the PowerPC psim BSP for test dl09 with the test hacked to show the trampoline stats is:

```

1 RTL List:
2 /dl09-o1.o
3 trampolines:
4 slots      : 3
5 size       : 48
6 slot size  : 16
7 used       : 1
8 relocs     : 0
9 unresolved: 3
10 yield     : 33%
11 /dl09-o2.o
12 trampolines:
13 slots      : 7
14 size       : 112
15 slot size  : 16
16 used       : 7
17 relocs     : 6
18 unresolved: 1
19 yield     : 100%
20 /dl09-o5.o
21 trampolines:
22 slots      : 6
23 size       : 96
24 slot size  : 16
25 used       : 6
26 relocs     : 6
27 unresolved: 0
28 yield     : 100%
29 /dl09-o3.o
30 trampolines:
31 slots      : 37
32 size       : 592
33 slot size  : 16
34 used       : 13

(continued from previous page)

```

35 relocs      : 12
36 unresolved: 25
37 yield       : 35%
38 /dl09-o4.o
39 trampolines:
40 slots       : 8
41 size        : 128
42 slot size   : 16
43 used        : 8
44 relocs      : 7
45 unresolved: 1
46 yield       : 100%

```

The dl09 test is a bit special because it does a large heap allocation between the loading of each object modules so the yields are close to 100%. The yield indicates how successful the slot usage is. There is an element of estimation in the allocation size of the table.

Note, ``/dl09-o3.o`` exposes a new issue related to the way the unresolved external trampoline slots are managed. This file has a yield of 35% because there are 25 unresolved relocation records. Most of these turn out to be small data (SDATA) relocations and do not need trampolines because they are in the small data section which is limited in size and these are for data which can be jumped too.

If we look at test dl08 we get:

```

1 RTL List:
2 /dl08-o1.o
3 trampolines:
4 slots      : 1
5 size       : 16
6 slot size  : 16
7 used       : 0
8 relocs     : 0
9 unresolved: 1
10 yield      : 0%
11 /libdl08_1.a:dl08-o2.o
12 trampolines:
13 slots      : 1
14 size       : 16
15 slot size  : 16
16 used       : 0
17 relocs     : 0
18 unresolved: 1
19 yield      : 0%
20 /libdl08_2.a:dl08-o3.o
21 trampolines:
22 slots      : 25
23 size       : 400
24 slot size  : 16

```

(continues on next page)

(continued from previous page)

```

25 used      : 0
26 relocs    : 0
27 unresolved: 25
28 yield     : 0%
29 /libdl08_1.a:dl08-o4.o
30 trampolines:
31 slots     : 1
32 size      : 16
33 slot size : 16
34 used      : 0
35 relocs    : 0
36 unresolved: 1
37 yield     : 0%
38 /libdl08_2.a:dl08-o6-123456789-123456789.o
39 trampolines: no slots allocated
40 /libdl08_2.a:dl08-o5.o
41 trampolines:
42 slots     : 1
43 size      : 16
44 slot size : 16
45 used      : 0
46 relocs    : 0
47 unresolved: 1
48 yield     : 0%

```

Notice we have a yield of 0% because no trampolines are needed and everything is within range. Again we have the same issue noted above with /libdl08_2.a:dl08-o3.o.

Author: Chris Johns 2019-05-02T01:47:14.000Z

Original author: dufault

- **Summary** changed from *libdl loading ELF objects from libbsd NFS file system ends in a deadlock* to *libdl loading ELF objects from libbsd NFS file system ends in a deadlock*

Author: Chris Johns 2019-05-03T00:12:02.000Z

Original author: dufault

I have worked on the way the relocs are parsed and now have dl09 on the psim and xilinx_zynq_a9_qemu BSPs reporting trampoline usage of:

```

1 RTL List:
2 /dl09-o1.o
3 trampolines:
4 slots      : 1
5 size       : 16

```

(continues on next page)

(continued from previous page)

```

6 slot size : 16
7 used      : 1
8 relocs    : 1
9 unresolved: 0
10 yield     : 100%
11 /dl09-o2.o
12 trampolines:
13 slots     : 7
14 size      : 112
15 slot size : 16
16 used      : 7
17 relocs    : 7
18 unresolved: 0
19 yield     : 100%
20 /dl09-o5.o
21 trampolines:
22 slots     : 6
23 size      : 96
24 slot size : 16
25 used      : 6
26 relocs    : 6
27 unresolved: 0
28 yield     : 100%
29 /dl09-o3.o
30 trampolines:
31 slots     : 13
32 size      : 208
33 slot size : 16
34 used      : 13
35 relocs    : 13
36 unresolved: 0
37 yield     : 100%
38 /dl09-o4.o
39 trampolines:
40 slots     : 8
41 size      : 128
42 slot size : 16
43 used      : 8
44 relocs    : 8
45 unresolved: 0
46 yield     : 100%

```

The dl08 results still have a 0% yield but the number of slots is lower:

```

1 RTL List:
2 /dl08-o1.o
3 trampolines:
4 slots      : 1
5 size       : 16

```

Original author: dufault

I have posted a reasonable solution to the bug but I think there is a better solution. The current trampoline processing is reloc record based and it should target symbol based. A trampoline to a target symbol will be the same set of instructions and could be shared by relocations. This would drop the trampoline slot count.

A change would move away from a trampoline cache of each record to a cache of target symbols referenced by reloc records. The tramp check would see which symbols are in range and which are out of range to determine the number of slots to allocate. A relocation record that is not the full address range would still need a slot if the symbol is unresolved. The symbol cache entry would reference count reloc records referencing it and be deleted once there are no more references. The symbol cache entry would hold the trampoline slot number once allocated for use by other relocation records.

Note, the trampoline code is transparent to the execution of the object code and only has the target symbol address in it therefore it can be shared by more than one relocation record.

The unresolved table code may need to be split as the symbol record may grow the size of the record union and effect the memory footprint for unresolved symbols.

Add `rtems_scheduler_get_processor_maximum()` as a replacement for `rtems_get_processor_count()`. The `rtems_get_processor_count()` is a bit orphaned. Adopt it by the Scheduler Manager. The count is also misleading, since the processor set may have gaps and the actual count of online processors may be less than the value returned by `rtems_get_processor_count()`.

Merges	0

Original author: sebastian.huber

The confdefs.h file contains Doxygen comments. They are not helpful and lead to a confusing Doxygen output. The documentation place for the RTEMS configuration is the RTEMS Classic API Guide:

https://docs.rtems.org/branches/master/c-user/configuring_a_system.html

Author: Chris Johns 2019-02-27T23:48:33.000Z

Original author: sebastian.huber

Can a link be added so doxygen generate docs point to the documentation?

Author: Joel Sherrill 2019-02-27T23:52:08.000Z

Original author: sebastian.huber

I am against a patch that removes them without verifying that all info in the Doxygen comments is already in the Classic API Guide. There has to be at least some information in confdefs.h comments that isn't in the manual.

Author: Trac Migrate 2019-02-28T14:18:19.000Z

Original author: sebastian.huber

I think we all agreed that the user documentation is in the manuals and Doxygen is for internal use, e.g. for RTEMS contributors.

If something is in Doxygen comments in confdefs.h which is not in the manual, then of course we should update the manual.

Author: Trac Migrate 2020-06-01T11:27:20.000Z

Original author: sebastian.huber

- **Milestone** changed from %"6.1" to %"5.1"

This issue was reported back is 2016 and it slipped through. I am creating a ticket here to track the issue.

<https://lists.rtems.org/pipermail/users/2016-January/029740.html>

- [libdl-rtl-mdreloc-mips-hi16-lo16.diff](#)

Author: Chris Johns 2019-02-14T23:15:51.000Z

The patch creates global data between the architecture relocater and the format. I wonder how the ELF format handles the same reloc records?

The latest code has support for architecture specific handling of reloc records. I wonder if this new infrastructure can be used to achieve the same thing?

Author: Chris Johns 2019-02-15T02:29:55.000Z

Original author: sebastian.huber

In C++17 there is a std::aligned_alloc():

https://en.cppreference.com/w/cpp/memory/c/aligned_alloc

Unfortunately, it doesn't work with RTEMS currently:

https://gcc.gnu.org/bugzilla/show_bug.cgi?id=85904

Provide aligned_alloc() and memalign() (as a strong alias to aligned_allo0()) by RTEMS.

The build fails with pdfindex complaining on an `_Undefined Control Sequence_`:

```

1 ! Undefined control sequence.
2 <argument> \spxpagem
3
4 1.88 ...ecture}, \hyperindexformat{\spxpagem}{183}

```

The Tex is:

```

1 \item[{\Architecture\index{Architecture@\spxentry{Architecture}|spxpagem}\
↪phantomsection\label{\detokenize{glossary/index:term-architecture}}}] \
↪leavevmode

```

And the IDX entry from makeindex is:

```

1 \item \spxentry {Architecture}, \hyperindexformat{\spxpagem}{183}

```

Author: Chris Johns 2019-01-08T23:24:50.000Z

Sphinx provides a Makefile in the build directory and this uses latexmk to create the PDF. I have seen posts from sphinx developers stating the Makefile should be used when building a PDF.

Sphinx 1.8 and later references `\spxpagem` which is provided in a support file called `sphinx.xdy`. The Makefile references this file in the xindy options:

```
1 export XINDYOPTS = -L english -C utf8 -M sphinx.xdy
```

The issue on FreeBSD with texlive-full-20150521 is the lack of the xindy command:

```
1 $ type xindy
2 xindy: not found
```

And latexmk expects it to exist.

Labels	priority::normal, qualification, resolution::fixed, rtems::score, ticket-type::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3621
Merges	0

Original author: sebastian.huber

Statically initialize the object information structures to make the configuration easier to review and simplify the debugging.

The workspace size estimate generated by <rtems/confdefs.h> looks currently like this:

```
1 const rtems_configuration_table Configuration = { ( ( ( (ssize_t) (((((1 +
2 0) != 0 ? 1 : 0) * ((Objects_Maximum) ((1 + 0) & ~0x80000000U))) *
(continues on next page)
```

(continued from previous page)

```

3 (sizeof(Configuration_Thread_control))) != 0 ? 1 : 0) * ((((((1 + 0) != 0 ? 1 :
4 0) * ((Objects_Maximum) ((1 + 0) & ~0x80000000U))) *
5 (sizeof(Configuration_Thread_control)) + (2 * sizeof(uintptr_t) +
6 (sizeof(Heap_Protection_block_begin) + sizeof(Heap_Protection_block_end)))) +
7 (((sizeof(Heap_Block)) + (8) - 1) - ((sizeof(Heap_Block)) + (8) - 1) % (8))) -
8 1) - ((((((1 + 0) != 0 ? 1 : 0) * ((Objects_Maximum) ((1 + 0) & ~0x80000000U)))
9 * (sizeof(Configuration_Thread_control)) + (2 * sizeof(uintptr_t) +
10 (sizeof(Heap_Protection_block_begin) + sizeof(Heap_Protection_block_end)))) +
11 (((sizeof(Heap_Block)) + (8) - 1) - ((sizeof(Heap_Block)) + (8) - 1) % (8)))

```

[more than 500 similar lines]

```

1 1) - (((sizeof(Configuration_Initial_Extensions) /
2 sizeof((Configuration_Initial_Extensions)[0])) *
3 sizeof(User_extensions_Switch_control) + (2 * sizeof(uintptr_t) +
4 (sizeof(Heap_Protection_block_begin) + sizeof(Heap_Protection_block_end)))) +
5 (((sizeof(Heap_Block)) + (8) - 1) - ((sizeof(Heap_Block)) + (8) - 1) % (8))) -
6 1) % (((sizeof(Heap_Block)) + (8) - 1) - ((sizeof(Heap_Block)) + (8) - 1) %
7 (8)))) + 0 + 0 + (0 * 1024) + (((2 * sizeof(uintptr_t) +
8 (sizeof(Heap_Protection_block_begin) + sizeof(Heap_Protection_block_end)))) +
9 (8) - 1) - (((2 * sizeof(uintptr_t) + (sizeof(Heap_Protection_block_begin) +
10 sizeof(Heap_Protection_block_end)))) + (8) - 1) % (8)) ),

```

The object controls reside on the heap even for fixed object count configuration. Using a statically allocated array makes it easier to find the objects during debugging.

Author: Chris Johns 2018-11-27T00:53:30.000Z

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

The object controls reside on the heap even for fixed object count configuration. Using a statically allocated array makes it easier to find the objects during debugging.

It is not clear me to what the requirements are these change are being based on? Is there some overriding push for everything to be static tables every where.

Static tables for initialisation do solve some issues such as audit-able configuration control but are there other use cases where this may not be a good fit. I cannot tell. For example statically inflexible kernel initialisation and libdl do not sit well together. The demands on the kernel configuration from the loadable code can vary and does and if you consider libdl as a means to produce “golden images” having the ability to vary the configuration is important. I have built systems where the bootloader loads the kernel configuration data and then loads the application. Can this still be done?

Author: Trac Migrate 2018-11-27T06:00:08.000Z

Original author: sebastian.huber

You can still do whatever you want after the system is initialized. I just want to get rid of the workspace allocations used during the system startup and instead use storage allocated by the linker.

Author: Chris Johns 2018-11-27T06:05:25.000Z

Original author: sebastian.huber

Great and thank you.

Original author: sebastian.huber

The RTEMS_USE_16_BIT_OBJECT define is not set by an RTEMS port. Remove support for 16-bit object identifiers. If someone really wants to use RTEMS on a 16-bit target, then it is better to use self-contained objects instead of playing around with object identifier optimizations.

Author: Trac Migrate 2018-11-21T07:06:49.000Z

4.2.1.180 3598 - Move internal types of API objects to separate header file

Id	3598
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-11-08T07:49:11.000Z
Updated	2024-04-25T20:46:42.244Z
Milestone	5.1
Labels	priority::normal, qualification, resolution::fixed, ticket-type::enhancement, version::5

Merges	0

Original author: sebastian.huber

The `<rtems.h>` header file still exposes a lot of implementation details via the definition of internal data structures, e.g. the `*_Control` structures of the API objects. They are only necessary for the application configuration. Move them to separate header files. Currently we have:

- `<rtems/rtems/XYZ.h>`
- `<rtems/rtems/XYZimpl.h>`

Use

- `<rtems/rtems/XYZdata.h>`

for this new header file.

Potential new header files are:

- `rtems/extensiondata.h`
- `rtems/rtems/asrdata.h`
- `rtems/rtems/barrierdata.h`
- `rtems/rtems/dpmemdata.h`
- `rtems/rtems/eventdata.h`
- `rtems/rtems/messagedata.h`
- `rtems/rtems/partdata.h`
- `rtems/rtems/ratemondata.h`
- `rtems/rtems/regiondata.h`
- `rtems/rtems/semdata.h`
- `rtems/rtems/tasksdata.h`

- `rtems/rtems/timerdata.h`

Original author: sebastian.huber

The standard C/POSIX functions malloc() and calloc() set errno in case of an error. A dependency to errno pulls in getreent() which pulls in a lot of data structures and functions. This is an issue in low level code especially in the area of a basic board support package initialization and device drivers.

Provide rtems_malloc() and rtems_calloc() functions declared in <rtems/malloc.h> which do the same as the corresponding C/POSIX functions except setting errno.

The posix_memalign() and aligned_alloc() functions do not have this issue with the errno.

This is a problem with old waf versions and python 3.7. See <https://gitlab.com/ita1024/waf/commit/facdc0b173d933073832c768ec1917c553cb369c> for details.

Original author: mamu

- **Summary** changed from *waf version in rtems-tools incompatible with python3*
to *waf version in various rtems-repositories incompatible with python 3.7*

That problem is also true for the following three repositories: * rtems-libbsd * rtems-
docs * examples-v2

I adapted the title of the bug report to reflect that.

At least examples-v2 and rtems-libbsd use waf to build. examples-v2 has a copy of waf known to work for the users' convenience. rtems-libbsd is missing one. Add one to rtems-libbsd.

Also (if there are other repos using waf), make sure they have a copy of waf also.

Original author: sebastian.huber

An RTEMS application default configuration is contained in cpukit/libmisc/dummy/default-configuration.c. This default configuration is contained in librtemscpu.a. This has at least two problems:

1. Application configuration errors may pull in the default configuration which in turn leads to multiply define symbols error. This is quite confusing. You have to consult the linker map file to figure out what caused the pull in of the default configurations. You need to know what a linker map file is and how you generate it with your build system. This is not very user friendly.
2. It prevents the use of default configuration items for each subsystem in librtemscpu.a. This can be used to reduce the size of the configuration itself.

Proposed change: Move the default configuration to a separate library, e.g. librtemsdefaultconfig.a.

Original author: sebastian.huber

The rtems_task_delete(RTEMS_SELF) function does not return. In order to aid compilers and static analysis tools provide an rtems_task_exit() function which can be specified as a no return function.

```
1 void rtems_task_exit(void) RTEMS_NO_RETURN;
```

This is similar to the POSIX equivalent.

```
1 void pthread_exit (void *__value_ptr) __dead2;
```

This configuration option was obsoleted in RTEMS 5.1.

Author: Joel Sherrill 2018-08-08T13:42:38.000Z

Original author: sebastian.huber

I think I proposed removing option on the devel@ list a while back. Normally I prefer to deprecate for one cycle as this ticket proposes but I don't see how anyone could be using this. The rate of change to the internal configuration with addition of SMP has been intense. There have been no questions indicating someone is trying to trail the CONFIGURE_XXX interface on their own.

It isn't a huge feature, but I really don't think it is used. If there is consensus, I wouldn't be opposed to killing it now. But now a huge deal.

Original author: sebastian.huber

Obsolete the CONFIGURE_HAS_OWN_CONFIGURATION_TABLE configuration option. The RTEMS configuration should be done via explicit configuration options to allow more freedom for implementation changes.

Author: Chris Johns 2018-08-08T07:28:53.000Z

Original author: sebastian.huber

Should this be deprecated for a release before being removed?

Maybe the question should be asked on the user and devel lists if there are users?

Author: Trac Migrate 2018-08-08T07:30:23.000Z

Original author: sebastian.huber

Normally, I would say that we should deprecate it, however, it is broken since RTEMS 4.11 and we didn't get a bug report or complaint. There is also no test case for this configuration option.

Author: Trac Migrate 2018-08-08T07:31:47.000Z

Original author: sebastian.huber

Replying to **Sebastian Huber**:

Normally, I would say that we should deprecate it, however, it is broken since RTEMS 4.11 and we didn't get a bug report or complaint. There is also no test case for this configuration option.

Sorry, I answered to the wrong ticket.

Obsolete == deprecate? Next step is remove in 6.1 (#3490).

Author: Chris Johns 2018-08-08T07:37:57.000Z

Original author: sebastian.huber

Thank you. Anyone interested can now see the reason.

Author: Trac Migrate 2018-08-08T07:41:30.000Z

Original author: sebastian.huber

Use uintptr_t to specify the length of the partition buffer area instead of uint32_t. This is in line with rtems_region_create(). On 64-bit targets, the length may exceed 4GiB. Use size_t for the

buffer size, since on some targets the single object size is less than the overall address range, e.g. m32c `sizeof(uintptr_t) > sizeof(size_t)`.

Original author: sebastian.huber

Buffer alignment required by `rtems_partition_create()` is too strict since it is checked via `_Addresses_Is_aligned()` which is

```

1 RTEMS_INLINE_ROUTINE bool _Addresses_Is_aligned (
2   const void *address
3 )
4 {
5   #if (CPU_ALIGNMENT == 0)
6     return true;
7   #else
8     return (((uintptr_t)address % CPU_ALIGNMENT) == 0);
9   #endif
10 }
```

The `CPU_ALIGNMENT` must take long double and vector data type alignment requirements into account. For the partition maintenance only pointer alignment is required. The user should ensure that its buffer is suitable for the items it wants to manage. The user should not be burdened to provide buffers with the maximum architecture alignment, e.g. why need a 16 byte aligned buffer if you want to manage items with 4 byte integers only?

Original author: sebastian.huber

In case an application defines CONFIGURE_MINIMUM_TASK_STACK_SIZE, then this may
change the CONFIGURE_INTERRUPT_STACK_SIZE as well:

```
1 #ifndef CONFIGURE_INTERRUPT_STACK_SIZE
2 #ifdef BSP_INTERRUPT_STACK_SIZE
3 #define CONFIGURE_INTERRUPT_STACK_SIZE BSP_INTERRUPT_STACK_SIZE
4 #else
5 #define CONFIGURE_INTERRUPT_STACK_SIZE CONFIGURE_MINIMUM_TASK_STACK_SIZE
6 #endif
7 #endif
```

I think this is not what a user expects.

Author: Trac Migrate 2018-07-30T05:57:30.000Z

Original author: sebastian.huber

This behaviour is more or less documented:

[https://docs.rtems.org/branches/master/c-user/configuring_a_system.html#
configure-interrupt-stack-size](https://docs.rtems.org/branches/master/c-user/configuring_a_system.html#configure-interrupt-stack-size)

The documentation doesn't mention that BSP_INTERRUPT_STACK_SIZE is involved
too.

Original author: sebastian.huber

We need an initialization stack to run the sequential system initialization before multitasking is enabled. The system initialization is done with interrupts disabled.

We need an interrupt stack for interrupt processing. This helps to avoid a per thread stack overhead for interrupt processing. The size for interrupt stack is application dependent, e.g. maximum interrupt nest level, stack demands of interrupt handlers.

The initialization and interrupt stacks are needed for each processor in the system.

Since interrupts are disabled during the sequential system initialization we can re-use the interrupt stack for the initialization stack. This is important for low end targets, with very limited RAM sizes. We need the initialization stack before a proper C run-time environment is set up e.g. we cannot assume that the access to global data is available. The stack memory area begin and size should be available via global symbols (named addresses). On some BSPs, e.g. ARM, this is done via the linker command file.

It should be possible to set the stack size via the `CONFIGURE_INTERRUPT_STACK_SIZE` configuration option and not via some magic stuff in linker command files.

Many BSPs set the BSS area to zero during system initialization. Thus, the initialization stack must not be contained in the BSS area.

The interrupt stack implementation is currently controlled by the following CPU port defines:

```

1 /**
2  * Does RTEMS manage a dedicated interrupt stack in software?
3  *
4  * If TRUE, then a stack is allocated in @ref _ISR_Handler_initialization.
5  * If FALSE, nothing is done.
6  *
7  * If the CPU supports a dedicated interrupt stack in hardware,
8  * then it is generally the responsibility of the BSP to allocate it
9  * and set it up.
10 *
11 * If the CPU does not support a dedicated interrupt stack, then
12 * the porter has two options: (1) execute interrupts on the

```

(continues on next page)

(continued from previous page)

```

13 * stack of the interrupted task, and (2) have RTEMS manage a dedicated
14 * interrupt stack.
15 *
16 * If this is TRUE, @ref CPU_ALLOCATE_INTERRUPT_STACK should also be TRUE.
17 *
18 * Only one of @ref CPU_HAS_SOFTWARE_INTERRUPT_STACK and
19 * @ref CPU_HAS_HARDWARE_INTERRUPT_STACK should be set to TRUE. It is
20 * possible that both are FALSE for a particular CPU. Although it
21 * is unclear what that would imply about the interrupt processing
22 * procedure on that CPU.
23 *
24 * Port Specific Information:
25 *
26 * XXX document implementation including references if appropriate
27 */
28 #define CPU_HAS_SOFTWARE_INTERRUPT_STACK FALSE
29
30 /**
31 * Does this CPU have hardware support for a dedicated interrupt stack?
32 *
33 * If TRUE, then it must be installed during initialization.
34 * If FALSE, then no installation is performed.
35 *
36 * If this is TRUE, @ref CPU_ALLOCATE_INTERRUPT_STACK should also be TRUE.
37 *
38 * Only one of @ref CPU_HAS_SOFTWARE_INTERRUPT_STACK and
39 * @ref CPU_HAS_HARDWARE_INTERRUPT_STACK should be set to TRUE. It is
40 * possible that both are FALSE for a particular CPU. Although it
41 * is unclear what that would imply about the interrupt processing
42 * procedure on that CPU.
43 *
44 * Port Specific Information:
45 *
46 * XXX document implementation including references if appropriate
47 */
48 #define CPU_HAS_HARDWARE_INTERRUPT_STACK TRUE
49
50 /**
51 * Does RTEMS allocate a dedicated interrupt stack in the Interrupt Manager?
52 *
53 * If TRUE, then the memory is allocated during initialization.
54 * If FALSE, then the memory is allocated during initialization.
55 *
56 * This should be TRUE is CPU_HAS_SOFTWARE_INTERRUPT_STACK is TRUE.
57 *
58 * Port Specific Information:
59 *
60 * XXX document implementation including references if appropriate
61 */

```

(continues on next page)

(continued from previous page)

```
62 #define CPU_ALLOCATE_INTERRUPT_STACK TRUE
```

Do the following steps to unify and simplify the initialization and interrupt stack support. 1. Add RTEMS_DECLARE_GLOBAL_SYMBOL() and RTEMS_DEFINE_GLOBAL_SYMBOL() macros to basedefs.h, to allow a global symbol definition via C code, e.g. in confdefs.h, to make the interrupt stack size available to the low level initialization code.

2. Add a special input section “.rtemsstack” to the linker command files to allow a placement of the interrupt stacks. The BSPs can provide the optimal memory location for this section, e.g. on-chip RAM, tightly-coupled memory.

This makes the CPU_HAS_SOFTWARE_INTERRUPT_STACK and CPU_HAS_HARDWARE_INTERRUPT_STACK CPU port defines superfluous, since the low level initialization code has all information available via global symbols.

This makes the CPU_ALLOCATE_INTERRUPT_STACK CPU port define superfluous, since the interrupt stacks are allocated by confdefs.h for all architectures. There is no need for BSP-specific linker command file magic.

The optional _CPU_Interrupt_stack_setup() is still useful to customize the registration of the interrupt stack area in the per-CPU information.

Author: Trac Migrate 2018-06-29T09:54:14.000Z

Original author: sebastian.huber

In [changeset:"511dc4b2bee78ce0714e83838644429a29d325b1/rtems"511dc4b/rtems]:

```
1 Rework initialization and interrupt stack support
2
3 Statically initialize the interrupt stack area
4 (_Configuration_interrupt_stack_area_begin,
5 _Configuration_interrupt_stack_area_end, and
6 _Configuration_interrupt_stack_size) via <rtems/confdefs.h>. Place the
7 interrupt stack area in a special section ".rtemsstack.interrupt". Let
8 BSPs define the optimal placement of this section in their linker
9 command files (e.g. in a fast on-chip memory).
10
11 This change makes makes the CPU_HAS_SOFTWARE_INTERRUPT_STACK and
12 CPU_HAS_HARDWARE_INTERRUPT_STACK CPU port defines superfluous, since the
13 low level initialization code has all information available via global
14 symbols.
15
16 This change makes the CPU_ALLOCATE_INTERRUPT_STACK CPU port define
17 superfluous, since the interrupt stacks are allocated by confdefs.h for
18 all architectures. There is no need for BSP-specific linker command
19 file magic (except the section placement), see previous ARM linker
20 command file as a bad example.
21
22 Remove _CPU_Install_interrupt_stack(). Initialize the hardware
23 interrupt stack in _CPU_Initialize() if necessary (e.g.
24 m68k_install_interrupt_stack()).
25
26 The optional _CPU_interrupt_stack_setup() is still useful to customize
27 the registration of the interrupt stack area in the per-CPU information.
28
29 The initialization stack can reuse the interrupt stack, since
30
31 * interrupts are disabled during the sequential system initialization,
32 and
33
34 * the boot_card() function does not return.
35
36 This stack reuse saves memory.
37
38 Changes per architecture:
39
40 arm:
41
42 * Mostly replace the linker symbol based configuration of stacks with
43 the standard <rtems/confdefs.h> configuration via
44 CONFIGURE_INTERRUPT_STACK_SIZE. The size of the FIQ, ABT and UND
45 mode stack is still defined via linker symbols. These modes are
46 rarely used in applications and the default values provided by the
47 BSP should be sufficient in most cases.
48
49 * Remove the bsp_processor_count linker symbol hack used for the SMP
50 support. This is possible since the interrupt stack area is now
```

(continues on next page)

(continued from previous page)

```

51 allocated by the linker and not allocated from the heap. This makes
52 some configure.ac stuff obsolete. Remove the now superfluous BSP
53 variants altcycv_devkit_smp and realview_pbx_a9_qemu_smp.
54
55 bfin:
56
57 * Remove unused magic linker command file allocation of initialization
58 stack. Maybe a previous linker command file copy and paste problem?
59 In the start.S the initialization stack is set to a hard coded value.
60
61 lm32, m32c, mips, nios2, riscv, sh, v850:
62
63 * Remove magic linker command file allocation of initialization stack.
64 Reuse interrupt stack for initialization stack.
65
66 m68k:
67
68 * Remove magic linker command file allocation of initialization stack.
69 Reuse interrupt stack for initialization stack.
70
71 powerpc:
72
73 * Remove magic linker command file allocation of initialization stack.
74 Reuse interrupt stack for initialization stack.
75
76 * Used dedicated memory region (REGION RTEMSSTACK) for the interrupt
77 stack on BSPs using the shared linkcmds.base (replacement for
78 REGION_RWEXTRA).
79
80 sparc:
81
82 * Remove the hard coded initialization stack. Use the interrupt stack
83 for the initialization stack on the boot processor. This saves
84 16KiB of RAM.
85
86 Update #3459.

4.2.1.202 3458 - rtems-test should not use the env PATH to find covoar

Id	3458
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate

Merges	0

The `rtems-test` command should know where `covoar` is when invoking it. It cannot use the environment's path. The path can contain invalid or outdated versions with subtle issues that could be hard to find.

There should be no need to run `install` to use and test `rtems-test` with coverage.

The `rtems-test` python code for running the tests knows where it is and adjusts. For example using an absolute path to `rtems-tests` in a build directly results in it being able to find the development tree `rtemstoolkit` and configuration data. The command needs to be taught to find the development version of `covoar`.

Note, currently `covoar` needs external tools and this is currently using the environment's path however there is work underway to remove this dependence so there case does not need to be handled.

4.2.1.203 3436 - Remove clock driver Clock_driver_support_shutdown_hardware() hook

Id	3436
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-05-25T12:32:59.000Z

Merges	0

Original author: sebastian.huber

Most applications use a clock driver and most BSPs use the clock driver framework provided by clockimpl.h. This framework offers a Clock_driver_support_shutdown_hardware() hook which is used like this.

```
1 #ifdef Clock_driver_support_shutdown_hardware  
2 /**  
3 * @brief Clock_exit  
  
(continues on next page)
```

(continued from previous page)

```

4 *
5 * This routine allows the clock driver to exit by masking the interrupt and
6 * disabling the clock's counter.
7 */
8 void Clock_exit( void )
9 {
10 Clock_driver_support_shutdown_hardware();
11
12 /* do not restore old vector */
13 }
14 #endif
15 ...
16 #ifdef Clock_driver_support_shutdown_hardware
17 atexit( Clock_exit );
18 #endif

```

The aim is to stop clock tick interrupts at some late point in the exit() procedure.

The use of atexit() pulls in malloc() which pulls in errno. It is incompatible with the intention of the CONFIGURE_DISABLE_NEWLIB_REENTRANCY configuration option.

The exit() function must be called from thread context, so accompanied clock tick interrupts should cause no harm. On the contrary, someone may assume a normal operating system operation, e.g. working timeouts.

Remove the superfluous Clock_driver_support_shutdown_hardware() hook.

Test runs with a interrupt driven console driver result in unreliable test outcomes.

Problem was noticed with test runs on Microzed, for example libtest/block08:

The test prints:

```
1 ** END OF TEST BLOCK 8 ***
```

The rtems-test command marks the result as a failure. There is a single * missing from the start of the line. I attach the full test trace.

- [microzed-block8.txt](#)

Author: Chris Johns 2017-10-06T04:03:09.000Z

- **Attachment** [microzed-block8.txt](#) added

RTEMS Tester test log for block8 on a Microzed.

Author: Chris Johns 2017-10-06T21:48:30.000Z

- **Summary** changed from *Microzed libtest/block8 fails to print end of test correctly.* to *Microzed libtest/block08 fails to print end of test correctly.*

I changed all printk calls in the block08 test to printf and the output from the test is now correct and rtems-test passes the test.

There must be something wrong with the Zync UART drivers. I have escalated this to critical because I would like the Zynq to be a tier 1 device with the Beaglebone Black so we have Cortex-A9 and Cortex-A8 devices in tier 1.

There are 233 printk references in the testsuite. I am sure some are needed however block08's printk calls were not needed so I am now wondering how many are?

Author: Trac Migrate 2017-10-09T07:19:29.000Z

Does the following patch alter the output:

```

Does the following patch alter the output:

No it did not make a difference.

See <https://lists.rtems.org/pipermail/build/2017-October/000007.html>. Search for Result: invalid Time: 0:00:23.859291 dumpbuf01.exe.img. The rtems_print_buffer() call uses rtems_putc and that uses printk or the putc equivalent.

Reviewing the failures there looks to be something wrong in the BSP. There are failures which should not or do not fail on other BSP. I cannot debug this remotely so it may have to wait. Are you able to run the tests on a Zynq?

Author: Trac Migrate 2017-10-13T06:48:49.000Z

Do you use a polled or interrupt driven console driver? The tests need a polled console driver.

Author: Chris Johns 2017-10-13T12:51:02.000Z

Replying to [Sebastian Huber](#):

Do you use a polled or interrupt driven console driver?

I use the default configuration:

```
1 configure --target=arm-rtems4.12 --prefix=/opt/work/chris/
   ↪ rtems/kernel/4.12 --disable-networking --enable-
   ↪ rtemsbsp=xilinx_zynq_zedboard --enable-maintainer-mode --
   ↪ enable-tests
```

I have always assumed the default configuration for **any** BSP lets the tests run. Is this not the case?

The tests need a polled console driver.

What do I do to make this happen?

No, this is not the case for the real hardware BSPs which usually use an interrupt driven console driver.

The tests need a polled console driver.

What do I do to make this happen?

This is BSP-specific. Try, to add
"ZYNQ_CONSOLE_USE_INTERRUPTS=" to the config-
ure command line.

No, this is not the case for the real hardware BSPs which usually use an interrupt driven console driver.

This seems like a new requirement. Has something changed in RTEMS to cause this? I do not remember having this problem with previous versions.

This is confusing because each BSP is different and has different options. The tests should manage this internally at runtime and not be dependent on low level BSP specific driver implementations. We have polled console driver support in BSPs, why not get the tests to use it?

Is this documented anywhere? FWIW I see adding some now as hiding the real issue.

What do I do to make this happen?

This is BSP-specific. Try, to add "ZYNQ_CONSOLE_USE_INTERRUPTS=" to the configure command line.

<sigh> I will consider the blocker status for this issue and discuss it with Joel today. He told me yesterday no tests should be using printk unless configured to do so, ie small memory targets. There seems to be some confusion.

At least since I use RTEMS, this was the case. I asked questions about this on the mailing list.

This is confusing because each BSP is different and has different options. The tests should manage this internally at runtime and not be dependent on low level BSP specific driver implementations. We have polled console driver support in BSPs, why not get the tests to use it? Is this documented anywhere? FWIW I see adding some now as hiding the real issue.

The console drivers are a real mess. We have no link-time configuration options/mechanism for drivers. Its not so easy.

Changing the tests so that they work with an interrupt driven console driver is hard. I don't think it makes sense. What we need is a non-blocking test output support.

What do I do to make this happen?

This is BSP-specific. Try, to add "ZYNQ_CONSOLE_USE_INTERRUPTS=" to the configure command line.

<sigh> I will consider the blocker status for this issue and discuss it with Joel today. He told me yesterday no tests should be using printk unless configured to do so, ie small memory targets. There seems to be some confusion.

Some tests must not use printf, due to execution environment constraints, e.g. interrupt context, no drivers, early system state, fatal error, etc.

If you consider this as a blocker, then you possibly delay the release for several months.

Author: Trac Migrate 2017-10-13T13:38:59.000Z

An short term option would be a unification of the BSP option to select a polled console driver.

Author: Joel Sherrill 2017-10-13T13:41:11.000Z

There is a buffered test up option for the tests which will help those that use the infrastructure. Should be in testsuites/configure.ac

At least since I use RTEMS, this was the case. I asked questions about this on the mailing list.

The beaglebone black does not have the same problems as the Zynq. I checked the drivers for the BBB and there is an interrupt version so I wonder if the polled driver is used by default. I did not check this.

The console drivers are a real mess. We have no link-time configuration options/mechanism for drivers. Its not so easy.

If consoles provide interrupt and poll devs, why have the test close the console and reopen it with the polled driver? Yeah ok It is easy to say this and no I have not looked into the detail and what complexity there is. :)

Changing the tests so that they work with an interrupt driven console driver is hard. I don't think it makes sense. What we need is a non-blocking test output support.

Agreed, I was not considering changing the tests to do this rather how output is handled. There is the TESTS_BUFFER_OUTPUT and TESTS_USE_PRINTK can they be forced on and all stdout and stderr paths switched to what is used?

If you consider this as a blocker, then you possibly delay the release for several months.

This is being a little dramatic. I am not after a rewrite, I am looking for a simple pragmatic solution. We need the ability to test on hardware in a repeatable manner for the life of the release branch.

The beaglebone black does not have the same problems as the Zynq. I checked the drivers for the BBB and there is an interrupt version so I wonder if the polled driver is used by default. I did not check this.

It depends also on the hardware, FIFO depth, DMA support, etc.

We have an option `--enable-tests=all`? Should this force polled drivers?

Author: Trac Migrate 2017-10-16T05:22:23.000Z

Its not really transparent to the user that `--enable-tests=all` tinkers with the console driver.

Tests must be audited to ensure that they don't call the standard output functions, e.g.

```
nm find -name '*.exe' | grep 'exe:|<f?printf>|<puts>'
```

Author: Trac Migrate 2017-10-27T05:01:07.000Z

Original author: sebastian.huber

- **Description** changed

```

1 + Test runs with a interrupt driven console driver result in unreliable_
  ↳test outcomes.
2 +
3 + Problem was noticed with test runs on Microzed, for example libtest/
  ↳block08:
4 +
5 The test prints:
6 {{{
7 ** END OF TEST BLOCK 8 ***
8 }}}
9
10 The `rtems-test` command marks the result as a failure. There is a_
  ↳single `*` missing from the start of the line. I attach the full test_
  ↳trace.
```

- **Summary** changed from *Microzed libtest/block08 fails to print end of test correctly.* to *Use BSP_output_char via RTEMS printer for test output by default*

If we use BSP_output_char for all tests, then the console driver is not tested. We probably need a special test for it.

We should also remove CONFIGURE_APPLICATION_NEEDS_CONSOLE_DRIVER from all other tests.

Author: Chris Johns 2017-09-22T08:12:37.000Z

My u-boot is the original one that comes with the board. I am working out how to get a new one to boot from an SD Card

Author: Chris Johns 2017-09-25T03:45:39.000Z

The SD card requires you position the SPL (MLO) and u-boot image in specific locations to boot:

```
1 dd if=MLO          of=sdcard.img count=1 seek=1 conv=notrunc bs=128k
2 dd if=u-boot.img of=sdcard.img count=2 seek=1 conv=notrunc bs=384k
```

The SD card can be formatted with anything.

Author: Trac Migrate 2017-05-31T00:52:01.000Z

Original author: burrusse

Originally discovered with MSYS2 on windows while building rtems 4.11. Building the gcc compiler fails when trying to build the documentation. This applies when a new version of gcc is used to build older versions of gcc (ie 4.8.3 such as when building bfin and m32c architectures for 4.11). The gcc maintainers recommend the use of MISSING=texinfo switch during configuration. A possible solution is attached.

NOTE: this problem should also exist when trying to build rtems 4.10 compilers and earlier.

Author: Chris Johns 2017-06-13T00:32:49.000Z

Original author: burrusse

Is it MISSING=texinfo per the comments or MAKEINFO=missing as in the patch?

Also I am thinking of adding this before the configure command set the environment variable:

```
1 %if %{_host_os} == win32
2 export MAKEINFO=missing
3 %endif
```

Author: Chris Johns 2017-06-13T05:45:21.000Z

Original author: burrusse

- **Milestone** set to %"4.11.2"

Author: Trac Migrate 2017-06-13T13:27:39.000Z

Original author: burrusse

- **Milestone** %"4.11.2" deleted

Sorry for the Confusion. I have been using: MAKEINFO=missing. I can not fathom where I got the other the switch from or if it is even valid.

Limiting the solution to just windows fixes the problem for now, but will become a problem down the road as more OS's move to newer versions of GCC. From my point of view having a test to see if the Host GCC version is > 6.x is the way to do it. but I do not see a way to execute that logic. So for the short term that solution looks good.

Author: Chris Johns 2017-06-14T00:06:10.000Z

Original author: burrusse

Thanks for clearing up which to use.

There is a reference on line to where the GCC developers discuss this issue and the solution?

I am sorry but I am not following the relationship with makeinfo and the host's gcc version.

Author: Trac Migrate 2017-06-14T18:25:56.000Z

Original author: burrusse

Chris, you are correct it is not GCC version, I should have looked a little further it is makeinfo version. I got my original patch idea from here: https://gcc.gnu.org/bugzilla/show_bug.cgi?id=60961 with better descriptions here: <https://dev.openwrt.org/ticket/13039> and here: <https://osmocom.org/issues/1916>

My MSYS2 is using makeinfo version 6.3 My CentOS was building fine and currently has makeinfo version 5.1

Author: Chris Johns 2017-06-15T03:13:29.000Z

Original author: burrusse

Replying to **Worth Burruss**:

Chris, you are correct it is not GCC version, I should have looked a little further it is makeinfo version. I got my original patch idea from here: https://gcc.gnu.org/bugzilla/show_bug.cgi?id=60961

Thanks. Yes we need to disabled it for all gcc-4 builds.

This says MISSING=texinfo.

with better descriptions here: <https://dev.openwrt.org/ticket/13039>

Here says MAKEINFO=missing.

and here: <https://osmocom.org/issues/1916>

and this has no solution.

My MSYS2 is using makeinfo version 6.3
My CentOS was building fine and currently has makeinfo version 5.1

Looks like we need this handled on the master branch as well.

Author: Chris Johns 2017-06-29T04:52:36.000Z

Original author: burrusse

I have a tried a both options and makeinfo is being run. I cannot make this work.

Author: Chris Johns 2017-06-29T05:43:27.000Z

Original author: burrusse

I was wrong MAKEINFO=missing is the solution. It seems like it is a configure thing.

Original author: arturete

I encountered an error compiling the xilinx_zynq_zedboard BSP. I am using a built of the RSB that I compiled in December. With that built of the RSB I could built this BSP several times until I did a git pull of the RTEMS repo two weeks ago. Today I updated my repos of the RTEMS and RSB sources, I rebuilt the RSB and I tried to built again the xilinx_zynq_zedboard BSP, encountering the same error:

```
gmake[6]: *** No rule to make target `posix/include/sys/mman.h', needed by
`../cpukit/../../xilinx_zynq_zedboard/lib/include/sys/mman.h'. Stop.
```

Author: Gedare Bloom 2017-05-09T14:24:45.000Z

Original author: arturete

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

You need to re-build your toolchain with a new git-pull of the RSB.

Author: Trac Migrate 2017-05-10T08:50:57.000Z

Original author: arturete

As I wrote, I updated the RSB sources by doing a git-pull. Then, I built it again, but using this new version I found the same error. I did it yesterday and today.

Author: Gedare Bloom 2017-05-10T12:46:23.000Z

Original author: arturete

- **Resolution** ~"invalid" deleted
- **Status** changed from *closed* to *reopened*

The sys/mman.h was moved from RTEMS into newlib awhile ago, but maybe there is a problem with the integration. I recently added the mmap/munmap support. I'll try to look at this, can anyone else replicate it?

Author: Joel Sherrill 2017-05-10T13:07:47.000Z

Original author: arturete

I built all BSPs overnight and didn't have any failures due to this. I always bootstrap -c and rebootstrap before a build sweep. It is quite possible that the Makefile.in didn't get regenerated in the reporter's source tree.

Author: Gedare Bloom 2017-05-10T16:40:46.000Z

Original author: arturete

Yes, that makes sense. Arturo, please do bootstrap -c and then bootstrap, configure and make.

Author: Trac Migrate 2017-05-11T07:31:02.000Z

Original author: arturete

- **Milestone** changed from %"4.12" to %"4.12.0"

Author: Trac Migrate 2017-05-11T08:25:39.000Z

Original author: arturete

Yes, that was the solution. I was not doing bootstrap -c.

From now I will do the built always following the steps as Joel said.

Thanks, so much. Sorry, if I made you losing a bit of time.

4.2.1.214 3007 - ARM caching issues

Id	3007
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2017-04-27T14:23:57.000Z

Merges	0

Original author: munster

There are two problems with the caching on ARM: * In cases where the buffer is not aligned to line boundary at the beginning or the end, the invalidate operation would lose modifications done on the adjacent data. This applies to both L1 and L2 caches. * The L2C-310 cache management operations use excessive locking. According to [manual](#), the used operations (Clean Line by PA, Clean and Invalidate Line by PA, Cache Sync) are atomic and do not require locking.

I have attached the proposed patch.

- [0001-Remove-excessive-locking-from-cache-operations.patch](#)
- [0002-Fix-cache-invalidate-behavior.patch](#)

Author: Trac Migrate 2017-05-08T10:02:40.000Z

Original author: munster

Replying to [Sebastian Huber](#):

Please don't change the function signatures. Please generate one patch for each issue. I have attached separate patches for these two issues.

Its up to the user to ensure that a cache line invalidation is safe. The cache manager should not take care of this. Generally you are right. However, the user may not be aware of this particular problem.

Author: Trac Migrate 2017-05-09T07:58:16.000Z

Original author: munster

Replying to [munster](#):

Replying to [Sebastian Huber](#):

Please don't change the function signatures. Please generate one patch for each issue.

I have attached separate patches for these two issues.

Could you please format the patches via "git format-patch":

<https://docs.rtems.org/branches/master/user/support/contrib.html>

Please help to improve the wiki and website if something is unclear or hard to find.

Its up to the user to ensure that a cache line invalidation is safe. The cache manager should not take care of this.

Generally you are right. However, the user may not be aware of this particular problem.

The we should fix this issue with better documentation. In

<https://git.rtems.org/rtems/tree/cpukit/rtems/include/rtems/rtems/cache.h#n111>

we have

```

1 /**
2  * @brief Invalidates multiple data cache lines.
3  *
4  * The cache lines covering the area are marked as_
5  * ↪invalid. A later read
6  *
7  * access in the area will load the data from memory.
8  *
9  * In case the area is not aligned on cache line_
10 * ↪boundaries, then this
11 * operation may destroy unrelated data.
12 *
13 * @param[in] addr The start address of the area to_
14 * ↪invalidate.
15 * @param[in] size The size in bytes of the area to_
16 * ↪invalidate.
17 */
18 void rtems_cache_invalidate_multiple_data_lines(
19   const void *addr,
20   size_t size
21 );

```

The cache manager documentation probably needs to move into the user manual. Maybe some examples help to show what can go wrong.

Author: Chris Johns 2017-04-18T00:34:38.000Z

I have looked into this issue in detail and it is complicated. At the heart of the

problem is the inherent path limit in the WIN32 API which is documented in [Naming Files, Paths, and Namespaces.aspx](#)). There is also [Python Issue 27731](<https://bugs.python.org/issue27731>) which details how Python will respond.

I see a couple of solution, one complicated and full of potential issues which others have solved, for example the MSYS2 shell, and the second is a simple hack. The complex solution is to step down to the Win32 API and selectively use Win32 API calls that support the Unicode extension to let the RSB work. I feel this is a lot of work and difficult to get to work. The second solution is to generate a script and to run it and let the shell on the host manage the issue. The RSB needs a shell to build most packages so it has to be present.

We see the long file name issue when coping a tree and removing a tree.

Original author: burrusse

The source Builder Fails to build 4.11 tools under MSYS2 and windows. Newer versions of MSYS use a version of gcc greater than 6.0 which can no longer be used to build older version of gcc.

The attached patch is from the gcc mailing list and originally was for gcc version 5.3. It has been adjusted so that it applies to 4.9.3.

This problem should also apply to linux and other systems that use newer gcc 6.0 and above.

Building 4.11.2-rc4 on Windows with a new MSYS2 install has an error on rtems-arm:

```

1 In file included from ../../gcc-4.9.3/gcc/cp/except.c:1013:0:
2 cfns.gperf: In function 'const char* libc_name_p(const char*, unsigned_
  ↳int)':
3 cfns.gperf:101:1: error: 'const char* libc_name_p(const char*, unsigned_
  ↳int)' redeclared inline with 'gnu_inline' attribute
4 cfns.gperf:26:14: note: 'const char* libc_name_p(const char*, unsigned_
  ↳int)' previously declared here
5 cfns.gperf: At global scope:
6 cfns.gperf:26:14: warning: inline function 'const char* libc_name_
  ↳p(const char*, unsigned int)' used but never defined
7 make[2]: *** [Makefile:1059: cp/except.o] Error 1

```

I am not sure the patch is ok so I am reopening this ticket.

Author: Chris Johns 2017-05-26T03:07:34.000Z

Original author: burrusse

The problem with ARM is the bset file includes an arch specific cfg file. This patch needs to be added to that file.

I suggest you create a new cfg file with just this patch, remove it from config/tools/rtems-gcc-4.9-newlib-2.2.0-1.cfg, then include the file. Also add the include to config/tools/rtems-arm-gcc-4.9.3-newlib-2.2.0-20150423-1.cfg.

DTC uses fnmatch and this function is not available on Windows in the MinGW environment. The use of this function makes it difficult to get this tool to work on native Windows.

A couple of solutions come to mind: 1. Fix the DTC tool. 2. Commit a DTB to the moxie project for the DTS and remove the dependency.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2968
Merges	0

inttypes.h defines some methods which are not present but required for POSIX compliance. They are also included in the FACE General Purpose Profile.

```
intmax_t imaxabs(intmax_t); imaxdiv_t imaxdiv(intmax_t, intmax_t); intmax_t str-
toimax(const char *restrict, char **restrict, int); uintmax_t strtoumax(const char *restrict, char
**restrict, int); intmax_t wctoimax(const wchar_t *restrict, wchar_t **restrict, int); uintmax_t
wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
```

This was originally discussed here (<https://sourceware.org/ml/newlib/2013/msg00626.html>) with follow up discussion here (<https://sourceware.org/ml/newlib/2017/msg00240.html>).

The consensus seems to be that the methods as currently implemented in FreeBSD address the concerns raised in that email thread.

This ticket is complete when:

- source for these methods is merged into newlib
- methods are documented in newlib
- RSB is updated appropriately
- tests are added to RTEMS
- RTEMS POSIX Compliance spreadsheet (<https://goo.gl/AXrnxO>) is updated

Merges	0

Add the file testsuites/rtems.tcfg to hold test states common to all BSPs. This lets us globally set a test state.

For example fileio is user-input.

Note, user-input will be added a test state to test this file.

Author: Trac Migrate 2017-03-31T04:59:42.000Z

I am not very fond of global files. The tests should be self contained. Maybe add some special comments to the test sources like in the GCC test suite?

```
1 /* { dg-options "-mthumb -Os" } */
2 /* { dg-require-effective-target arm_thumb2_ok } */
3 /* { dg-final { scan-assembler "ands" } } */
```

Author: Chris Johns 2017-03-31T06:26:42.000Z

I have never looked at the gcc testsuite and from what I have read about it was not flattering.

I do not think adding 500+ files to state fileio is a user-input test and will never complete is not good. Maybe global is not a great word, maybe common is better. We need accurate data to determine the results of tests.

It is similar to the work you have been doing to have a common linkercmd file where ever possible. It is the same thing or are you saying we should create a separate linker command file for every bsp as well? ;)

Look at the results with a work in progress rtems-test for erc32-run:

```
1 Passed:      546
2 Failed:      1
3 User Input:   4
4 Expected Fail: 0
```

(continues on next page)

(continued from previous page)

```

```

Note, the benchmark tests have broken parallel testing because of the time they now take.

Author: Trac Migrate 2017-03-31T06:32:12.000Z

Replying to [Chris Johns](#):

I have never looked at the gcc testsuite and from what I have read about it was not flattering.

My comment was not about the GCC testsuite in general.

I do not think adding 500+ files to state fileio is a user-input test and will never complete is not good. Maybe global is not a great word, maybe common is better. We need accurate data to determine the results of tests.

Why 500+ files, its just one:

```

1 diff --git a/testsuites/samples/fileio/init.c b/

Replying to [Chris Johns](#):

I do not think adding 500+ files to state fileio is a user-input test and will never complete is not good. Maybe global is not a great word, maybe common is better. We need accurate data to determine the results of tests.

```
Why 500+ files, its just one: {{{ diff -git

```

Sure I thought you were talking about tcfg files. There is no standard for this plus and how does the comment get to rtems-test.

I am leveraging the expected-fail mechanism to handle this. That needs to be external to test.

All I am doing is collecting these things into a common place and a common framework.

It is similar to the work you have been doing to have a common linkercmd file where ever possible. ```

1 testsuite: Add a common test configuration. Fix configure.ac and
  ↳ Makefile.am errors.
2
3 - Add a top level test configuration file for test states that are
  ↳ common
4 to all BSPs. This saves adding a test configuration (tcfg) file for
5 every BSP.
6
7 - Add the test states 'user-input' and 'benchmark'. This
8 lets 'rtems-test' stop the test rather than waiting for a timeout or
9 letting a benchmark run without the user asking for it to run.
10
11 - Implement rtems-test-check in Python to make it faster. The shell
  ↳ script
12 had grown to a point it was noticeably slowing the build down.
13
14 - Fix the configure.ac and Makefile.am files for a number of the
15 test directories. The files are difficult to keep in sync with the
16 number of tests and mistakes can happen such as tests being left
17 out of the build. The test fsrofs01 is an example. Also there was
18 a mix of SUBDIRS and _SUBDIRS being used and only _SUBDIRS should be
19 used.
20
21 - Fix the test fsrofs01 so it compiles.
22
23 Closes #2963.
```

Tests can be set to the result we expect such as expected-fail, user-input and indeterminate as well as excluded so we can maintain accurate results for the testsuite.

This ticket covers setting of the correct state for all tests for tier 1 BSPs. Please add an “Updates #” for this ticket to any related commits and once done we can close this ticket.

Note: I have add a top level test configuration file called testsuites/rtems.tcfg that lets us specify a test configuration for all BSPs.

4.2.1.222 2935 - Termios task driven mode not compatible with SMP

Id	2935
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate

Merges	0

Original author: martinaberg

When the Termios task driven functioning mode is used, `rtems_termios_open_tty()` calls `rtems_task_create()` with `RTEMS_NO_PREEMPT` in the initial task mode parameter. `RTEMS_NO_PREEMPT` is not supported on SMP.

`rtems_task_create()` returns `RTEMS_UNSATISFIED` in this SMP scenario and Termios ends up in `rtems_fatal_error_occurred()`.

Termios starts the RX and TX tasks successfully on SMP if `RTEMS_NO_PREEMPT` is removed from the initial task modes of these tasks. However, I suspect there may be assumptions on the `NO_PREEMPT` mode for the RX and TX tasks in other parts of Termios.

Author: Trac Migrate 2017-03-16T14:39:51.000Z

Original author: martinaberg

The task driven mode in general needs a review and possibly a re-implementation. A good alternative is the `TERMIOS_IRQ_SERVER_DRIVEN` mode in case the interrupt server is available.

In [changeset:"bb01a36dfb59d3cdccd33178d2b6be7f479e3d87/rtems"bb01a36/rtems]:

```

1 Fixed issue with searching mapped addresses
2
3 The loop that checks if the current address is already mapped uses
4 the same local variable for the chanin node as the newly allocated
5 chain node so the allocated chain node gets over written.
6
7 Added a new local variable for the loop that checks the address
8
9 Updates #2859.

```

Author: Trac Migrate 2017-07-20T05:31:10.000Z

In [changeset:"b965f461a8d2627fafb0166ed4ef0351ad597551/rtems"b965f461/rtems]:

```

1 posix: Use unprotected chain operations
2
3 Operarations are already protected by mmap_mappings_lock.
4
5 Updates #2859.

```

Author: Trac Migrate 2017-07-20T05:33:50.000Z

The mmap_mappings_lock attributes don't create a mutex:

```

(RTEMS_PRIORITY      | RTEMS_SIMPLE_BINARY_SEMAPHORE      |
RTEMS_NO_INHERIT_PRIORITY | RTEMS_NO_PRIORITY_CEILING |
RTEMS_LOCAL)

```

I suggest to use the libio mutex and keep the specialized lock/unlock functions. Mutex lock/unlock should not return a status code to simplify the error handling.

The posix_devctl() method is defined in POSIX 1003.26 and required by the FACE POSIX profiles. The only use case that needs to be supported is FIONBIO on sockets per the FACE Technical Standard.

ioctl() is not a standardized method per POSIX and is not included in the FACE Profiles.

Making operations non-blocking can also be done with fcntl() but due to RTOS qualification concerns, fcntl() is not included in the more stringent FACE profiles. Specifically, it is not in the Safety Base profile which matches the RTEMS POSIX capabilities.

This requires adding the `<devctl.h>` file to newlib. That has been done. I am testing my implementation but a tool update will be needed before this can be pushed to the community. This is OK because we have other reasons to move to a new gcc and newlib version soon.

4.2.1.225 2775 - ARM CP15 arm_cp15_set_translation_table_entries fails if TTB in read-only memory

Id	2775
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate

Merges	0

If the TTB is held in the text section and the section is set to read-only, and cached when booting no section change happen at run time because the table cannot be written too to change. The table cannot be changed unless the MMU is disabled.

I suggest the MMU be disabled, the table updated and then the MMU enabled.

Note, the issue only shows up on real hardware, qemu does not complain.

Author: Trac Migrate 2016-08-14T21:51:15.000Z

I think that disabling of MMU at runtime is highly problematic. You need to stop all parallel processes to ensure that all modifications held in cache are propagated to memory and then switch MMU off. If multiple CPUs are running (SMP) then there is almost no way hot to ensure fully synchronized case for at least some ARM architecture members. Coherency is maintained through MMU and guaranteed only for cache clean through VMA. The cache clean by level+set+way does not need to generate required snoop operations.

On the other hand, ARM architecture is prepared and operations are optimized for runtime page tables updates and switching and there are defined operations sequences to ensure correct page tables changes propagations in ARM architecture manuals. So I vote for this direction.

Author: Chris Johns 2016-08-14T22:38:09.000Z

I agree it is problematic for a running system. I had not seen the note in your git commit about adding the MMU tables section. I have a patch which add this to the default set. It removes the current issue we are facing.

Having 4.11 on master is confusing users as they build 4.11 tool on master and there may be issues in 4.11 configurations fixed on the 4.11 branch.

Leave 4.9 and 4.10 until they are branched off master. We will make these branches once 4.12 is stable again.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2608
Merges	0

I am beginning to add support for the clock attribute to POSIX condition variables.

http://pubs.opengroup.org/onlinepubs/9699919799/functions/pthread_condattr_getclock.html

Since the clock can't be a CPU time clock, that leaves CLOCK_MONOTONIC and CLOCK_REALTIME. The thread queue is based on CLOCK_MONOTONIC and does not have an option to use CLOCK_REALTIME. Threads and timers waiting on CLOCK_REALTIME should be impacted by time of day changes.

https://docs.google.com/document/d/1GsGer0t84p-nUfZFim4Ty0LTDYNhgKBvIwip_gLQjTY/edit?usp=sharing is a Google doc with my notes so far in it on POSIX clocks. I will move it to the Wiki as it turns into something more concrete than notes and reflects plans/code.

So the first issue is how best to alter the thread queue to support using either clock source? And what does that do to the current ticks based API since you proposed different time representations for the ticks (relative/monotonic) and seconds (absolute/realtime) structures?

That would be nice to have. Please update once Joel pushes his changes to the Quick Start. Thanks.

Author: Trac Migrate 2018-11-18T14:04:04.000Z

I generalized the release version of RTEMS with "urversion" in rtems-docs/rsb and rtems-docs/user ,and specified a paragraph regarding the same below the commands. I also made a table in the Quick Start and rsb/project-sets page which displays the released versions and their status. here is the details of the table

release notes	status
5	development
4.11	current release
4.10	previous release

here is what the note says

"In the above commands and all commands on this page, **urversion** gives the version of RTEMS you are building or want to build. Replace it with reference to release version table on *projects sets* page ."

The patch with all changes made has been added to the attachments

Author: Trac Migrate 2018-11-18T14:21:31.000Z

- **Attachment** [0001-version-number-notation-Ticket-2562-GCI-2018.patch](#) added

Author: Chris Johns 2018-11-18T21:36:07.000Z

The user manual is for a single release. I think it would be confusing to mention others releases or to make the manual appear suitable for other releases. For example the manual has command lines for tools which vary between releases and so it will not be correct for at least one release.

May I suggest you run the commands listed and update the output for RTEMS 5.

Author: Trac Migrate 2018-11-21T08:59:13.000Z

I have added a paragraph about version numbers in the quick start and updated the outputs of the commands at quick start I am unable to give the patch file because of spam message, please help me with this.

The file libcpu/i386/cpu.h provides functions referenced in rtems/score/i386.h Relatedly, libcpu/i386/cpu.h is the only other consumer than score/cpu.h of the score/interrupts.h. The libcpu/i386/cpu.h should be refactored into rtems/score/i386.h, which could also then subsume rtems/score/interrupts.h.

Remove the powerpc/score603e BSP per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_BSP

Rationale: AFAIK this BSP was only used on a program supported by OAR. That program is no longer in active development and is completely frozen. If that situation changes, the BSP can be resurrected. It was introduced in 1999 and has not has a modification other than general maintenance in the last six years.

Remove the arm/gp32 BSP per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_BSP

Rationale: This BSP is for an open source alternative to the Gameboy Advance introduced in 2001. Wikipedia notes that 30K units were sold but it has been unavailable since 2007. This was a useful BSP when there were few ARM BSPs and the openness was interesting but with the Pi, Beagle, etc. these days are long past.

Remove the arm/nds BSP per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_BSP

Rationale: This BSP is for very old Nintendo hardware and required the use of either a simulator or hard to obtain programmable game cartridge. Nintendo was aggressive in shutting down resellers of those cartridges. There is no real console input and it is hard to automate testing. This was a useful BSP when there were few ARM BSPs but with the Pi, Beagle, etc. these days are long past.

Remove the m32r/m32rsim BSP per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_BSP

Rationale: This is a radiation hardened MIPS R3000 CPU that has only been used by a few missions. After discussions with various NASA and commercial engineers, we have learned that it is no longer considered an option for new missions and has not an option for a considerable length of time. The missions still underway (including New Horizons) are locked down on very old versions of their development infrastructure including hosts.

Grrr... you need to rebase your RTEMS tree. The rtems patch to remove the BSP does not apply.

git checkout master git pull git checkout am # assuming that's the name of the branch git rebase -i master

make a new patch

Please also delete all obsolete patches on this PR.

Author: Joel Sherrill 2015-12-09T23:13:47.000Z

Please combine all patches for rtems-testing into a single patch.

Also do not remove support for the m32r architecture in general. This means rtems-testing should not be modified.

Please resubmit

Author: Trac Migrate 2015-12-10T00:19:50.000Z

I am not aware of a method of deleting the obsolete patches. As far as I know, that requires admin privileges.

I take back something I said. There maybe m32rsim references in the rtems-testing/gcc subdirectory. If so, kill them. But don't drop the entire m32r.

Sorry. This gets complicated.

Still hasn't been removed from rtems-testing.git.

Author: Joel Sherrill 2016-01-03T21:06:57.000Z

Do we remove the tests from sim-scripts even when supported by older ports? I am reasonably happy to do this because the three ports being removed this time are all but useless. But in general, we need to be more deliberate.

I suppose it is OK if there are release branches for this repo.

Remove the m68k/sim68000 BSP per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_BSP

Rationale: This is a BSP for a simulator named BSVC (<http://www4.ncsu.edu/~bwmott/bsvc/>) that was never under a truly free license and has not been updated in a decade. Although a decent tool, it was extremely slow.

Remove the m68k/mvme136 BSP per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_BSP

Rationale: Although it is sad to see the BSP for the board that RTEMS was developed for be removed, this board was current in 1988-9. It has only 1MB RAM, 2 UARTS, and no NIC. It is unlikely to be available and without a NIC, isn't that useful.

Original author: ralf.corsepius

The tarballs being created in libtests/tar01 and libtests/tar02 contain non deterministic uids/gids (Those of the user creating the tarball) and permissions (as specified by the user's creating the tarballs umask).

Author: Chris Johns 2010-07-29T05:54:11.000Z

Original author: ralf.corsepius

- **Cc** added @@chrisj

Replying to comment:2:

That said, at present, I am leaning towards adding binary tarballs with predefined uids/gids/permissions and not to user-generate them.

If we are converting the binary tar file to a C file should we just commit the C file ?

I am not sure if this approach can be extended to all RTEMS applications. I know with Parrot we need to create a base file system at the build time to capture the host compiled byte code files. I wonder if the building of the test Parrot application should fail if a no suitable tar can be found on the build host. Ralf, I would appreciate your feed back on this issue.

Original author: miguelgarcia

In order to execute an RTEMS 5.1 image in a Raspberry Pi 2, documentation (<https://ftp.rtems.org/pub/rtems/releases/5/5.1/docs/html/user/bsps/bsps-arm.html#setup-sd-card>) specifies that the boot files can be downloaded from <https://github.com/raspberrypi/firmware/tree/master/boot>

Last commit that I could check is 0c3ecac5... and it does not work.

On the other hand, I could check the version in tag 1.20190718 and it works. <https://github.com/raspberrypi/firmware/tree/1.20190718/boot>

Maybe documentation can be updated to link with the correct version of Raspberry Pi booting.

Remove the H8300 port per the instructions at https://devel.rtems.org/wiki/Developer/Removing_a_Port.

All BSPa must be removed before the architectural port can be removed. These are tracked by the following tickets:

2453 - h8sim

Rationale: The h8 has been end of lifed. There do not appear to be any users based up questions and tickets filed. The architecture itself has issues which lead to breakages in gcc (which do get fixed though often slowly) and those same issues force us to disable some features like iconv in newlib. With no users, end of life, and tool issues, it is time to remove it.

Original author: GabrielMoyano

The function `genirq_set_active()` can return a value greater than 1 under some conditions

This function is used by `genirq_enable()` and `genirq_disable()` and both of them returns the value returned by `genirq_set_active()`. According to the documentation in `genirq.h`, they should return -1, 0 or 1.

When this issue can happen? If there are 3 entries in the list of IRQ and 2 of them are already enabled, the variable `enabled` would be 2, because of `enabled += isrentry->enabled`.

As a possible solution, the value of `enabled` can be changed to 1 if it's greater than 1.

Original author: soja

Cloned from [#4055](#):

We experienced that u-boot (at least from Xilinx repositories) does not wait until all its output has left the TX Buffer of the stdout uart, before handing over to the RTEMS application

This causes some garbage output at the begin of the RTEMS application in some cases and corrupts the test begin marker prohibiting rtems-test to recognize the test correctly.

Proposed fix is to let RTEMS wait until the TX Buffer of the uart is empty before configuring and using it.

Author: Chris Johns 2020-08-13T08:47:07.000Z

The build log is showing:

```

1 + cd /build/rtems/releases/build/5.1-rc2/rtems-source-builder-5.1-rc2/
   ↳ rtems/build/rtems-libbsd-b96abfd647154f10ea8f7fac68e25676636eded5-x86_
   ↳ 64-freebsd12.1-1

```

This looks like the wrong branch or version is being packaged.

Author: Chris Johns 2020-08-13T11:57:05.000Z

It looks like the release to branch mapping in the release script is broken. This was added to handle the inconsistent branch naming in libbsd:

1 Package rtems-source-builder 5: master

The branch should be 5 not master.

Author: Chris Johns 2020-08-14T21:18:29.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

Fix, the right branch is being used.

4.2.1.264 4049 - RTEMS version number 5.1 breaks RTEMS version code

Id	4049
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate

The rtems.git code assumes major.minor.revision and changing it to version.revision breaks the configure processing to create the cpuopts.h file. For example using 5.1-rc2 as the version string results in:

```

1 In file included from /build/rtems/releases/build/5.1-rc2/rtems-source-builder-5.

Original author: sebastian.huber

The C11 <threads.h> support should be available in all RTEMS configurations. Since the POSIX API is still optional the C11 threads implementation should be changed to use Classic tasks.

```

Author: Chris Johns 2020-07-25T05:50:55.000Z

There are a number of versions of `eieio` in RTEMS. The implementation in `io.h` is:

```
1 __asm__ __volatile__ ("eieio");
```

and the FreeBSD is:

```
1 __asm __volatile ("eieio" : : : "memory");
```

I am not sure about the specifics of needing the memory constraint but I wonder if it is something we should do? I do not know the PowerPC well enough to know the effect of having memory as a constraint.

Author: Trac Migrate 2020-07-27T04:42:09.000Z

The “memory” clobber is important. Without it this instruction makes little sense.

I think the real issue is the `<bsp.h>` includes `<libcpu/io.h>`.

We also have an `ppc_enforce_in_order_execution_of_io()` in `<libcpu/powerpc-utility.h>`.

Author: Chris Johns 2020-07-28T05:37:18.000Z

Replying to [Sebastian Huber](#):

The “memory” clobber is important. Without it this instruction makes little sense.

OK. I will add it.

I think the real issue is the `<bsp.h>` includes `<libcpu/io.h>`. We also have an `ppc_enforce_in_order_execution_of_io()` in `<libcpu/powerpc-utility.h>`.

There are a number of `eieio` instructions in various pieces of code. I have renamed the function in `io.h` and LibBSD builds. Given this is for a release I am looking to only make small changes.

4.2.1.268 4016 - shm_unlink uses uninitialized obj_err on successful return from _POSIX_Shmem_Get_by_name

Id	4016
State	closed
Type	ISSUE
Author	Kinsey Moore
Assignee(s)	Trac Migrate
Created	2020-06-28T00:18:51.000Z

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4016
Merges	1

In the nominal case checked by spsysinit01, obj_err in shm_unlink is unmodified when _POSIX_Shmem_Get_by_name returns non-NULL. In the case of shm_unlink, this means an uninitialized value is passed into the switch and it appears this test was passing by virtue of the stack having the right value on it in most cases.

Author: Kinsey Moore 2020-08-06T18:45:47.000Z

The patches to fix this for 5.x and master have been posted to the mailing list for a while now.

Author: Chris Johns 2020-08-10T05:43:55.000Z

Can you please provide the links to the devel list archive for the post patches?

Author: Kinsey Moore 2020-08-10T11:47:50.000Z

Sure, this is the first patch posted for master back in January: <https://lists.rtems.org/pipermail/devel/2020-January/056993.html>

And this is the more recent patch posted for 5.x specifically for this issue: <https://lists.rtems.org/pipermail/devel/2020-June/060292.html>

Author: Chris Johns 2020-08-10T23:26:50.000Z

Thanks. Joel or someone who knows this part of the POSIX code is going to have to review these changes. I am working towards an RC2 so if the review is not done I will be forced to bump then to 5.2.

Author: Joel Sherrill 2020-08-11T12:33:12.000Z

These are OK to push to the 5 branch and master. According to the mailing list archives, Gedare did review and approve one.

Original author: sebastian.huber

Currently, the only way to create interrupt servers is `rtems_interrupt_server_initialize()`. This function creates the default interrupt server and in SMP configurations additional interrupt servers for the additional processors. The interrupt server is heavily used by libbsd. This includes the epoch based reclamation which performs time consuming resource and memory deallocation work. This does not work well with time critical services, for example an UART over SPI or I2C. One approach to address this problem is to allow the application to create custom interrupt servers with the right priority and task properties. The interrupt server API accounted for this, however, it was not yet implemented.

Add `rtems_interrupt_server_create()` and `rtems_interrupt_server_destroy()` for this purpose.

Original author: soja

During testing the rtems-libbsd examples, we experienced GP exceptions from within the ISR from time to time during initialization.

When the init task is restored for the first time and the a pending interrupt is available, an ISR could overwrite its own return address if it is spawned between restoring the eflags register and restoring the esp register.

Original author: sebastian.huber

Some tests need CONFIGURE_DISABLE_SMP_CONFIGURATION to work correctly on SMP configurations. These tests must be reviewed. There should be a comment why this option is necessary or they should be changed to not use features unavailable on SMP, e.g. disabled preemption or an interrupt level mode > 0.

- **Status** changed from *new* to *assigned*

Refer to <https://lists.rtems.org/pipermail/devel/2017-May/017784.html>

testsuites/testdata can be enhanced to know that these tests fail on SMP. This would make a master list of the tests. Longer term, the tests need to be reviewed for underlying cause. If it is a specific SMP unsafe operation, then split that into a different test.

Link	https://gitlab.rtems.org/rtems/rtems/-/issues/4017
Merges	0

Deep in the set builder is an old piece of logic to trigger tarballs when in a cross-compile environment. This dates back to cross-compiling tool sets.

The adding the kernel and 3rd party packages means the RSB command line can have the `--host` and `--target` options and if the kernel and a package like libbsd are on a single command line the `--host` and `--target` trigger a tarball install and this breaks the build.

Fix:

- Remove the tarball trigger.
- Check the kernel and packages are not effected. Having both may break a package build if passed automatically to a configure command line.

```

Removing the `-Wl,--gc-sections` argument from the command line works.

It seems there is conflict between the flags ``-Wl,-gc-sections`` for LibBSD to link and how autoconf link tests are constructed.

I would like this ticket to only be closed when the Beaglebone and PC BSP stacks build with the RSB git master and a release snapshot on Linux and FreeBSD.

Author: Trac Migrate 2020-06-15T05:15:20.000Z

I cannot reproduce this problem with the following command:

```

1 ../source-builder/sb-set-builder --prefix=/build/rtems/5.1 --no-clean 5/
↪ bsp/pc
2 ...
3 reporting: net/protobuf-2.6.1-1.cfg -> protobuf-2.6.1-i386-rtems5-1.txt
4 reporting: net/protobuf-2.6.1-1.cfg -> protobuf-2.6.1-i386-rtems5-1.xml
5 staging: protobuf-2.6.1-i386-rtems5-1 -> /scratch/git-rtems-source-
↪ builder/rtems/build/tmp/sb-10000-staging
6 Build Set: Time 0:00:41.351672
7 Build Set: Time 0:03:56.786477

```

(continues on next page)

(continued from previous page)

```

8 installing: 5/bsps/pc -> /build/rtems/5.1
9 Staging Size: 1.387GB
10 Build Set: Time 0:25:46.568974

```

Which command line option did you use? Was something installed in the prefix?
Was the build directory clean?

Author: Trac Migrate 2020-06-15T06:28:23.000Z

This works also:

```

1 ../source-builder/sb-set-builder --prefix=/build/rtems/5.1 --no-clean 5/
  ↪bsps/beagleboneblack
2 ...
3 reporting: net/protobuf-2.6.1-1.cfg -> protobuf-2.6.1-arm-rtems5-1.txt
4 reporting: net/protobuf-2.6.1-1.cfg -> protobuf-2.6.1-arm-rtems5-1.xml
5 staging: protobuf-2.6.1-arm-rtems5-1 -> /scratch/git-rtems-source-
  ↪builder/rtems/build/tmp/sb-10000-staging
6 Build Set: Time 0:00:42.319813
7 Build Set: Time 0:04:07.640366
8 installing: 5/bsps/beagleboneblack -> /build/rtems/5.1
9 Staging Size: 3.267GB
10 Build Set: Time 0:42:13.692753

```

I have a different Autoconf command line:

```

1 configure:3322: checking whether the C compiler works

Maybe there is an issue with the macro evaluation on your system. I don't see the -lbsd -lm -lz in your report also.

I have an unmodified RSB
(cbae90a5817a6b66f8d576b7e95c7df46c5f0833).

The only difference is the RTEMS 6 tools update.

Author: Chris Johns 2020-06-15T06:59:44.000Z

Replying to [Chris Johns](#):

(the modification is unrelated)

I think it is related. The effect of looking for the reason the libcurl does not build for Joel effected the output of the dep check script and that effected this test.

Checking and adding the -lrtemsdefaultconfig is OK for building rtems-libbsd dependent packages because any executables created when building those packages cannot and will never run if loaded onto a target.

I am building with the same git hash as you, that is master.

(continues on next page)

(continued from previous page)

```

4
5 This is not a GIT checkout but module content appears to
6 be missing. Do not use 'git archive' or GitHub download links
7 to acquire QEMU source archives. Non-GIT builds are only
8 supported with source archives linked from:
9
10 https://www.qemu.org/download/#source
11
12 Developers working with GIT can use scripts/archive-source.sh
13 if they need to create valid source archives.

```

This means any build of qemu taken from git will fail as a release. The qemu4 build is qemu-4.1.0 so it may be simpler to move to using the release source than git. I do not think modeling the QEMU source release process in our release process is a good idea.

NOTE: Making the change will require some testing on Linux by Zynq and RISC-V core developers before I branch.

Provide support to search library files (archives) for symbols loading the object file that contains the symbol. The support shall:

1. Parse a configuration file called `/etc/libdl.conf` for the list of archive symbols to load. Support `fnmatch()` wildcard parsing. Allow runtime updates reloading if there is a change.

2. Maintain archive symbol tables in memory to improve symbol search performance. Archives must have a ranlib generated symbol table. Reload an archive if it has changed.
3. Make sure separate text and data built object files is supported. Assume a duplicate symbol means that section and symbol has already been loaded. Load all sections not loaded. There is no need to be efficient at this point in time.
4. Add support to check if there are any system wide unresolved symbols.
5. Automatically unloaded archive object files that are not referenced.
6. Duplicate symbols in archives is not an error. The first archive that has the symbol in an object file is loaded.

The feature adds **symbol based demand loading** of object files to libdl. A user loads an object file using the dlopen function and unresolved symbols are loaded from the libraries hosted on the target.

The signals implementation has some (severe) defects:

Fixing them is a major work package. I suggest to enable the non-signal related stuff of the POSIX API by default.

4.2.1.284 3968 - symlinks in RTEMS source tree

Id	3968
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2020-05-05T00:52:18.000Z
Updated	2020-05-09T12:10:55.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, tool::test, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3968
Merges	0

There is a symlink in the RTEMS git repo and source tree. We cannot have symlinks in released tar files because it breaks on Windows and MSYS:

```
1 $ find . -type l
2 ./testsuites/libtests/tar01/symlink
```

MSYS reports:

```
1 $ find . -type l
2 ./testsuites/libtests/tar01/symlink
```

The software engineering manual needs an entry stating symlinks cannot appear in the source repo or git in any RTEMS repos. The solution is to create a symlink on suitable hosts, i.e. not Windows when building.

This ticket will address the removal and not state of the effected test. That will be the subject of another ticket if someone creates it.

The bare/bare-config.cfg has the wrong major version number for RTEMS.

Author: Trac Migrate 2020-05-08T04:34:30.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"955c1c173e02e2ed62fe1cc11b13733700e99bcb/rtems-source-builder" 955c1c1/rtems-source-builder]:

```

1 bare/qemu: Fixes building on FreeBSD
2
3 - Move the qemu config to a common file shared by qemu and qemu4.
4
5 - Disable nettle on qemu4, FreeBSD complained.
6
7 - Add some extra git cleaning steps to the git path. These however
8 do not full clean the qemu submodules and it is not worth the
9 effort to try and fix.
10
11 - The devel/qemu will not build on machines with python set to
12 python3. This will not be fixed, use qemu4.
13
14 Closes #3966

```

4.2.1.287 3974 - Deprecate ephipany port in rtems5 and remove in rtems6

This port has not built in a while and gcc does not appear to be getting fixed. It has been at Tier 4 for a while because of this.

If this port is of interest, work to get gcc fixed and help resurrect this port.

Deprecate for RTEMS 5.x Remove in RTEMS 6.x

Author: Trac Migrate 2020-05-07T04:37:16.000Z

- **Resolution** set to ~"fixed"

Original author: sebastian.huber

Change the following pattern:

some.h:

```

1 #ifndef SOME_XYZ_EXTERN
2 #define SOME_XYZ_EXTERN extern
3 #endif
4 SOME_XYZ_EXTERN type xyz;

```

some_xyz.c:

```

1 #define SOME_XYZ_EXTERN
2 #include <some.h>

```

into:

some.h:

```

1 extern type xyz;

```

some_xyz.c:

```

1 #include <some.h>
2 type xyz;

```

See discussion:

<https://lists.rtems.org/pipermail/devel/2016-January/013506.html>

Update Developer Coding Conventions accordingly.

4.2.1.290 3813 - RSB does not handle --rsb-file in releases

Id	3813
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2019-11-03T22:34:52.000Z
Updated	2020-04-29T05:14:11.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, tool::rtems-source-builder, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3813
Merges	0

A released RSB does not handle the set source option --rsb-file:

```

1 package: arm-rtems5-gcc-fb371a33fa6-newlib-6661a67-x86_64-freebsd12.0-1
2 download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/sources/
   ↳ fb371a33fa6 -> sources/gnu-mirror-gcc-fb371a33fa6.tar.gz
3 download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/sources/
   ↳ fb371a33fa6: error: HTTP Error 404: Not Found
4 download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/
   ↳ fb371a33fa6 -> sources/gnu-mirror-gcc-fb371a33fa6.tar.gz
5 download: https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/
   ↳ fb371a33fa6: error: HTTP Error 404: Not Found
6 download: https://codeload.github.com/RTEMS/gnu-mirror-gcc/tar.gz/fb371a33fa6 ->
   ↳ sources/gnu-mirror-gcc-fb371a33fa6.tar.gz
7 downloading: sources/gnu-mirror-gcc-fb371a33fa6.tar.gz - 93.6MB

```

The released source has the --rsb-file name as the file name and not the URL file name. The transformation occurred when the release process downloaded the files to make the release. The release fails to find the source in the RTEMS file server and falls back to the home site to fetch the source.

Looks like curl isn't building for the qoriq_e500 bset. This seems like a weird outlier. Any ideas?

```

    ↪powerpc-rtems5-gcc: error: unrecognized command-line option '-mfloat-
    ↪gpr=double'

```

The build picks up the installed compiler and not the new one of the build set. I think this is a known issue. The compiler is not in my \$PATH. It was picked up by the default prefix. I will try it again with an empty prefix.

Author: Trac Migrate 2020-04-09T10:18:04.000Z

The configure check doesn't use the linker garbage collection and this leads to undefined symbols:

```

1 configure:6802: powerpc-rtems5-gcc -o conftest -qrtems -B/scratch/git-
    ↪rtems-source-builder/rtems/build/tmp/sb-10000-staging/powerpc-rtems5/

```

Author: Trac Migrate 2020-04-09T12:01:34.000Z

I think the root cause for this and similar issues is that we have no reliable way to get the essential tool flags of an installed BSP. The new build system is supposed to fix this.

Author: Trac Migrate 2020-04-12T16:13:52.000Z

Why don't we add -Wl,-gc-sections to the standard linker flags?

Author: Chris Johns 2020-04-28T05:13:43.000Z

Replying to [Sebastian Huber](#):

The build picks up the installed compiler and not the new one of the build set. I think this is a known issue. The compiler is not in my \$PATH. It was picked up by the default prefix. I will try it again with an empty prefix.

I am not sure how the PATH is being set. The prepend path is set here ... <https://git.rtems.org/rtems-source-builder/tree/source-builder/sb/setbuilder.py#n422> ... and this is the staging area. The build module does not play with the path and the defaults handles the prepend and postpend and extras ... <https://git.rtems.org/rtems-source-builder/tree/source-builder/defaults.mc#n267> I am confused. Maybe using --trace and inspecting the variables would highlight the issue.

Is there something in gcc causing the prefix to used?

Author: Chris Johns 2020-04-28T05:15:38.000Z

Replying to [Sebastian Huber](#):

Why don't we add -Wl,-gc-sections to the standard linker flags? Is this issue closed? I have been building the kernel and libbsd with the RSB as separate steps for the e500 and e6500_32 and did not see any failures.

Author: Trac Migrate 2020-04-28T05:29:54.000Z

The error was in curl. I sent a patch to fix this issue: <https://lists.rtems.org/pipermail/devel/2020-April/059305.html>

Author: Chris Johns 2020-04-28T06:29:26.000Z

Can we close the ticket?

Author: Trac Migrate 2020-04-28T06:50:26.000Z

The patch is not checked in, you wanted to adjust it a bit: <https://lists.rtems.org/pipermail/devel/2020-April/059311.html>

Author: Trac Migrate 2020-04-28T06:51:40.000Z

I can send also a v2 if you like, I just found it would be easier if you adjust it yourself.

Author: Chris Johns 2020-04-28T07:35:53.000Z

Oh, I am sorry. I will have a look.

Author: Chris Johns 2020-04-28T07:50:25.000Z

Does rtems_waf need the change as well? Is libbsd fixed?

Author: Trac Migrate 2020-04-28T07:55:04.000Z

Th rtems_waf and thus libbsd have another workaround to enable the linker garbage collection.

Author: Trac Migrate 2020-04-28T08:41:36.000Z

Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3945
Merges	0

Original author: crmm

The DTC example on `rtems-docs/user/rsb/configuration.rst` should be reviewed and updated in order to be consistent with what is available in the RSB tree.

For instance, the link (<http://www.jdl.com/software>) provided in the webpage is not available anymore and some environment variables described in the text need also to be verified (“DESTDIR” and a “DISTDIR”). Thus, it is needed to review this part of the documentation.

Author: Joel Sherrill 2020-04-08T17:17:32.000Z

Original author: crrm

- **Milestone** changed from %”6.1” to %”5.1”
- **Owner** set to @chrisj
- **Status** changed from *new* to *assigned*

I don’t like moving this back to 5.1 but it is wrong and according to git blame was written in 2016. I assigned it back to the author (per git blame). Hopefully a quick review and edit will get this into shape.

Installing GCC on FreeBSD 12 leads to build issues. This along with the issue that the GCC build should be done with the GNU sed in the \$PATH during the RSB process needs to be added to the documentation here:

<https://docs.rtems.org/branches/master/user/hosts/posix.html#freebsd>

Author: Trac Migrate 2020-04-27T00:14:50.000Z

- **Owner** set to Chris Johns <chrisj@rtems.org>

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

In [changeset:"7fab12c679f46863ecde3c98ed34068de9c57922/rtems-docs" 7fab12c/rtems-docs]:

```
1 freebsd: Update to reflect the current release 12 requirements
2
3 Closes #3960
```

Author: Joel Sherrill 2020-04-27T12:51:10.000Z

I read the change and didn't see sed mentioned. Did you want to make a note about that?

Author: Trac Migrate 2020-04-27T14:18:21.000Z

The RTEMS 5 build sets contain some workarounds for the GNU sed problem. So, for the RTEMS 5 release it is not necessary to mention the GNU sed.

The RTEMS 6 build sets don't have them, so they don't build all on FreeBSD 12 using the BSD sed.

Author: Chris Johns 2020-04-28T03:57:05.000Z

Replying to **Joel Sherrill**:

I read the change and didn't see sed mentioned. Did you want to make a note about that?

I added the package to the needed list to install . . .

<https://git.rtems.org/rtems-docs/tree/user/hosts/posix.rst#n196>

Author: Trac Migrate 2019-11-06T10:26:42.000Z

Original author: jeff.mayes

I was able to build the RTEMS 5 tools with 12.0-RELEASE-p2. I will try to update to the latest FreeBSD 12 and see what happens.

Author: Joel Sherrill 2019-11-06T14:35:01.000Z

Original author: jeff.mayes

Replying to [Sebastian Huber](#):

I was able to build the RTEMS 5 tools with 12.0-RELEASE-p2. I will try to update to the latest FreeBSD 12 and see what happens.

This is with a fresh install from their images. Jeff can give you the URL if it matters. Hopefully, there is something stupid on our side and not a difference between FreeBSD pre-release images and the final release image.

Author: Trac Migrate 2019-11-06T14:38:09.000Z

Original author: jeff.mayes

I did an update to FreeBSD 12.1 and at least ARM is building fine:

<https://lists.rtems.org/pipermail/build/2019-November/008065.html>

Author: Chris Johns 2019-11-06T21:37:59.000Z

Original author: jeff.mayes

Do you have libiconv installed?

```
1 $ pkg which /usr/local/lib/libiconv.a
2 /usr/local/lib/libiconv.a was installed by package libiconv-1.14_11
```

Author: Trac Migrate 2019-11-07T06:00:10.000Z

Original author: jeff.mayes

Yes, I have the same output. We installed the following packages:

```
1 pkg install git
2 pkg install python
3 pkg install bison
4 pkg install gmake
5 pkg install subversion
6 pkg install makeinfo
7 pkg install texinfo
```

Author: Joel Sherrill 2019-11-07T13:46:24.000Z

Original author: jeff.mayes

Strangely, it looks like the autoconf tests must be passing to detect libiconv but when it comes time to link, the symbols aren't there.

Do you know how to turn on verbose mode so the make shows the real commands? That might help some.

Author: Trac Migrate 2019-11-07T15:04:17.000Z

Original author: jeff.mayes

I updated to FreeBSD 12.1 yesterday, but it still fails the same way.

Yes, I have libiconv installed, same version shown above.

However, I didn't have subversion or makeinfo installed. Just installed subversion, so I'll try again and report back. What's up with makeinfo?

```
1 # pkg install makeinfo
2 Updating FreeBSD repository catalogue...
3 FreeBSD repository is up to date.
```

(continues on next page)

(continued from previous page)

```

4 All repositories are up to date.
5 pkg: No packages available to install matching 'makeinfo' have been_
  ↳ found in the repositories

```

Author: Trac Migrate 2019-11-07T16:22:39.000Z

Original author: jeff.mayes

Still fails after subversion install, unsurprisingly.

Does this look correct? I excluded matches in /home directories.

```

1 # find / -name "libiconv*"

Replying to [Jeff Mayes](#):

Does this look correct? I excluded matches in /home directories.

FreeBSD makes a **distinction** between /usr and /usr/local. Anything under /usr excluding /usr/local is part of the base OS and you should not touch. Additional packages or ports are installed under /usr/local. If you look back at comment 5 by me you will see I have referenced a /usr/local path and not a /usr path like you have.

There are a couple of paths ...

1. You need to check if you have the libiconv package installed as ask in comment 5. Maybe try `pkg info | grep libiconv` to see.
2. When I originally added libiconv support for FreeBSD the OS versions of the libraries were not up to date and so the libiconv port was needed. The OS versions maybe suitable now, however at a guess I would say they are not as the build fails. You could look closely at the errors and OS provided library to know.

Replying to **Joel Sherrill**:

Strangely, it looks like the autoconf tests must be passing to detect libiconv but when it comes time to link, the symbols aren't there. Do you know how to turn on verbose mode so the make shows the real commands? That might help some.

The log contains all the command and if that is not enough detail try `--trace (1)`

The log will show a shell script is created and I think that script is run with `set -x` which prints the commands. On a failed build the script is left in the build tree.

- (1) <https://docs.rtems.org/branches/master/user/rsb/commands.html#set-builder-sb-set-builder>

The RSB isn't the problem here. It is the GDB build itself. They have gone to a quiet build which only prints something like "CCLD gdb" which isn't helpful at all.

I think you mentioned that the main libiconv package may be broken and that there is another in ports. Is that correct? If so, should the default one be removed and the ports one used?

I am OK with that change. There is so much rubbish printed that is meaningless. Assuming automake I suggest you have a look at.

https://www.gnu.org/software/automake/manual/html_node/Automake-Silent-Rules.html

Try adding `V=1` to the make command line.

I think you mentioned that the main libiconv package may be broken and that there is another in ports. Is that correct?

I am not sure it is broken, that depends on how it is used and the interfaces provided. Is this library part of a standard? If it is not then I would not use "broken".

If so, should the default one be removed and the ports one used?

No, ports are added. FreeBSD provides the kernel and base user land as a release. This means a libiconv may be provided by the OS base if it is needed that is suitable for the base OS user land executables. A port is also provided so there may be differences other software such as gdb requires.

I feel you are approaching the issue from a Linux point of view which is a kernel as a separate configuration item plus the distro's user land where all the user land is under `/usr` as one big and hopefully happy family. FreeBSD follows the historical (?) path of the kernel and base user land being a

single controlled and released item and so you do not touch it. The benefit is the base OS is tested to work and if you do not touch it no matter what you install you can at least recover back to that base.

Author: Joel Sherrill 2020-04-05T16:24:00.000Z

Original author: jeff.mayes

The only response I got on the gdb list said the person manually overrode where libiconv was located. I can't seem to find that email now. The autoconf is broken, known broken, ...

I have no idea why this works for others. It is still broken as of my overnight build.

<https://lists.rtems.org/pipermail/build/2020-April/012863.html>

If this works for others on FreeBSD 12, I would like to know how.

Author: Chris Johns 2020-04-06T00:04:13.000Z

Original author: jeff.mayes

I recently add this to for 12 ...

<https://git.rtems.org/rtems-source-builder/commit/source-builder/sb/freebsd.py?id=599c4d7c87fab531014a614f2a32b56be0a3ce28> <https://git.rtems.org/rtems-source-builder/tree/source-builder/sb/freebsd.py#n113>

Is there an issue on 12 with this?

Author: Joel Sherrill 2020-04-06T00:12:59.000Z

Original author: jeff.mayes

The failure per <https://lists.rtems.org/pipermail/build/2020-April/012863.html> (sparc) and <https://lists.rtems.org/pipermail/build/2020-April/012855.html> (riscv) is in sis. I have no idea is this is before or after where gdb would be built and trip the iconv issue. Looks like a separate issue.

Original author: Kaidoho

Hi,

I am following

<https://docs.rtems.org/branches/master/user/hosts/windows.html>

to build a Windows Host toolchain on Linux Mint 19. However, the build of rtems-tools fails with: “unknown host: i686-w64-mingw32”.

I can track the issue down to the function “check_options” in the wscript. The function expects a host called “mingw32” or “x86_64-w64-mingw32”. My naive solution would be to simply extend the list with “i686-w64-mingw32”, but I’ve just started with RTEMS so I might have chosen a wrong path in an earlier step.

Original author: sebastian.huber

It is currently quite easy to misconfigure the SMP EDF scheduler so that not enough memory is reserved for the scheduler data structures. The only feedback to the user from these configuration errors is a memory corruption. Improve the configuration means or at least issue a fatal error.

Original author: sebastian.huber

Add a chapter to the User Manual to aid the user to migrate applications from previous RTEMS versions to RTEMS 5.

Author: Chris Johns 2020-03-04T08:23:07.000Z

Original author: sebastian.huber

Thanks for adding the ticket.

I am happy to add this section. I will complete my current doco task and then do this.

Sorry for not catching the POSIX tests. I assigned a bit more RAM to my build ramdisk and now it builds with POSIX enabled.

Author: Joel Sherrill 2020-04-08T13:30:22.000Z

I made a series of commits and an overnight build shows this is resolved. The epiphany is the only BSP which doesn't build and that's a GCC ICE.

Thanks.

Closing.

One option is to disable this test on sparc64.

Author: Gedare Bloom 2020-04-06T16:15:43.000Z

Original author: sebastian.huber

I'm going to take a brief look today. I haven't been using the sparc64 since 2012 so there is not much motive for me other than keeping it maintained. If it is too much trouble I will let it decay down the tiers toward deprecation.

Author: Joel Sherrill 2020-04-06T16:27:03.000Z

Original author: sebastian.huber

I was disappointed in general when I looked for ABI definitions for TLS for various architectures. I think there is an Ulrich Drepper document describing a few (<https://>

[//akkadia.org/drepper/tls.pdf](https://akkadia.org/drepper/tls.pdf)) but I think it is undefined for a lot of architectures.

Does GCC have a default mechanism? I couldn't find any hint of architecture specific TLS in the few secondary architectures I looked at. If there is a default way of calling a method for TLS info, it would be great. But at this point, I don't think TLS works from a GCC perspective on maybe half the architectures we support.

sparc64 isn't a secondary gcc architecture so I am sure it works in GCC. Whether we want it around long term is another question entirely.

4.2.1.309 3388 - rtems-tester: possible parsing error for qemuprep-altivec on exclude SMP configuration

Id	3388
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2018-04-11T22:30:55.000Z
Updated	2020-04-06T05:09:31.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, tool, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3388
Merges	0

These failures have persisted across all the autoconf changes:

```
Failures:  powerpc/qemuprep-altivec:  configure -target=powerpc-rtems5 -enable-
rtemsbsp=qemuprep-altivec-prefix=/home/joel/rtems-work/bsps -enable-networking
-enable-smp ld/collect2:0 error: no error message found! powerpc/qemuprep-altivec: config-
ure -target=powerpc-rtems5 -enable-rtemsbsp=qemuprep-altivec-prefix=/home/joel/rtems-
work/bsps -enable-debug -enable-smp ld/collect2:0 error: no error message found!
powerpc/qemuprep-altivec: configure -target=powerpc-rtems5 -enable-rtemsbsp=qemuprep-
altivec-prefix=/home/joel/rtems-work/bsps -enable-debug -enable-networking -enable-
smp ld/collect2:0 error: no error message found! powerpc/qemuprep-altivec: configure
-target=powerpc-rtems5 -enable-rtemsbsp=qemuprep-altivec-prefix=/home/joel/rtems-
work/bsps -enable-smp ld/collect2:0 error: no error message found!
```

I checked and it looks like qemuprep-altivec is listed in the smp excludes section.

It is the only BSP with a - in the name that is in smp-excludes. Could it be that the matching fails in this case?

The other is pc586-sse which is SMP excluded also but using a different mechanism..

Author: Chris Johns 2018-10-19T00:34:17.000Z

This should be fixed in a recent rtems-tools. Please test and closed fixed if it is fixed.

Author: Chris Johns 2018-10-19T00:35:16.000Z

Why rtems-tester in the subject line?

Do not include the remote repos in a build repo is the --mail option is used. This avoids posting private repo configuration data for a user. This ticket is in response to this discussion ...

<https://lists.rtems.org/pipermail/devel/2020-February/057765.html>

If --mail is used report the remote repos as:

```
1 Remotes:
2 [ removed, contact me@there.here for details ]
```

and keep the remotes for builds that are not posted.

As reported in this email <https://lists.rtems.org/pipermail/users/2018-November/032802.html>:

“I could imagine that the GCC 6.3.0 of the TASTE VM isn’t suitable to build RTEMS toolchain with RTEMS source builder & kernel masters but I can’t find information which of all those config files of RSB I have to use for a successful build (targets: ARM, x86-64). This is pretty frustrating and very disappointing. There are so many variables which are not exactly documented, at least for the current version of RSB/kernel.”

there is no documented way to get a configuration report of an RSB configuration. The documentation needs to be updated to show how this can be done. For example:

```
1 $ ./source-builder/sb-reports 5/rtems-sparc
2 $ less 5-rtems-sparc.txt
```

It looks like there is a bug in the code that fetches source/patches. Jiri's site is a simple https:

```
1 making dir: /home/joel/rtems-work/rtems-source-builder/bare/patches
2 _url: https://gaisler.org/qemu/0001-LEON3-Add-emulation-of-AMBA-plug-play.patch ->
   ↪ /home/joel/rtems-work/rtems-source-builder/bare/patches/0001-LEON3-Add-
   ↪ emulation-of-AMBA-plug-play.patch
3 download: (full) https://gaisler.org/qemu/0001-LEON3-Add-emulation-of-AMBA-plug-
   ↪ play.patch -> patches/0001-LEON3-Add-emulation-of-AMBA-plug-play.patch
4 download: https://gaisler.org/qemu/0001-LEON3-Add-emulation-of-AMBA-plug-play.
   ↪ patch -> patches/0001-LEON3-Add-emulation-of-AMBA-plug-play.patch
5 download: no ssl context
6 download: https://gaisler.org/qemu/0001-LEON3-Add-emulation-of-AMBA-plug-play.
   ↪ patch: error: <urlopen error [Errno -2] Name or service not known>
7 error: downloading https://gaisler.org/qemu/0001-LEON3-Add-emulation-of-AMBA-plug-
   ↪ play.patch: all paths have failed, giving up
```

This is a build with the following script:

```
1 version=5
2 # variant="-couverture"
3
4 time ../source-builder/sb-set-builder \
5 --trace \
6 --log=l-qemu.txt \
7 --prefix=${HOME}/rtems-work/tools/${version} \
8 devel/qemu${variant}
```

Author: Chris Johns 2019-10-29T04:36:13.000Z

Are you sure it is a bug? I do not see the issue and have been downloading these files a lot over the last few days with the RSB.

Author: Joel Sherrill 2019-10-29T15:22:07.000Z

Replying to [Chris Johns](#):

Are you sure it is a bug? I do not see the issue and have been downloading these files a lot over the last few days with the RSB.

Jiri has a patch which moves the patches to another server. This resolves it for me. But I am on Centos 7 and have tried Python 2.7 and 3.6. The patches load in a browser but don't fetch. Not sure what's up. I don't see this on any other package or patch.

Author: Chris Johns 2019-10-29T18:28:21.000Z

Replying to [Joel Sherrill](#):

Jiri has a patch which moves the patches to another server. This resolves it for me.

But this does not find out if there is an issue. Lets not paper over the issue. Your debugging of this would help.

But I am on Centos 7 and have tried Python 2.7 and 3.6. The patches load in a browser but don't fetch. Not sure what's up. I don't see this on any other package or patch.

The code is ...

<https://git.rtems.org/rtems-source-builder/tree/source-builder/sb/download.py#n367>

Please add a raise here ...

<https://git.rtems.org/rtems-source-builder/tree/source-builder/sb/download.py#n390>

so the failure is printed. Even better if you could add code to better report the exception it would help long term. Python has great doco on exceptions and catching them.

Author: Trac Migrate 2019-10-30T11:23:58.000Z

The issue could have been caused by some temporary network problem to or in my server. How about if I attach the Leon3 Qemu patches to this ticket and modify RSB to fetch the patches from here ...? We used to do that for the sis/gdb patches and that worked OK.

Author: Joel Sherrill 2019-10-30T12:42:04.000Z

I tried this again yesterday and this morning and did not have issues. I am closing this as spurious network issues. We can always reopen it.

Author: Chris Johns 2019-10-30T20:50:27.000Z

Replying to [Jiri Gaisler](#):

The issue could have been caused by some temporary network problem to or in my server. How about if I attach the Leon3 Qemu patches to this ticket and modify RSB to fetch the patches from here ...? We used to do that for the sis/gdb patches and that worked OK.

That is for Jiri to comment on. No one else is having problems and I think it is something local to your setup.

Author: Trac Migrate 2020-03-08T09:34:03.000Z

The `bsp_fdt_map_intr()` must be provided by the BSP, e.g. `bsps/arm/beagle/start/bspstart.c`.

Author: Trac Migrate 2020-03-08T21:16:06.000Z

The same bug happens for libbsd master. Niteesh recently enabled FDT support for this BSP (following my suggestion) to be able to support the console for Pi2 and Pi3. It seems that I missed that libbsd doesn't build anymore when reviewing the patches. So the bug is not in libbsd but in RTEMS.

Author: Trac Migrate 2020-03-08T21:50:56.000Z

And of course - like everything else on this chip family - the interrupts can't be simple on RPi. There are at least two groups. Interrupts from the GPU and ones from the normal system.

See <https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/tree/Documentation/devicetree/bindings/interrupt-controller/brcm,bcm2835-armctrl-ic.txt?id=791d3ef2e11100449837dc0b6fe884e60ca3a484> and <https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/tree/Documentation/devicetree/bindings/interrupt-controller/brcm,bcm2836-l1-intc.txt?id=36464580e658019ac7be26a08c4679bee0454d2c>

The interrupts in the device tree look like this:

```

1 // GPIO - 49 to 52 in RTEMS
2 interrupts = <2 17>, <2 18>, <2 19>, <2 20>;
3 // USB - 9 in RTEMS
4 interrupts = <1 9>;
5 // Mailbox - most likely 65 in RTEMS
6 interrupts = <0 1>;

```

So I **assume** it should be a mapping like follows (in pseudo code):

```

1 #define MAGIC_OFFSET_FOR_SECOND_LEVEL 32
2
3 switch(first_number) {
4 case 0:
5 return second_number + BCM2835_IRQ_ID_BASIC_BASE_ID;
6 break;
7 case 1:
8 return second_number;
9 break;
10 case 2:
11 return second_number + MAGIC_OFFSET_FOR_SECOND_LEVEL;
12 break;
13 default:
14 /* Handle invalid interrupt */
15 break;
16 }

```

Author: Trac Migrate 2020-03-09T06:27:45.000Z

At least it looks like the API can handle this.

Author: Trac Migrate 2020-03-10T07:51:33.000Z

I created a patch that should work. But I didn't have the time to test it yet. I'll test it in the next few days.

Author: Trac Migrate 2020-03-10T07:52:10.000Z

- **Attachment** [0001-bsp-raspberry-Add-a-bsp_fdt_map_intr.patch](#) added

Untested patch for the problem.

Author: Trac Migrate 2020-04-04T10:55:45.000Z

Sorry for the long delay: The patch works and delivers the correct results (tested for the three cases GPIO0, USB and MBOX mentioned above). I'll send it to the mailing list.

I'm not sure what to do about this. If building sqlite is a requirement, then host setup instructions, sb-check, etc are impacted. But dtc is a required component for a few things and the RSB deals with it. It is also possible to say that sqlite should not be in the BSP bsets.

This is IMO a blocker at some level for the 5.1 release because it impacts building all bsets.

- make -j 8 sqlite3.h libsqlite3.la

```
tcsh /home/joel/rtems-cron-5/rtems-source-builder/rtems/build/sqlite-3.8.8.1-powerpc-

Author: Joel Sherrill 2020-04-02T19:09:55.000Z

Advice from Jonathan Brandmeyer (<https://lists.rtems.org/pipermail/devel/2020-April/058905.html>).

We just copied the amalgamation's single .c and .h file into our repository and built it as a single object into our application. So the following recommendations come only from an amateur reading of the sources on current rtems-source-builder master.

3.8.8 is pretty old. I'd just jump straight to 3.30.1, the current release.

Instead of downloading the sqlite-src zip, download sqlite-amalgamation or sqlite-autoconf and use that as a base. I think the bset's configuration invocation is OK, except that I would set different CFLAGS as described in the next couple of paragraphs. See also <https://sqlite.org/amalgamation.html>

By default, the SQLite write-ahead-log relies on mmap to share some of its index structures between multiple processes. It looks like the current RTEMS bset disables the WAL entirely. Using the WAL gives much better performance than the rollback journal for write-intensive use cases. We used SQLite to reliably buffer up and stitch together segments of our field software update process, which fits the WAL very well. We set `-DSQLITE_MAX_MMAP_SIZE=0 -DSQLITE_DEFAULT_LOCKING_MODE=1` at compile time to avoid mmap's use since RTEMS has neither a VMM nor multiple address spaces. It is still up to the application to choose either the WAL or the rollback journal. See also <https://sqlite.org/wal.html#noshm>

We also added `-DSQLITE_ENABLE_MEMSYS5` to our build, and used it to give SQLite its own memory spaces to operate on distinct from the rest of our application. We explicitly provided it with its own MEMSYS5 heap, page cache, and lookaside pools. RTEMS just needs to add the correct compile-time option to support this functionality. It is still up to the application to configure and monitor those memory pools at runtime. See also <https://sqlite.org/malloc.html>

Original author: sebastian.huber

New device drivers (e.g. Termios, I2C, SPI, libbsd) use IMFS generic nodes to hook into the filesystem. This does not work with the device filesystem enabled by the

```
1 #define CONFIGURE_USE_DEVFS_AS_BASE_FILESYSTEM
```

configuration option. Replace the device filesystem with a specialization of the IMFS.

Author: Chris Johns 2020-03-03T21:14:52.000Z

Original author: sebastian.huber

Will the changes include the examples and the devfs hello world example?

How does the size of this approach compare to the devfs approach?

Author: Trac Migrate 2020-03-04T05:48:53.000Z

Original author: sebastian.huber

Replying to [Chris Johns](#):

Will the changes include the examples and the devfs hello world example?

Yes, the aim is to fix this example so that it works with Termios based console drivers.

How does the size of this approach compare to the devfs approach?

I don't have numbers yet. I guess it will slightly increase.

You can further reduce the code size if you disable the support for the legacy IO drivers and use the new `IMFS_add_node()` instead.

I don't think this matters. If you want a minimal setup, then why do you want to use the POSIX open/read/write API to access devices? The POSIX functions pull in `errno` for example which pulls in the re-entrancy support which pulls in a hell of dependencies.

Original author: sebastian.huber

Replying to Sebastian Huber:

Replying to Chris Johns:

How do the size of this approach compare to the devfs approach?

I don't have numbers yet. I guess it will slightly increase.

I checked the code size change of the devfs04 test before and after the change to the IMFS specialization:

size pre/devfs04.exe text data bss dec hex filename 57328 1152 17312 75792 12810 pre/devfs04.exe

size post/devfs04.exe text data bss dec hex filename 58384 1152 16096 75632 12770 post/devfs04.exe

The code size increases by 1056 bytes on SPARCV8.

In case the support for legacy IO drivers is disabled via

```

1 #define CONFIGURE_IMFS_DISABLE_MKNOD_DEVICE
2 #define CONFIGURE_IMFS_DISABLE_MKNOD

```

the code size drops to: size devfs04.exe text data bss dec hex filename 56496 1152 16096 73744 12010 devfs04.exe

Using IMFS_add_node() gives you access to all file handlers and removes four layers of indirection, e.g.

read() -> device_read() -> rtems_deviceio_read() -> rtems_io_read()
-> _IO_Driver_address_table -> device handler

compared to

read() -> device handler.

The following constants in confdefs.h that are available for users to use are not defined in the Sphinx documentation.

- `CONFIGURE_APPLICATION_NEEDS_ATA_DRIVER` - internal and `CONFIGURE_APPLICATION_NEEDS_IDE_DRIVER` turns into this. Should we recognize both?
- `CONFIGURE_ATA_DRIVER_TASK_PRIORITY` - Document this. Looks like `CONFIGURE_APPLICATION_NEEDS_ATA_DRIVER` should replace `CONFIGURE_APPLICATION_NEEDS_IDE_DRIVER` based on this name. There is no “IDE task priority” configure option.
- `CONFIGURE_CBS_MAXIMUM_SERVERS` - document this.
- `CONFIGURE_EXECUTIVE_RAM_SIZE` - do we want users to define this anymore?
- `CONFIGURE_EXTRA_MPCI_RECEIVE_SERVER_STACK`
- `CONFIGURE_MAXIMUM_POSIX_KEY_VALUE_PAIRS` - document this.
- `CONFIGURE_MAXIMUM_PTYS` - document this. Used by telnetd. Is this the same on old and new TCP/IP stacks?
- `CONFIGURE_MAXIMUM_TASK_VARIABLES` - document for 4.11, not master
- `CONFIGURE_TIMER_FOR_SHARED_MEMORY_DRIVER` - internal only, do not document

Author: Trac Migrate 2017-01-19T12:08:02.000Z

For `CONFIGURE_MAXIMUM_PTYS` see [#2872](#).

4.2.1.320 3609 - Update Spike Version in RSB (RISC-V simulator)

Id	3609
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2018-11-15T23:15:54.000Z
Updated	2020-04-01T23:21:54.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, tool::rtems-source-builder, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3609
Merges	0

The spike version in the RSB does not run the test executables. Per Hesham, we should be using a newer version from git.

This is one of the two alternative simulators to run RISC-V executables. At the moment, neither Spike nor Qemu are usable for the RISC-V as present in the RSB.

Author: Trac Migrate 2018-11-16T09:43:42.000Z

RSB should already build an updated version of Spike as of this commit:[\[https://github.com/RTEMS/rtems-source-builder/commit/693e6b518d1710793096cdb11f806d9e511a8972\]](https://github.com/RTEMS/rtems-source-builder/commit/693e6b518d1710793096cdb11f806d9e511a8972)

Do you have any issues running RTEMS with it?

Author: Trac Migrate 2019-12-19T11:19:28.000Z

Is this issue fixed?

Author: Joel Sherrill 2019-12-19T14:05:20.000Z

The RSB appears to be updated based on this build list result from my build this week.

<https://lists.rtems.org/pipermail/build/2019-December/009507.html>

But... none of the RISC-V BSPs ran correctly on Spike so there is something wrong still:

<https://lists.rtems.org/pipermail/build/2019-December/009509.html>

Could be Spike but more easily the rtems-tools configuration for the execution of the simulator. Does it work for you Hesham?

Author: Joel Sherrill 2020-04-01T23:21:54.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

I updated the RSB to have a functional Spike with a git version. Results have been posted to build@

4.2.1.321 2683 - Configuration table's smp_enabled conditional on RTEMS_SMP

Id	2683
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate
Created	2016-04-04T01:48:22.000Z
Updated	2020-03-31T10:59:35.000Z
Milestone	5.1
Labels	priority::normal, resolution::invalid, rtems::score, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2683
Merges	0

The rtems_configuration_table has:

```
1 #ifdef RTEMS_SMP
2 bool                smp_enabled;
3 #endif
```

I would like the smp_enabled variable to always be defined for 4.12 and always set to false when RTEMS_SMP is not defined. It is impossible to parse the configuration table with external auditing tools with out this field always being present unless you examine the DWARF debug info.

I wonder if User_multiprocessing_table is the same so this means the members of the configuration table must always be defined.

Chris

Author: Chris Johns 2016-04-04T01:48:55.000Z

- **Description** changed

```
1 The `rtems_configuration_table` has:
2
3 {{{
4 #ifdef RTEMS_SMP
```

(continues on next page)

the configuration table. All that is being suggested to always have the elements in the table. There is no code.

Author: Trac Migrate 2017-02-15T14:25:52.000Z

- **Milestone** changed from %"4.12" to %"Indefinite"
- **Owner** set to sebastian.huber
- **Status** changed from *new* to *assigned*

Author: Trac Migrate 2020-03-31T10:59:06.000Z

- **Milestone** changed from %"Indefinite" to %"5.1"
- **Resolution** set to ~"invalid"
- **Status** changed from *assigned* to *closed*

The configuration table no longer exists. In particular, the SMP enabled indicator is no longer used. The `User_multiprocessing_table` no longer exists. In MPC1 configurations, there is now an `_MPC1_Configuration`.

4.2.1.322 3909 - rtems_waf with python2 needs to handle unicode strings with waf

Id	3909
State	closed
Type	ISSUE
Author	Chris Johns

A build of the VERSION file in the release rtems-tools source package is reporting:

```
1 invalid version file: error: Invalid version file: ./VERSION: No option 'revision
  ↳ ' in section: 'version'
```

Author: Trac Migrate 2019-11-18T22:16:06.000Z

In [changeset:"5f7c53a7bd5845a54ba1ad4776ac92324ef2f184/rtems-source-builder" 5f7c53a/rtems-source-builder]:

```
1 sb: Align the version processing with rtems-tools.
2
3 - Use the same VERSION file format as rtems-tools so a common release
4 generation can be used.
5
6 - The version.py is almost the same as rtems-tools. There are some
7 minor differences, one is the RTEMS version is present in this
8 file while rtems-tool uses config/rtems-release.ini.
9
10 Updates #3822
```

Spike has a fully qualified hard-coded path to `dtc` which when built with the RSB ends up being inside the temporary tree.

Broken as a consequence of ARM rework that did not get done to this BSP. On top of that, there are at least 3 BSPs supported by Qemu which have more peripheral support with the Zynq being at the top of that list.

4.2.1.329 3849 - Fix PSIM memory map

Id	3849
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2020-01-02T11:53:27.000Z
Updated	2020-03-06T03:29:17.000Z
Milestone	5.1
Labels	arch:powerpc, priority::normal, resolution::fixed, tickettype::defect, version::5

Merges	0

Original author: sebastian.huber

[changeset:"b08278e8520d14e5b809bb07785b724c7a127e29/rtems" b08278e/rtems] leads to the following run-time error on PSIM:

```

1 BATs must not overlap; area 0x08000000..0x09000000 hits DBAT 0
2 BATs must not overlap; area 0x0c000000..0x0d000000 hits DBAT 0

```

The RAM overlaps with the PCI area:

```

1 /*
2 * Setup BATs and enable MMU
3 */
4 /* Memory */
5 setdbat(0, 0x0<<28, 0x0<<28, 1<<28, _PAGE_RW);
6 setibat(0, 0x0<<28, 0x0<<28, 1<<28, 0);
7 /* PCI */
8 setdbat(1, 0x8<<24, 0x8<<24, 1<<24, IO_PAGE);
9 setdbat(2, 0xc<<24, 0xc<<24, 1<<24, IO_PAGE);

```

Increasing the RAM size to 256MiB (0x10000000) on PSIM breaks also the shared memory support:

```

1 typedef struct {
2 /* 0x0c000000 - 0x0c007FFF - AMD 29F040 */
3 volatile uint8_t Flash[ 512 * 1024 ];
4
5 /* 0x0c080000 - 0x0c0FFFFFF - NVRAM/NVRAM */
6 volatile uint8_t nvram[ 512 * 1024 ];
7
8 /* 0x0c100000 - 0x0c100007 - NVRAM/RTC */

```

(continues on next page)

(continued from previous page)

```

9  psim_rtc_t RTC;
10
11 /* 0x0c100008 - 0x0c10000f - NVRAM/RTC */
12 uint8_t gap1[8];
13
14 /* 0x0c100010 - 0x0c10001b - System V IPC Semaphore */
15 psim_sysv_sem_t Semaphore;
16
17 /* 0x0c10001c - 0x0c10001f - NVRAM/RTC */
18 uint8_t gap2[4];
19
20 /* 0x0c100020 - 0x0c10005f - Ethernet */
21 volatile uint8_t Ethtap[ 64 ];
22
23 /* 0x0c100060 - 0x0c10ffff - NVRAM/RTC */
24 uint8_t gap3[65440];
25
26 /* 0x0c110000 - 0x0c12ffff - System V IPC Shared Memory */
27 uint8_t SharedMemory[ 128 * 1024 ];
28
29 /* 0x0c130000 - 0x0c170000 - OpenPIC IRQ Controller */
30 volatile uint8_t OpenPIC[ 256 * 1024 ];
31
32 } psim_registers_t;

```

Proposed solution is to adjust the memory map so that 256MiB of RAM are supported. Probably needs changes in rtems-tools.

Author: Joel Sherrill 2020-03-05T22:58:03.000Z

Original author: sebastian.huber

The code posted here misses the most important part – the simulator device tree (<https://git.rtems.org/rtems-tools/tree/tester/rtems/testing/bsps/psim-device-tree>). All of the device addresses start with 0x0c000000 which was OK when the RAM was smaller. But increasing the RAM to 256MB (0x10000000) resulted in the RAM overlapping the devices. The simplest option I see is to change the leading 0x0c... to 0xfc... in all device addresses and avoid the conflict.

As best I can tell, the set of changes is pretty small:

- Change rtems-tools/tester/testing/bsps/psim-device-tree to use 0xFC for all devices. This reconfigures the “hardware”
- Change rtems/bsps/powerpc/psim/linkcmds to change new base address of of all the devices which are at the symbol PSIM
- Delete rtems/bsps/powerpc/start/device-tree and update the BSP README to note where the device tree file is. Also update the README to note that you don’t need a modified gdb since the modifications have been in since the last century and no one knows the papyrus BSP anymore. I can’t even remember it.

- Change `rtems/bsps/start/bspstart.c` to fix 0x0c to 0xfc in the PCI setdbat calls.
Note: I don't remember how a base address is broken down to be passed in

I think that's it.

- **Attachment** [libbsd-library-check.diff](#) added

Add libbsd library check support

Author: Chris Johns 2020-03-04T11:53:45.000Z

It looks like `debugger.h` is being installed when there is no support and this is tripping the test in `libbsd` so it thinks there is `libdebugger` support.

I attach a patch to add a library check however this fails because of link errors for a BSP that has the library.

It looks like the include install support in RTEMS needs to be fixed.

Original author: sebastian.huber

Mapping task priorities to/from POSIX thread priorities is probably done in many applications. There seems to be no API to help doing this. Add the following API functions to map a task priority to/from a POSIX thread priority:

```

1 /**
2  * @brief Map a task priority to the corresponding POSIX thread priority.
3  *
4  * @param scheduler_id Identifier of the scheduler instance.
5  * @param priority The task priority to map.
6  * @param[out] posix_priority Pointer to a POSIX thread priority value.
7  *
8  * @retval RTEMS_SUCCESSFUL Successful operation.
9  * @retval RTEMS_INVALID_ADDRESS The @a posix_priority parameter is @c NULL.
10 * @retval RTEMS_INVALID_ID Invalid scheduler instance identifier.
11 * @retval RTEMS_INVALID_PRIORITY Invalid task priority.
12 */
13 rtems_status_code rtems_scheduler_map_to_posix_priority(
14 rtems_id          scheduler_id,
15 rtems_task_priority priority,
16 int              *posix_priority
17 );
18
19 /**
20 * @brief Map a POSIX thread priority to the corresponding task priority.
21 *
22 * @param scheduler_id Identifier of the scheduler instance.
23 * @param posix_priority The POSIX thread priority to map.
24 * @param[out] priority Pointer to a task priority value.
25 *

```

(continues on next page)

(continued from previous page)

```

26 * @retval RTEMS_SUCCESSFUL Successful operation.
27 * @retval RTEMS_INVALID_ADDRESS The @a priority parameter is @c NULL.
28 * @retval RTEMS_INVALID_ID Invalid scheduler instance identifier.
29 * @retval RTEMS_INVALID_PRIORITY Invalid POSIX thread priority.
30 */
31 rtems_status_code rtems_scheduler_map_from_posix_priority(
32 rtems_id          scheduler_id,
33 int               posix_priority,
34 rtems_task_priority *priority
35 );

4.2.1.336 3687 - Add architecture section support to libdl and support PowerPC's small data.

Id	3687

Add support for architecture specific sections. Allow architecture back end support to handle sections that are specific to an architecture.

Add PowerPC sdata and sbss support. The PowerPC can support a **small data** 64K continuous system wide region of memory. Small data accesses are faster as the instruction is smaller however the variable is referenced as a signed 16bit offset from the register r13. This register is offset from the region's base address by 32K. The linker creates the .sdata and .sbss regions and sets the _SDA_BASE_ symbol which is loaded into r13. Any run-time loaded code with small data support needs space in the small data region therefore a BSP needs a way to define the space and the linker needs to allocate it. Provide a way for PowerPC BSPs to add extra memory to the small data region.

RTEMS supports the PowerPC EABI and uses sysv small data allocations. RTEMS uses the default variable size of 8 as the selector for a variable to be allocated in the small data region. The GCC user manual recommends all code is built with the same settings. Dynamically loaded code could be built with small data disabled and if enabled the default size is recommended.

Note, small data is system wide which means a default size of 8 allows only 8192 8 byte variables.

Provide an allocator to manage the available small data memory.

Author: Trac Migrate 2019-02-08T23:08:42.000Z

In [changeset:"6c9f0176a916cdbe88e04417e7aa1405d80c500f/rtems" 6c9f017/rtems]:

```

1 libdl: Add powerpc large memory and small data support.
2
3 - Add support for architecure sections that can be handled by the
4 architecture back end.
5
6 - Add trampoline/fixup support for PowerPC. This means the PowerPC
7 now supports large memory loading of applications.
8
9 - Add a bit allocator to manage small block based regions of memory.
10
```

Original author: sebastian.huber

The IO library uses a POSIX key to store an optional POSIX user environment pointer. This pulls in the POSIX keys support in every application configuration. Add a user environment pointer to the thread control block (TCB) instead. Applications which do not need the POSIX user environment will just get an overhead of one pointer per thread.

The following patch in newlib adds links and Windows does not have symlinks and it is emulated as copy. This complicates a bsdtar extraction of source ...

<https://github.com/RTEMS/sourceware-mirror-newlib-cygwin/commit/cfc4955234828881145a20987c8a0a3cd373585c>

I tried the -E option that was added to the RSB to extract the tar file a second time, this has worked with other tar files with symlinks however it does not work. I have not investigated why.

We need Windows building to make a release.

Note, this is in the ``tools/rsb`` component however is not an RSB bug. I need input on what the RSB needs to do to fix this issue if that is the path we take.

Author: Chris Johns 2020-02-10T05:12:53.000Z

Hand testing with MSYS's tar (GNU tar) indicates links are handled with a suitable file copy.

It could be changing the RSB from bsdtar to tar may be a workable solution. The use of bsdtar seems to be before 2012 ...

<https://git.rtems.org/rtems-source-builder/commit/?id=8f84a6b3a0bc7cbce09605f39329d3832682bf63>

I remember there was a number of issues getting the source unpacked on Windows. I can build arm tools with tar.

4.2.1.339 2408 - Linker set based initialization

Id	2408
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2015-09-02T12:52:05.000Z
Updated	2020-02-06T14:24:21.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::enhancement, version::4.10
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/2408
Merges	0

Original author: sebastian.huber

Linker sets are used for example in Linux, FreeBSD (they are used in the RTEMS port of the FreeBSD network stack, e.g. libbsd), eCos and for global C++ constructors. They provide a space efficient and flexible means to initialize modules. A linker set consists of

- dedicated input sections for the linker (e.g. `.ctors` and `.ctors.*` in the case of global constructors),
- a begin marker (e.g. provided by `crtbegin.o`, and
- an end marker (e.g. provided by `ctrend.o`).

A module may place a certain data item into the dedicated input section. The linker will collect all such data items in this section and creates a begin and end marker. The initialization code can then use the begin and end markers to find all the collected data items (e.g. function pointers).

Lets look how this works using a simple example. For this we need three files `myset.h`,

```

1 #ifndef MYSET_H
2 #define MYSET_H
3
4 /* The linker set items */
5 typedef struct {
6 void (*func)(void);
7 } item;
8
9 /*
10 * Macro to create a linker set item. The first parameter is
11 * the designator of the item. It must be unique within the

```

(continues on next page)

(continued from previous page)

```

12 * module scope. The second parameter is the desired function.
13 */
14 #define MYSET_ITEM(i, f) \
15 __attribute__((used)) \
16 __attribute__((section(".rtemsroset.myset.content"))) \
17 static item i = { f }
18
19 #endif /* MYSET_H */

```

module.c

```

1 #include "myset.h"
2 #include <stdio.h>
3
4 /*
5 * Some global function that needs a module specific
6 * initialization done by f().
7 */
8 void
9 g(void)
10 {
11
12 printf("g()\n");
13 }
14
15 /* The module constructor */
16 static void
17 f(void)
18 {
19
20 printf("f()\n");
21 }
22
23 /*
24 * This registers the module constructor f()
25 * in the linker set "myset".
26 */
27 MYSET_ITEM(i, &f);

```

and init.c.

```

1 #include "myset.h"
2 #include <stddef.h>
3
4 /* Should be in a proper header file */
5 void g(void);
6
7 /* Define the start marker */
8 __attribute__((used))
9 __attribute__((section(".rtemsroset.myset.begin")))

```

(continues on next page)

(continued from previous page)

```

10 static volatile const item begin[0];
11
12 /* Define the end marker */
13 __attribute__((used))
14 __attribute__((section(".rtemsroset.myset.end")))
15 static volatile const item end[0];
16
17 int main(void)
18 {
19     size_t n = &end[0] - &begin[0];
20     size_t i;
21
22     /* Call all functions of the linker set */
23     for (i = 0; i < n; ++i) {
24         (*begin[i].func)();
25     }
26
27     /*
28      * This will pull in the module.c and register its item in the
29      * linker set "myset". So g() can rely on f() being called first.
30      */
31     g();
32
33     return (0);
34 }

```

In the linker command file of the GNU linker we need the following statement.

```

1 .rtemsroset : {
2 KEEP (*(SORT(.rtemsroset.*)))

```

The KEEP() ensures that a garbage collection by the linker will not discard the content of this section. This would be normally the case since the linker set items are not referenced directly. The SORT() directive sorts the input sections lexicographically. Please note the lexicographical order of the .begin, .content and .end section name parts in the previous example which ensures that the position of the begin and end markers are right. The interesting part of linker map file of the previous example may look like this.

```

1 .rtemsroset      0x0000000001001990      0x4 load address 0x00000000002268c
2 *(SORT(.rtemsroset.*))
3 .rtemsroset.myset.begin
4 0x0000000001001990      0x0 init.o
5 .rtemsroset.myset.content
6 0x0000000001001990      0x4 module.o
7 .rtemsroset.myset.end
8 0x0000000001001994      0x0 init.o

```

So what is the benefit of using linker sets to initialize modules? Currently in RTEMS all available managers (semaphore, message queue, barrier, etc.) are initialized since the initialization code doesn't know what is actually used by the application. With the linker set approach we need to initialize only those managers that are used by the application. In case an application uses

message queues, then it must call `rtems_message_queue_create()`. In the module implementing this function we can place a linker set item and register the message queue handler constructor. Otherwise, in case the application doesn't use message queues, then there will be no reference to the `rtems_message_queue_create()` function and the constructor is not registered, thus nothing of the message queue handler will be in the final executable.

= 4.12/POSIX =	101680	1808	6592	45336	53736
= 4.12 =	101472	1808	6528	44336	52672

The huge increase in the test size from 4.9 to 4.10 is mostly due to the introduction of the `pipe()` support which pulls in `sprintf()`.

The increase of the BSS section from 4.10 to 4.11 is due to the static initialization of the scheduler data structures (move from workspace to BSS).

Executable sizes for the SPARC/SIS minimum.exe.

4.2.1.340 3857 - Use EAGAIN for POSIX mq wait in ISR error

Id	3857
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2020-01-24T13:59:24.000Z
Updated	2020-02-01T13:58:17.000Z
Milestone	5.1
Labels	api::posix, priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3857
Merges	0

POSIX message queues which are about to block in an ISR currently return ENOMEM. This is a status not listed by POSIX. The better status is EAGAIN per https://pubs.opengroup.org/onlinepubs/9699919799/functions/mq_receive.html.

Author: Trac Migrate 2020-01-24T14:48:59.000Z

1 posix-users/message_passing.rst: Add status for cannot block in ISR
2
3 Updates #3857.
```

Author: Trac Migrate 2020-01-24T14:49:35.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"e22554535796fc29a7ed7c5e2338128e324a621d/rtems" e225545/rtems]:

```
1 Use EAGAIN for POSIX mq wait in ISR error
2
3 Modify the status code returned by _CORE_message_queue_Submit() when it
4 detects a wait about to happen in an ISR (which would be deadly) to
5 return a status which translated to EAGAIN instead of ENOMEM.
6
7 This is only relevant for POSIX message queues, since Classic API_
8 ↪message
9 queues cannot block on send.
10
11 The motivation is to match the "most related" errno value returned from
12 mq\_send\(\) and mq\_timedsend\(\) according to POSIX, via Open Group:
```

(continues on next page)

(continued from previous page)

```

12 [EAGAIN]
13 The O_NONBLOCK flag is set in the message queue description
14 associated with mqdes, and the specified message queue is full.
15
16 or via the RTEMS POSIX users documentation
17
18 EAGAIN
19 The message queue is non-blocking, and there is no room on the queue
20 for another message as specified by the mq_maxmsg.
21
22 Neither of these matches the case of if avoided ISR wait perfectly, but
23 they seem to be the closest equivalent, unless it is desirable to keep a
24 new non-standard error for this case. It is presumed that this is not
25 desirable.
26
27 The previously returned ENOMEM error value is not documented in either
28 the Open Group or the RTEMS POSIX users documentation. A companion patch
29 corrects the documentation to include this error condition.
30
31 Based on the discussion in:
32 https://lists.rtems.org/pipermail/devel/2020-January/056891.html
33
34 closes #3857.

4.2.1.341 3685 - Add large memory support to libdl

Id	3685
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2019-02-02T04:32:04.000Z
Updated	2020-01-02T11:54:11.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3685
Merges	0

Add large memory support to libdl. Some architectures use small relative offsets with smaller instructions for performance reasons. Object files loaded at addresses that are outside the relative range require trampoline calls that bridge the instruction in the object to the target symbol. The mechanism used depends on the archives.

Libdl requires generic support to parse the relocation record before the object file allocation to provide the memory to hold the trampoline calls.

The ARM and PowerPC architectures require trampolines. This is called veneers on ARM.

Author: Trac Migrate 2019-02-08T23:08:11.000Z

In [changeset:"b08278e8520d14e5b809bb07785b724c7a127e29/rtems" b08278e/rtems]:

```

1 powerpc/psim: Increase the psim memory to 256M
2
3 This allows test dl09 to run and test PowePC backend trampoline support.
4
5 Updates #3685
```

Author: Trac Migrate 2019-02-08T23:08:35.000Z

In [changeset:"d8c70ba65b13cd023b50b8aed5d91e455017cdd5/rtems" d8c70ba6/rtems]:

```

1 libdl: Add support for trampolines
2
3 - Trampolines or fixups for veneers provide long jump support
4 for instrucion sets that implement short relative address
5 branches. The linker provides trampolines when creating a
6 static image. This patch adds trampoline support to libdl
7 and the ARM architecture.
8
9 - The dl09 test requires enough memory so modules are outside
```

(continues on next page)

(continued from previous page)

```

10 the relative branch instruction ranges for the architecture.
11
12 Updates #3685

```

Author: Trac Migrate 2019-02-08T23:08:38.000Z

In [\[changeset:"194eb403c39f5ad346e63dc3352e29570857fd93/rtems"194eb403/rtems\]](#):

```

1 libdl: Add support for large memory programs
2
3 - Add trampolines to support relocs that are out of range on
4 support architectures.
5
6 - Support not loading separate text/data sections in an object
7 file if the symbol provided in the section is a duplicate.
8 A base image may have pulled in part of an object and another
9 part needs to be dynamically loaded.
10
11 - Refactor the unresolved handling to scale to hundreds of
12 unresolved symbols when loading large number of files.
13
14 Updates #3685

```

Author: Trac Migrate 2019-02-08T23:08:42.000Z

In [\[changeset:"6c9f0176a916cdbe88e04417e7aa1405d80c500f/rtems"6c9f017/rtems\]](#):

```

1 libdl: Add powerpc large memory and small data support.
2
3 - Add support for architecure sections that can be handled by the
4 architecture back end.
5
6 - Add trampoline/fixup support for PowerPC. This means the PowerPC
7 now supports large memory loading of applications.
8
9 - Add a bit allocator to manage small block based regions of memory.
10
11 - Add small data (sdata/sbss) support for the PowerPC. The support
12 makes the linker allocated small data region of memory a global
13 resource available to libdl loaded object files.
14
15 Updates #3687
16 Updates #3685

```

Author: Trac Migrate 2019-02-19T22:09:47.000Z

In [changeset:"22afb03411133bcf928aeb85233648a94f259b44/rtems" 22afb034/rtems]:

```

1 libdl/alloc: Add a locking interface to the allocator.
2
3 - Allow an allocator to lock the allocations. This is needed to
4 lock the heap allocator so the text and trampoline table are
5 as close together as possible to allow for the largest possible
6 object file size.
7
8 - Update the default heap allocator to lock the heap allocator.
9
10 - Update ELF loading to lock the allocator.
11
12 Updates #3685

```

Author: Trac Migrate 2019-12-13T08:33:02.000Z

[changeset:"b08278e8520d14e5b809bb07785b724c7a127e29/rtems" b08278e/rtems] leads to the following run-time error on PSIM:

```

1 BATs must not overlap; area 0x08000000..0x09000000 hits DBAT 0
2 BATs must not overlap; area 0x0c000000..0xd0000000 hits DBAT 0

```

The RAM overlaps with the PCI area:

```

1 /*
2 * Setup BATs and enable MMU
3 */
4 /* Memory */
5 setdbat(0, 0x0<<28, 0x0<<28, 1<<28, _PAGE_RW);
6 setibat(0, 0x0<<28, 0x0<<28, 1<<28, 0);
7 /* PCI */
8 setdbat(1, 0x8<<24, 0x8<<24, 1<<24, IO_PAGE);
9 setdbat(2, 0xc<<24, 0xc<<24, 1<<24, IO_PAGE);

```

Author: Trac Migrate 2019-12-13T08:41:49.000Z

Increasing the RAM size to 256MiB (0x10000000) on PSIM breaks also the shared memory support:

```

1 typedef struct {
2 /* 0x0c000000 - 0x0c007FFF - AMD 29F040 */
3 volatile uint8_t Flash[ 512 * 1024 ];
4
5 /* 0x0c080000 - 0x0c0FFFFF - NVRAM/NVRAM */
6 volatile uint8_t nvram[ 512 * 1024 ];
7
8 /* 0x0c100000 - 0x0c100007 - NVRAM/RTC */

```

(continues on next page)

(continued from previous page)

```

9 psim_rtc_t RTC;
10
11 /* 0x0c100008 - 0x0c10000F - NVRAM/RTC */
12 uint8_t gap1[8];
13
14 /* 0x0c100010 - 0x0c10001b - System V IPC Semaphore */
15 psim_sysv_sem_t Semaphore;
16
17 /* 0x0c10001c - 0x0c10001f - NVRAM/RTC */
18 uint8_t gap2[4];
19
20 /* 0x0c100020 - 0x0c10005F - Ethernet */
21 volatile uint8_t Ethtap[ 64 ];
22
23 /* 0x0c100060 - 0x0c10FFFF - NVRAM/RTC */
24 uint8_t gap3[65440];
25
26 /* 0x0c110000 - 0x0c12FFFF - System V IPC Shared Memory */
27 uint8_t SharedMemory[ 128 * 1024 ];
28
29 /* 0x0c130000 - 0x0c170000 - OpenPIC IRQ Controller */
30 volatile uint8_t OpenPIC[ 256 * 1024 ];
31
32 } psim_registers_t;

```

I suggest to revert this change.

Author: Chris Johns 2019-12-17T20:18:36.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

The large memory support in libdl task has finished. The psim issue should be moved to another ticket and the solution is to change the address map of the devices as suggested by Joel on the devel@ list.

examples-v2 doesn’t build for qemu. both_hello fails because of something going on with rtems-ld. Taking that out of the wscript results in getting further but fails with an undefined error for the same symbol.

```
/home/joel/rtems-work/tools/5/bin/powerpc-rtems5-gcc: hello-deep.o: In function
`__wrap_Thread_Life_action_handler':
/home/joel/rtems-work/tools/5/bin/powerpc-rtems5-gcc:
/home/joel/rtems-work/examples-v2/build/powerpc-rtems5-qemu/ hello-deep.c:1304:
undefined reference to `Thread_Life_action_handler' /home/joel/rtems-work/tools/5/bin/powerpc-rtems5-gcc: collect2: error: ld returned 1 exit status
```

error: linking: Linker error

Author: Chris Johns 2018-04-26T03:33:03.000Z

The score thread definition files have not been updated after a change in the score:

<https://git.rtems.org/rtems-tools/tree/linkers/rtems-score-thread.ini#n8>

which is referenced from:

https://git.rtems.org/examples-v2/tree/hello/both_hello/hello-deep.ini#n21

I am OK with a change to remove the definition being pushed.

Note, adding libdwrf support to rtems-tools would remove the need for these files.

Please remember rtems-tools repo changes require an RSB update to have the RSB pick up any changes.

I was able to build the examples with these patches.

Author: Joel Sherrill 2019-12-19T13:47:44.000Z

It really would be better to have dynamic loading examples in rtems-examples rather than just bolting on some odd build stuff to an unrelated example. Neither both_hello or triple_period are intended to demonstrate dynamic loading and don't use it.

4.2.1.344 3665 - Add low level event recording infrastructure

Id	3665
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-12-19T07:01:36.000Z
Updated	2019-12-19T09:26:09.000Z
Milestone	5.1
Labels	library, priority::normal, resolution::fixed, tickettype::enhancement, version::5

Merges	0

Original author: sebastian.huber

Add low level event recording infrastructure for system and user defined events. The infrastructure should be able to record high frequency events such as

- SMP lock acquire/release,
- interrupt entry/exit,
- thread switches,
- UMA zone allocate/free,
- Ethernet packet input/output, etc.

It should allow post-mortem analysis in fatal error handlers, e.g. the last events should be in the record buffer, the newest event overwrites the oldest event. It should be possible to detect record buffer overflows for consumers that expect a continuous stream of events, e.g. to display the system state in real-time.

The framework should support high-end SMP machines (more than 1GHz processor frequency, more than four processors).

The existing capture engine tries to solve this problem, but its performance is not good enough for high-end production systems. The main issues are the variable-size buffers and the use of SMP locks for synchronization. To fix this, the API would change significantly.

Add a new API instead. The implementation should use per-processor data structures and no atomic read-modify-write operations. It is pretty much a per-processor ring buffer for record events.

Use the CPU counter to get the time of events. Combine it with periodic uptime events to synchronize it with CLOCK_REALTIME.

Here is an example of the

```

1 /**
2  * @brief Produces a record item.
3  *
4  * @param event The record event without a time stamp for the item.
5  * @param data The record data for the item.
```

(continues on next page)

(continued from previous page)

```
6 */
7 void rtems_record_produce( rtems_record_event event, rtems_record_data data );
```

function PowerPC machine code generated by GCC:

```
1 00000000 <rtems_record_produce>:
2 0: 7d 00 00 a6 mfmsr r8
3 4: 7c 00 01 46 wrteei 0
4 8: 7d 2e 82 a6 mfspr r9,526

6 10: 81 4a 02 b4 lwz r10,692(r10)
7 14: 55 29 50 2a rlwinm r9,r9,10,0,21
8 18: 7d 23 1b 78 or r3,r9,r3
9 1c: 81 2a 00 00 lwz r9,0(r10)
10 20: 80 ca 00 08 lwz r6,8(r10)
11 24: 38 e9 00 01 addi r7,r9,1
12 28: 7d 29 30 38 and r9,r9,r6
13 2c: 55 29 18 38 rlwinm r9,r9,3,0,28
14 30: 7d 2a 4a 14 add r9,r10,r9
15 34: 90 69 00 48 stw r3,72(r9)
16 38: 90 89 00 4c stw r4,76(r9)
17 3c: 7c 20 04 ac lwsync
18 40: 90 ea 00 00 stw r7,0(r10)
19 44: 7d 00 01 06 wrtee r8
20 48: 4e 80 00 20 blr
```

Just 19 instructions, no branches, no stack frame, no atomic-read-modify-write, just a light weight synchronization to ensure that the consumer reads not half finished items.

Original author: sebastian.huber

There are a lot of configure checks which produce HAVE_* defines which are no longer used or superfluous since we demand a recent Newlib version anyway.

This will be fixed by the new build system, see [#3818](#).

Author: Trac Migrate 2018-04-11T01:58:07.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"aa567bc1cc639fd4b791d0b57db0615a7b6ea648/rtems"aa567bc1/rtems]:

```

1 configure: Add subdir-objects to all automake flags.
2
3 This option silences warning with automake-1.16.1 allowing us to
4 upgrade to that version.
5
6 This change has been tested with automake-1.12.6 and automake-1.16.1.
7 It seems version 1.16.1 configures slower than 1.12.6 for the same
8 source and BSP. The newer versions is 6 second slower.
9
10 Close #3387.
```

Author: Trac Migrate 2018-04-11T05:21:30.000Z

I am not sure, but I think this breaks the BSP build. We have now for example in the build tree:

```

1 pwd
2 sparc-rtems5/c/erc32/lib/libbsp/sparc/erc32
3 make clean
4 test -z "" || rm -f

20 rm -f ../shared/*.o
21 rm -f ../shared/irq/*.o
22 rm -f ../shared/startup/*.o
23 rm -f clock/*.o
24 rm -f console/*.o
25 rm -f erc32sonic/*.o
26 rm -f gnatsupp/*.o
27 rm -f startup/*.o
28 rm -f timer/*.o

```

This assumes that the build and source tree have the same layout. However, this is not the case. For example:

```

1 pwd
2 sparc-rtems5/c/erc32/lib/libbsp/sparc/erc32
3 ls ../../../../../../
4 at697f bsp c erc32 gr712rc gr740 leon2 leon3 ut699 ut700

```

The critical issues is that the bsp directory is not BSP-specific.

Author: Trac Migrate 2018-04-11T05:21:40.000Z

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

Author: Chris Johns 2018-04-11T06:04:13.000Z

Replying to [Sebastian Huber](#):

I am not sure, but I think this breaks the BSP build.

I think it exposes a bug in the BSP Makefile support. Object files must stay contained under the BSP directory. Why does the cpukit not have a problem?

Author: Trac Migrate 2018-04-11T06:07:22.000Z

The problem is that we are right in between a move of the BSP sources from one tree to another.

Author: Chris Johns 2018-04-11T06:11:10.000Z

Will the move clean up the build tree and avoid this issue once the move is done? If so the only thing that is broken is building more than one BSP at a time. Is that a problem for you?

Author: Trac Migrate 2018-04-11T06:21:34.000Z

To finish the move will need a couple of weeks (more than four I guess). Do I have to use the BSP builder to build the BSPs?

Author: Chris Johns 2018-04-11T06:41:40.000Z

Replying to [Chris Johns](#):

Will the move clean up the build tree and avoid this issue once the move is done?

Nice, I am looking forward to this happening.

If so the only thing that is broken is building more than one BSP at a time. Is that a problem for you?

That is one way.

Just thought of a simpler solution that may work. What if you remove the `subdir-objects` option from the just the effected Makefile.am file(s)? This leave the parts of the build tree that are fixed ready and as you fix the broken parts the option can be added. It also lets automake-1.16.1 indicate we have a problem in the areas we have not fixed.

Does that work?

Author: Trac Migrate 2018-04-12T05:55:53.000Z

4.2.1.349 3753 - Rename CONFIGURE_LIBIO_MAXIMUM_FILE_DESCRIPTOR

Id	3753
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2019-05-21T15:43:26.000Z
Updated	2019-12-19T07:57:47.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, rtems::config, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3753
Merges	0

CONFIGURE_LIBIO_MAXIMUM_FILE_DESCRIPTOR probably should not mention LIBIO as that is an internal component/organization aid which should not be visible to the user.

This ticket is to discuss renaming CONFIGURE_LIBIO_MAXIMUM_FILE_DESCRIPTOR to just CONFIGURE_MAXIMUM_FILE_DESCRIPTOR.

Perhaps deprecate now and obsolete in next major version. Include code to warn and map old name to new.

Thoughts?

Author: Trac Migrate 2019-05-22T05:45:29.000Z

I like `CONFIGURE_MAXIMUM_FILE_DESCRIPTOR`s better, however, do we really want to tinker with this configuration option which is used probably in hundreds of application configurations? It will probably force users to do something like this

```
1 #if RTEMS_VERSION >= 5
2 #define CONFIGURE_MAXIMUM_FILE_DESCRIPTOR X
3 #else
4 #define CONFIGURE_LIBIO_MAXIMUM_FILE_DESCRIPTOR X
5 #endif
```

Author: Chris Johns 2019-12-12T23:30:31.000Z

Sebastian, can this be worked on while you are playing with the config?

Author: Trac Migrate 2019-12-13T06:04:11.000Z

Yes, I work on this. I hope to finish the configuration related stuff by end of next week.

Merges	0

Original author: sebastian.huber

Remove the CONFIGURE_HAS_OWN_MULTIPROCESSING_TABLE configuration option. The RTEMS configuration should be done via explicit configuration options to allow more freedom for implementation changes. The use of this configuration option had a note in the documentation:

“This is a configuration parameter which is very unlikely to be used by an application. If you find yourself wanting to use it in an application, please reconsider and discuss this on the RTEMS Users mailing list.”

No discussion took place in a couple of years about this topic.

Original author: javi

It seems that the method for accessing an existing file repository both isn't covered much in the "manual", but it also fails to find it. Looking at the python code in download.py, it requires the format `file://` to identify the local file protocol, but then tries to access the actual file/directory using that the entire url (including `file://`).

This unfortunately fails and I'm not familiar enough with Python to correct this, although it appears that the `"file://"` part should be cut from the URL before calling the `"return path.isdir(url)"` in the `_file_downloader` function.

Can you provide some more information about the failure? What are you trying to build, what is the config/bset being used, what %source directive fails? It may help to attach the log

Author: Trac Migrate 2015-09-15T08:45:29.000Z

Original author: javi

Well, at the moment I'm chasing a build bug in newlib and have modified a bset to allow me to change the source code locally. This was a perfect match for the "file" type available for %source, but as I stated it doesn't seem to work completely. (I

would also like to use it later to have git sources as submodules instead of cloned-on-demand.)

E.g., if I use a bset and modify the %source path for newlib from e.g. git:// to file:///full_path_to_this_dir/sources/git/newlib it doesn't find the directory. I added a printout of the url variable in _file_downloader in download.py, and the url contains the full given address as file:///full_path_to_this_dir/sources/git/newlib. This is then given to path.isdir and predictably fails.

Or am I missing something fundamental here?

Author: Chris Johns 2015-09-15T23:54:47.000Z

Original author: javi

There maybe a bug in the 'file' implementation, but I think what you are asking for is something new. I think you are asking to use the source tree as is in the location it is and to build using it where the 'file' expects a tar type file. Using the source in the specified location is currently not implemented. It is an interesting feature to add and I like it. It however would require I take a look to see what it effects and currently time is limited.

Note: No category for rtems-tools.

My first attempt to send run logs didn't go so well. This was a weird failure mode. It didn't exit but had to be killed by hand. I dropped off the options related to mailing the log and it still failed. This is on an up to date CentOS 7 (rtbf64c 7.4) as well as my 7.3 VM.

Replying to [Joel Sherrill](#):

Seems to be worse now but at least the output isn't an exception trace. Updated, cleaned, and reinstalled.

Thank you for the report. I am wondering is something is happening with the installed version I have broken. It looks like there is also some issues with the naming of the INI files and the BSP name I need to resolve.

```
Both installed and from the source tree fail with
this: [joel@rtbf64c b-erc32]$ /home/joel/rtems-

```

Sorry my mistake and a silly one. I was playing about seeing if YAML was installed and was checking a number of hosts and all my hosts seem to have support for Python while the 2.7 docs for Python have no such module. I left the line in by mistake. Your error supports the reason I have not added YAML support, we would need a module in our code.

4.2.1.357 3384 - Prefer int for int32_t

Id	3384
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-04-09T06:09:46.000Z
Updated	2019-12-13T06:07:28.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::enhancement, tool::gcc, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3384
Merges	0

Original author: sebastian.huber

Common systems like Linux and FreeBSD define `int32_t` to `int`. This means a lot of third party code works well in these cases:

```

1 #include <stdint.h>
2
3 void f(int32_t);
4
5 void f(int);
6
7 void g(int32_t *);
8
9 void h(void)
10 {
11     int i;
12     g(&i);
13 }
```

On RTEMS you get however in C

```

1 test.c:5:6: error: conflicting types for 'f'
2 void f(int);
3 ^
4 test.c:3:6: note: previous declaration of 'f' was here
5 void f(int32_t);
6 ^
7 test.c: In function 'h':
8 test.c:12:4: warning: passing argument 1 of 'g' from incompatible pointer type [-
  ↳Wincompatible-pointer-types]
9 g(&i);
10 ^
11 test.c:7:6: note: expected 'int32_t * {aka long int *}' but argument is of type
  ↳'int *'
12 void g(int32_t *);

```

and C++

```

1 test.c: In function 'void h()':
2 test.c:12:4: error: invalid conversion from 'int*' to 'int32_t* {aka long int*}'
  ↳[-fpermissive]
3 g(&i);
4 ^~
5 test.c:7:6: note: initializing argument 1 of 'void g(int32_t*)'
6 void g(int32_t *);
7 ^

```

This is due to a Newlib speciality which uses long for int32_t if long is a 32-bit type. To ease the use of third party software in RTEMS we should override this option and use int for int32_t just like the standard host operating systems (e.g. Linux and FreeBSD). Only a small GCC patch is required to do this:

```

1 diff --git a/gcc/config/rtems.h b/gcc/config/rtems.h
2 index 439199d4cbb..9b1408efe6f 100644
3 --- a/gcc/config/rtems.h

6 -latomic -lc -lgcc --end-group %(!qno-linkcmds: -T linkcmds%s}}}"
7
8 #define TARGET_POSIX_IO
9 +
10 +/* Use int for int32_t (see stdint-newlib.h). */
11 +#undef STDINT_LONG32
12 +#define STDINT_LONG32 0

```

Author: Joel Sherrill 2018-04-09T13:39:53.000Z

Original author: sebastian.huber

Just to keep it clean, what if int is 16 bits on the target?

Author: Trac Migrate 2018-04-09T13:46:46.000Z

Original author: sebastian.huber

See newlib-stdint.h in GCC sources:

```
1 [...]
2 #define INT32_TYPE (STDINT_LONG32 ? "long int" : INT_TYPE_SIZE == 32 ?
   ↪ "int" : SHORT_TYPE_SIZE == 32 ? "short int" : CHAR_TYPE_SIZE == 32 ?
   ↪ "signed char" : 0)
3 [...]
```

So, 16-bit targets should not use this option.

Add 5/rtems-llvm to build LLVM for supported hosts.

This can used to help resolve the dependency the recent trace changes have created by using LLVM symbol/dwarf support.

After applying the attached patch to update the md5's to sha512's, something goes wrong in the RSB build of Qemu. There is nothing obvious from the qemu build directory. But it appears that the cd into the qemu git directory didn't work and it is acting on my RSB git clone. The RSB trace is:

```

1 script: 78: cd "/data/home/joel/rtems-work/rtems-source-builder/bare/build/qemu-

Stafford Horne emailed me to say that he just pushed the or1k gcc to the FSF repository. We can now switch from gcc 4.9.3 to a hash from the gcc master. I was testing periodically from his

repository before the merge so it should be working.

I am marking this as a blocker but expect it to be easy and quick to resolve. We don't want to release using gcc 4.9.3 for any target.

Author: Joel Sherrill 2019-12-12T23:16:24.000Z

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3416
Merges	0

The command in 3.1.5 of the RSB guide for Ubuntu seems to work for 17.10 but on at least one system gives the error:

Error :: You must put some 'source' URIs in your sources.list

A description of how to address this is at:

<https://askubuntu.com/questions/496549/error-you-must-put-some-source-uris-in-your-sources-list>

Perhaps this would be useful info to update the RSB guide with (updated Ubuntu works + hint)

- [0001-Update-list-of-required-packages-for-building-on-Ubu.patch](#)

Author: Chris Johns 2018-10-14T01:08:44.000Z

- **Status** changed from *new* to *accepted*

Author: Chris Johns 2018-10-19T00:25:12.000Z

- **Status** changed from *accepted* to *new*

I do not user Ubuntu. A user would be the best person to do this as they can test it.

Author: Trac Migrate 2018-11-11T16:47:06.000Z

I tried building RTEMS on Ubuntu 18.04 and it worked great with the packages installed by using only this command:

```

1 sudo apt install build-essential bison flex texinfo unzip python3-dev
  ↵ git pax

```

This package list is based on the output of `sb-check` and error messages I got during the installation which I corrected installing the packages above. This probably also works for Ubuntu 17.10 but 18.04 is more important because it's LTS while 17.10 not. Because of this, Ubuntu 17.10 is also unsupported since July 19, 2018.

I also think that the part which mentions Xubuntu (the Xfce Ubuntu flavour) is redundant because every official Ubuntu flavour has the same base packages (the packages that change from flavour to flavour are the desktop environment related ones like the file managers, graphical text editors, etc. but usually not development packages like the ones that are required to build RTEMS). The id in the link (<https://docs.rtems.org/branches/master/user/hosts/posix.html#xubuntu> <-), also should be ubuntu instead of xubuntu.

With the patch attached here I fixed and updated everything.

Author: Trac Migrate 2018-11-11T16:47:43.000Z

- **Attachment** [0001-Update-list-of-required-packages-for-building-on-Ubu.patch](#) added

Author: Joel Sherrill 2019-12-12T22:24:13.000Z

The documentation changes did not include information on “Error :: You must put some ‘source’ URIs in your sources.list” being reported. As this occurred on an Ubuntu version that was not LTS, it is not being added. If this error occurs in the future on a LTS release, then add this information.

Original author: Kevin Gordon

Cloned from [#3195](#):

Consider the following example using ELF .o files from compiled source files module-0.c and module-1.c from ticket [#3194](#):

module-0.o is loaded using `dlopen()` with no code or data dependencies. module-1.o is loaded using `dlopen()` with both code and data dependencies on module-0 which are resolved by RTL.

The RTL function `dlclose()` returns no error when module-0 is unloaded, when it should return an error and not unload module-0. This becomes quite dangerous because a subsequent call to

module1Function1() in the currently-loaded module-1.o, which accesses shared_resource_0[] and calls module0Function0(), will result in an unexpected trap on qemu or the call succeeding with the correct return value on hardware when it should not.

The erroneous successful unload() of module-0 aside, it appears as though the resources are not actually deleted and I believe this ticket is related to tickets [#3192](#) and [#3194](#).

Architecture is sparc-leon3 using both the RTEMS 4.11.1 public release and rtems master [@f043b9bd3bf25626fb1a311dd7fa041eacc68adc](#) with rtems-source-builder [@55f2d69e9b67cde23d61375fa34ef5b0f04a985d](#).

Execution environments are qemu-system-sparc and LEON3 UT700 hardware.

Merges	0

I think <https://docs.rtems.org/branches/master/user/hardware/tiers.html> is intended to be the real site of this information. However, <https://devel.rtems.org/wiki/Developer/Architectures> also describes the tiers rules with slightly different language.

I think the Wiki page can be reviewed and removed. But any references and sub-pages should be dealt with at the same time. <https://devel.rtems.org/search?q=Developer%2FArchitectures&noquickjump=1&wiki=on> shows two sub-pages to deal with:

- <https://devel.rtems.org/wiki/Developer/Architectures/ARM> which is one sentence and can be removed.
- <https://devel.rtems.org/wiki/Developer/Architectures/ARM/ARM-EABI> which probably should move to the Users Manual.

This would eliminate a few pages and a point of duplication for a very important concept to the RTEMS Project.

Author: Trac Migrate 2019-12-04T13:26:37.000Z

I removed both ARM pages. The information was out of date since a couple of years.

Author: Joel Sherrill 2019-12-04T13:28:09.000Z

Thanks. I tripped across this doing the FSW slides. Were there links to these pages?

Author: Trac Migrate 2019-12-04T13:31:34.000Z

How can we figure out if there are links?

The Developer/Architectures looks like content which should be synchronized with the user manual and then get deleted.

Author: Trac Migrate 2019-12-05T14:34:51.000Z

I would interpret the two sources slightly different: 1. The manual (at docs.rtems.org) sounds like tiers are a per commit property. That would mean that

every published result tells “The BSP has this Tire on commit/release xyz”. That seems like a sane approach. 2. The wiki on the other hand tells something about “all commits”. That’s a quite inaccurate description. It doesn’t tell what the first commit is. So in theory every commit since RTEMS exists has to build and work for that board. That is just impossible. Beneath that the wiki allows simulator results in tire 1. So it’s not entirely clear what the difference to tire 2 is.

I would vote for dropping the inaccurate description in the wiki in favor of the more accurate one in the manual.

A Git clone via HTTPS does not give much interactive feedback. This could result in users thinking that a network issue exists and let them abort the command.

```
1 git clone https://git.rtems.org/rtems-libbsd
2 Cloning into 'rtems-libbsd'...
3 Checking out files: 100% (5159/5159), done.
```

vs.

```
1 git clone git://git.rtems.org/rtems-libbsd.git
2 Cloning into 'rtems-libbsd'...
3 remote: Counting objects: 34566, done.
4 remote: Compressing objects: 100% (8700/8700), done.
5 remote: Total 34566 (delta 24457), reused 34566 (delta 24457)
6 Receiving objects: 100% (34566/34566), 30.33 MiB | 1.34 MiB/s, done.
7 Resolving deltas: 100% (24457/24457), done.
8 Checking out files: 100% (5159/5159), done.

4 4 drwxr-xr-x   2 root root  4096 Apr 10 06:17 bin

```

Author: Trac Migrate 2019-08-09T10:49:09.000Z

Original author: sebastian.huber

In source-builder/sb/check.py:

```

1 def path_check(opts, silent = False):
2     if 'PATH' in os.environ:
3         paths = os.environ['PATH'].split(os.pathsep)
4         for p in paths:
5             if len(p.strip()) == 0:
6                 if not silent:
7                     log.notice('error: environment PATH contains an empty path')
8                 return False
9             elif not options.host_windows and (p.strip() == '.' or p.strip() == '..
    ↪ ):
10             if not silent:
11                 log.notice('error: environment PATH invalid path: %s' % (p))
12             return False
13             elif not path.exists(p):
14                 if not silent and opts.warn_all():
15                     log.notice('warning: environment PATH not found: %s' % (p))
16                 elif not path.isdir(p):
17                     if not silent and opts.warn_all():
18                         log.notice('warning: environment PATH not a directory: %s' % (p))
19             return True

```

The path.exists() seems to be rather complicated, why is it necessary in addition to path.isdir()? What is the overall goal of this check? Is it not the responsibility of the

user to take care of his \$PATH variable?

Author: Trac Migrate 2019-11-27T13:52:12.000Z

Original author: sebastian.huber

This bug is still open. It is a show stopper on some systems.

Author: Trac Migrate 2019-11-27T13:55:58.000Z

Original author: sebastian.huber

- **Owner** set to sebastian.huber
- **Status** changed from *new* to *accepted*

I suggest to remove this check. I think the RSB tries to be smarter than necessary here.

Author: Trac Migrate 2019-11-29T06:34:35.000Z

Original author: sebastian.huber

I am not sure if these hard errors are really useful, e.g.

```
1 $ export PATH=::$PATH
2 $ ./source-builder/sb-set-builder --prefix=/build/rtems/5 5/rtems-arm --
  ↪source-only-download
3 RTEMS Source Builder - Set Builder, 5 (f3b44b25d135)
4 error: environment PATH contains an empty path
5 error: host build environment is not set up correctly
6 Build FAILED
```

Why don't we just issue a warning? If something goes wrong the warning will show up in the logs.

Author: Chris Johns 2019-12-01T23:14:09.000Z

Original author: sebastian.huber

I wonder how many issues have been fixed by having this check present that users cleaned up?

If we remove this test and we get no increase in issues then the test did nothing and our users all had clean environments. An increase means it did serve a purpose. I also think your point about the RSB nannying our users this way may be a step too far so making the tests just warnings and no fatal would be a good compromise. It would let us request the output with debugging a specific user problem.

Author: Trac Migrate 2019-12-02T08:48:07.000Z

Original author: sebastian.huber

Nannying fits quite well. The empty path check is not superfluous. If I remove it, then RSB fails with:

```
1 $ export PATH=::$PATH
2 $ ../source-builder/sb-set-builder 5/rtems-arm --source-only-download
3 error: unknown application load error
4 error: unknown application load error
```

At least, not in some circumstances.

For example, foo/bar.txt untar's just fine, but foo/bar/baz.txt does not. If sub-directory foo/ exists first, then foo/bar/baz.txt does unpack correctly.

We only use the Untar_*() family during our initial programming workflow, so hacking around this problem wasn't too laborious for us.

The release snapshot m1911 as found here:

<https://ftp.rtems.org/pub/rtems/releases/5/5.0.0/5.0.0-m1911/>

has a kernel (rtems-5.0.0-m1911.tar.xz) in the top directory and another copy in the sources directory.

The top level copy is the head of the branch, in this case master while I suspect the copy in the sources directory is created by the RSB when collecting the source.

Which is correct for a release? I am not sure, the tagged version in the RSB or the release packaged version?

I tend to think the release packaged version is used and the RSB collected versions should not be collected. They are only useful when working from git.

Building m68k/mrm332 on Linux and MSYS2 to compare results. Builds with all tests on Linux. Multiple build failures on MSYS2. Some appear to be because on MSYS2, tests are being build which are marked as exclude in the .tcfg file. For example, <https://git.rtems.org/rtems/tree/bsps/m68k/mrm332/config/mrm332-testsuite.tcfg#n11> says that fsdosfsname01 should be excluded but it is being built as shown below:

```
1 m68k-rtems5-gcc -mcpu=cpu32 -Os -g -fomit-frame-pointer -Wall -Wmissing-
  ↳ prototypes -Wimplicit-function-declaration -Wstrict-prototypes -Wnested-externs
  ↳ -B./../../../../lib/libbsp/m68k/mrm332 -B/home/jrs007/rtems-work/rtems/bsps/m68k/
  ↳ mrm332/start -specs bsp_specs -qrtems -L./../../../../cpukit -L/home/jrs007/rtems-
  ↳ work/rtems/bsps/m68k/shared/start -Wl,--wrap=printf -Wl,--wrap=puts -Wl,--
  ↳ wrap=putchar -o fsdosfsname01.exe fsdosfsname01/fsdosfsname01-init.o support/
  ↳ fsdosfsname01-ramdisk_support.o ./../../../../lib/libbsp/m68k/mrm332/librtemsbsp.a ./
  ↳ ./../../../../cpukit/librtemscpu.a
2 c:/msys64/home/jrs007/rtems-work/tools/5/bin/./lib/gcc/m68k-rtems5/7.3.0/../../../../
  ↳ ./m68k-rtems5/bin/ld.exe: fsdosfsname01.exe section `.text' will not fit in
  ↳ region `rom'
3
4 c:/msys64/home/jrs007/rtems-work/tools/5/bin/./lib/gcc/m68k-rtems5/7.3.0/../../../../
  ↳ ./m68k-rtems5/bin/ld.exe: region `rom' overflowed by 874128 bytes
5
6 collect2.exe: error: ld returned 1 exit status

Running `cdtest.exe` fails. I am wondering if there is an issue in the `linkcmd` scripts this BSP uses. The `psim` works.

The trace is:

```

1 config addr is 0xf1000cf8
2 config data is 0xf1000cfc

Maybe related to [#3339](#).

Author: Chris Johns 2019-04-11T07:06:51.000Z

Replying to [Sebastian Huber](#):

Maybe related to [#3339](#).

If you mean a broken linkcmd file, yes. There are a number of BSP specific linkcmd files and this is hurting us, these BSPs and their users. A common linkcmd file for the arch means a simulator is able to do a lot of the needed testing.

We have a lot of important systems running PowerPC BSPs and there are issues. I think it would be good to sort this out but we need someone to do this or use a support service and we need someone with enough gear or access to people with the gear it to make the changes and get a working base line.

Merges	0

Original author: sebastian.huber

Currently, the following fatal error is generate in case of heap errors:

```

1 static void _Heap_Protection_block_error_default(
2 Heap_Control *heap,
3 Heap_Block *block
4 )
5 {
6 /* FIXME */
7 _Terminate( INTERNAL_ERROR_CORE, 0xdeadbeef );
8 }

```

Replace this with a dedicated fatal error source and a context structure (similar to assert()).

This was caught in a build sweep using rtems-bsp-builder.

Configure command:

```
1 /home/joel/rtems-cron-5/rtems/configure --target=arm-rtems5 --enable-
  ↳ rtemsbsp=atsamv --prefix=/home/joel/rtems-cron-5/tools/5/bsps --enable-rtems-
  ↳ debug --disable-smp
```

Compiler output:

```
1 arm-rtems5-gcc --pipe -DHAVE_CONFIG_H -I. -I/home/joel/rtems-cron-5/b-atsam/arm-
  ↳ rtems5/c/atsamv/include -I/home/joel/rtems-cron-5/rtems/cpukit/include -I/home/

The issue is due to the shell command string containing " character that are not escaped. On MinGW these commands have to use the MSYS2 shell and not the host's shell which is some form of cmd.exe. The command to invoke the MSYS2 shell is ...

<https://git.rtems.org/rtems-source-builder/tree/source-builder/sb/config.py#n430>

The wrapping of the string in "" effects the shell's processing.

The failing command on Windows is:

```

1 sh -c "/mingw64/bin/python2-config --ldflags | awk 'BEGIN{FS=" "}/
  ↪python/{for(i=1;i<NF;++i)if(match($i,.*lpython.*)) print "lib
  ↪"substr($i,3)”*”;}””

```

4.2.1.384 3760 - BBB MMU update crashes

Id	3760

Calling `arm_cp15_set_translation_table_entries()` on a BBB (Cortex-A8) crashes in the call to `arm_cp15_tlb_invalidate_entry_all_asids()`. There is no HYP support in the BBB's A8. The cp15 register is documented in the A8 manual but the BBB device from TI does not have the support built in.

A check of the A8 doco from ARM says this is for use in HYP mode so should we be using without checking if HYP is supported and if it is active? I am also wondering if we use should be using it on the Zynq. I have no idea why the Zync (A9) does not complain, it may be ignoring the invalidate request.

While looking at this code I was wondering why we do not follow ARM's recommendation of 'break-make' updates of the TLB? I do not know we could support such a process because we may be asked to invalidate the entry for the text section we are running in to update it.

Note, following the other path in the call works on a BBB.

Author: Chris Johns 2019-06-25T10:08:06.000Z

The implementation is:

```

1 ARM_CP15_TEXT_SECTION static inline void
2 arm_cp15_tlb_invalidate_entry_all_asids(const void *mva)
3 {
4   ARM_SWITCH_REGISTERS;
5
6   mva = ARM_CP15_TLB_PREPARE_MVA(mva);
7
8   __asm__ volatile (
9     ARM_SWITCH_TO_ARM
10    "mcr p15, 0, %[mva], c8, c7, 3\\n"
11    ARM_SWITCH_BACK
12    : ARM_SWITCH_OUTPUT
13    : [mva] "r" (mva)
14    );
15 }
```

The cp15 register c8, 0, c7, 3 is undefined for a Cortex-A8 (ARM's document DDI0334K p3-12). The conditional define in arm_cp15_set_translation_table_entries catches the Cortex-A8.

Can the availability checked via a feature register at runtime?

Author: Chris Johns 2019-06-25T10:44:49.000Z

Replying to [Sebastian Huber](#):

Can the availability checked via a feature register at runtime?

Yes I think so. The test can be for variant 3 or earlier for the Cortex-A8 and 4 or higher for Cortex-A9 or later.

4.2.1.385 3777 - libdl object unload debugger delete support is broken

The test dl09.exe crashes on BBB, Zedboard, and RPi2 but runs on arm qemu and psim. The issue is uncovered by the heap protection support in free() where the free block has been touched.

It turns out _rtld_linkmap_delete() list code is broken. The object module's block should not be walked to the end.
