The BBB is ARM mode and crashes dl09.exe. This is due to only Thumb mode trampoline

support.

Add support to the RSB for BSP build sets. The support includes building 3rd party packages for a BSP.

1. Add BSP buildset support 1. Build packages for a BSP 1. Stage buildset builds if not the outer build so dependent packages and be built before a package and used 1. Fix packages to support staged builds

4.2.1.395 3748 - libdl uses a linear symbol search on object file symbols

Id	3748
State	closed

Symbol searching has two parts, searching the object file and searching the global symbol table. Currently the object file search is linear and the global table search uses a hash table.

A large incrementally linked object file can have a large local and global set of symbols and this can slow the loading process. This issue does not show up for small object files with a few symbols which is typically how our libraries are made.

Change the object file symbol search to a binary search (bsearch). A hash table for each object file would increase the in memory object file footprint by a significant amount and would harm the small object file use case that only have a few symbols. A binary search is a suitable compromise.

4.2.1.396 3532 - RSB source only download is host specific

Id	3532
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2018-09-27T22:59:29.000Z

Labels	priority::normal, resolution::fixed, tickettype::defect, tool::rtems-source-builder, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3532
Merges	0

The RSB source only download is host specific. Configurations for builds can restrict sources or patches by host to work around specific host issues. Currently a source only download is host specific because the host check is based on the host the RSB is being run on.

The release process uses source only downloading to create the complete set of sources in a release. This issue means some host specific source may not be captured.

I am yet to figure how to resolve this issue because the download logic is driven by the configuration scripts and this type of logic exists in configuration files such as `rtems-gcc-7.3.0-newlib-d13c84eb07e35984bf7a974cd786a6cdac29e6b9.cfg`:

```

1 %if %[_build_os] == freebsd || %[_build_os] == darwin
2 %patch add gcc --rsb-file=freebsd-libgcc-sed-fix.patch -p0 https://gcc.gnu.org/
  ↳ bugzilla/attachment.cgi?id=41380
3 %hash sha256 freebsd-libgcc-sed-fix.patch_
  ↳ 8a11bd619c2e55466688e328da00b387d02395c1e8ff4a99225152387a1e60a4
4 %endif

```

The simpler construct in `rtems-tools-common-1.cfg` of:

```

1 %ifos win32 mingw ming32
2 SB_BUILD_ROOT_WAF=$SB_BUILD_ROOT$(echo %[_prefix] | cut -c 1-2)
3 %else
4 SB_BUILD_ROOT_WAF=$SB_BUILD_ROOT
5 %endif

```

is easier to manage as the `%ifos` logic can always return True however the `%else` path also need to be followed and this could break the logic in a configuration file. Yes, the example is not about sources or patches however it shows what could be used. I do not think creating a new variable such as ``%{download_only}`` and adding logic to the configuration file will help, for example:

```

1 %if %[_download_only] || %[_build_os] == freebsd || %[_build_os] == darwin
2 %patch add gcc foobar-bsd.patch
3 %else
4 %patch add gcc foobar-gnu.patch
5 %endif

```

We require the logic to follow the `%if` True path **and** the `%else` path.

Author: Chris Johns 2018-09-27T23:08:52.000Z

- **Description** changed

```

Original author: sebastian.huber

While testing on a NXP LPC1788 it found that this chip is affected by the Cortex-M3 Errata 602117. NXP didn't bother to document this in their errata sheet for the chip:

https://www.nxp.com/docs/en/errata/ES_LPC177X_8X.pdf

To avoid the issues, you have to compile everything with `-mfix-cortex-m3-ldrd`. This option is enabled by default, if you use `-mcpu=cortex-m3`.

I think we have to change our GCC multilibs to account for this errata. For example:

```

1 diff --git a/gcc/config/arm/t-rtems b/gcc/config/arm/t-rtems
2 index 026a5895662..e276b4f3e57 100644
3 --- a/gcc/config/arm/t-rtems
4 +++ b/gcc/config/arm/t-rtems

```

(continues on next page)

This test is failing because the second stage of the symbol loading does not check if a section referenced by a symbol has been loaded.

It is not clear yet if the lack of support in libdl for group sections is a factor.

The config file processing of conditionals:

- %ifos
- %ifnos
- %ifarch

do not correctly process lists of arguments. The argument list is split in 2 with the first element correct handled and the remaining treated as a lump. The argument list needs to be split evenly.

The BSP_output_char should output a char and not mingle with high level processing, e.g. 'n' to 'rn' translation. Move this translation to rtems_putc(). Remove it from all the BSP_output_char implementations.

Is this an internal RTEMS function?

Could this change any external code that may be using it?

What do users call to get the same thing as we currently have?

It is a good change, I am just considering the timing late in a release development cycle.

Author: Trac Migrate 2017-09-11T08:44:16.000Z

Original author: sebastian.huber

Replying to **Chris Johns**:

Is this an internal RTEMS function?

This is the function pointer used by rtems_putc() and printk().

Could this change any external code that may be using it?

What do users call to get the same thing as we currently

have? It is a good change, I am just considering the timing late in a release development cycle.

This is not an API change. Only the “n” to “rn” moves from the lowest level one step up to `rtems_putc()`.

28 cpsr          25  25  164           4  uint32_t
```

The target support in libdebugger is a simple array of 32bit ints. This needs to change to handle registers at various offsets. The lack of fp regs was a simplification at the time I first implement this server. Loos like I need to sort this out.

Author: Chris Johns 2019-04-06T00:39:37.000Z

- **Status** changed from *new* to *accepted*

I suspect the more recent gdb we are using is checking the g register data length and libdebugger was not returning the correct amount for the ARM processor.

Author: Chris Johns 2019-04-06T00:43:24.000Z

Adding support for offsets to the ARM backend has things working. The following is with master RSB, kernel and libbsd:

```

1 $ /opt/work/rtems/5/bin/arm-rtems5-gdb ./build/arm-rtems5-xilinx_zynq_
  ↪zedboard-default/debugger01.exe

Original author: stavros.passas

RTEMS threads getting locked up when using certain c++ functionality. Issue happens for example when `std::future` is combined with `std::async`.

Investigating deeper, seems like this happens if `std::async` executes before `std::future` gets scheduled to run. Both of these create a `pthread_once` instance.

`_once()` uses a common semaphore for all calls, thus the first function (`async.get` usually) gets the lock, calls its “init” function (which blocks until the second function has completed. After this, `std::future` also uses `pthread_once` to execute, but because the lock is already taken, it also blocks, causing a deadlock.

Attached you can find a test application that reproduces the deadlock.

- [3334-Fix-pthread_once-deadlock.patch](#)

Test Application

Author: Trac Migrate 2018-03-13T13:22:26.000Z

Original author: stavros.passas

Copying the suggestion from Sebastian, (from the mailing list) about this issue:

“Please open a ticket and provide a test case for the RTEMS test suite. Maybe we have to use dedicated mutexes for each `pthread_once_t` object. This is what Linux and FreeBSD do. This would require a Newlib update.”

Author: Trac Migrate 2018-03-13T13:28:56.000Z

Original author: stavros.passas

- **Attachment** 3334-Fix-pthread_once-deadlock.patch added

Proposed fix

Author: Trac Migrate 2018-03-13T13:34:02.000Z

Original author: stavros.passas

I agree with Sebastian, that using one dedicated mutex for each pthread_once_t instance would be a longer term and elegant solution, but it would also add overhead for each pthread_t instance.

I am adding a different proposed solution, which doesn't require newlib changes (and increasing the pthread_t size):

The _once implementation uses a single mutex. Currently this mutex protects the whole function, while I believe we need to protect reads/writes to the once_state variable only. Concurrent tasks finding the state on RUNNING, could just yield until the state becomes ONCE_STATE_COMPLETE.

Author: Trac Migrate 2018-03-13T14:12:26.000Z

Original author: stavros.passas

- **Milestone** changed from %"4.11.4" to %"5.1"

Please send patches to the mailing list.

The yield loop may fail if thread priorities come into play. It should be replaced with a condition variable. So, for the once implementation we need a mutex and a condition variable (#include <rtems/thread.h>). There is currently no condition variable with API mutex support. We need protection from asynchronous deletion. Maybe use _Thread_Set_life_protection() directly in _Once().

If we want to back port this fix to RTEMS 4.11, then we have to use <sys/lock.h> instead of <rtems/thread.h>.

Consider this call:

```
1 #include <rtems/dumpbuf.h>
2 rtems_print_buffer ((const unsigned char *) "\\x12\\x23\\x56\\x78", 4);
```

On psim you get:

```
1 1f 2f 5f 7f | .#Vx |
```

Author: Chris Johns 2019-01-29T03:39:55.000Z

The line in Dump_Line:

```
1 rtems_putc(hexlist[0xf]);
```

should be:

```
1 rtems_putc(hexlist[c & 0xf]);
```

Author: Trac Migrate 2019-01-29T09:10:42.000Z

Yes, looks good.

4.2.1.413 3677 - ARM BSP contains ARM code in THUMB only build

Id	3677
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate
Created	2019-01-21T00:41:14.000Z
Updated	2019-01-29T08:04:26.000Z
Milestone	5.1
Labels	priority::normal, resolution::wontfix, tickettype::defect, tool::gcc, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3677
Merges	0

The xilinx_zynq_a9_qemu BSP contains a memcpy that is ARM mode code and not THUMB. This can be seen with hello.exe and vlan01.exe in the libbsd examples.

The script run with the command that follows shows there is a single ARM function in the executable. The python script is:

```
1 from __future__ import print_function
2 import sys
3 for line in sys.stdin:
4     ls = line.split()
5     if len(ls) == 8 and ls[0][-1] == ':' and ls[3] == 'FUNC':
6         addr = int(ls[1], 16)
7         if addr & 1 == 0:
8             print(ls[7])
```

Command with output:

```
1 $ arm-rtems5-readelf -a `find . -name hello.exe` | python ./arm-thumb.py
2 memcpy
```

The presence of this single function makes me wonder why and if something is wrong in the building of the memcpy function. Examination with rtems-exeinfo shows the code is built by GNU AS from the file memcpy-armv7a.S while other asm files are not generating ARM code. The section of the output from:

```
1 $ rtems-exeinfo -a `find . -name hello.exe`
```

is:

```
1 GNU AS 2.31.1: 14 objects
2 | arm_exc_interrupt.S
3 | armv4-exception-default.S
4 | bpabi.S
5 | bpabi.S
6 | bsp-start-memcpy.S
7 | cpu_asm.S
```

(continues on next page)

(continued from previous page)

```

8 | lib1funcs.S
9 | lib1funcs.S
10 | lib1funcs.S
11 | memchr.S
12 | memcpy-armv7a.S
13 | start.S
14 | strcmp-armv7.S
15 | strlen-armv7.S

```

GNU LD is correctly managing the interworking and the code runs however is this behavior expected and understood? Note, the existence of this code breaks libdl's loading of dhcpd.c as section .rel.text.dhcpd_handle_hwaddr contains a R_ARM_THM_JUMP24 relocation record which requires a veneer in large memory application as well as bl to blx support. This support could be added but I am not currently in favor of having this support for something that should not happen.

Author: Chris Johns 2019-01-21T00:44:30.000Z

Hmmmm <https://github.com/RTEMS/sourceware-mirror-newlib-cygwin/blob/master/newlib/libc/machine/arm/memcpy-armv7a.S#L47>

Author: Trac Migrate 2019-01-21T06:17:19.000Z

The interworking support is mandatory in ARM EABI. The memcpy() code is from ARM, I guess they know what they are doing.

4.2.1.416 3472 - Update of libbsd to a version close to the FreeBSD 12 release

Id	3472
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-07-19T05:20:30.000Z
Updated	2019-01-24T06:35:25.000Z
Milestone	5.1
Labels	libbsd, priority::normal, resolution::fixed, tickettype::project, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3472
Merges	0

Original author: sebastian.huber

The FreeBSD project is about to prepare the FreeBSD 12 release soon:

<https://www.freebsd.org/releases/12.0R/schedule.html>

Use this time frame to update the libbsd stepwise to a FreeBSD trunk version close to the FreeBSD 12 release.

Author: Trac Migrate 2018-07-19T05:28:07.000Z

Original author: sebastian.huber

```
1 Update FreeBSD kernel timespec support
2
3 This change is based on the following FreeBSD commit:
4
5 "Make timespecadd(3) and friends public
6
7 The timespecadd(3) family of macros were imported from NetBSD back in
8 r35029. However, they were initially guarded by #ifdef _KERNEL. In the
```

(continues on next page)

(continued from previous page)

```

9 meantime, we have grown at least 28 syscalls that use timespecs in some
10 way, leading many programs both inside and outside of the base system to
11 redefine those macros. It's better just to make the definitions public.
12
13 Our kernel currently defines two-argument versions of timespecadd and
14 timespecsub. NetBSD, OpenBSD, and FreeBSD.org's libbsd, however,
15 ↪ define
16 ↪ three-argument versions. Solaris also defines a three-argument version,
17 ↪ but
18 ↪ only in its kernel. This revision changes our definition to match the
19 common three-argument version.
20
21 Bump _FreeBSD_version due to the breaking KPI change.
22
23 Discussed with: cem, jilles, ian, bde
24 Differential Revision: https://reviews.freebsd.org/D14725
25
26 To make the change public (outside #ifdef _KERNEL) it must be integrated
27 in Newlib.
28
29 Update #3472.

```

Author: Trac Migrate 2018-08-24T07:37:03.000Z

Milestone	5.1
Labels	libbsd, priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3554
Merges	0

It is out of date at least by mentioning 4.12 instead of 5. If there are other nits or issues, they need to be addressed while updating the release info.

Author: Joel Sherrill 2018-10-18T21:55:02.000Z

Author: Trac Migrate 2019-01-10T07:06:34.000Z

Interesting, this is due to the -O0 optimization level. For the erc32 the empty loop is optimized away and there is no reference.

Original author: sebastian.huber

In [changeset:"98f051efed0b415cce5c19d3f4a71858091a3cef/rtems" 98f051e/rtems]:

```

1 riscv: Remove RISCVC_GCC_RED_ZONE_SIZE
2
3 The current ABI says that there is no stack red zone:
4
5 https://github.com/riscv/riscv-elf-psabi-doc/blob/master/riscv-elf.md
6
7 "Procedures must not rely upon the persistence of stack-allocated data
8 whose addresses lie below the stack pointer."

```

(continues on next page)

(continued from previous page)

9
10 Update #3433.

Author: Trac Migrate 2018-06-29T09:59:03.000Z

Original author: sebastian.huber

In [changeset:"9510742e7ff48c3df177ec9f7b5e0d229c696e85/rtems"
9510742/rtems]:

1 riscv: Fix CPU_STACK_ALIGNMENT
2
3 According to the RISC-V psABI
4
5 <https://github.com/riscv/riscv-elf-psabi-doc/blob/master/riscv-elf.md>
6
7 the stack alignment **is** 128 bits (16 bytes).
8
9 Update #3433.

Author: Trac Migrate 2018-06-29T09:59:13.000Z

Original author: sebastian.huber

In [changeset:"a49a3c8eed0663bfc4de8b854dcede1573daf246/rtems"
a49a3c8e/rtems]:

1 riscv: Do **not** clear thread context
2
3 Do **not** clear the complete thread context. Initialize only the necessary
4 members. The Context_Control::is_executing member must be preserved
5 across _CPU_Context_Initialize() calls.
6
7 Update #3433.

Author: Trac Migrate 2018-06-29T09:59:23.000Z

4.2.1.423 3000 - Setting interrupt level in the mode arg on SMP returns RTEMS_UNSATISFIED

Id	3000
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Joel Sherrill
Created	2017-04-19T02:11:59.000Z
Updated	2019-01-09T09:37:17.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, rtems::score, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3000
Merges	0

If for any reason a user sets the interrupt level in the mode on an SMP build the error RTEMS_UNSATISFIED is returned. The documentation indicates this is a lack of stack and this confusing.

The reason this happens is the SMP check for an interrupt level being set is in the score's `_Thread_Initialize`. I propose that and `is_preemptible` check be converted to an assert and checks be added to the Classic API to catch these errors and report suitable error codes.

There is no meaningful error code available without abusing an existing one so I propose adding RTEMS_INVALID_MODE.

Author: Joel Sherrill 2017-04-19T03:28:50.000Z

I think this is a generally a good idea but there are a number of pieces to do this completely:

- the status has to also be returned by `rtems_task_mode()`

- add status to list in rtems status to string
- add status to list in Ada binding. Should be mechanical.
- add status to status table in Classic API manual
- add new status to rtems_task_create() documentation
- add new status to rtems_task_mode() documentation
- add test for rtems_task_create() new error
- add test for rtems_task_mode() new error

I am unsure if the assert() is debug mode only. That needs to be clarified.

Sorry to be pedantic with the list but this looks like the type of change that is small but has tentacles that would be easy to miss pieces. I suspect my list isn't complete yet.

Author: Chris Johns 2017-04-19T04:42:23.000Z

Replying to [Joel Sherrill](#):

I think this is a generally a good idea but there are a number of pieces to do this completely:

Great and yes.

- the status has to also be returned by rtems_task_mode()

OK.

- add status to list in rtems status to string

Done in the posted patch.

- add status to list in Ada binding. Should be mechanical.

Is there any documentation on how to do this?

Answer: Edit rtems.ads and add it. It is just an enumerated list. You won't have trouble. c/src/ada/rtems.ads around line 353.

- add status to status table in Classic API manual
- add new status to rtems_task_create() documentation
- add new status to rtems_task_mode() documentation

I will create a docs patch once I have a suitable patch for master.

- add test for
rtems_task_create() new
error
- add test for
rtems_task_mode() new
error

Yes however the tests are only running in the single core mode even when built with SMP so the error is not able to be tripped.

ANSWER: Sounds like a new SMP test is needed.

I am unsure if the assert() is debug mode only. That needs to be clarified.

That is correct. The assert's catch a bug in a user of the score API when built with RTEMS_DEBUG. The users of the call need to protect the score thread initialise call.

Sorry to be pedantic with the list but this looks like the type of change that is small but has tentacles that would be easy to miss pieces. I suspect my list isn't complete yet.

This looks the list to me.

Should the examples work with all RTEMS versions or just RTEMS 5?

Author: Chris Johns 2019-01-07T05:29:58.000Z

Replying to [Sebastian Huber](#):

Should the examples work with all RTEMS versions or just RTEMS 5?

I suppose the examples should be equivalent to what a user sees so in this case they should build with RTEMS 5 and have no errors or warnings. The examples are captured as part of a release which means there is a history and the changes needed for RTEMS.

If I had an application that needed to work with 4.11 and 5 I would detect the version and conditionally handle the changes in the build system and code.

I am OK with them building for RTEMS 5.

4.2.1.426 3537 - RSB and RTEMS Tools Support for python2 and python3

Id	3537
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2018-10-02T21:38:43.000Z
Updated	2018-12-25T01:15:53.000Z
Milestone	5.1
Labels	priority::high, resolution::fixed, tickettype::defect, tool, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3537
Merges	0

Upstream python does not create a python command any more and creates python2 and python3. Distributions and operating systems are starting to ship without the python command.

The RSB and RTEMS Tools python commands need to be updated and tested so they run on Python2 and Python3 and support added to use the available commands.

Author: Trac Migrate 2018-10-04T05:55:01.000Z

Do we have a host platform without python3 support? If not, then I would simply use python3 and stop using python/python2.

Author: Chris Johns 2018-10-04T06:30:58.000Z

Replying to [Sebastian Huber](#):

Do we have a host platform without python3 support? If not, then I would simply use python3 and stop using python/python2. In time we will need to switch to python3 however I am not in a position to go over all the code and do this. I think it also makes things difficult or at least more complicated for users with established environment to get such a hard error. We should consider a softer landing if this is possible. I am considering moving to a shell script that checks for python2 then python3 and if not found outputs a user friendly error message. The existing code is moved into the python directories run from the python command line. Once we are happy with python3 we can switch the order we check. A script would let us add an environment variable we could use to force a version to test with without needing symlinks etc.

Author: Trac Migrate 2018-10-04T06:40:08.000Z

I think we already have a fairly good Python 3 support, since on a recent msys2 there is no Python 2 available?

One issue is probably the RTEMS Tester. We had some difficulties with the TFTP Server:

<https://github.com/msoulier/tftpy/pull/94>

The latest tftpy seems to work only with Python 3.5, but not 3.4.

Author: Chris Johns 2018-10-04T07:21:09.000Z

Replying to [Sebastian Huber](#):

I think we already have a fairly good Python 3 support, since on a recent msys2 there is no Python 2 available?

I agree we seem to be in good shape so this is not about our code or even the developer set ups. I am concerned about user set ups and considering the effect on them.

Also, will there be a python4, if so do we go through all this again?

One issue is probably the RTEMS Tester. We had some difficulties with the TFTP Server: <https://github.com/msoulier/tftpy/pull/94> The latest tftpy seems to work only with Python 3.5, but not 3.4.

Hmmm.

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

Support for python-config needs to be added. FreeBSD 11.2-RELEASE-p5 has:

```

1 $ find /usr/local/ -name Python.h
2 /usr/local/include/python3.6m/Python.h

```

Notice the *m* in the path. The python-config command gives:

```

1 $ python3-config --includes
2 -I/usr/local/include/python3.6m -I/usr/local/include/python3.6m

```

The RSB should detect and use a suitable the python-config command to find the include paths and to use those paths before looks at default paths.

Original author: sebastian.huber

Author: Chris Johns 2017-11-24T05:25:37.000Z

Original author: sebastian.huber

Solving this problem requires:

1. Capturing the installed headers files with an MD5 checksum so each can be clearly identified in the source tree.
2. Capturing the preinstall view of the process with the install path and a source tree path.
3. Defining the include paths in RTEMS and any macros required to reference the header within that tree.

For each preinstall header we need to collate the source headers and determine what overlaps. With the define directories we want to have we can determine the moves we need. I am getting close to having this data.

Original author: sebastian.huber

In [changeset:"2afb22b7e1ebcbe40373ff7e0efae7d207c655a9/rtems"
2afb22b/rtems]:

```
1 Remove make preinstall
2
3 A speciality of the RTEMS build system was the make preinstall step. It
4 copied header files from arbitrary locations into the build tree. The
5 header files were included via the -Bsome/build/tree/path GCC command
6 line option.
7
8 This has at least seven problems:
9
10 * The make preinstall step itself needs time and disk space.
11
12 * Errors in header files show up in the build tree copy. This makes it
13 hard for editors to open the right file to fix the error.
14
15 * There is no clear relationship between source and build tree header
16 files. This makes an audit of the build process difficult.
17
18 * The visibility of all header files in the build tree makes it
19 difficult to enforce API barriers. For example it is discouraged to
20 use BSP-specifics in the cpukit.
21
22 * An introduction of a new build system is difficult.
23
24 * Include paths specified by the -B option are system headers. This
25 may suppress warnings.
26
27 * The parallel build had sporadic failures on some hosts.
28
29 This patch removes the make preinstall step. All installed header
30 files are moved to dedicated include directories in the source tree.
31 Let @RTEMS_CPU@ be the target architecture, e.g. arm, powerpc, sparc,
32 etc. Let @RTEMS_BSP_FAMILY@ be a BSP family base directory, e.g.
33 erc32, imx, qorIQ, etc.
34
35 The new cpukit include directories are:
36
37 * cpukit/include
38
39 * cpukit/score/cpu/@RTEMS_CPU@/include
40
41 * cpukit/libnetworking
42
43 The new BSP include directories are:
44
45 * bsps/include
46
47 * bsps/@RTEMS_CPU@/include
48
49 * bsps/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@/include
50
```

(continues on next page)

(continued from previous page)

```

51 There are build tree include directories for generated files.
52
53 The include directory order favours the most general header file, e.g.
54 it is not possible to override general header files via the include path
55 order.
56
57 The "bootstrap -p" option was removed. The new "bootstrap -H" option
58 should be used to regenerate the "headers.am" files.
59
60 Update #3254.

```

4.2.1.428 3626 - sigtimedwait() needed when POSIX is disabled

Id	3626
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2018-11-27T14:45:01.000Z
Updated	2018-11-30T14:37:09.000Z
Milestone	5.1
Labels	api::posix, priority::high, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3626
Merges	0

When POSIX is disabled, psxmsgq01 does not link. Should we enable sigtimedwait() when POSIX is disabled or disable this test?

```

1 /data/home/joel/rtems-work/tools/5/bin/./lib/gcc/powerpc-rtems5/7.3.0/../../../../
  ↳/powerpc-rtems5/bin/ld: psxmsgq01/psxmsgq01-init.o: in function `wait_for_signal
  ↳':
2 /home/joel/rtems-work/rtems-testing/rtems/build-powerpc-ss555-rtems/powerpc-
  ↳rtems5/c/ss555/testsuites/psxtests/../../../../rtems/c/src/../../../../
  ↳testsuites/psxtests/psxmsgq01/init.c:932: undefined reference to `sigtimedwait'

```

Author: Trac Migrate 2018-11-28T06:15:05.000Z

I would not enable signals by default. The signal implementation in RTEMS is quite bad.

The test should be only enabled if the POSIX API is enabled.

Author: Joel Sherrill 2018-11-29T22:35:32.000Z

This is weirder than it seems. Only these BSPs fail to build:

m68k-mcf5206elite m68k-mcf52235 m68k-mrm332 moxie-moxiesim powerpc-haleakala powerpc-mpc8260ads powerpc-qemuppc powerpc-qoriq_e6500_64 powerpc-ss555

I have built every BSP and those fail. Why only those?

And I don't disagree about no signals with POSIX is disabled. But you can't disable the entirety of psxmsgq01. It tests a lot more than just mq_notify().

Author: Joel Sherrill 2018-11-29T23:40:03.000Z

Looks like not enough is disabled based on POSIX API being unavailable. I have ss555 building and will build all overnight to see if that resolves it. ss555 does have a gcc option for no-inline set. I wonder if the others do also. Maybe a weird optimization difference leaving the method in

Original author: sebastian.huber

There are currently two implementations of a block device (disk). Deprecate the legacy `rtems_disk_create_phys()`, etc. implementation. Remove all RTEMS internal uses except in the `block01` test. Add `RTEMS_DEPRECATED` attribute to API.

Original author: Kevin Gordon

Cloned from [#3195](#):

Consider the following example using ELF .o files from compiled source files module-0.c and module-1.c from ticket [#3194](#):

module-0.o is loaded using dlopen() with no code or data dependencies. module-1.o is loaded using dlopen() with both code and data dependencies on module-0 which are resolved by RTL.

The RTL function dlclose() returns no error when module-0 is unloaded, when it should return an error and not unload module-0. This becomes quite dangerous because a subsequent call to module1Function1() in the currently-loaded module-1.o, which accesses shared_resource_0[] and calls module0Function0(), will result in an unexpected trap on qemu or the call succeeding with the correct return value on hardware when it should not.

The erroneous successful unload() of module-0 aside, it appears as though the resources are not actually deleted and I believe this ticket is related to tickets [#3192](#) and [#3194](#).

Architecture is sparc-leon3 using both the RTEMS 4.11.1 public release and rtems master [@f043b9bd3bf25626fb1a311dd7fa041eacc68adc](#) with rtems-source-builder [@55f2d69e9b67cde23d61375fa34ef5b0f04a985d](#).

Execution environments are qemu-system-sparc and LEON3 UT700 hardware.

Cloned from [#3527](#):

By default GCC puts uninitialized global variables into a common section in the ELF file. When attempting to load the resulting ELF file at runtime using `dlopen()`, these global symbols are not resolved as expected.

The RTL reports unresolved symbols, and runtime code that take the address of the global get NULL instead.

This is reproducible using the libtests/dl01 example by adding a global variable to the module code. I will attach a patch that replicates the issue.

Test platform is QEMU using pc686 BSP, RTEMS source version 4.11.3 (latest on 4.11 git branch as of this writing)

In [changeset:"803eac954ed7a3481c6af9b020d5d25419d3a19d/rtems" 803eac9/rtems]:

```

1 libdl: Manage the allocation of common uninitialised variables.
2
3 The use of separate text and data results in uninitialised variables
4 being placed in the common section. There is no section in ELF for
5 the common variables so the loader needs to create the section and
6 allocate the variables in that section. This patch does that.
7
8 The patch adds a second pass over the symbols.
9
10 The issue can also be seen as a section 65522 error.
11
12 Updates #3604

```

The m32c architecture port is incomplete, e.g. important features such as interrupt support are missing. It never run on real hardware. The tools are out dated and unmaintained. There are no known users:

Cygwin no longer has libtermcap. gdb/sim/erc32 needs a patch to find libncurses. Upstream gdb patch already merged.

<https://sourceware.org/git/gitweb.cgi?p=binutils-gdb.git;a=commitdiff;h=c1230d1bab8e36e1aa40f3bbadcef9b5d9ddc041>

This ticket is just to contain a patch that applies cleanly to gdb 8.0.1 and to track adding that patch to the RSB.

Original author: sebastian.huber

We already use GCC in-tree libraries for MPFR, MPC, GMP and zlib. Use them also for CLoog and ISL. This helps to ensure that the same target code is generated across host systems. It also

helps to avoid GCC build issues in case future versions of ISL and CLooG available on the host system are incompatible to the GCC version picked up by the RSB for RTEMS.

Author: Trac Migrate 2018-11-05T07:12:29.000Z

Original author: sebastian.huber

Since GCC 5 the CLooG library is no longer necessary.

The `%{_tmproot}` path is currently based on a `BuildRoot` setting in the build configuration files. The line is:

```
1 BuildRoot: %[_tmppath]/%{name}-root-%(%{__id_u} -n)
```

This is for a shared `$TEMP` path plus the name is not shortened so on Windows these paths become long. Remove the `BuildRoot` from all configuration files and add support for a shortened temporary path. Windows needs short paths due to the 256 max. path length issue.

Author: Trac Migrate 2018-11-05T04:47:51.000Z

Jiri has suggested that the patches used in the RSB that are hosted by him be moved to rtems.org and the RSB patches link be changed.

This impacts at least qemu.

Author: Chris Johns 2018-04-25T02:21:41.000Z

Please avoid personal directories on `ftp.rtems.org`. There are no other accessible paths on that host.

You can use a ticket and attachments. I cannot see a way to get a txt version of our mailing list archives.

Author: Chris Johns 2018-10-19T00:19:07.000Z

Can someone else please handle this?

Author: Joel Sherrill 2018-10-23T17:05:31.000Z

I only see this one patch referencing Jiri's servers:

```
1 ./tools/rtems-gdb-7.12-1.cfg:%patch add gdb https://gaisler.org/gdb/gdb-
  ↪7.12.1-sis-leon2-leon3.diff
```

The current rtems-gdb-8.0.1-1.cfg references a ticket attachment.

```
1 %patch add gdb https://devel.rtems.org/raw-attachment/ticket/3460/gdb-8.
  ↪0.1-sis-leon2-leon3.diff
```

Is it OK to close this since the current sparc/gdb build doesn't touch his server?

Author: Chris Johns 2018-10-23T21:48:12.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

Yes it is fine to close this ticket, I will do it. I will clean out the configs on the 5 branch when it is created.

```

1 timecounter: Merge FreeBSD change r282424
2
3 Implement a mechanism for making changes in the kernel<->driver PPS_
  ↳ interface without breaking ABI or API compatibility with existing_
  ↳ drivers.
4
5 The existing data structures used to communicate between the kernel and
6 driver portions of PPS processing contain no spare/padding fields and no
7 flags field or other straightforward mechanism for communicating changes
8 in the structures or behaviors of the code. This makes it difficult to
9 MFC new features added to the PPS facility. ABI compatibility is
10 important; out-of-tree drivers in module form are known to exist. (Note
11 that the existing api_version field in the pps_params structure must
12 contain the value mandated by RFC 2783 and any RFCs that come along_
  ↳ after.)
13
14 These changes introduce a pair of abi-version fields which are filled in
15 by the driver and the kernel respectively to indicate the interface
16 version. The driver sets its version field before calling the new
17 pps_init_abi() function. That lets the kernel know how much of the
18 pps_state structure is understood by the driver and it can avoid using
19 newer fields at the end of the structure that it knows about if the_
  ↳ driver
20 is a lower version. The kernel fills in its version field during the_
  ↳ init
21 call, letting the driver know what features and data the kernel_
  ↳ supports.
22
23 To implement the new version information in a way that is backwards
24 compatible with code from before these changes, the high bit of the
25 lightly-used 'kcmode' field is repurposed as a flag bit that indicates_
  ↳ the
26 driver is aware of the abi versioning scheme. Basically if this bit is
27 clear that indicates a "version 0" driver and if it is set the driver_
  ↳ abi
28 field indicates the version.
29
30 These changes also move the recently-added 'mtx' field of pps_state from
31 the middle to the end of the structure, and make the kernel code that_
  ↳ uses
32 this field conditional on the driver being abi version 1 or higher. It
33 changes the only driver currently supplying the mtx field, usb_serial,_
  ↳ to
34 use pps_init_abi().

2
3 Hide the boottime and boottimebin globals, provide the getboottime(9)
4 ↪ and getboottimebin(9) KPI. Change consumers of boottime to use the
5 ↪ KPI. The variables were renamed to avoid shadowing issues with local
6 ↪ variables of the same name.
7
8
9 Issue is that boottime* should be adjusted from tc_windup(), which
10 requires them to be members of the timehands structure. As a
11 preparation, this commit only introduces the interface.
12
13
14 Some uses of boottime were found doubtful, e.g. NLM uses boottime to
15 identify the system boot instance. Arguably the identity should not
16 change on the leap second adjustment, but the commit is about the
17 timekeeping code and the consumers were kept bug-to-bug compatible.

```

1 timecounter: Merge FreeBSD change r304285
2
3 Implement userspace gettimeofday(2) with HPET timecounter.
4
5 Right now, userspace (fast) gettimeofday(2) on x86 only works for
6 RDTSC. For older machines, like Core2, where RDTSC is not C2/C3
7 invariant, and which fall to HPET hardware, this means that the call

```

(continues on next page)

(continued from previous page)

```

8 has both the penalty of the syscall and of the uncached hw behind the
9 QPI or PCIe connection to the sought bridge. Nothing can be done
10 against the access latency, but the syscall overhead can be removed.
11 System already provides mappable /dev/hpetX devices, which gives
12 straight access to the HPET registers page.
13
14 Add yet another algorithm to the x86 'vdso' timehands. Libc is updated
15 to handle both RDTSC and HPET. For HPET, the index of the hpet device
16 to mmap is passed from kernel to userspace, index might be changed and
17 libc invalidates its mapping as needed.
18
19 Remove cpu_fill_vdso_timehands() KPI, instead require that
20 timecounters which can be used from userspace, to provide
21 tc_fill_vdso_timehands{,32}() methods. Merge i386 and amd64
22 libc/<arch>/sys/__vdso_gettc.c into one source file in the new
23 libc/x86/sys location. __vdso_gettc() internal interface is changed
24 to move timecounter algorithm detection into the MD code.
25
26 Measurements show that RDTSC even with the syscall overhead is faster
27 than userspace HPET access. But still, userspace HPET is three-four
28 times faster than syscall HPET on several Core2 and SandyBridge
29 machines.

2
3 When the RTC is adjusted, reevaluate absolute sleep times based on the_
4 ↪RTC
5
6 POSIX 2008 says this about clock_settime(2):
7
8 If the value of the CLOCK_REALTIME clock is set via clock_settime(),
9 the new value of the clock shall be used to determine the time
10 of expiration for absolute time services based upon the
11 CLOCK_REALTIME clock. This applies to the time at which armed
12 absolute timers expire. If the absolute time requested at the
13 invocation of such a time service is before the new value of
14 the clock, the time service shall expire immediately as if the
15 clock had reached the requested time normally.
16
17 Setting the value of the CLOCK_REALTIME clock via clock_settime()
18 shall have no effect on threads that are blocked waiting for
19 a relative time service based upon this clock, including the
20 nanosleep() function; nor on the expiration of relative timers
21 based upon this clock. Consequently, these time services shall
22 expire when the requested relative interval elapses, independently
23 of the new or old value of the clock.
24
25 When the real-time clock is adjusted, such as by clock_settime(3),
26 wake any threads sleeping until an absolute real-clock time.
27 Such a sleep is indicated by a non-zero td_rtcgen. The sleep functions
28 will set that field to zero and return zero to tell the caller
29 to reevaluate its sleep duration based on the new value of the clock.
30
31 At present, this affects the following functions:

```

(continues on next page)

Whoops, Joel closed this. I need to test the fix implemented in [#3557](#) to make sure no developers that do not have an account on trac receive an email.

4.2.1.447 3382 - Testsuite Makefile merge to one per group of tests

Id	3382
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2018-04-05T02:46:39.000Z
Updated	2018-10-19T00:30:39.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, rtems::build, ticket-type::enhancement, version::5

Merges	0

Merge the nested Makefile.am files into a single file per group of tests.

A single Makefile.am for all tests is not practical at this point in time because a test is an estimated 7 lines and with over 750 tests this means the file would be too big and a conflict hot spot.

Because there are no native tools in the RTEMS tree anymore, the RTEMS install point will not have a bin/ directory. If the `--rtems-tools` and `--rtems` directories are different, the sanity check by `_waf configure` for `${rtems}/bin` fails. See examples-v2.

```

1 + ./waf configure -v --rtems=/home/joel/rtems-work/bsp-install --rtems-tools=/
  ↳home/joel/rtems-work/tools/5 --rtems-bsps=powerpc/qemuppc
2 Setting top to                               : /home/joel/rtems-work/examples-v2
3 Setting out to                              : /home/joel/rtems-work/examples-v2/build

```

(continues on next page)

(continued from previous page)

```

4 RTEMS path is not valid. No bin directory found.
5 (complete log in /home/joel/rtems-work/examples-v2/build/config.log)

```

Command line defines defined by the build system make it difficult get a consistent view of the sources from other entities, e.g. static code analysis, code editors and reviews.

Command line defines are currently used here:

```

1 c/src/lib/libbsp/mips/hurricane/Makefile.am:libbsp_a_CPPFLAGS = $(AM_CPPFLAGS) -
  ↳ DRM52XX
2 c/src/lib/libbsp/mips/rbtx4938/Makefile.am:libbsp_a_CPPFLAGS = $(AM_CPPFLAGS) -
  ↳ DTX49
3 c/src/lib/libbsp/mips/jmr3904/Makefile.am:libbsp_a_CPPFLAGS = $(AM_CPPFLAGS) -
  ↳ DTX39
4 cpukit/pppd/Makefile.am:libpppd_a_CPPFLAGS = $(AM_CPPFLAGS) -D__BSD_VISIBLE -I
  ↳ $(srcdir)/../libmd
5 cpukit/libfs/Makefile.am:libjffs2_a_CPPFLAGS += -D__ECOS
6 cpukit/libfs/Makefile.am:libjffs2_a_CPPFLAGS += '-DKBUILD_MODNAME="JFFS2"'
7 cpukit/mghttpd/Makefile.am:# libmghttpd_a_CPPFLAGS += -DHAVE_MD5
8 cpukit/mghttpd/Makefile.am:libmghttpd_a_CPPFLAGS += -DNO_SSL -DNO_POPEN -DNO_CGI -
  ↳ DUSE_WEBSOCKET
9 cpukit/librpc/Makefile.am:librpc_CPPFLAGS = -D_RPC_read=read -D_RPC_write=write -
  ↳ D_RPC_close=close \\
10 cpukit/libnetworking/Makefile.am:libnetworking_CPPFLAGS = -DINET -DNFS \\
11 cpukit/libnetworking/Makefile.am:libc_CPPFLAGS = -DNO_POLL -DNOSELECT -D__BSD_
  ↳ _VISIBLE -D_THREAD_SAFE
12 cpukit/libnetworking/Makefile.am:lib_CPPFLAGS = -DNO_POLL -DNOSELECT
13 cpukit/libnetworking/Makefile.am:lib_a_CPPFLAGS = $(AM_CPPFLAGS) $(lib_CPPFLAGS) -
  ↳ D__BSD_VISIBLE
14 cpukit/libdl/Makefile.am:libdl_a_CPPFLAGS = $(AM_CPPFLAGS) -DRTEMS_RTL_RAP_
  ↳ _LOADER=1 -DRTEMS_RTL_ELF_LOADER=1

```

Original author: sebastian.huber

What are you thinking of doing?

Author: Trac Migrate 2018-03-27T06:18:03.000Z

Original author: sebastian.huber

Move the defines to a header file.

Author: Joel Sherrill 2018-03-27T23:09:52.000Z

Original author: sebastian.huber

For places where the source comes from other places (e.g. JFFS2, etc), what's the approach that doesn't modify the upstream source?

Author: Trac Migrate 2018-03-28T05:02:03.000Z

Original author: sebastian.huber

We just have to be careful to avoid potential conflicts with upstream merges. JFFS2 is the only area with an active upstream.

Author: Chris Johns 2018-03-28T23:25:38.000Z

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

We just have to be careful to avoid potential conflicts with upstream merges. JFFS2 is the only area with an active upstream.

This looks like ppc403 and ppc405 are both defined but I am not seeing source of the ppc405 definition. The warning is in this section of code:

```
if defined (ppc403)
```

```
define exisr 0x040 /* DCR: external interrupt status register */
```

```
define exier 0x042 /* DCR: external interrupt enable register */
```

```
endif /* ppc403 */
```

```
if defined(ppc405)
```

```
define exisr 0x0C0 /* DCR: external interrupt status register */
```

```
define exier 0x0C2 /* DCR: external interrupt enable register */
```

```
endif /* ppc405 */
```

Some ppc* defines are RTEMS-specific GCC built-in defines.

Author: Joel Sherrill 2018-10-14T00:52:17.000Z

We discussed removing this BSP on the mailing list. Is the resolution of this ticket to refer to a ticket to remove this BSP before 5.1 and close this as won't fix?

Author: Joel Sherrill 2018-10-13T22:34:50.000Z

- **Owner** set to @joel
- **Status** changed from *new* to *assigned*

Author: Joel Sherrill 2018-10-14T20:52:58.000Z

With the Makefile.inc system, all tests build successfully and this is the command sequence for hello_world_c

```
1 mips-rtems5-gcc --pipe -B/home/joel/rtems-work/tools/5/bsp-install/mips-
  ↪ rtems5/rbtx4925/lib/ -specs bsp_specs -qrtems -Wall -O2 -g -fomit-
  ↪ frame-pointer -ffunction-sections -fdata-sections -mips3 -G0 -EL ↪
  ↪ -c -o o-optimize/test.o test.c
2 mips-rtems5-gcc --pipe -B/home/joel/rtems-work/tools/5/bsp-install/mips-
  ↪ rtems5/rbtx4925/lib/ -specs bsp_specs -qrtems -Wall -O2 -g -fomit-
  ↪ frame-pointer -ffunction-sections -fdata-sections -mips3 -G0 -EL ↪
  ↪ -Wl,--gc-sections -mips3 -G0 -EL -o o-optimize/hello.exe o-
  ↪ optimize/test.o
```

With the following waf command, the configure fails:

```
1 ./waf configure --rtems=/home/joel/rtems-work/tools/5/bsp-install \
2 --rtems-tools=/home/joel/rtems-work/tools/5 --rtems-bsps=mips/rbtx4925
```

The test probe gcc is this:

```
1 [' /home/joel/rtems-work/tools/5/bin/mips-rtems5-g++', '-qrtems', '-B/
  ↪ home/joel/rtems-work/tools/5/bsp-install/mips-rtems5/lib/', '-B/home/
  ↪ joel/rtems-work/tools/5/bsp-install/mips-rtems5/rbtx4925/lib/', '--
  ↪ specs', 'bsp_specs', '-mips3', '-mips3', '-fomit-frame-pointer', '-
  ↪ fomit-frame-pointer', '-ffunction-sections', '-ffunction-sections', '-
  ↪ fdata-sections', '-fdata-sections', 'test.cpp.1.o', '-o/home/joel/
  ↪ rtems-work/examples-v2/build/.conf_check_
  ↪ 2580b0f878d416be57b9cf3634e02230/testbuild/testprog', '-Wl,-Bstatic',
  ↪ '-Wl,-Bdynamic']
2 err: /home/joel/rtems-work/tools/5/lib/gcc/mips-rtems5/7.3.0/../../../../
  ↪ /mips-rtems5/bin/ld: /home/joel/rtems-work/tools/5/bsp-install/mips-
  ↪ rtems5/rbtx4925/lib/start.o: compiled for a little endian system and
  ↪ target is big endian
```

Notice the -G0 and -EL (or -EB) are missing.

```

Author: Chris Johns 2018-04-18T01:15:58.000Z

Ouch, I will need to think about this one because rtems-ld does not know about mutilib configurations and the BSP has -mips3 -EL as options to the linker.

Author: Chris Johns 2018-04-18T01:28:13.000Z

Looking at the `rtemstoolkit/rld-cc.cpp` function `get_library_path()` is asking gcc for the path to a library and if this is being used it may be a simple matter of adding the `CFLAGS` or `CPU_FLAGS` to `rtems-ld`.

I suspect `-E` will need to be added to the flag filter list so as a machine flag.

Original author: JustinP

On Ubuntu 18.04.1 LTS there is no command named Python. I have the following Python commands:

```

1 python2.7    python3.6    python3.6m-config
2 python3m-config  python 2.7-config    python3.6-config    python3-config
  ↳python3
3 python3.6m      python3m

```

I am going to symlink python2.7 to python to make it work, but there should be a better solution.

As of March 30, the compiler invocations had warnings flags. As of today (4/11), there are no warnings flag on most of the compiler invocations.

Something has been lost in the updates.

Author: Chris Johns 2018-04-12T00:28:12.000Z

Are you able to git bisect and find the commit?

Author: Joel Sherrill 2018-04-18T13:44:07.000Z

I was unable to pin down the commit with a git bisect.

Author: Trac Migrate 2018-09-17T11:32:44.000Z

I started fixing the warnings in libdebugger with the latest tools but apparently some of the variables can't be changed to const char *const. So filing as a ticket so Chris can fix them more accurately.

```

I have noticed all the c-user guide has .. index:: labels after headings and they should be before the headings. They need to be moved to before to make clicking on an index work better. This needs to happen on all documents.

Both coverage and tracing are large enough areas that lumping them into tools or other random categories makes work on them harder to trac.

Please add coverage and tracing. Coverage could be a subcategory of tools. Tracing could be a standalone component. It has target and tool components.

Original author: sebastian.huber

The Telnet service started via `rtems_telnetd_start()` has a `keep_stdio` feature. This just a task and executes the command function in a loop. For this kind of service we do not library support. This can be done by an application task on its own. Remove this functionality and provide only the real Telnet services.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3531
Merges	0

Add programs to report default attributes for various POSIX objects including barriers, condition variables, message queues, mutexes, pthreads, and rwlocks. The programs should be able to run on any POSIX host and report what it uses for object attribute defaults.

Object attribute defaults are unspecified by POSIX. The portable practice is to explicitly set every attribute. These programs allow one to probe and compare various operating system implementations.

4.2.1.471 3465 - Integrate all changes from Linux v3.11 to v4.17 made in the JFFS2 sources

Id	3465
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-07-02T05:40:49.000Z
Updated	2018-10-08T05:16:02.000Z
Milestone	5.1
Labels	filesystem::jffs2, priority::normal, resolution::fixed, tickettype::task, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3465
Merges	0

Original author: sebastian.huber

The original import version of the JFFS2 sources was Linux v3.11 (September 2013). Update the JFFS2 sources to Linux v4.17.

The Git command to generate the patches is:

```
1 git format-patch v3.11..v4.17 -- include/uapi/linux/jffs2.h fs/jffs2/LICENCE fs/
  ↳ jffs2/acl.h fs/jffs2/build.c fs/jffs2/compr.c fs/jffs2/compr.h fs/jffs2/compr_
  ↳ rtime.c fs/jffs2/compr_rubin.c fs/jffs2/compr_zlib.c fs/jffs2/debug.c fs/jffs2/
  ↳ debug.h fs/jffs2/erase.c fs/jffs2/gc.c fs/jffs2/jffs2_fs_i.h fs/jffs2/jffs2_fs_
  ↳ sb.h fs/jffs2/nodelist.c fs/jffs2/nodelist.h fs/jffs2/nodemgmt.c fs/jffs2/read.
  ↳ c fs/jffs2/readinode.c fs/jffs2/scan.c fs/jffs2/summary.h fs/jffs2/write.c fs/
  ↳ jffs2/xattr.h
```

We need a source file transformation in the patches:

```
1 sed -i 's%/fs/jffs2%/cpukit/libfs/src/jffs2/src%g' 00*
```

To support the first commit:

```

Merges	0

Move the `rtems-bsp-builder` configuration files to a common area in the RTEMS Tools project and create an `rtems.py` module to handle the configuration. This allows a number of tools access to the `arch/bsp` data.

In time this directory of data can move into the `rtems.git` repo.

Original author: sebastian.huber

For the SMP support the global construction was changed to use an approach with a thread restart after global construction. With this implementation thread-local objects and POSIX keys initialized during global construction are not present in the initialization thread (main thread). This is not in line with what users familiar with GNU/Linux or FreeBSD would expect. See for example:

<https://lists.rtems.org/pipermail/users/2017-July/031525.html>

4.2.1.479 3516 - sb-set-builder should report disk usage of build

Id	3516
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Chris Johns
Created	2018-09-13T17:09:34.000Z
Updated	2018-09-27T22:18:50.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::defect, ticket-type::enhancement, tool::rtems-source-builder, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3516
Merges	0

Helping others work through the hello world, it is common for their VM images to not have enough disk space for the build to complete. It would be useful if the set-builder could report disk usage of the build/ directory. This information could be fed into the Users Guide.

It is frustrating and a bad experience to watch the build fail 90% of the way through.

I did a sparc tools build and it used 7.9 GB in build/. That probably means you need 12-15GB to have all the sources, rtems, and build RTEMS. Needs to be verified by others and to other architectures.

Author: Chris Johns 2018-09-15T23:38:54.000Z

What do you define as space that needs to be accounted for?

1. The build tree after each package in a build set has been built?
2. Installed files?
3. Source and patches?

Author: Joel Sherrill 2018-09-16T00:00:08.000Z

Replying to [Chris Johns](#):

What do you define as space that needs to be accounted for? 1. The build tree after each package in a build set has been built? 2. Installed files? 3. Source and patches?

Good questions. The ultimate answer is all of that. :)

The build tree peak is a critical piece of information. I saw people run out of disk space during the gcc/newlib phase. If we knew that, our instructions could give guidance. I did a no clean and was left with 8GB in build for SPARC. That's probably harsh if normally each package's build is cleaned. But SPARC now has more multilibs than I expected but arm and powerpc both have a lot also.

The question is "how much do I need to build the tools for architecture X?" That includes source tarballs, git, patches, peak space for untar'ed, and peak build usage. And ideally we want to give advice that leaves people enough room to clone RTEMS and build it.

How can we get the input to give good advice that avoids folks running out of build space during the "getting started"?

Author: Chris Johns 2018-09-16T03:35:55.000Z

I have taken a look at implementing this and it is not easy and complex to do so I do not think I will adding this feature.

The prep, build and clean are all part of a shell script that is generated and run and while I could add some du commands to the script to dump the sizes there is no way to capture the output in a way that can be reported.

I feel it is simpler to create a script to wrap the sb-set-builder command with the --no-clean option and then dump the sizes once built. If this is run on a machine with plenty of storage you should be able to get the results to update the user manual.

Author: Chris Johns 2018-09-17T04:06:24.000Z

Replying to [Chris Johns](#):

I have taken a look at implementing this and it is not easy and complex to do so I do not think I will adding this feature. The prep, build and clean are all part of a shell script that is generated and run and while I could add some du commands to the script to dump the sizes there is no way to capture the output in a way that can be reported.

I have taken a further look and it looks like the clean phase of the script is not being used and the RSB is cleaning a build in Python. This makes implementing something possible. I still need to check all the .cfg files to see if this is true.

The issue is any shell variables defined in one phase could be used in another phase and splitting the scripts means the variables or settings will not seen in subsequent phases.

Author: Chris Johns 2018-09-20T03:20:07.000Z

I am concerned there is another issue which cause the overflow of a VM disk. What is in the 7.9G build directory?

I have a patch I am testing which gives the following output for a rtems-sparc build:

```
1 Build Sizes: usage: 3.661GB total: 2.412GB (sources: 1.472GB, patches: ↵
  ↵6.630MB, installed 955.801MB)
```

The full output is:

```

In [changeset:"38fd56c8a896a52bcab4f8921f67c483e36cf728/rtems-source-builder" 38fd56c/rtems-source-builder]:

```

1 sb: Monitor the build disk usage. Report the usage, total and various
  ↪ sizes
2
3 - Track the size of a build of a package in a build set to determine the
4 maximum amount of disk space used. This can be used as a guide to
5 documenting how much space a user needs to set aside to build a specific
6 set of tools.
7
8 - The `%clean` stage of a build is now split into a separate script.
9 I do not think this is an issue because I could not find any `%clean`
10 sections in any build configs we have. In time support for the
11 `%clean` section will be removed, the package builder cleans up.
12
13 Closes #3516

The MacOS section of the RSB manual has some minor things that need to be fixed:

- says Serria when it should be Sierra (I think).
- has +sb-check+ which indicates a formatting error

Please review as a Mac user and make sure that's it. :)

40c623a8/rtems]:

```

1 powerpc/shared/startup/linkcmds.base: Add wildcards on some sections
2
3 Closes #3307.
```

Author: Trac Migrate 2018-03-07T09:48:06.000Z

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

I reverted [40c623a8/rtems] and built the qorik_e6500_32 with the -fPIC option. I got no linker failures in the test suite.

We should investigate what sections are not recognized before we add dangerous *.x wildcards.

See also [1fcdd639ee38a990e629fdaa670eeda9faae9beb/rtems].

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3432
Merges	0

This scheduler was the first SMP scheduler added. It was created to have an easy SMP scheduler to debug. This was especially important when all of the SMP modifications and support were new. A Simple Scheduler has a use case as a low resource alternative for small uniprocessor systems. But the SMP variant just doesn't seem to have a good use case. If you have an SMP system, the application is almost certain to have enough resources where the more complicated data structures used by the other schedulers wouldn't be a burden. The Deterministic Priority Scheduler uses ~3K for FIFO with 256 priorities. This should not be an issue for an SMP system.

This ticket is a proposal to remove this as no longer having a use case.

Author: Trac Migrate 2018-05-25T07:59:43.000Z

Please don't remove this scheduler. I may change it a bit to support also the simple one-to-one and one-to-all thread processor affinities. It uses very simple data structures which yield a small object code size. Even big SMP machines may have a small L1 cache.

Author: Trac Migrate 2018-09-17T11:34:20.000Z

- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

This scheduler implementation should not be removed. It is useful in clustered scheduler scenarios.

4.2.1.487 3176 - __getreent in libc.a and generated by confdefs.h

Some applications are getting duplicate symbol definitions for `__getreent()`. One of the examples-v2 programs is doing this. It is because there are two bodies for this method – one from `confdefs.h` and another from `newlib`.

<https://sourceware.org/ml/newlib/2017/msg01020.html> addresses the issues and needs to be incorporated by the RSB.

<https://sourceware.org/ml/newlib/2017/msg01019.html> is a cleanup that was spotted at the same time. It can be picked up by a newlib snapshot.

Author: Joel Sherrill 2017-10-11T10:31:43.000Z

- **Milestone** set to %”4.12.0”

This needs to be fixed for 4.12. I haven’t checked if this is also needed for 4.11. If 4.11 confdefs.h defines `__getreent()`, then it has the bug also.

Merges	0

Original author: sebastian.huber

RTEMS uses currently a signed 32-bit integer for `time_t` on Newlib. Thus, it is affected by the year 2038 problem. There are only 22 years left and this time span is within the realistic time frame of some RTEMS applications that are developed now.

The `time_t` should be changed to `int64_t` in Newlib. To make sure that all integer operations are carried out properly I suggest to temporarily do this

```

{{{#include <sys/_stdint.h>
typedef struct { __int64_t _val; } time_t;
static inline time_t _time_add(time_t a, time_t b) { time_t r = { a._val + b._val }; return r; }
static inline time_t _time_sub(time_t a, time_t b) { time_t r = { a._val - b._val }; return r; }
static inline time_t _time_mul(time_t a, time_t b) { time_t r = { a._val * b._val }; return r; }
static inline time_t _time_div(time_t a, time_t b) { time_t r = { a._val / b._val }; return r; } }}}

```

Make sure that RTEMS and Newlib build with this. Add test cases to highlight the `time_t` integer limits.

Author: Trac Migrate 2016-03-07T06:59:51.000Z

Original author: sebastian.huber

`_time_t` 's required to be an integer or floating-point type by POSIX: <http://pubs.opengroup.org/onlinepubs/009696699/basedefs/sys/types.h.html>

Author: Trac Migrate 2016-03-07T07:02:49.000Z

Original author: sebastian.huber

Yes, this is why I wrote temporarily. Once we are reasonably sure that all the integer operations are all right, we use

```
1 typedef __int64_t time_t
```

I am not sure if we should keep the inline functions for clarity.

Author: Chris Johns 2016-03-07T23:01:46.000Z

Original author: sebastian.huber

What do you mean by “all integer operations are carried out properly”? How do you decide everything is done properly?

Is this specific to RTEMS and 3rd party code such as gcc and newlib RTEMS depends on?

What happens to code such as `cpukit/ftpd/ftpd.c:1193` or `cpukit/libfs/src/jffs2/src/fs-rtems.c:1053`? The JFFS has `time_t` in its struct `iattr` and I am not sure if this is embedded in the file system in the flash. The RFS has a special type for time in the inode on disk.

Author: Joel Sherrill 2016-03-07T23:11:34.000Z

Original author: sebastian.huber

I don't see the value of adding helper methods. Much of the code impacted would have to be altered to use them. Internal code using 64-bit `time_t` should just work. The issue is where there are interfaces to other representations or storage systems.

Analyse the cases Chris mentions, ask on newlib if there are any known places to be concerned about, and just try it.

Adding use of non-standard helper functions on a standard type is just extra work.

Author: Trac Migrate 2016-03-08T16:58:06.000Z

Original author: sebastian.huber

I didn't assign the ticket to me because I don't work actively on this topic. Its a ticket to collect some ideas.

I just want to point out that its not as simple as "typedef __uint64_t time_t".

Joel, how would you ensure that you don't accidentally use maybe a long for `time_t` arithmetic in Newlib and RTEMS?

4.2.1.491 2576 - arm/lpc176x: linker script update (add KEEP() sections)

Id	2576
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2016-02-06T16:24:07.000Z
Updated	2018-09-14T19:03:46.000Z
Milestone	5.1
Labels	arch:arm, bsp, priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/2576
Merges	0

This BSP's linker script does not include KEEP() directives and thus cannot have per-function and per-data element section support enabled.

The preferred solution is to convert the BSP to use a shared base linker script. The acceptable solution is to add the proper KEEP directives to the existing linker script(s).

Shared linker scripts for the arm, m68k, and sparc have the proper KEEP sections and can serve as examples.

Author: Trac Migrate 2016-02-06T16:26:47.000Z

In changeset e41d8ce5a764d57952102009ff1c5e5ace69a1c8:

arm/.../lpc1768_embed.cfg: Disable per function sections updates
#2576.

Author: Trac Migrate 2016-03-17T20:12:25.000Z

I looked into the linkerscript and it uses the shared for all arm's, which uses KEEP directives. Then I tested this BSP enabling the flags, and samples work ok:

hello.exe : section size addr .start 772 0 .text 79136 776 .rodata 4152 79936 .vector 1256 268435456 .data 1656 268436712 .bss 5656 268438368

With flags: hello.exe : section size addr .start 772 0 .text 61424 776 .rodata 3512 62224 .vector 1256 268435456 .data 1604 268436712 .bss 5592 268438336

And the same for the other samples.

Author: Trac Migrate 2016-03-22T14:51:04.000Z

I suggest to apply the linker flags and deprecate this bug

Original author: sebastian.huber

FreeBSD started to use lock-free data structures (Concurrency Kit) with epoch based reclamation (EBR) in May 2018. The goal of this synchronization approach is to avoid atomic read-modify-write operations in the fast path. The algorithms need highly efficient access to per-processor data. This gives raise to add a new feature to RTEMS: thread to processor pinning. Thread pinning is orthogonal to thread processor affinity and overrules the processor affinity settings of a thread. It is intended for temporary use in short critical sections which allow preemption.

Merges	0

The PDF generated documents have an empty index.

Author: Chris Johns 2018-08-21T02:14:12.000Z

We cannot have a `genindex.rst` file, the documentation reserves this for a generated file. Removing the `genindex` entry from the TOC of a document results in the PDF having an index. Removing the `genindex` entry from the TOC removes the index from the HTML generated output.

The solution is to specialize the HTML template however the template processing in `common` and `common/waf.py` looks broken. The path in `common/conf.py` is a build path that is not present and the common templates are copied into each docs HTML build tree and the path in the file is relative to the top directory.

Author: Trac Migrate 2018-08-21T03:48:28.000Z

- **Resolution** set to ~"fixed"

4.2.1.502 3496 - Remove superfluous interrupt enable in _Thread_Dispatch_enable()

Id	3496
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-08-10T05:08:18.000Z
Updated	2018-08-20T06:37:24.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, rtems::score, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3496
Merges	0

Original author: sebastian.huber

The `_Thread_Dispatch_enable()` contains a superfluous interrupt enable. This bug had probably no effect since the interrupt enable is idempotent on all CPU ports.

```

1 RTEMS_INLINE_ROUTINE void _Thread_Dispatch_enable( Per_CPU_Control *cpu_self )
2 {
3   uint32_t disable_level = cpu_self->thread_dispatch_disable_level;
4
5   if ( disable_level == 1 ) {
6     ISR_Level level;
7
8     _ISR_Local_disable( level );
9
10    if (
11      cpu_self->dispatch_necessary
12      #if defined(RTEMS_SCORE_ROBUST_THREAD_DISPATCH)
13      || !_ISR_Is_enabled( level )
14      #endif
15    ) {
16      _Thread_Do_dispatch( cpu_self, level ); <-- This function enabled interrupts
17    } else {
18      cpu_self->thread_dispatch_disable_level = 0;
19      _Profiling_Thread_dispatch_enable( cpu_self, 0 );
20    }
21
22    _ISR_Local_enable( level ); <-- Here we enable it again

```

(continues on next page)

(continued from previous page)

```

23 } else {

4.2.1.503 3502 - PL111_LCD_CONTROL_LCD_BPP_16 Redefined

Id	3502
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2018-08-14T23:31:03.000Z
Updated	2018-08-20T06:36:58.000Z
Milestone	5.1
Labels	arch:arm, priority::normal, resolution::fixed, tickettype::defect, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3502
Merges	0

The constant `PL111_LCD_CONTROL_LCD_BPP_16` is defined twice in the file `bsp/arm/include/bsp/arm-pl111-regs.h`:

```
define PL111_LCD_CONTROL_LCD_BPP_16 0x04U
```

```
define PL111_LCD_CONTROL_LCD_BPP_24 0x05U
```

```
define PL111_LCD_CONTROL_LCD_BPP_16 0x06U
```

```
define PL111_LCD_CONTROL_LCD_BPP_12 0x07U
```

Given the context, I am guessing the first one should be BPP_32 but since Sebastian added the file, I am assuming he has docs and can answer this question for sure.

Merges	0

Two files define the MSR_RI macro. Since one is a register name on the PowerPC, this shows up on 48 PowerPC BSPs. This is one example.

```
log/powerpc-qoriq_e6500_64.log:.././.././../././rtems/c/src/./../cpukit/dev/serial/sc16is752-
regs.h:117:0: warning: “MSR_RI” redefined log/powerpc-qoriq_e6500_64.log:
#define MSR_RI (1u << 6) log/powerpc-qoriq_e6500_64.log: #de-
fine MSR_RI (1<<1) /* Recoverable Exception / log/powerpc-
qoriq_e6500_64.log:.././.././../././rtems/c/src/./../cpukit/dev/serial/sc16is752-regs.h:117:0:
warning: “MSR_RI” redefined log/powerpc-qoriq_e6500_64.log: #define MSR_RI (1u << 6)
log/powerpc-qoriq_e6500_64.log: #define MSR_RI (1<<1) / Recoverable Exception */
```

Author: Joel Sherrill 2018-08-14T23:23:52.000Z

- **Owner** set to Christian Mauderer
- **Status** changed from *new* to *assigned*

Assigning to Christian since the git log says he added the file `cpukit/dev/serial/sc16is752-regs.h`

Author: Trac Migrate 2018-08-15T07:41:32.000Z

Also I didn't add the file but only the line in that file, it's quite clearly my responsibility. I was sure that this driver is only used in the ATSAM-BSP. But it seems that it is compiled for every BSP. I'll add a prefix to the register names and send a patch.

Original author: sebastian.huber

Now, that all BSP header files are in

- bsp/include
- bsp/@RTEMS_CPU@/include
- bsp/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@/include

we should also move the BSP sources to this new directory tree. How do we want to organize the BSP sources in bsp/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@?

- include (this is already there, see [#3254](#))
- config
- somebsp.cfg
- start (everything required to run a minimal application without devices)
- start.S
- bspstart.c
- bspsmp.c
- linkcmds
- cache (everything for the cache controller support)
- irq (everything for the interrupt controller support)
- console (everything for the console driver)
- clock (everything for the clock driver)
- i2c (everything for the I2C driver)
- spi (everything for the SPI driver)
- net (legacy network stack drivers)
- mpci (RTEMS_MULTIPROCESSING support)
- rtc (everything for the RTC driver)

- ata (everything for the ATA driver)
- contrib (import of external sources)
- The layout of external sources should be used as is if possible.

Author: Trac Migrate 2018-01-31T11:51:51.000Z

Original author: sebastian.huber

In [changeset:"4cf93658eff5cf6b0c02e98a0d1ec33dea5ed85c/rtems" 4cf93658/rtems]:

```

1 bsps: Rework cache manager implementation
2
3 The previous cache manager support used a single souce file
4 (cache_manager.c) which included an implementation header (cache_.h).
5 This required the use of specialized include paths to find the right
6 header file. Change this to include a generic implementation header
7 (cacheimpl.h) in specialized source files.
8
9 Use the following directories and files:
10
11 * bsps/shared/cache
12
13 * bsps/@RTEMS_CPU@/shared/cache
14
15 * bsps/@RTEMS_CPU@/@RTEMS_BSP_FAMILY/start/cache.c
16
17 Update #3285.
```

6
7 we should also move the BSP sources to this new directory tree. How do_
8 ↪ we want to organize the BSP sources in bsps/@RTEMS_CPU@/@RTEMS_BSP_
9 ↪ FAMILY@?
10
11 * include (this is already there, see #3254)
12 * start (everything required to run a minimal application without_
```

(continues on next page)

(continued from previous page)

```

↳devices)
11 * start.S
12 * bspstart.c
13 * linkcmds
14 * cache.c
15 * smp
16 * bspsmp.c
17 - * dev (Everything device driver related)
18 ?      ^
19
20 + * dev (everything device driver related)
21 ?      ^
22
23 * clock.c
24 * console.c
25 * i2c.c
26 * spi.c
27 * make
28 * somebsp.cfg
29 - * network (legacy network stack drivers)
30 + * net(legacy network stack drivers)
31 * mpci (RTEMS_MULTIPROCESSING support)
32 + * contrib (import of external sources)
33 +   * The layout of external sources should be used as is if possible.
34
35 Explicit directories for smp, network, mpci may make it possible to_
↳automatically generate the Makefile.am with an AM_CONDITIONAL() for_
↳the respective directory.
36
37 The excessive use of subdirectories which contain usually only one file_
↳should be avoided.
38
39 - The layout of external sources should be used as is if possible.
40 -
41 The first step is to move all libcpu sources to
42
43 * bsps/@RTEMS_CPU@/shared, or
44 * bsps/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@.

3 This patch is a part of the BSP source reorganization.
4
5 Update #3285.
```

Author: Trac Migrate 2018-04-13T07:45:53.000Z

Original author: sebastian.huber

I move slowly to the real BSP sources. After some review and effort calculation I propose a new structure for the BSPs in bsp/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@:

- include (this is already there, see [#3254](#))
- make
- somebsp.cfg
- start (everything required to run a minimal application without devices)
- start.S
- bspstart.c
- bspsmc.c
- linkcmds
- cache (everything for the cache controller support)
- irq (everything for the interrupt controller support)
- console (everything for the console driver)
- clock (everything for the clock driver)
- i2c (everything for the I2C driver)
- spi (everything for the SPI driver)
- net (legacy network stack drivers)
- mpci (RTEMS_MULTIPROCESSING support)
- contrib (import of external sources)
- The layout of external sources should be used as is if possible.

This essentially removes the new dev directory of the original proposal and is closer to the existing BSP layout. The existing layout has standard directory names, but the file names vary greatly. This new proposal helps to move the files with less human intervention.

Author: Joel Sherrill 2018-04-13T12:36:21.000Z

Original author: sebastian.huber

I see you are back to moving the contents of make/custom to make/. I still have my local branch where I was well along the path of doing that. I can resurrect it if desired.

Author: Chris Johns 2018-04-14T04:30:25.000Z

Original author: sebastian.huber

I suggest we move away from make to config. Make is an implementation.

Can we please create a doc type file in the bsps to list the directories we allow?

Original author: sebastian.huber

- **Description** changed

```
1 Now, that all BSP header files are in
2
3 * bsp/include
4 * bsp/@RTEMS_CPU@/include
5 * bsp/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@/include
6
7 we should also move the BSP sources to this new directory tree. How do_
8 ↪ we want to organize the BSP sources in bsp/@RTEMS_CPU@/@RTEMS_BSP_
9 ↪ FAMILY@?
10
11 * include (this is already there, see #3254)
12 + * config
13 + * somebsp.cfg
14 * start (everything required to run a minimal application without_
15 ↪ devices)
```

(continues on next page)

(continued from previous page)

```

13 * start.S
14 * bspstart.c
15 + * bspsmp.c
16 * linkcmds
17 + * cache (everything for the cache controller support)
18 + * irq (everything for the interrupt controller support)
19 + * console (everything for the console driver)
20 + * clock (everything for the clock driver)
21 + * i2c (everything for the I2C driver)
22 + * spi (everything for the SPI driver)
23 - * cache.c
24 - * smp
25 - * bspsmp.c
26 - * dev (everything device driver related)
27 - * clock.c
28 - * console.c
29 - * i2c.c
30 - * spi.c
31 - * make
32 - * somebsp.cfg
33 - * net(legacy network stack drivers)
34 + * net (legacy network stack drivers)
35 ?      +
36
37 * mpci (RTEMS_MULTIPROCESSING support)
38 + * rtc (everything for the RTC driver)
39 + * ata (everything for the ATA driver)
40 * contrib (import of external sources)
41 * The layout of external sources should be used as is if possible.
42 -
43 - Explicit directories for smp, network, mpci may make it possible to_
44 ↪ automatically generate the Makefile.am with an AM_CONDITIONAL() for_
45 ↪ the respective directory.
46 -
47 - The excessive use of subdirectories which contain usually only one_
48 ↪ file should be avoided.
49 -
50 - The first step is to move all libcpu sources to
51 -
52 - * bsps/@RTEMS_CPU@/shared, or
53 - * bsps/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@.

```

5
6 This patch is a part of the BSP source reorganization.
7
8 Update #3285.
```

Author: Trac Migrate 2018-04-23T13:19:00.000Z

Original author: sebastian.huber

In [changeset:"37dc0471b278c325cf6181701fd8a4514262b148/rtems" 37dc047/rtems]:

```
1 bsp: Remove AC_CONFIG_SRCDIR()
2
3 This AC_CONFIG_SRCDIR() is just a sanity check in this insane build
4 system. Since all content of
5 c/src/lib/libbsp/@RTEMS_CPU@/@RTEMS_BSP_FAMILY@ is bound to be moved it
6 makes no sense to keep it.
7
8 This patch is a part of the BSP source reorganization.
9
10 Update #3285.
```

Original author: sebastian.huber

Add macros to <rtems/score/basedefs.h> for the GNU extension builtin_expect(). Use RTEMS_PREDICT_TRUE() and RTEMS_PREDICT_FALSE() similar to the FreeBSD predict_true() and predict_false(). Alternatives are the Linux likely() and unlikely() or directly the GCC builtin_expect(), however, the FreeBSD names seem to be the most easy to understand.

We are missing the `const` and `restrict` on the first parameter. This requires a change to `newlib` and `RTEMS`. The correct prototype is:

```
int pthread_mutex_getprioceiling( const pthread_mutex_t *restrict mutex, int *prioceiling )
```

Author: Joel Sherrill 2018-03-14T22:34:10.000Z

- **Owner** set to @joel

Author: Joel Sherrill 2018-03-20T18:45:55.000Z

Change pushed to `newlib`. I have a patch pending for `RTEMS` pending a tool bump.

4.2.1.514 2751 - Thread dispatch via interrupt is broken at least on ARM and PowerPC

Id	2751
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2016-07-01T07:42:38.000Z
Updated	2018-06-29T09:58:41.000Z
Milestone	5.1
Labels	cpukit, priority::high, priority::normal, resolution::fixed, rtems::score, smp, tickettype::defect, version::4.11
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/2751
Merges	0

Original author: sebastian.huber

The ARM and PowerPC interrupt epilogues call `_Thread_Dispatch()` with interrupts disabled (counter example: SPARC).

On SMP configurations, since inter-processor interrupts set the thread dispatch necessary indicator this prevents a thread dispatch notification in post-switch handlers (which all run with interrupts disabled).

On all configurations, this is a serious issue for the interrupt latency.

4.2.1.516 3320 - Add a simple task console driver

Id	3320
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-03-06T07:07:36.000Z
Updated	2018-06-29T09:53:37.000Z
Milestone	5.1
Labels	device::serial, priority::normal, resolution::fixed, ticket-type::enhancement, version::5
Link	https://gitlab.rtems.org/rtems/rtems/-/issues/3320
Merges	0

Original author: sebastian.huber

The default console driver for tests is the simple console driver. It uses a polled output via `rtems_putc()` done directly in the context of the executing thread. This is a problem for timing sensitive tests. Add a simple task console driver.

```

1 .. index:: CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER
2
3 .. _CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER:
4
5 CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER
6 -----
7
8 CONSTANT:
9 ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER``
10
11 DATA TYPE:

```

(continues on next page)

(continued from previous page)

```

12 Boolean feature macro.
13
14 RANGE:
15 Defined or undefined.
16
17 DEFAULT VALUE:
18 This is not defined by default.
19
20 DESCRIPTION:
21 ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER`` is defined if
22 the application wishes to include the Simple Task Console Device Driver.
23
24 NOTES:
25 This device driver is responsible for providing the :file:`/dev/console`
26 device file. This device is used to initialize the standard input, output,
27 and error file descriptors.
28
29 This device driver reads via ``getchark()``.
30
31 This device driver writes into a write buffer. The count of characters
32 written into the write buffer is returned. It might be less than the
33 requested count, in case the write buffer is full. The write is
34 non-blocking and may be called from interrupt context. A dedicated task
35 reads from the write buffer and outputs the characters via
36 ``rtems_putc()``. This task runs with the least important priority. The
37 write buffer size is 2047 characters and it is not configurable.
38
39 Use ``fsync(STDOUT_FILENO)`` or ``fdatsync(STDOUT_FILENO)`` to drain the
40 write buffer.
41
42 The Termios framework is not used. There is no support to change device
43 settings, e.g. baud, stop bits, parity, etc.
44
45 The
46
47 * ``CONFIGURE_APPLICATION_NEEDS_CONSOLE_DRIVER``,
48
49 * ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_CONSOLE_DRIVER``, and
50
51 * ``CONFIGURE_APPLICATION_NEEDS_SIMPLE_TASK_CONSOLE_DRIVER``
52
53 configuration options are mutually exclusive.

4.2.1.518 3455 - Remove install-if-change script

Id	3455
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-06-15T05:40:58.000Z
Updated	2018-06-18T05:12:45.000Z
Milestone	5.1
Labels	priority::normal, resolution::fixed, tickettype::task, tool, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3455
Merges	0

Original author: sebastian.huber

The last installed tool in RTEMS repository is the install-if-change script. This script does the same as the standard “install” program with an additional feature to install variants via the -V command line option.

This script is used by the standard Makefile support:

```
c/src/make/host.cfg.in:INSTALL_CHANGE=$(PROJECT_BIN)/install-if-change
```

The INSTALL_CHANGE is used by:

```
c/src/make/host.cfg.in:ifndef INSTALL_CHANGE c/src/make/host.cfg.in:INSTALL_CHANGE=$(PROJECT_BIN)
if-change c/src/make/host.cfg.in:INSTALL_VARIANT=$(INSTALL_CHANGE) -V
“$(LIB_VARIANT)”
```

Is the variant stuff still supported?

I would remove the support for it and replace the “install-if-change” script with the standard “install” program.

Author: Trac Migrate 2018-06-15T06:22:33.000Z

Original author: sebastian.huber

The script has no license information.

Author: Joel Sherrill 2018-06-15T06:40:12.000Z

Original author: sebastian.huber

Remove it and uses on technical grounds. The remaining use isn’t enough to even make the lack of license a factor.

Author: Trac Migrate 2018-06-18T05:12:45.000Z

Original author: sebastian.huber

- **Resolution** set to ~”fixed”
- **Status** changed from *assigned* to *closed*

In [changeset:”bac8d934189c02635cca752d36dce1fdad6338b8/rtems”
bac8d934/rtems]:

```
1 tools: Remove install-if-change program
2
3 The last installed tool in RTEMS repository is the install-if-change
4 script. It is not used to build/install BSPs. This script does the
5 same as the standard "install" program with an additional feature to
6 install variants via the -V command line option.
7
8 This script is used by the standard Makefile support:
9
```

(continues on next page)

(continued from previous page)

```

10 c/src/make/host.cfg.in:INSTALL_CHANGE=$(PROJECT_BIN)/install-if-change
11
12 The INSTALL_CHANGE is used by:
13
14 c/src/make/host.cfg.in:ifndef INSTALL_CHANGE
15 c/src/make/host.cfg.in:INSTALL_CHANGE=$(PROJECT_BIN)/install-if-change
16 c/src/make/host.cfg.in:INSTALL_VARIANT=$(INSTALL_CHANGE) -V
17 "$(LIB_VARIANT)"
18
19 Remove the support for variant installation and instead use the standard
20 "install" program. This breaks application Makefiles using the standard
21 Makefile support of RTEMS.
22
23 Close #3455.

```

4.2.1.519 3379 - Remove packhex program

Id	3379
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate

Author: Joel Sherrill 2018-06-15T05:27:50.000Z

Original author: sebastian.huber

Users of this tool cannot use ELF because this is used with boards where you must download in hex formats.

Author: Chris Johns 2018-06-15T05:42:25.000Z

Original author: sebastian.huber

Replying to **Joel Sherrill**:

Users of this tool cannot use ELF because this is used with boards where you must download in hex formats.

If you logically extend this should we support all possible formats users can download? I suggest we do not.

The code is available for users to integrate into their workflow.

Original author: sebastian.huber

This script is horribly out of date. A new version could be placed in RTEMS tools if necessary.

Author: Joel Sherrill 2018-06-13T08:17:24.000Z

Original author: sebastian.huber

I don't disagree with removing this. The question this script is trying to answer is "what's the code space requirement for RTEMS?" This is usually asked as "How big is RTEMS?" The answer is that it depends.

This script produced a report similar to some other RTOS when it was written. But I evolved to think that the linked size of sample reference applications like base_sp, minimum, hello, minimum networking, etc.

A real application will vary in size based on the set of services it uses. Often those services depends on things that add code which we wouldn't consider part of RTEMS. A C++ application with megabytes of code from the C++ Standard Library is large but may use a very small but of code from RTEMS itself. The Qt demos were similar.

Also size varies by architecture, optimization level, gcc version, function section linking, etc.

There is no single answer and no standard guides. So we need to decide what we think is useful, explain it, and watch it.

```

Looks like the -D option from the CPU\_CFLAGS is missing and many of the options are duplicated.

```

1 CPU_CFLAGS = -mcpu=8540 -meabi -msdata=sysv -fno-common $(CPU_CFLAGS_
2 ↪FLOAT) \
3 -D__ppc_generic -mstrict-align

```

**Author:** Chris Johns 2018-05-03T02:25:09.000Z

Thank you, it is what I suspected. There are BSPs where something special or different is happening. It highlights the issue with BSP configurations in a format like make.

If we can collect what we need to have on the CFLAGS in the .pc files I can look at fixing it.

**Author:** Joel Sherrill 2018-05-07T20:07:13.000Z

The underlying problem is that the rtems\_waf application support eats a few gcc arguments that are needed to build applications. In this case it is -Dxxx where xxx is a macro indicating PowerPC type.

The proper solution to this is to ban use of -D in the required BSP CFLAGS. We should not require a -D to be specified on the application command line to either compiler correctly or at all.

This impacts some PowerPC BSPs and defining the expected symbol in bsp.h will work based on this traceback.

```

error: #error "Unsupported CPU Model"
```

^~~~~~

My solution is to move the -D in impacted PowerPC BSPs from CFLAGS (or CPU\_CFLAGS) to bsp.h

**Author:** Chris Johns 2018-05-07T21:04:02.000Z

Replying to [Joel Sherrill](#):

My solution is to move the -D in impacted PowerPC BSPs from CFLAGS (or CPU\_CFLAGS) to bsp.h

I agree, applications should only be required to match some machine related flags to make sure the correct ABI is being used.

**Author:** Trac Migrate 2018-05-08T07:37:02.000Z

There are a couple of BSPs which use -D flags:

```
1 grep -- -D bsps/*/config/*
2 bsps/arm/rtl22xx/config/rtl22xx_t.cfg:#CPU_CFLAGS += -mthumb-interwork -
  ↪ -D __THUMB_INTERWORK__ -mthumb
```

(continues on next page)

Replying to [Sebastian Huber](#):

I don't have time for this ticket at least in the next two weeks.

Is the approach I used on the arm and sparc64 BSPs acceptable? I am testing a similar patch for the PowerPC BSPs. Use BSP\_SETOPTS when variants and AC\_DEFINE when there are no variants.

If so, this will eliminate the use of -Dxxx in .cfg files.

Original author: sebastian.huber

The current `rtems_panic()` implementation is quite heavy weight. It depends on `_exit()` which calls the global destructors. It uses `fprintf(stderr, ...)` for output which depends on an initialized console device and the complex `fprintf()`.

Introduce a new fatal source `RTEMS_FATAL_SOURCE_PANIC` for `rtems_panic()` and output via `printk()`.

Document this function in Fatal Manager chapter.

Replace all `BSP_panic()` with `rtems_panic()`.

Original author: sebastian.huber

Always build network services (tftpfs, ftpfs, ftpd, telnetd, libdebugger) which only depend on the POSIX socket API (provided by Newlib header files) as support libraries. Remove them from libbsd.

The network services must reside in dedicated libraries to avoid a cyclic dependency between libbsd.a and librtemscpu.a.

**Author:** Trac Migrate 2018-05-02T07:59:18.000Z

Original author: sebastian.huber

In [changeset:"dd8e4b760b6b86a49be79f04a29fa7be20e11b92/rtems" dd8e4b7/rtems]:

```
1 libdebugger: Move to separate library
2
3 Always build remote TCP support since it depends only on the POSIX
4 socket API. It works with the legacy network stack and libbsd. Move it
5 to a separate libdebugger.a library to allow an easy use with libbsd via
6 "-ldebugger -lbsd" otherwise we would have a cyclic dependency between
7 libbsd.a and librtemscpu.a.
8
9 Update #3419.

```

**Author:** Chris Johns 2018-05-03T02:21:40.000Z

Original author: sebastian.huber

Does this change require user applications update their list of libraries linked to use the services moved to separate libraries?

**Author:** Trac Migrate 2018-05-03T05:25:55.000Z

Original author: sebastian.huber

Yes, the old network stack already had libftpd.a and libtelnetd.a. In the libbsd it was previously included. The libtftpfs.a and libtftpfs.a are new. The debugger support with libdebugger.a will be new in RTEMS 5.1.

**Author:** Chris Johns 2018-05-03T05:39:58.000Z

examples-v2 fail to compile qemu PPC because linkcmds.base is not installed.

They build OK for sparc/erc32. This must be a minor glitch from the build system changes.

Original author: sebastian.huber

The RTEMS 5 tool set contains the RTEMS tools (rtems-tools). The version of the RTEMS tools is determined by the tool set build time since the current Git master branch is fetched. Instead use an explicit RTEMS tools version (similar to all other tools, e.g. Binutils, Newlib, GCC, GDB) to make the RTEMS tool set independent of the arbitrary build time.

Original author: sebastian.huber

The following code gives a warning with GCC and -std=c++17:

```

1 void f(void)
2 {
3   register int i;
4 }

test.cc: In function \ |md_0_8216|\ void f()\ |md_0_8217|\ :
test.cc:3:15: warning: ISO C++1z does not allow \ |md_0_8216|\ register\ |md_0_
↪8217|\ storage class specifier [-Wregister]
3   register int i;
4   ^

```

Remove the use of the register keyword at least in the public header files for C++ compatibility.

The R\_ARM\_V4BX does not have a symbol and this raised an error with dl06 with a ARMv7 instruction set when merging sections when creating a RAP image.

Ignore this relocation record.

**Author:** Trac Migrate 2018-04-16T01:57:46.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"ec419a05ee52869a7d5b8712ea8e7a7d74fde096/rtems-tools"  
ec419a0/rtems-tools]:

```

1 rtemstoolkit/rap: Ignore R_ARM_V4BX relocation records
2
3 Note, this removes the details needed to alter the instruction for
4 an ARMv4 instruction set. Currently this type of record is not handled
5 in the RAP format loader and the RTL loader ignores it.
6
7 Close #3396

```

1 testsuites/dl06: Add a test for RAP format.
2
3 This test loads a RAP format file that contains calls that are not
4 in the kernel and linked from libm. It uses and test rtems-ld.
5
6 Update #2769

```

**Author:** Chris Johns 2018-04-13T00:30:33.000Z

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

I have add rtems-ld to the testsuite so it and rtems-syms are both run and I cannot see any temp files being left. I wonder if this happens when there is an error?

I am going to close the ticket with invalid and it can be opened again if this appears again.

## 4.2.1.544 3390 - NFS: Remove support for cexp

Original author: sebastian.huber

There is some support for cexp and tests in the NFS client directory:

```
cpukit/libfs/src/nfsclient/src/cexphelp.c          cpukit/libfs/src/nfsclient/src/dirutils.c
cpukit/libfs/src/nfsclient/src/nfs.modini.c        cpukit/libfs/src/nfsclient/src/nfsTest.c
cpukit/libfs/src/nfsclient/src/rpcio.modini.c
```

There are also some \*.rel files installed. This stuff is probably unused. If it is still in use it should move elsewhere, e.g. some general cexp support outside of the main RTEMS sources. Dead/untested code should not be present in the RTEMS code base.

The mhttp's http etag uses the mtime and file length and this can cause subtle issues if a target has no RTC or it is incorrect and files are being copied without preserving the mtime or changes happen that do not change the length.

The cp and untar code do not update a file's time.

Add support for an etag callback so a user can manage the tag, ie MD5 or something similar.

I was updating the md5's to sha512's on qemu and made a typo which resulted in this message:

```

1 reporting: devel/qemu-git-1.cfg -> qemu-42d58e7c6760cb9c55627c28ae538e27dcf2f144-
  ↳x86_64-linux-gnu-1.xml
2 error: qemu-git-1.cfg:57: invalid number of hash args
3 loading: vdeplug
4 get: requires ()

```

The error message did not result in the build aborting. Perhaps this should be a fatal error.

The broken RSB fragment was in qemu-git-1.cfg:

```

1 %patch add qemu %{rtems_http_git}/rtems-tools/plain/tools/qemu/0001-openrisc-
  ↳terminate-qemu-process-upon-receiving-a-hal.patch

Original author: aurelio

When running configure with an incorrect bsp name the script does not cause an error. You can ever run make without getting any warning message.

The script should check the name of the bsp and continue only if it is a valid bsp. On the other hand if the bsp name given by the user is invalid the script should prompt a message.

Original author: enetor

**Background** There are two ways to address a block in RFS: 1. Via a single 32bit block number (bno) 2. Via a group number(gno) and a bit offset (bit) They should be fully convertible (1-1 mapping). In other words, the equation to convert 1 to 2 should be unique within the RFS implementation.

**The bug** The RFS implementation contains two different conversions between 1 and 2.

**Details** 1. In `rtems_rfs_group_bitmap_alloc` (`rtems-rfs-group.c`, line 172)

```
1 bno = gno * group_blocks + bit
```

2. In `rtems_rfs_group_bitmap_alloc` (`rtems-rfs-group.c`, line 228)

```
1 bno = gno * group_blocks + bit + 1 (via rtems_rfs_group_block() function)
```

3. In `rtems_rfs_group_bitmap_free` (`rtems-rfs-group.c`, line 283)

```
1 bno = gno * group_blocks + bit + 1 (RTEMS_RFS_SUPERBLOCK_SIZE)
```

4. In `rtems_rfs_group_bitmap_test` (`rtems-rfs-group.c`, line 332)

```
1 bno = gno * group_blocks + bit
```

To summarize, the implementation contains two ways of converting a bno to a (gno, bit) pair:  
Either:

```
1 bno = gno * group_blocks + bit
```

Or:

```
1 bno = gno * group_blocks + bit + 1
```

**The Fix** The RFS implementation should consistently convert a bno to a (gno, bit) pair with:

```
1 bno = gno * group_blocks + bit + RTEMS_RFS_SUPERBLOCK_SIZE
```

This is because the superblock is not accounted for in the block bitmaps. So places to change:

1. rtems-rfs-group.c: all references to the conversion must be updated to use RTEMS\_RFS\_SUPERBLOCK\_SIZE explicitly.
2. rtems\_rfs\_group\_block converts the pair to bno via:

```
1 #define rtems_rfs_group_block(_g, _b) (((_g)->base) + (_b))
```

(\_g)->base is calculated via rtems-rfs-format.c from:

```
1 #define rtems_rfs_fs_block(_fs, _grp, _blk) \
2 ((((_fs)->group_blocks) * (_grp)) + (_blk) + 1)
```

The “+ 1” part should really be “+ RTEMS\_RFS\_SUPERBLOCK\_SIZE” to be logically correct. As RTEMS\_RFS\_SUPERBLOCK\_SIZE itself has a comment saying:

```
1 /**
2 * Number of blocks in the superblock. Yes I know it is a superblock and not
3 * superblocks but if for any reason this needs to change it is handled.
4 */
5 #define RTEMS_RFS_SUPERBLOCK_SIZE (1)
```

In [changeset:"30218f5ca5b6b060258791a4f4c915e16f1edbe9/rtems-tools" 30218f5/rtems-tools]:

```

1 tester: Add reporting the RTEMS version, build and tools.
2
3 Update #3217.

```

**Author:** Trac Migrate 2017-11-13T13:16:44.000Z

I get build failures on CentOS Linux release 7.4.1708 with a “make -j 1”:

```

1 + version=5
2 + bsp=t32mppc
3 + target=powerpc
4 + build_dir=b-t32mppc
5 + source_dir=/home/rtems/rtems
6 + rm -rf b-t32mppc
7 + mkdir b-t32mppc
8 + cd b-t32mppc
9 + /home/rtems/rtems/configure --target=powerpc-rtems5 --prefix=/opt/
  ↪ rtems/5 --enable-maintainer-mode --enable-rtemsbsp=t32mppc --enable-
  ↪ posix --disable-tests --enable-networking --enable-smp

```

**Author:** Chris Johns 2017-11-13T21:53:06.000Z

Replying to [Sebastian Huber](#):

I get build failures on CentOS Linux release 7.4.1708 with a “make -j 1”:

^ ~~~~~

I can repeat this. And ..

```

1 $ find . -name version-vc-key.h
2 $

```

**Author:** Chris Johns 2017-11-14T01:00:54.000Z

- **Attachment** [0001-build-Fix-the-dependence-for-the-generating-the-key-.patch](#) added

Please test and report if this works. Thanks

**Author:** Trac Migrate 2017-11-14T06:07:03.000Z

In [\[changeset:”631f711598ca63bfcdfe3bdf4a57fdda5243c64/rtems”631f711/rtems\]](#):

```

1 build: Fix the dependence for the generating the key file.
2
3 Update #3217.

```

**Author:** Trac Migrate 2017-11-14T06:07:47.000Z

Thanks, this patch worked.

**Author:** Joel Sherrill 2017-12-05T14:27:35.000Z

Is this resolved? The tests are reporting version information. I can't tell what else is required before this ticket is complete.

The list email referenced is <https://lists.rtems.org/pipermail/devel/2017-July/018513.html>

---

**Author:** Chris Johns 2017-11-14T01:56:02.000Z

---

I wonder if this is due to different directories installing the same files at different levels in the build system and this has exposed something present in the build systems. We could see calls for install happening at the same time on the same file and I wonder if the Linux install executable is doing some checking that exposes this issue.

---

**Author:** Chris Johns 2017-11-16T22:02:27.000Z

---

- **Attachment** [0001-build-Provide-system-level-locking-so-only-one-insta.patch](#) added

This patch add support for parallel installs. I have tested it on FreeBSD, Windows, and MacOS. Please test and report back. Make sure you run `./bootstrap -p` in the top RTEMS source directory and you bootstrap `autoconf` and `automake`.

---

**Author:** Chris Johns 2017-11-16T22:09:52.000Z

---

Note, make `install` is broken. I will look at that if this fixes the build issue.

---

**Author:** Chris Johns 2018-04-09T23:11:56.000Z

---

- **Resolution** set to ~”fixed”
- **Status** changed from *assigned* to *closed*

This has been fixed with the switch to real parallel building of sub-directories, the removal of pre-installed header files, and now the testsuite has been refactored to use one nested make call per test group.

There is a limited number of BSPs that support SMP or MP so using the BSP wildcard will result in a failed build. Require the user provide a BSP.

| <b>Milestone</b>   | 5.1                                                                                                                 |
| <b>Labels</b>      | arch:powerpc, priority::normal, resolution::fixed, tickettype::defect, version::5                                   |
| <b>Link</b>        | <a href="https://gitlab.rtems.org/rtems/rtems/-/issues/3354">https://gitlab.rtems.org/rtems/rtems/-/issues/3354</a> |
| <b>Merges</b>      | 0                                                                                                                   |

The following BSPs:

powerpc-beatnik powerpc-mcp750 powerpc-mtx603e powerpc-mvme2100 powerpc-mvme2307 powerpc-mvme5500 powerpc-qemuprep-altivec powerpc-qemuprep

use bsp/powerpc/include/libcpu/page.h which defines `_ALIGN`, `PAGE_MASK`, and `PAGE_SIZE`. These are defined by `<machine/param.h>`. I think the solution is to delete the versions in `libcpu/page.h`. Comments appreciated.

```
define PAGE_MASK (~(PAGE_SIZE-1))
```

Original author: sebastian.huber

Changes of the CLOCK\_REALTIME must trigger absolute timeouts. This is not the case. There is no test for this in RTEMS.

**Author:** Joel Sherrill 2017-10-12T17:34:48.000Z

Original author: sebastian.huber

I think this only can be used via `clock_nanosleep()` or a timeout on a condition variable. Do both not wakeup after a time change on `CLOCK_REALTIME`?

Are there tests for this?

**Author:** Trac Migrate 2017-10-13T08:07:57.000Z

**Author:** Trac Migrate 2017-10-19T12:47:54.000Z

Original author: sebastian.huber

According to POSIX we have for clock\_nanosleep():

[http://pubs.opengroup.org/onlinepubs/9699919799/functions/clock\\_nanosleep.html](http://pubs.opengroup.org/onlinepubs/9699919799/functions/clock_nanosleep.html)

“If, at the time of the call, the time value specified by rqtp is less than or equal to the time value of the specified clock, then clock\_nanosleep() shall return immediately and the calling process shall not be suspended.”

Would it be all right to perform a sched\_yield() in this case? This would make the implementation of the thread queue enqueue a bit easier.

**Author:** Joel Sherrill 2017-10-19T13:03:51.000Z

Original author: sebastian.huber

I think having a time in the past yield is a good solution. Just add it to the documentation in the right spots.

**Author:** Trac Migrate 2017-10-19T13:06:45.000Z

Original author: sebastian.huber

A yield may lead to a pre-emption. I am not sure if this is all right with respect to the “return immediately and the calling process shall not be suspended”.

**Author:** Trac Migrate 2017-10-19T13:40:08.000Z

Original author: sebastian.huber

Why is nanosleep() not implemented as clock\_nanosleep(CLOCK\_REALTIME, 0, rntp, rntp)?

**Author:** Joel Sherrill 2017-10-19T13:44:02.000Z

Original author: sebastian.huber

History. nanosleep has been there much longer.

Original author: sebastian.huber

Use the `Thread_queue_Context::enqueue_callout` to do the timeout handling. This avoids the switch statement in `_Thread_queue_Timeout()`. It removes the thread queue dependency to `_Thread_Timeout()`.

**Author:** Trac Migrate 2017-08-24T09:52:09.000Z

Original author: sebastian.huber

As discussed here

<https://lists.rtems.org/pipermail/devel/2017-October/019169.html>

it was agreed to use version 5.1 with the new number scheme for the next RTEMS release.

Most important items of this release:

- SMP support
- 64-bit time\_t (year 2038 problem)
- the network stack header consolidation and the move to Newlib
- self-contained POSIX synchronization objects (impacting the configuration)
- improved Ada support (however, not all Ada tests pass currently)

The following steps are necessary to carry out the number change:

1. ~~Change version of RTEMS tools~~
2. ~~Change version of RSB~~
3. ~~Change version of RTEMS~~
4. ~~Documentation repo. Easy.~~
5. ~~Documentation website repo. Easy.~~
6. Release procedure repo. Easy.
7. ~~Trac tickets. Not sure.~~
8. ~~Trac wiki. Medium(?). A wiki search of 4.12 gives 21 hits.~~
9. rtems.org website. That needs Joel.
10. Make announcement on the devel and user mailing list

Each port contains a `types.h` file. It universally defines one type (`CPU_Uint32ptr`) that is required. Some of the `types.h` files define a CPU specific simple vectored ISR handler prototype.

- Move the `CPU_Uint32ptr` typedef to `cpu.h`
- If unused, delete the ISR handler prototype. If used, move to `cpu.h`

bsps/arm/lpc176x/include/bsp.h defines OPERATION\_COUNT in an attempt to override the autoconf generated constant. This conflicts and results in this warning:

```
/home/joel/rtems-work/rtems-testing/rtems/rtems/bsps/arm/lpc176x/include/bsp.h:42:0:
warning: "OPERATION_COUNT" redefined
```

I understand why this is lowered by the BSP but the mechanism used is not good. And if the include file order is different between tests, you could get the BSP value or the autoconf generated value based on the order.

This warning needs to be fixed and a safer mechanism for a BSP to override `OPERATION_COUNT` defined.

My first suggestion is to use `BSP_OPERATION_COUNT` and add logic to one of the common test .h files to undef `OPERATION_COUNT` and redefine it to `BSP_OPERATION_COUNT` if it is defined.

A safer option might be to change the name of the autoconf generated variable to `OPERATION_COUNT_DEFAULT` and rely on logic in a common test support .h to define `OPERATION_COUNT` to `OPERATION_COUNT_DEFAULT` or `BSP_OPERATION_DEFAULT`.

This .h file uses the same macro names for two blocks of INT macros. My assumption given that the second looks to be a different INT, is that it should not be INT3 again but INT3.

TIMER\_STATUS, TIMER< DISABLE, and TIMER\_ENABLE are defined in bf52x.h and in bf533.h. Disable second definition in full bf533 register set list and add a sanity check to ensure it stays the same.

log/powerpc-hsc\_cm01.log:/home/joel/rtems-work/rtems-testing/rtems/rtems/bsps/powerpc/gen83xx/include  
warning: "FPGA\_START" redefined log/powerpc-hsc\_cm01.log:/home/joel/rtems-work/rtems-testing/rtems/rtems/bsps/powerpc/gen83xx/include/bsp/hwreg\_vals.h:246:0: warning:  
"FPGA\_SIZE" redefined

Looking at the code, it is pretty clear that the macros are redefined. Unfortunately one of the three has a different value the second time:

```
define FPGA_START 0xF8000000

define FPGA_SIZE 0x8000

define FPGA_END (FPGA_START+FPGA_SIZE-1)

/* * working values for various registers, used in start/start.S */
/* fpga config 16 MB size */

define FPGA_CONFIG_START 0xF8000000

define FPGA_CONFIG_SIZE 0x01000000

/* fpga register 8 MB size */

define FPGA_REGISTER_START 0xF9000000

define FPGA_REGISTER_SIZE 0x00800000

/* fpga fifo 8 MB size */

define FPGA_FIFO_START 0xF9800000

define FPGA_FIFO_SIZE 0x00800000

define FPGA_START (FPGA_CONFIG_START)

// fpga window size 32 MByte
```

```
define FPGA_SIZE (0x02000000)
```

```
define FPGA_END (FPGA_START+FPGA_SIZE-1)
```

In [changeset:"0a7a30d19d7d2e3067fc7d7be0d54730b8275f2f/rtems" 0a7a30d/rtems]:

```

1 Add PowerPC paravirtualization support
2
3 Cannot read or write MSR when executing in user mode. This
4 is used when RTEMS_PARAVIRT is defined.
5
6 Provide alternate methods to disable/enable interrupts
7
8 Closes #3306.
```

## 4.2.1.572 3325 - Simplify clustered scheduler configuration

Improve the scheduler configuration documentation according to user review.

Do not use names derived from scheduler implementation details. Instead use names derived from the scheduler configuration or documentation.

Provide defines for backward compatibility.

Original author: amaan

On certain shells, the “-e” option is not supported, and causes echo to output the flag along with the quoted text.

```
1 -> % sh
2 $ echo -e "foo bar"
3 -e foo bar
4 $
```

This varies by shell, and is not even consistent between sh or bash.

It was introduced [while removing the make preinstall stage here](#), and may still work on most shells, though it didn't for me on sh on Ubuntu 16.04 LTS (4.4.0-78-generic x86\_64 GNU/Linux)

- as far as I can tell, this bug hasn't made it to any releases yet, so just fixing it on master should be enough.

A patch is attached.

Reference to the POSIX standard which confirms that -n is the only argument supported.

Original author: mfletcher

It might be more helpful i the case of a thread exit to output some information about that thread to make tracking it down simpler.

This example works ok.

```
static void thread_exitted_print_info(rtems_tcb *tcb) { printf(“Thread exited: %s (id %d)n”,
tcb->Object.name, tcb->Object.id) }
```

```
/* In your configuration: */
```

```
define CONFIGURE_INITIAL_EXTENSIONS \
{ .thread_exitted = thread_exitted_print_info }
```

The define call in macros.py checks for a str while the \_\_setitem\_\_ call can convert a unicode string to str. Remove the check.

Remove the other places in macros.py a key str check is made and see if they can be improved.

The following has been reported to me:

Original author: sebastian.huber

Use C11 mutexes instead of Classic semaphores as a performance optimization and to simplify the application configuration.

A performance of Classic semaphores vs. C11 mutexes was measured on the arm/atsam BSP. A NXP SC16IS752 was connected via SPI. The RTEMS application used one task to read from the device and write it immediately back (look back via task). A development system constantly transmitted data at 115200 bits per second.

CPU usage by function with Classic semaphores:

| name                     | ratio  | 1% | 2% | 5% | 10% |

Original author: nopscmn

Hello,

I use tmpfile() in my RTEMS application, and found that it has memory leak. I wrote small test application (see attachment), that output memory usage:

Memory usage before: Number of used blocks: 12 Largest used block: 1288 Total bytes used: 3628

Memory used after: Number of used blocks: 1013 Largest used block: 1288 Total bytes used: 112064

By 1000 iteration, each call tmpfile() cause memory leak about 108 bytes.

I think real memory leak was fixed. How we can see in first memory trace after 1000 tmpfile() was allocated 1000+1 block. In Gedare memory trace after test was allocated 1 block. This block probably allocated at first tmpfile() for some initialization.

I can try to find out this 1 block allocation and write test but it can take a long time.

Not for license wars, this attached application is too simple to licensing and can be written by any RTEMS developer. Nonetheless, formalities for I give all rights on attached test application to Joel Sherrill.

Original author: sebastian.huber

The Classic API has some weaknesses:

- Dynamic memory (the workspace) is used to allocate object pools. This requires a complex configuration with heavy use of the C pre-processor.
- Objects are created via function calls which return an object identifier. The object operations use this identifier and map it internally to an object representation.
- The objects reside in a table, e.g. they are suspect to false sharing of cache lines.
- The object operations use a rich set of options and attributes. For each object operation these parameters must be evaluated and validated at run-time to figure out what to do exactly for this operation.

The overhead for Classic API mutexes used for example in Termios and the SPI framework is significant, see discussion:

<https://lists.rtems.org/pipermail/devel/2016-December/016543.html>

There are some API options available:

1. Use C11 mutexes and condition variables.
2. Turn the POSIX synchronization objects into self-contained objects and use them.
3. Use FreeBSD synchronization objects like [MUTEX\(9\)](https://www.freebsd.org/cgi/man.cgi?query=condvar&apropos=0&sektion=9&manpath=FreeBSD+10.3-RELEASE+and+Ports&arch=default&format=html) or [\[CONDVAR\(9\)\]](https://www.freebsd.org/cgi/man.cgi?query=condvar&apropos=0&sektion=9&manpath=FreeBSD+10.3-RELEASE+and+Ports&arch=default&format=html) (<https://www.freebsd.org/cgi/man.cgi?query=condvar&apropos=0&sektion=9&manpath=FreeBSD+10.3-RELEASE+and+Ports&arch=default&format=html>).
4. Add RTEMS-specific self-contained synchronization objects and use them.

Option 1. and 2. lack support for binary semaphores which are used for task/interrupt synchronization, e.g. Termios.

Option 2. needs run-time evaluation to figure out the actual object variant, e.g. non-recursive, recursive, ceiling, error-checking, robust POSIX mutex.

Option 3. uses hash tables, thus it is not suitable for real-time systems.

Option 1. and 2. lack support for user-defined object names that may help for system diagnostic, tracing and debugging.

Option 4. could be used to avoid all shortcomings of options 1-3. It would be trivial to implement, test and document.

In order to enable user-defined object names one option is to add a const char \*name member to Thread\_queue\_Queue.

- **Description** changed

```

1 - Use C11 mutexes instead of Classic API priority inheritance.
   ↳semaphores throughout the RTEMS code base as a performance
   ↳optimization and to simplify the application configuration.
2 + The Classic API has some weaknesses:
3
4 - See discussion:
5 + * Dynamic memory (the workspace) is used to allocate object pools.
   ↳This requires a complex configuration with heavy use of the C pre-
   ↳processor.
6 + * Objects are created via function calls which return an object
   ↳identifier. The object operations use this identifier and map it
   ↳internally to an object representation.
7 + * The objects reside in a table, e.g. they are suspect to false
   ↳sharing of cache lines.
8 + * The object operations use a rich set of options and attributes.
   ↳For each object operation these parameters must be evaluated and
   ↳validated at run-time to figure out what to do exactly for this
   ↳operation.
9 +
10 + The overhead for Classic API mutexes used for example in Termios and
   ↳the SPI framework is significant, see discussion:
11
12 https://lists.rtems.org/pipermail/devel/2016-December/016543.html
13 +
14 + There are some API options available:
15 +
16 + 1. Use C11 mutexes and condition variables.
17 + 2. Turn the POSIX synchronization objects into self-contained objects
   ↳and use them.
18 + 3. Use FreeBSD synchronization objects like [MUTEX(9)](https://www.
   ↳freebsd.org/cgi/man.cgi?query=muxem&sektion=9) or [CONDVAR(9)](https://
   ↳www.freebsd.org/cgi/man.cgi?query=condvar&apropos=0&sektion=9&
   ↳manpath=FreeBSD+10.3-RELEASE+and+Ports&arch=default&format=html).
19 + 4. Add RTEMS-specific self-contained synchronization objects and use
   ↳them.

```

(continues on next page)

(continued from previous page)

```

20 +
21 + Option 1. and 2. lack support for binary semaphores which are used
    ↳ for task/interrupt synchronization, e.g. Termios.
22 +
23 + Option 2. needs run-time evaluation to figure out the actual object
    ↳ variant, e.g. non-recursive, recursive, ceiling, error-checking,
    ↳ robust POSIX mutex.
24 +
25 + Option 3. uses hash tables, thus it is not suitable for real-time
    ↳ systems.
26 +
27 + Option 1. and 2. lack support for user-defined object names that may
    ↳ help for system diagnostic, tracing and debugging.
28 +
29 + Option 4. could be used to avoid all shortcomings of options 1-3. It
    ↳ would be trivial to implement, test and document.
30 +
31 + In order to enable user-defined object names one option is to add a
    ↳ const char *name member to Thread_queue_Queue.
32 +

```

- **Summary** changed from *Use C11 mutexes instead of Classic API priority inheritance semaphores* to *Use self-contained objects instead of Classic API for drivers and support libraries*

Can Option 4 be NP extensions to POSIX after Option 2 is done?

**Author:** Trac Migrate 2016-12-20T10:28:54.000Z

Original author: sebastian.huber

Replying to [chrisj](#):

Can Option 4 be NP extensions to POSIX after Option 2 is done?

Binary semaphores are not available out of the box with POSIX. You need a mutex and a condition variable for this, e.g. <http://stackoverflow.com/questions/7478684/how-to-initialise-a-binary-semaphore-in-c>.

Option 4. should be implementable via POSIX to allow to run the software without RTEMS, however, it should use a specialized implementation on RTEMS to minimize run-time and space overheads.

What are the downsides for self-contained objects? (Is there a clear definition of what self-contained objects are?)

---

**Author:** Trac Migrate 2016-12-21T06:43:21.000Z

---

Original author: sebastian.huber

Self-contained means the user must provide the storage for the object.

<https://sourceware.org/git/gitweb.cgi?p=newlib-cygwin.git;a=blob;f=newlib/libc/sys/rtems/include/sys/lock.h;h=c0549db67cbb559edacbef49584156fb8ac346fd;hb=HEAD>

What you cannot do with self-contained objects is using them in a distributed system with distinct address spaces, e.g. a usage case RTEMS was initially designed for. Here you need one level of indirection to identify objects globally.

With object identifiers you can detect a use of deleted objects under certain conditions. You cannot detect use of a deleted and re-used object. To detect/prevent the use of deleted objects in SMP configurations is quite difficult (e.g. hazard pointers) and not implemented in RTEMS.

From my point of view the advantages of self-contained objects are apparent.

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

All cpukit services use now self-contained objects, except:

- gxx\_wrappers.c (legacy, would need GCC patch)
- ada\_intrsupp.c (would need GCC patch)
- libi2c.c (legacy, I2C drivers should use new framework)
- sse\_test.c (seems to be dead code)

4.2.1.581 3294 - gcc version report for released tools is wrong.

There is some support for MPC505 in libcpu, however, I cannot find a BSP for this code. Remove this apparently dead code.

```

1 sdk_dpaa: What to do with tail queue drop?
2
3 The issue is this:
4
5 static int dpaa_eth_macless_probe(struct platform_device *_of_dev)
6 {
7     [...]
8     INIT_LIST_HEAD(&priv->dpa_fq_list);
9
10    err = dpa_fq_probe_macless(dev, &priv->dpa_fq_list, RX);
11    if (!err)

```

(continues on next page)

(continued from previous page)

```

12 err = dpa_fq_probe_macless(dev, &priv->dpa_fq_list,
13 TX);
14 if (err < 0)
15 goto fq_probe_failed;
16 [...]
17 /* Add the FQs to the interface, and make them active */
18 /* For MAC-less devices we only get here for RX frame queues
19 * initialization, which are the TX queues of the other
20 * partition.
21 * It is safe to rely on one partition to set the FQ taildrop
22 * threshold for the TX queues of the other partition
23 * because the ERN notifications will be received by the
24 * partition doing qman_enqueue.
25 */
26 err = dpa_fqs_init(dev, &priv->dpa_fq_list, true);
27 if (err < 0)
28 goto fq_alloc_failed;
29 [...]
30
31 The priv->dpa_fq_list contains a list of FQ_TYPE_RX_PCD and FQ_TYPE_TX
32 items. I don't understand what the "For MAC-less devices we only get
33 here for RX frame queues initialization" means in this context. The
34 td_enable == true in dpa_fqs_init(). So, we have:
35
36 int dpa_fq_init(struct dpa_fq *dpa_fq, bool td_enable)
37 {
38 [...]
39 if (dpa_fq->fq_type == FQ_TYPE_TX ||
40 dpa_fq->fq_type == FQ_TYPE_TX_CONFIRM ||
41 dpa_fq->fq_type == FQ_TYPE_TX_CONF_MQ) {
42 [...]
43 initfq.we_mask |= QM_INITFQ_WE_OAC;
44 [...]
45 }
46
47 if (td_enable) {
48 initfq.we_mask |= QM_INITFQ_WE_TDTHRESH;
49 qm_fqd_taildrop_set(&initfq.fqd.td,
50 DPA_FQ_TD, 1);
51 initfq.fqd.fq_ctrl = QM_FQCTRL_TDE;
52 }
53
54 The td_enable == true && dpa_fq->fq_type == FQ_TYPE_TX causes later:
55
56 int qman_init_fq(struct qman_fq *fq, u32 flags, struct qm_mcc_initfq_
57 ↪ *opts)
58 {
59 [...]
60 if (opts && (opts->we_mask & QM_INITFQ_WE_OAC)) {

```

(continues on next page)

(continued from previous page)

```

60 /* And can't be set at the same time as TDTHRESH */
61 if (opts->we_mask & QM_INITFQ_WE_TDTHRESH)
62 return -EINVAL;
63 }
64
65 This aborts the initialization of the MAC-less driver. I don't
66 understand why this path doesn't happen on the SDK Linux system.
67
68 Update #3277.

```

Original author: sebastian.huber

The CLOCK\_MONOTONIC time services use currently the clock tick based watchdog. This is a problem in case the uptime (measured via the timercounter) and the ticks since boot drift away (measured via the clock ticks). Introduce a new watchdog which uses the uptime. The memory overhead is quite small (two pointers per processor).

Original author: bharath.s.jois

The semaphore `osem` is still in use in `rtems_termios_close` while an attempt to delete it is made and hence is not deleted. Consequently, it results in a `RTEMS_TOO_MANY` on `rtems_semaphore_create`, which further results in failure of `rtems_termios_open`.

Patch to testsuites/libtests/termios01/init.c

**Author:** Trac Migrate 2010-08-12T06:36:21.000Z

Original author: bharath.s.jois

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*
- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

Let me explain the problem with the clean up during the last close. The Termios driver is an example for a driver that will be opened by one thread, but the read and write access may be issued by different threads concurrently. The close may happen also concurrently (exit() may be called concurrently?). I think a concurrent call to close() will lead to more problems, so I omit this here. I think currently that the only way to avoid accesses to deleted resources is to not delete anything during the last close. Instead we should simply flush the output buffer.

What should happen with this ticket?

|                                                         |
|---------------------------------------------------------|
| <b>Author:</b> Trac Migrate    2018-02-05T07:53:24.000Z |
|---------------------------------------------------------|

Original author: bharath.s.jois

- **Milestone** changed from %”4.11.3” to %”5.1”
- **Resolution** set to ~”fixed”
- **Status** changed from *reopened* to *closed*

Due to the reference counting of file descriptors (#3132) this problem no longer exists in RTEMS 5.1. If you close() a file descriptor which is still in use, you get an error (EBUSY).

#### 4.2.1.588 2363 - SPARC: Silent FP context corruption possible

Original author: sebastian.huber

On uni-processor configurations the post-switch actions (e.g. signal handlers) and context switch extensions may silently corrupt the floating point context. Set test sptests/spcontext01.

This problem exists for many years and might be working as intended. It is possible to fix this issue using the SPARC\_USE\_SAFE\_FP\_SUPPORT option. This is already used for the SMP configurations. The disadvantage is that this disables the deferred floating point support.

Original author: sebastian.huber

In order to build a tool chain with Ada support you need a native GCC with Ada support of the same version as the cross compiler. The RSB uses hard coded paths for the gcc and g++ programs:

```
1 source-builder/defaults.mc:__cc:           exe,      required, '/usr/bin/gcc'
2 source-builder/defaults.mc:__cxx:          exe,      required, '/usr/bin/g++'
```

So, the RSB user must change the main GCC installation of the machine to build a particular RTEMS tool chain. This is undesired/infeasible in most situations.

**Author:** Chris Johns 2018-01-31T00:03:21.000Z

Original author: sebastian.huber

I am OK with changing this to 'gcc' and 'g++'. There are a few other paths that could be relaxed, ie I remembering seeing something in your build logs.

This is something that has appeared as the RSB ages.

The Xilinx AXI I2C IP has a race condition when the PIRQ read FIFO level is reached and the clock is throttling.

**Author:** Trac Migrate 2017-11-09T06:27:14.000Z

- **Milestone** changed from %"4.12.0" to %"5.1"

Milestone renamed

**Author:** Trac Migrate 2018-02-01T04:00:19.000Z

- **Resolution** set to ~”fixed”
- **Status** changed from *assigned* to *closed*

In [changeset:”05015dc1886d08e9f9f3ed453688c52cebd4cc3f/rtems”  
05015dc1/rtems]:

```

1 Xilinx AXI I2C driver IP race condition causes clock glitch.
2
3 Setting the PIRQ to 0 before reading the data produces a short clock
  ↳ pulse.
4 Moving the write to after reading the data fixes the issue.
5
6 Close #3173

```

#### 4.2.1.592 3278 - bsp-builder has incorrect print (%s in output)

The PowerPC BSP family headers need some refactoring for the RTEMS 5 release. The BSP family relies on the preinstall process to get suitable headers installed to work and removing preinstall exposes this. The specific issue appears with `irq.h` when building the no-preinstall branch. There is a PowerPC BSP family header and a number of BSPs also have an `irq.h` which overrides families header. The code has `#include <bsp/irq.h>` and the header used depends on the include order on the GCC command line. This is fragile for any user. These headers needs to be moved to BSP specific paths, for example `#include <mvme3100/irq.h>`.

Original author: sebastian.huber

The libpci is currently only used on SPARC. It is in cpukit, so BSP-specific header files are not allowed. Unfortunately this is not the case for libpci. However, it seems the the routines depending on BSP\_PCI\_BIG\_ENDIAN are not used:

```
grep -r 'pci_[ldst]{2}_' . ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE uint16_t
pci_ld_le16(volatile uint16_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_le16(volatile uint16_t *addr, uint16_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint32_t pci_ld_le32(volatile uint32_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_le32(volatile uint32_t *addr, uint32_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint16_t pci_ld_be16(volatile uint16_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_be16(volatile uint16_t *addr, uint16_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint32_t pci_ld_be32(volatile uint32_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_be32(volatile uint32_t *addr, uint32_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint16_t pci_ld_le16(volatile uint16_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_le16(volatile uint16_t *addr, uint16_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint32_t pci_ld_le32(volatile uint32_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_le32(volatile uint32_t *addr, uint32_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint16_t pci_ld_be16(volatile uint16_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_be16(volatile uint16_t *addr, uint16_t val) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
uint32_t pci_ld_be32(volatile uint32_t *addr) ./cpukit/libpci/pci/access.h:RTEMS_INLINE_ROUTINE
void pci_st_be32(volatile uint32_t *addr, uint32_t val)
```

Is this dead code and can I remove BSP\_PCI\_BIG\_ENDIAN?

Another issue is the use of a BSP-specific interrupt API in `cpukit/libpci/pci/irq.h`.

The missing functions should be added to `<rtems/irq-extension.h>`.

Is there anything in the implementations that is BSP, not architecture, specific? They could be moved to cpukit if we have confidence they can be implemented always that way.

Or they can be real methods provided by the bsl

**Author:** Chris Johns 2017-12-26T21:59:42.000Z

Replying to [Joel Sherrill](#):

Is there anything in the implementations that is BSP, not architecture, specific? They could be moved to cpukit if we have confidence they can be implemented always that way. Or they can be real methods provided by the bsl

Sorry I do not know.

<https://gcc.gnu.org/ml/gcc-patches/2017-11/msg01751.html>

This patch series adds workarounds for the newly discovered errata for UT699, UT700, and GR712RC. The errata and possible workarounds are described in the following documents available at <http://www.gaisler.com/index.php/information/app-tech-notes>:

GRLIB-TN-0010 - LEON3/FT AHB Deadlock After Sequence of Load and Atomic Instructions  
 GRLIB-TN-0011 - LEON3/FT AHB Lock Release during Atomic Operation  
 GRLIB-TN-0012 - GR712RC Incorrect Annulation of Floating-point Operation on Instruction Cache Parity Error  
 GRLIB-TN-0013 - GRFPU Floating-point controller: Missing FDIV/FSQRT Result

Daniel Cederman (4): [SPARC] Errata workaround for GRLIB-TN-0012 [SPARC] Errata workaround for GRLIB-TN-0011 [SPARC] Errata workaround for GRLIB-TN-0010 [SPARC] Errata workaround for GRLIB-TN-0013

Original author: sebastian.huber

The `mq_open()` function returns a descriptor to a POSIX message queue object identified by a name. This is similar to `sem_open()`. In contrast to the POSIX semaphore the POSIX message queues use a separate object for the descriptor. This extra object is superfluous, since the object identifier can be used directly for this purpose, just like for the semaphores.

Original author: andreic

The function `Stack_check_Dump_threads_usage` displays the stack high, low, and current pointers incorrectly.

Instead of displaying these pointers in conventional hex format, the values have a proper prefix of 0x, but the pointer value is displayed in decimal.

The incorrect `inttypes.h` formatting define was used.

Wasn't a fix for this committed? Is there work left to do? Either close or state actions left. Please

**Author:** Chris Johns 2017-12-06T06:05:34.000Z

Original author: andreic

No, the format of the prints is wrong and this patch fixes it. It needs to be applied and that should close the ticket.

<https://devel.rtems.org/wiki/TBR/UserManual/SupportedCPUs> is out of date. I have the information to update it if that's what we want to do.

I don't know the best way to provide this broad view from 4.6 up on what architectures are supported. The wiki seems OK.

**Author:** Chris Johns 2017-10-25T22:23:34.000Z

Is this a duplicate of [#3206](#)?

The architecture and BSP is closely linked.

**Author:** Joel Sherrill 2017-10-25T22:26:58.000Z

They are related but I tend to think the architecture page is OK to do by hand and the BSP page needs something where you can look at a file per release.

Not 100% sure what the right answer is but the set of BSPs is more fluid than the set of architectures.

And the porting guide could include adding an entry and the release procedure could include adding a column.

**Author:** Chris Johns 2017-10-25T22:36:30.000Z

Replying to [Joel Sherrill](#):

Not 100% sure what the right answer is but the set of BSPs is more fluid than the set of architectures.

Amar's database highlights a complexity hidden in just top level \_architectures\_, take ARM, we support a subset of the available variants and having this listed would be awesome.

And the porting guide could include adding an entry and the release procedure could include adding a column.

Column of?

**Author:** Trac Migrate 2017-10-26T05:39:15.000Z

I would move this information to the RTEMS CPU Architecture Supplement and delete the wiki page. We can add a chapter with obsoleted architectures and just mention the version which removed them.

There must be a recent change to msys2 which is breaking things. I installed the 64-bit version from <https://msys2.github.io/> per the instructions at <https://docs.rtems.org/branches/master/user/hosts/index.html#microsoft-windows>

```
1 $ ./source-builder/sb-check
2 error: no hosts defaults found; please add
```

After adding some prints, I learned this:

```
1 $ ./source-builder/sb-check
2 posix
3 made it
4 MSYS_NT-10.0
5 error: no hosts defaults found; please add
```

I filled in options.py and windows.py to recognize this as MSYS2. I was then able to run sb-check. But it wasn't happy. Apparently the pacman command in the User's Guide is missing some packages based on newer versions:

```

1 $ ./source-builder/sb-check
2 posix
3 MSYS_NT-10.0
4 RTEMS Source Builder - Check, 5 (8b30eb3f440a modified)
5 error: exe: not found: (__ar) ar
6 error: exe: not found: (__as) as
7 error: exe: not found: (__cc) x86_64-w64-mingw32-gcc
8 error: exe: not found: (__cxx) x86_64-w64-mingw32-g++
9 error: exe: not found: (__ld) ld
10 error: exe: not found: (__nm) nm
11 error: exe: not found: (__objcopy) objcopy
12 error: exe: not found: (__objdump) objdump
13 error: exe: not found: (__ranlib) ranlib
14 Environment is not correctly set up

```

I installed binutils explicitly with pacman and then sb-check is complaining about gcc. I did a find to locate the gcc's installed:

```

1 $ find / -name "*gcc.*"
2 /home/jrs007/.ssh/id_rsa_gcc.pub
3 /mingw64/bin/gcc.exe
4 /mingw64/bin/x86_64-w64-mingw32-gcc.exe
5 /mingw64/lib/gcc/x86_64-w64-mingw32/6.2.0/include/stdint-gcc.h
6 /mingw64/lib/gcc/x86_64-w64-mingw32/6.2.0/libgcc.a
7 /mingw64/share/info/gcc.info.gz
8 /mingw64/share/man/man1/gcc.1.gz
9 /usr/share/vim/vim80/compiler/gcc.vim
10 find: failed to read file names from file system at or below \ |md_0_8216|\ / \_

```

My installed gcc is much newer than yours?

Did you follow this procedure <https://github.com/msys2/msys2/wiki/MSYS2-installation#iii-updating-packages> ?

**Author:** Joel Sherrill 2017-12-05T14:31:08.000Z

- **Resolution** set to ~"worksforme"
- **Status** changed from *reopened* to *closed*

This should have been closed. The issue was that my install needed to be updated after the initial install. Apparently, they don't give you the latest version of anything on an initial install.

Closing.

**Author:** Trac Migrate 2017-11-09T06:27:14.000Z

- **Milestone** changed from %”4.12.0” to %”5.1”

Milestone renamed

**Author:** Joel Sherrill 2017-12-05T14:21:44.000Z

- **Resolution** set to ~”fixed”
- **Status** changed from *assigned* to *closed*

This must have been fixed since the ticket was filed. It builds now. There are warnings but that’s a different issue.

## 4.2.1.605 3256 - Ada run-time needs support for self-contained POSIX synchronization objects

Notepads were marked as obsolete in #2265. Next step is to remove them. Documentation should mention that notepads are removed and list the alternatives, e.g. POSIX keys or thread local storage.

- [0001-api-Remove-deprecated-Notepads.patch](#)

Original author: sebastian.huber

- Remove RTEMS\_API\_Control::Notepads
- Remove all rtems\_task\_note\*() functions and now unused dependencies.
- Build with all tests enabled and fix all compile and link time errors.

- Run tests without regressions.
- Remove RTEMS\_tasks\_MP\_Packet::note\*.
- Build with `-enable-multiprocessing`.
- Build with all tests enabled and fix all compile and link time errors.
- Run tests without regressions.
- Update documentation, to be defined.

Notepads were a feature of RTEMS' tasks that simply functioned in the same way as POSIX keys or threaded local storage (TLS). They were introduced well before per task variables, which are also deprecated, and were barely used in favor of their POSIX alternatives.

In addition to their scarce usage, Notepads took up unnecessary memory. For each task: \* 16 32-bit integers were allocated. \* A total of 64 bytes per task per thread.

This is especially critical in low memory and safety-critical applications.

They are also defined as `uint32_t`, and therefore are not guaranteed to hold a pointer.

Lastly, they are not portable solutions for SMP and uniprocessor systems, like POSIX keys and TLS.

I am closing this ticket once the patch is committed.

Original author: sebastian.huber

The Classic Region manager enables users to wait until memory is available to satisfy an allocation request. This is done through special purpose code that basically implements a condition variable.

The region can be configured to let threads wait in FIFO or priority order. The self-contained condition variables do not support this. Keep this special case implementation as is.

Original author: sebastian.huber

Change the POSIX read-write lock into a self-contained object using <sys/lock.h>, e.g.

```
1 typedef struct {
2 struct _Thread_queue_Queue _queue;
3 unsigned int _flags;
4 unsigned int _readers;
5 } pthread_rwlock_t;
```

Original author: sebastian.huber

In [changeset:"e460cd00fddc586908192fa8f46b7e5bfe6bd5ce/rtems" e460cd00/rtems]:

```

1 score: Rename to _Scheduler_Control
2
3 Rename struct Scheduler_Control to _Scheduler_Control to allow its use
4 in standard header files, e.g. <pthread.h>.
5
6 Update #3112.

```

**Author:** Trac Migrate 2017-09-27T12:57:42.000Z

Original author: sebastian.huber

In [changeset:"e2fe881a87331e7e20dab95126a8860e42cdddf0/rtems" e2fe881a/rtems]:

```

1 score: Simplify red-black tree debug support
2
3 Make the RBTNode layout independent of RTEMS_DEBUG (and all other
4 build configuration options). This allows the use of this structure in
5 Newlib.
6
7 Update #3112.
```

Original author: sebastian.huber

Change the POSIX condition variable into a self-contained object using <sys/lock.h>, e.g.

```

1 typedef struct {
2 struct _Condition_Control  _condition;
3 pthread_mutex_t           *_mutex;
4 clockid_t                 _clock;
5 } pthread_cond_t;

```

BSPs can use the `bsp_fatal_extension()` to provide BSP-specific fatal error handling. There is no need for a `_BSP_Fatal_error()`.

The getentropy() system call was introduced by OpenBSD and is now also available on glibc 2.25 and later. It is used for example by arc4random\_buf(). Which in turn is used by various cryptographic functions.

Original author: sebastian.huber

Several drivers in `c/src/lib/libbsp/sparc/shared/` use `interrupt disable/enable` for low-level mutual exclusion. This is not enough on SMP configurations.

With the most recent patches send to the `devel-list` most drivers have been fixed and now supports SMP.

Still there are a couple which has not been addressed, the focus has been on the device drivers that are present/used on multi-core LEON devices such as dual-core GR712RC and quad-core GR740.

The remaining drivers that generate warnings about this are:

- `shared/spw/grspw.c` - old driver, better functionality and SMP support in `shared/spw/grspw_pkt.c`. I’m thinking we should disable this driver for SMP builds.
- `shared/1553/gr1553rt.c` - Used by GR740. Was considered of lower priority but will be fixed in June.

Related to this topic also important:

- `sparc/shared/spw/grspw_router.c` - Central for GR740. Build does not produce warnings since HW does not generate interrupts. A patch is pending on this one including SMP support and more importantly API updates for the GR740.

Personally I think the current LEON3 BSP state regarding topic this should not be a blocker for a 4.12 branch?

Do you want to release RTEMS 4.12 with the message that most drivers work on your SMP chips or all?

---

**Author:** Trac Migrate 2017-05-12T10:22:16.000Z

---

Original author: sebastian.huber

I assumed that there will be some time after the branching until 4.12 is released? Maybe this is wrong? The two first should be quick to fix. The SpW router turned out to be more work than we initially expected.

Replying to [Daniel Hellstrom](#):

I assumed that there will be some time after the branching until 4.12 is released? Maybe this is wrong? The two first should be quick to fix. The SpW router turned out to be more work than we initially expected.

I would prefer we get things sorted and stable on master, make the branch and then release. The overheads for making a release are coming down each time it happens so a dot point release to add a fix for a driver is fine with me.

Original author: sebastian.huber

Sorry for my late reply.

It seems that “Update #2355” in the commit message does not work when I push. But the text says “remote: 3: update trac” as if it working when pushing.

The following patches affect the status of this ticket since August:

```
* 1ccce05337be6e81f823039932a8a10d2b07c2d8
* 6b339b5af65b243ea32edce29dc5642440ba68d5
59af2cc58e37481f176cbea96e6a59e70a9f5598 (pushed today)
```

Status (libbsp/sparc/shared/): \* [FIXED] spw/grspw.c - disabled on SMP builds via Makefiles. Only safe in UP configuration. \* [FIXED] spw/grspw\_router.c - SMP protection via spin-locks & semaphore. \* [TODO] 1533/gr1553rt.c - work not started yet. Is not SMP safe currently.

With the router patch it is only the GR1553B in RT mode that is not SMP safe on the GR740. We could disable the RT driver on SMP for now to avoid the warnings until SMP is fixed? My initial plan was to have this driver SMP safe a long time ago. I don't think the remaining is a blocking issue and I suggest to change this ticket from being a blocker into major?

**Author:** Trac Migrate 2017-11-14T10:08:52.000Z

Original author: sebastian.huber

The Trac update via commits doesn't work if you push more than one commit at once.

How much work is it to fix the GR1553B driver?

**Author:** Trac Migrate 2017-11-20T14:18:52.000Z

Original author: sebastian.huber

Thanks for information, I will test it with this RT patch.

Thats right, its not much work but its the testing that concerns me. I have posted a patch which fixes the RT driver with SMP support and closes this ticket: <https://lists.rtems.org/pipermail/devel/2017-November/019556.html>

Original author: sebastian.huber

We must not clear the priority updates in `_Thread_queue_Extract_locked()` since this function is used by the priority ceiling surrender operations after the ceiling priority handover from the previous owner to the new owner. This is especially important in SMP configurations.

Move the `_Thread_queue_Context_clear_priority_updates()` invocation to the callers.

Original author: sebastian.huber

The `_Semaphore_Get_operations()` must return the proper operations for priority inheritance semaphores.

Add a test case for `rtems_semaphore_flush()` with priority inheritance.

Original author: sebastian.huber

The use of a file descriptor after or during a close() operation may result in a **use after free**. Finding such errors in applications is difficult. Especially in SMP systems using the highly dynamic libbsd network stack.

The file descriptor objects reside in a table with a application configuration defined size. So, the storage of a file descriptor object is always present, only the referenced file system node may change over time. The file system nodes may use an internal reference counting, which is independent of the file descriptors.

To implement reference counting for the file descriptors add a bit field for the reference count to the `rtems_libio_t::flags` and use atomic operations to maintain the flags.

Each operation using a file descriptor should perform a sequence like this:

```

1 int op( int fd, ... )
2 {
3   rtems_libio_t *iop;
4   unsigned int   flags;
5
6   if ( (uint32_t) fd >= rtems_libio_number_iops ) {
7     rtems_set_errno_and_return_minus_one( EBADF );
8   }
9
10  iop = rtems_libio_iop( fd );
11  flags = rtems_libio_iop_hold( iop );
12
13  if ( ( flags & LIBIO_FLAGS_OPEN ) == 0 ) {
14    rtems_libio_iop_drop( _iop );
15    rtems_set_errno_and_return_minus_one( EBADF );
16  }
17
18  do_op( iop, ... );
19  rtems_libio_iop_drop( iop );
20  return 0;
21 }
```

A `close()` should return -1 with `EBUSY` in case the file descriptor is referenced. In this case, no close operation will be performed.

- **Description** changed

```
1 The use of a file descriptor after or during a close() operation may
  ↳ result in a [use after free](https://cwe.mitre.org/data/definitions/
  ↳ 416.html). Finding such errors in applications is difficult.
  ↳ Especially in SMP systems using the highly dynamic libbsd network
  ↳ stack.
2
3 The file descriptor objects reside in a table with a application
  ↳ configuration defined size. So, the storage of a file descriptor
  ↳ object is always present, only the referenced file system node may
  ↳ change over time. The file system nodes may use an internal reference
  ↳ counting, which is independent of the file descriptors.
4
5 To implement reference counting for the file descriptors add a bit
  ↳ field for the reference count to the rtems_libio_t::flags and use
  ↳ atomic operations to maintain the flags.
6
7 Each operation using a file descriptor should perform a sequence like
  ↳ this:
8 {{{
9 - int op(int fd, ...)
10 + int op( int fd, ... )
11 ?      +      +
```

(continues on next page)

(continued from previous page)

```

12
13 {
14 -   uint32_t flags;
15 rtems_libio_t *iop;
16 -
17 -   iop = rtems_libio_iop(fd, &flags);
18 -   if (iop == NULL) {
19 -       return EBADF;
20 +   unsigned int  flags;
21 +
22 +   if ( (uint32_t) fd >= rtems_libio_number_iops ) {
23 +       rtems_set_errno_and_return_minus_one( EBADF );
24 }
25
26 -   if (conditions_for_op_are_not_ok(flags)) {
27 +   iop = rtems_libio_iop( fd );
28 +   flags = rtems_libio_iop_hold( iop );
29 +
30 +   if ( ( flags & LIBIO_FLAGS_OPEN ) == 0 ) {
31 -       rtems_libio_iop_done(iop);
32 ?               ^^
33
34 +   rtems_libio_iop_drop( _iop );
35 ?           + ^ ++ +
36
37 +   rtems_set_errno_and_return_minus_one( EBADF );
38 }
39
40 -   do_op(iop);
41 +   do_op( iop, ... );
42 ?       +   ++++++
43
44 -   rtems_libio_iop_done(iop);
45 ?               ^^
46
47 +   rtems_libio_iop_drop( iop );
48 ?           + ^ + +
49
50 return 0;
51 }
52 }}}
53
54 A close() should return -1 with EBUSY in case the file descriptor is_
  ↪referenced. In this case, no close operation will be performed.

In section 5 of the User's Manual, the clone of rtems-source-builder has you clone it into rsb but the sb-bootstrap command is based on cloning it into the rsb subdirectory.

Original author: sebastian.huber

Patches for RTEMS tools are available via the RTEMS tools repository:

<https://git.rtems.org/rtems-tools/tree/tools>

They are organized using subdirectories.

The RSB uses these patches. It removes the subdirectories and collects everything in a “patches” directory, e.g.

download: <https://git.rtems.org/rtems-tools/plain/tools/4.11/newlib/arm/newlib-ARM-Optimize-IEEE-754-sqrt-implementation.diff> -> patches/newlib-ARM-Optimize-IEEE-754-sqrt-implementation.diff

This works only in case the patch file names are unique. So, the use of subdirectories in the RTEMS tools is questionable.

---

**Author:** Amar Takhar 2017-03-22T12:25:02.000Z

---

Original author: sebastian.huber

This should be easily solved by preserving the subdirectories when downloading. Keeping the subdirectories is good for organisation and still handy when they've been downloaded.

---

**Author:** Chris Johns 2017-03-22T23:42:36.000Z

---

Original author: sebastian.huber

Is the issue switching between branches when testing?

There is the patch option of `--rsb-file=` that overrides the RSB's detection of a file name from the URL. This option assumes a file name and not a file path.

I question the need for patches being in rtems-tools, the less we have the better off we are. I cannot see how we can remove the ones we have without needing to update the 4.11 and master branches.

The RSB has evolved to being able to download patches from a range of sources. I prefer to see patches referenced from upstream sources where ever possible. Mailing list archives are a good source of patches and I wonder if this is a better place for us to hold any patches we need?

The ability to support a download directory structure would mean the RSB would need to more complex code to handle some of sites we currently download from. I am not sure how to do this.

---

Original author: sebastian.huber

The problem of multiple patches with the same name would be a problem regardless of the source of the patches. This namespace problem could be solved by renaming all patches to something that should be unique, e.g. the hash value of the file.

---

**Author:** Chris Johns 2017-03-24T01:28:52.000Z

---

Original author: sebastian.huber

Replying to **Gedare**:

The problem of multiple patches with the same name would be a problem regardless of the source of the patches. This namespace problem could be solved by renaming all patches to something that should be unique, e.g. the hash value of the file.

The hash value of the file would work and a good idea. I was concerned about making it difficult to find the patch or file from the error or log but a hash is something you can grep the config tree for.

If no hash is provided the file name can be used. This keeps the bootstrap of adding new files like it currently is, ie a warning.

This would be common to the source and patch directories. Is that OK?

---

**Author:** Chris Johns 2017-03-24T04:29:59.000Z

---

Original author: sebastian.huber

A problem with using the hashes is releases, that is:

<https://ftp.rtems.org/pub/rtems/releases/4.11/4.11.1/sources/>

The release procedure uses the RSB in a download only mode to collect all the source needed in a release.

I am not sure how to handle this.

---

**Author:** Trac Migrate 2017-03-24T10:27:31.000Z

Sebastian, I did not understand your last comment.

---

**Author:** Chris Johns 2017-03-27T04:37:32.000Z

---

Original author: sebastian.huber

I fixed [#2951](#) using the patch from the newlib mailing list:

<https://git.rtems.org/rtems-source-builder/commit/?id=b47a811955e427f945f8958de87158e9990dc7da>

I like this approach. The `-rsb-file` option can be used to make a patch name unique such as pre-pending `rtems-4.11-` to the start.

---

Original author: sebastian.huber

I think we should copy everything we need to a place we can control. URLs may get out of date and web servers may disappear. GCC snapshots seem to be only available for six months or so.

---

**Author:** Trac Migrate 2017-03-27T05:20:21.000Z

---

Original author: sebastian.huber

Replying to [Sebastian Huber](#):

I think we should stop to use subdirectories in the RTEMS tools for the patches.

In case we copy everything into one directory on the patch consumer side, e.g. RSB, release directory, then we should not use subdirectories to make a patch unique on the patch provider side, e.g. RTEMS tools.

---

**Author:** Chris Johns 2017-03-27T05:42:35.000Z

---

Original author: sebastian.huber

Replying to **Sebastian Huber**:

I think we should copy everything we need to a place we can control. URLs may get out of date and web servers may disappear.

For a release this is what happens. The directory for 4.11.1 is:

<https://ftp.rtems.org/pub/rtems/releases/4.11/4.11.1/sources/>

and this is all the source for that release.

I am not sure I follow the context of “copy everything”. In terms of a time line the only points that matter are the release branch heads for the active and previous branch and master. I do not see any value in a single collection point for any and every patch the RSB references over time.

Attempting to make sure all commits in the RSB are functional does not make sense. Hosts change and this effects the RSB so there are 2 dependent variables in play.

GCC snapshots seem to be only available for six months or so.

Yes as we have discovered. I am fine with an FTP area on the ftp.rtems.org being set up for special cases if we have a need and gcc fills this role. If a release references a GCC snapshot when the release will contain a copy. The downside of this is a clutter of files that are of no value sitting around.

In case we copy everything into one directory on the patch consumer side, e.g. RSB, release directory, then we should not use subdirectories to make a patch unique on the patch provider side, e.g. RTEMS tools.

Yes, and I am for us not using rtems-tools for patches any more.

Original author: sebastian.huber

The use of a 64-bit integer for the uptime seconds is overkill. Use int32\_t instead for \_Time-counter\_Time\_uptime. Change derived APIs, e.g. rtems\_clock\_get\_uptime\_seconds().

Hi

Multiple tests have this warning. Appears to be something not quite right in the newlib .h files.

```

1 21 ../../../../../../rtems/c/src/../../../../testsuites/psxtests/psxhdrs/pthread/

How did you get these warnings? I get them when I turn on -Wsystem-headers by hand.

**Author:** Trac Migrate 2017-10-13T06:09:49.000Z

Fixed in Newlib. I will integrate this with the October Newlib snapshot.

Original author: sebastian.huber

The current vprintk() implementation has a questionable licence header, lacks support for the ‘z’ and ‘j’ format specifiers, is not robust against invalid format specifiers, uses a global variable for output. Replace it with a stripped down version of the FreeBSD kernel kvprintf() function.

**Author:** Chris Johns 2017-11-02T20:48:50.000Z

Original author: sebastian.huber

Good idea.

Original author: sebastian.huber

As a best-effort approach, a very large relative timeout should result in the maximum monotonic watchdog value and not in an undefined integer overflow.

I assume this is a side-effect of recent checksum changes. Otherwise, there is a serious problem.

The number of resources needs to be lowered on m32c. It has limited indexing and offset ability in its instructions. This patch lets it compile. Is this OK to commit?

There appear to be two issues in smptests/Makefile.am:

1. smppsxafinity0[12] are listed twice. This causes a warning. I am unsure if they should always be built or only when POSIX is enabled.
2. smppsxmutex01 is listed in the "HAS\_POSIX" section. Aren't POSIX mutexes always on now so this test should not be inside the conditional?

**Author:** Joel Sherrill 2017-10-12T18:32:53.000Z

- **Owner** set to sebastian.huber
- **Status** changed from *new* to *assigned*

**Author:** Trac Migrate 2017-10-13T04:55:00.000Z

It is a bit work left to enable the POSIX tests by default, e.g. a lot of them use pthread\_create().

**Author:** Trac Migrate 2017-10-25T05:59:02.000Z

The 2. is a duplicate of [#2514](#).

**Author:** Trac Migrate 2017-10-25T05:59:40.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"e3ef14b1a66197746b9aecef3b208c701ee440b8/rtems" e3ef14b/rtems]:

```
1 smptests: Remove duplicate Makefile targets
2
3 Close #3187.
```

I built a toolset and all BSPs on Centos 7 after switching this to rtems-default.bset again. There was no comment indicating why it was using an older gcc so I assume something has been fixed.

The POSIX Compliance Guide was never converted from texinfo. Beyond that, it is out of date and follows the outline of the printed version of the POSIX standard which no one sees anymore. This ticket proposes:

1. new Sphinx document
2. contents generated from POSIX API tracking spreadsheet (CSV)
3. outline per .h file, not functional area
4. use bullets, not tables so easier to format

Original author: sebastian.huber

There is no need to have a copy of the thread attributes used for the pthread\_create() in POSIX\_API\_Control::Attributes. This is at least in line with Linux.

Original author: sebastian.huber

The internal status codes encode a Classic `rtems_status_code` and error codes used by the POSIX and C11/C++11 APIs. In case the POSIX API is disabled, the C11/C++11 support must still work.

Original author: sebastian.huber

We have too many tickets with an unclear state if someone is working on them. One problem is that the tickets are assigned to a real person by default. Assign the tickets to a virtual person NeedsReview to make it clear that this ticket has nobody assigned which can resolve it.

**Author:** Chris Johns 2017-10-04T23:53:48.000Z

Original author: sebastian.huber

I would prefer we remove the default owner from the components and have Trac leave the ticket unassigned.

**Author:** Trac Migrate 2017-10-05T04:56:39.000Z

Original author: sebastian.huber

Ok, I will remove the default owners tomorrow if nobody objects.

**Author:** Trac Migrate 2017-10-02T11:50:12.000Z

I removed these types some months ago. Are you on the right branch? How can I build this stuff?

---

**Author:** Chris Johns 2017-10-02T22:23:58.000Z

---

Replying to [Sebastian Huber](#):

I removed these types some months ago. Are you on the right branch?

Yes. There are types in the trace definitions ...

<https://git.rtems.org/rtems-tools/tree/linkers/rtems-score-coremutex.ini>

These definitions are a quick and dirty hack I would prefer to avoid however the long term solution is getting function signatures and types from the DWARF data but that work is more than the time I have available. I need someone to support the effort.

How can I build this stuff?

Clone examples-v2 and then build using the ./waf I have just added to the repo. The examples uses rtems\_waf so configured in a similar way to libbsd.

---

**Author:** Trac Migrate 2017-10-06T07:34:14.000Z

---

The CORE mutex implementation changed considerably. Most of it moved to inline functions. I am not sure what you want to trace here?

---

**Author:** Trac Migrate 2017-10-06T07:36:18.000Z

---

Maybe this should be replaced by the thread queue enqueue and extract functions.

---

**Author:** Chris Johns 2017-10-07T00:16:31.000Z

---

Replying to [Sebastian Huber](#):

Maybe this should be replaced by the thread queue enqueue and extract functions.

I think anything that makes sense will do. It is more of an example of what we can trace and the fact you can trace into the kernel some distance.

This still fails for me. Did you actually push the fix? I fixed a few other examples-v2 failures. But these remain:

-> task in 'hello-deep.texte' failed with exit status 10 (run with -v to display more information)

Looks like missing update from recent changes.

-> task in 'fat\_ramdisk.texte' failed with exit status 10 (run with -v to display more information)

Looks like missing update from recent changes.

-> task in 'fdopen.texte' failed with exit status 10 (run with -v to display more information)

Not building filesystem image

-> task in 'crc.exe' failed with exit status 1 (run with -v to display more information)

Not building filesystem image

-> task in 'psx\_sched\_report.exe' failed with exit status 1 (run with -v to display more information)

RTEMS confdefs.h and newlib libc.a both define getreent.

Replying to **Joel Sherrill**:

This still fails for me. Did you actually push the fix?

<https://git.rtems.org/examples-v2/commit/?id=c7dfbaf83c5b119106f9ee38c902988cc463b0aa>

It removes the dump-on-error issue which is the subject of this ticket.

Are you seeing **#3160**?

---

**Author:** Joel Sherrill 2017-10-05T22:26:58.000Z

---

Yes. It appears to impact both `_hello` and `fat_ramdisk`.

Did you look at the two tests which aren't building a filesystem image in waf?

---

**Author:** Chris Johns 2017-10-05T23:12:15.000Z

---

Replying to **Joel Sherrill**:

Yes. It appears to impact both `_hello` and `fat_ramdisk`.

It is the trace linker definitions. They need updating.

Did you look at the two tests which aren't building a filesystem image in waf?

No. Is that issue **#3158**? If so please update that ticket with the command you used to configure and build plus the output.

---

**Author:** Joel Sherrill 2017-10-05T23:40:26.000Z

---

OK. Looks like 3158 but I don't have a toolset now. Rebuilding with the latest changes. Will do that in the morning.

---

- **Resolution** `~”fixed”` deleted
- **Status** changed from *closed* to *reopened*

I think this is still broken for me. I did a “git module update” and it didn’t seem to pull anything. The configure was this:

```
./waf configure -rtems=$HOME/rtems-work/tools/4.12/bsps -rtems-
tools=$HOME/rtems-work/tools/4.12 -rtems-bsps=sparc/erc32
```

I did “./waf -k” and multiple tests do not build currently. I cd’ed to file\_io/crc and then did this:

```
$ ../../waf clean 'clean-sparc-rtems4.12-erc32' finished successfully
(0.065s) [joel@localhost crc]$ ../../waf Waf: Entering directory
`/home/joel/rtems-work/examples-v2/build/sparc-rtems4.12-erc32' [0/2]
Compiling rootfs/image.img [1/2] Compiling ../../build/sparc-rtems4.12-
erc32/file_io/crc/fs-root.tar [2/6] Compiling crc_32.c [3/6] Compiling
../../build/sparc-rtems4.12-erc32/file_io/crc/fs-root-tar.c [4/6] Compiling init.c
../../file_io/crc/init.c:18:10: fatal error: FilesystemImage.h: No such file or
directory
```

```
^ ~~~~~ compilation terminated.
```

```
Waf: Leaving directory `/home/joel/rtems-work/examples-v2/build/sparc-
rtems4.12-erc32' Build failed -> task in 'crc.exe' failed with exit status 1 (run with
-v to display more information)
```

I did a “git submodule deinit .” and reinitialized the modules but that didn’t help either.

|                                                     |
|-----------------------------------------------------|
| <b>Author:</b> Chris Johns 2017-10-06T21:57:35.000Z |
|-----------------------------------------------------|

Replying to [Joel Sherrill](#):

I think this is still broken for me. I did a “git module update” and it didn’t seem to pull anything.

I have not worked on this since my last changes you have.

I did “./waf -k” and multiple tests do not build currently. I cd’ed to file\_io/crc and then did this:

Using -k is a good idea. I should have done that.

```
../../file_io/crc/init.c:18:10: fatal error: Filesys-
temImage.h: No such file or directory
```

```
^ ~~~~~
```

I have changed the bin2tar file name to clean up the code. The code now uses the rtems\_waf //rootfs// to create the C filesystem file.

I did a “git submodule deinit .” and reinitialized the modules but that didn’t help either.

This a bug I did not see because the build I did stopped at the trace linker errors.

**Author:** Joel Sherrill 2017-10-06T22:04:09.000Z

**Author:** Chris Johns 2017-10-12T15:59:18.000Z

Replying to [Sebastian Huber](#):

The following errors are left: {{{ Waf: Entering directory  
 `build/arm-rtems4.12-xilinx\_zynq\_a9\_qemu' [ 29/115] Compil-  
 ing file\_io/crc/init.c [ 34/115] Compiling build/arm-rtems4.12-  
 xilinx\_zynq\_a9\_qemu/file\_io/fdopen/test.c.2.o error: config section:  
 dump-on-error: not found }}}}

The fix is to remove the line from the INI file.

```

{{{ [108/115] Linking build/arm-rtems4.12-
xilinx_zynq_a9_qemu/posix_api/psx_sched_report/psx_sched_report.exe
../../file_io/crc/init.c:18:10: fatal error: FilesystemImage.h:
No such file or directory

^~~~~~ compilation termi-
nated. }}}

```

I change the name of the file system image. I have refactored  
 the support so rtems\_waf can build a tar file and create the  
 C/H files with a single build instance. I forgot to update the  
 init.c files.

```

{{{ librtemscpu.a(default-configuration.o): In
function `__getreent': confdefs.h:2342: multiple
definition of `__getreent' }}}

```

This is one Joel has been looking at and has  
 posted on the newlib list about.

- **Owner** set to sebastian.huber
- **Status** changed from *new* to *assigned*

---

**Author:** Joel Sherrill 2017-09-29T20:55:48.000Z

---

Original author: jeff.mayes

- **Summary** changed from *PowerPC tools doesn't build* to *PowerPC tools don't build*

I have built the tools on two CentOS 7 computers. Jeff was on Cygwin and has successfully built both arm and x86.

---

**Author:** Trac Migrate 2017-09-30T07:20:20.000Z

---

Please make sure that no previous RTEMS tools are in your \$PATH before the build, e.g. delete the previous installation and try it again.

- **Resolution** ~"duplicate" deleted

- **Status** changed from *closed* to *reopened*

OK. There are no RTEMS tools in my path. I deleted the build folder in my working dir and tried again. I also changed the #PREFIX to use a different directory. It still fails with the same error as reported.

Any other ideas? Thanks

**Author:** Trac Migrate 2017-10-04T19:55:52.000Z

Original author: jeff.mayes

Joel had the idea to see what verbose gcc output showed. This shows the as version used (2.29).

We have checked and my RSB is up to date. Is there any chance 64-bit PowerPC support is disabled in binutils on Cygwin?

29 Assembler messages:
30 Fatal error: -a64 unsupported

```

**Author:** Chris Johns 2017-10-04T23:45:27.000Z

Original author: jeff.mayes

The error is happening in as and it would appear the PPC as does not support 64bit options. Does an as Linux build of the PPC support the -a64 option? Hint, use -save-temp to get a .s file and shift it to Linux and try.

I would compare the full build logs for a Linux build and a Cygwin build paying extra attention to the assembler configure and build. I would try and locate a PowerPC 64bit assembler file in the as source and see if it is build on Linux and Cygwin.

**Author:** Trac Migrate 2017-10-05T06:53:10.000Z

Original author: jeff.mayes

The BFD configuration is in Binutils bfd/config.bfd:

```

1 powerpc-*-bsd* | powerpc-*-elf* | powerpc-*-sysv4* | powerpc-*-eabi* | \
  ↪ \
2 powerpc-*-solaris2* | powerpc-*-linux-* | powerpc-*-rtems* | \
3 powerpc-*-chorus*)
4 targ_defvec=powerpc_elf32_vec
5 targ_selvecs="rs6000_xcoff_vec powerpc_elf32_le_vec powerpc_boot_vec"
6 targ64_selvecs="powerpc_elf64_vec powerpc_elf64_le_vec"
7 ;;

```

Looks like some Cygwin-specific build problem to me.

**Author:** Trac Migrate 2017-10-10T22:53:01.000Z

Original author: jeff.mayes

With Joel's help, I got it to build today. Here are the changes we made:

```

No other hosts have been tested. We were happy it worked on Cygwin. If you are ok with the patch, we can test it elsewhere.

**Author:** Chris Johns 2017-10-11T11:32:44.000Z

Original author: jeff.mayes

Replying to **Joel Sherrill**:

No other hosts have been tested. We were happy it worked on Cygwin. If you are ok with the patch, we can test it elsewhere.

Patch looks fine with a minor change in the commit to say Enable 64-bit BFD support. Needed on 32bit hosts.. We just need to make sure other hosts are not broken.

**Author:** Joel Sherrill 2017-10-11T12:13:05.000Z

Original author: jeff.mayes

Testing now on CentOS 7 and Fedora 26 which are 64-bit hosts.

Following up on a comment from Sebastian that I missed. This is not Cygwin specific. It is an issue on all 32-bit hosts. The bfd magic silently disables 64-bit BFD on 32-bit hosts unless you specify `--enable-64-bit-bfd`. I have not checked yet if sparc64 or aarch64 will build on 32-bit Cygwin. They may need this option also. I will ask Jeff to check if they build. They may need this option also.

**Author:** Trac Migrate 2017-10-11T20:24:31.000Z

Original author: jeff.mayes

Just tested aarch64 and sparc64 with the fixed files, and they both build just fine.

Original author: sebastian.huber

A zero-initialized pthread\_once\_t reduces the ROM usage of RTEMS applications, since the global pthread\_once\_t objects may reside in the BSS section.

c6f8e51/rtems-docs]:

```

1 Shorten the name of the BSP and Device Driver Development Guide
2
3 Old name:
4
5 RTEMS BSP and Device Driver Development Guide
6
```

(continues on next page)

(continued from previous page)

```

7 This is long and causes problems in the PDF output. This patch
8 changes the name to:
9
10 RTEMS BSP and Driver Guide
11
12 Closes #3141.

```

**Author:** Trac Migrate 2017-10-13T00:04:38.000Z

In [changeset:"13a15f908d0296b0547cb6c5f198c18a6d309aee/rtems-docs" 13a15f9/rtems-docs]:

```

1 Shorten BSP and Driver Guide name (missed commit)
2
3 Updates #3141.

```

Original author: sebastian.huber

Currently, the free list of file descriptors is organized as a LIFO. In erroneous systems which use a file descriptor after a call to `close()`, this increases the likelihood that this error is undetected due to the prompt re-use of the file descriptor. The use of a FIFO has the benefit that free file descriptors remain on the free list as long as possible. This increases the time frame in which an invalid use of a closed file descriptor returns an error status.

Remove unused LIBIO\_FLAGS\_CREATE flag.

**Author:** Trac Migrate 2017-09-14T05:10:53.000Z

Original author: sebastian.huber

The LIBIO\_FLAGS\_CREATE is actually used in one place via `rtems_libio_to_fcntl_flags()` for `fcntl(fd, F_GETFL)`. However, POSIX mandates that only access and status flags are returned.

<http://pubs.opengroup.org/onlinepubs/9699919799/functions/fcntl.html>

Status flags are defined here:

<http://pubs.opengroup.org/onlinepubs/9699919799/basedefs/fcntl.h.html>

Doxygen latex output on sync.rtems.org does not build.

Does latex output build on any host? If so which hosts and what tool combination.

If it does not build we should consider defaulting the setting for latex output to “no”.

```

**Author:** Trac Migrate 2017-09-08T12:15:33.000Z

Original author: sebastian.huber

The problem seems to be still in stddef.h:

```

Original author: sebastian.huber

Newlib uses `_times_r()` in `clock()`. The problem is that the `_times_r()` clock frequency is defined by `sysconf(_SC_CLK_TCK)`. The clock frequency of `clock()` is the constant `CLOCKS_PER_SEC`.

FreeBSD uses `getrusage()` for `clock()`.

**Author:** Trac Migrate 2017-09-07T05:40:56.000Z

Original author: sebastian.huber

In [changeset:"bdbf1ffa6e81d75ab3ab7adc11e35b1ee1670c29/rtems" bdbf1ffa/rtems]:

```

1 Implement clock()
2
3 Newlib uses _times_r() in clock(). The problem is that the _times_r()
4 clock frequency is defined by sysconf(_SC_CLK_TCK). The clock frequency
5 of clock() is the constant CLOCKS_PER_SEC.
6
7 FreeBSD uses getrusage() for clock(). Since RTEMS has only one process,
8 the implementation can be simplified.
9
10 Update #3121.
```

Original author: sebastian.huber

Change the POSIX semaphore into a self-contained object using <sys/lock.h>, e.g.

```

1 typedef struct {
2 struct _Semaphore_Control _sem;
3 } sem_t;

```

```

Looking down into libiberty.h, I picked on basename()

/\* HAVE\_DECL\_\* is a three-state macro: undefined, 0 or 1. If it is undefined, we haven't run the autoconf check so provide the declaration without arguments. If it is 0, we checked and

failed to find the declaration so provide a fully prototyped one. If it is 1, we found it so don't provide any declaration at all. \*/

```
if !HAVE_DECL_BASENAME
```

```
if defined (__GNU_LIBRARY__) || defined (__linux__) \
```

```
|| defined (__FreeBSD__) || defined (__OpenBSD__) || defined (__NetBSD__) \ || defined
(__CYGWIN__) || defined (__CYGWIN32__) || defined (__MINGW32__) \ || defined (__Drag-
onFly__) || defined (HAVE_DECL_BASENAME) extern char *basename (const char *) AT-
TRIBUTE_RETURNS_NONNULL ATTRIBUTE_NONNULL(1);
```

```
else
```

```
/* Do not allow basename to be used if there is no prototype seen. We either need to use the
above prototype or have one from autoconf which would result in HAVE_DECL_BASENAME
being set. */
```

```
define basename basename_cannot_be_used_without_a_prototype
```

```
endif
```

```
endif
```

```
ifndef basename
```

```
/* Return the file name within directory of FILENAME. We don't declare the function if the
'basename' macro is available (defined in <libgen.h>) which makes the XPG version of this
function available. */
```

```
ifdef __CORRECT_ISO_CPP_STRING_H_PROTO
```

```
extern "C++" char *basename (char * __filename) __THROW __asm ("basename") __nonnull
((1)); extern "C++" const char *basename (const char * __filename) __THROW __asm ("base-
name") __nonnull ((1));
```

```
else
```

```

In [changeset:"f2bb43913b129209934dcbf1db4eb0beea8275e3/rtems-tools" f2bb439/rtems-tools]:

```

1 rtemstoolkit/libiberty: Fix broken configure detection.
2
3 The file libiberty.h requires some configure macros to control some
4 ↪ parts
5 ↪ and these are not provided so the file did not match what was needed.
6 ↪ Hard
7 code the result and remove the need for the macros. The related calls
8 are not provided in our libiberty usage and not needed.
9
10 Closes #3103.
```

In [changeset:"78bbe4c1a31dc62c3a9bee919645c0aa8781709b/rtems-tools" 78bbe4c/rtems-tools]:

```

1 linkers/exe-info Support ARM static constructors.
2
3 Note, ARM destructors are registered at runtime and currently not
4 easily found.
5
6 Update libiberty to get a newer demangler.
7
8 Closes #3102.

```

Provide a wrapper to the FDT library for use on RTEMS. The wrapper provides a simplified interface suitable for applications. The shell command provides access to registered FDT blobs so a user can search the tree like a file system and optionally read and write from device addresses.

**Author:** Chris Johns 2017-08-16T03:54:57.000Z

- **Status** changed from *assigned* to *accepted*

**Author:** Trac Migrate 2017-08-20T01:12:55.000Z

In [changeset:"6b7efdb2ed77760e3c68c5cf450a9620a1cd6562/rtems" 6b7efdb2/rtems]:

```

1 libmisc/rtems-fdt: Add RTEMS FDT wrapper and shell command to libmisc.
2
3 - Provide application support for handling FDT blobs in RTEMS. This
4 is useful when interfacing FPGA fabrics.
5 - Provide a shell command to list a blob as well as provide read
6 and write access to addresses in the FTB.
7
8 Closes #3099.
```

The makefile overrides recipe warnings had disappeared with Chris' rework to improve parallelism. Unfortunately, one Makefile has had the warning return. To reproduce, complete a build with all tests enabled, then just type `make >/dev/null` at the top of the build tree

[joel@rtbf64c rtems-work]\$ ./build\_bsp sparc erc32 Using rtems for RTEMS source

```
real 5m4.247s user 5m58.188s sys 1m34.959s 0 [joel@rtbf64c rtems-work]$ cd b-erc32/

Original author: sebastian.huber

A “make” in the top level build directory does not build the Ada tests (used to work some weeks ago). A “make” in ./sparc-rtems4.12/c/erc32/ada-tests for example works.

The configuration step seems to work:

```

1 configure: configuring in ada-tests
2 configure: running /bin/sh './../rtems/c/src/ada-tests/configure' '--
  ↳prefix=/home/joel/rtems-4.11-work/bsp-install' '--host=sparc-rtems4.12' '--
  ↳build=x86_64-pc-linux-gnu' '--target=sparc-rtems4.12' '--enable-smp' '--disable-
  ↳profiling' '--disable-multiprocessing' '--enable-rtems-debug' '--enable-cxx' '--
  ↳disable-rdbg' '--enable-maintainer-mode' '--enable-tests' '--enable-networking'
  ↳'--enable-posix' '--disable-itron' '--disable-deprecated' '--enable-ada' '--
  ↳enable-expada' 'SIMSPARC_FAST_IDLE=1' '--with-target-subdir=sparc-rtems4.12' '--
  ↳exec-prefix=/home/joel/rtems-4.11-work/bsp-install/sparc-rtems4.12' '--
  ↳includedir=/home/joel/rtems-4.11-work/bsp-install/sparc-rtems4.12/include'
  ↳'build_alias=x86_64-pc-linux-gnu' 'host_alias=sparc-rtems4.12' 'target_
  ↳alias=sparc-rtems4.12' '--with-project-root=../..' '--with-project-top=../..'
  ↳'RTEMS_BSP=erc32' 'RTEMS_CPU_MODEL=erc32' 'RTEMS_BSP_FAMILY=erc32' 'CFLAGS=-
  ↳mcpu=cypress -O2 -g -ffunction-sections -fdata-sections -Wall -Wmissing-

```

(continues on next page)

(continued from previous page)

```

↪ prototypes -Wimplicit-function-declaration -Wstrict-prototypes -Wnested-externs
↪ ' --enable-rtems-root=../' --enable-project-root=../../erc32' '--
↪ with-project-top=../../' --enable-rtemsbsp=erc32' --cache-file=/dev/
↪ null --srcdir=../../rtems/c/src/ada-tests
3 configure: loading site script /usr/share/site/x86_64-unknown-linux-gnu
4 checking for gmake... gmake

```

However:

```

1 gmake[4]: Entering directory '/scratch/git-rtems-testing/rtems/build-sparc-erc32-
  ↪ rtems/sparc-rtems4.12/c/erc32/ada-tests'
2 gmake[4]: Nothing to be done for 'all-am'.

```

This is a 4.12 problem and related to recent changes in the build system.

**Author:** Chris Johns 2017-10-12T05:39:24.000Z

Original author: sebastian.huber

- **Status** changed from *assigned* to *new*

No point assigning this to me, I do not have an Ada compiler and when I last looked it did not build easily on my hosts. I have no ability to test any of this.

I suggest you change SUBDIRS to \_SUBDIRS and see what happens. SUBDIRS is owned by automake and our build system circumvented automake long ago.

**Author:** Trac Migrate 2017-10-12T08:52:56.000Z

Original author: sebastian.huber

The uniprocessor floating point context switching is unsafe, e.g. it is possible to silently corrupt the floating point context. The SMP floating point switching is safe, however, it doesn't use a deferred switch. Implement lazy floating point switching in uniprocessor configurations. This fixes test case spcontext01.

**Author:** Trac Migrate 2017-07-25T09:45:08.000Z

Original author: sebastian.huber

In [changeset:"146adb1edfaa0271ee0df5180a1f64d54e6e860d/rtems" 146adb1/rtems]:

```

1 sparc: Add lazy floating point switch
2
3 The SPARC ABI is a bit special with respect to the floating point_
  ↳ context.
4 The complete floating point context is volatile. Thus, from an ABI_
  ↳ point
5 of view nothing needs to be saved and restored during a context switch.
6 Instead the floating point context must be saved and restored during
7 interrupt processing. Historically, the deferred floating point switch_
  ↳ was
8 used for SPARC and the complete floating point context is saved and
9 restored during a context switch to the new floating point unit owner.
10 This is a bit dangerous since post-switch actions (e.g. signal handlers)
11 and context switch extensions may silently corrupt the floating point
12 context.
13
14 The floating point unit is disabled for interrupt handlers. Thus, in_
  ↳ case
15 an interrupt handler uses the floating point unit then this will result_
  ↳ in a
16 trap (INTERNAL_ERROR_ILLEGAL_USE_OF_FLOATING_POINT_UNIT).
17
18 In uniprocessor configurations, a lazy floating point context switch is
19 used. In case an active floating point thread is interrupted (PSR[EF]_
  ↳ == 1)
20 and a thread dispatch is carried out, then this thread is registered as_
  ↳ the
21 floating point owner. When a floating point owner is present during a
22 context switch, the floating point unit is disabled for the heir thread
23 (PSR[EF] == 0). The floating point disabled trap checks that the use_
  ↳ of the
24 floating point unit is allowed and saves/restores the floating point_
  ↳ context
```

Original author: sebastian.huber

There are declarations of global functions in various driver source files, e.g.

c/src/lib/libbsp/sparc/shared/drvmgr/ambapp\_bus\_gplib.c c/src/lib/libbsp/sparc/shared/drvmgr/ambapp\_bu

The declaration should move to a header file or a static function should be used.

Original author: sebastian.huber

Create an interrupt server for every processor in the system with a one-to-one thread processor affinity. This allows load balancing for interrupt processing. Add support routines to customize the setup after initialization.

**Author:** Trac Migrate 2017-07-12T06:02:08.000Z

Original author: sebastian.huber

In [changeset:"e7ee719f795fdbd8b5185769bdc893d8840b6855/rtems"  
e7ee719f/rtems]:

```
1 Create one interrupt server per processor
2
3 This allows load balancing of interrupt processing in SMP
4 configurations.
5
6 Update #3071.
```

**Author:** Trac Migrate 2017-07-12T06:02:20.000Z

Original author: sebastian.huber

In [changeset:"a961e1980c1674679b1090bb24630cf3de8d6b48/rtems"  
a961e198/rtems]:

```
1 Add interrupt server suspend/resume
2
3 This mechanism can be used to safely move the interrupt server from one
4 scheduler instance to another for example.
5
6 Update #3071.
```

**Author:** Trac Migrate 2017-07-12T06:02:31.000Z

Original author: sebastian.huber

The EDF SMP scheduler supports simple thread processor affinities (see #3059) with a small run-time overhead. The current default SMP scheduler lacks support for thread processor affinities at all. The EDF SMP scheduler offers a good feature set for most applications. So, use it by default. Run-time libraries like libgomp, MTAPI, work stealing schedulers, language interpreters (e.g. Erlang virtual machine), etc. use a one-to-one thread processor affinity for example.

**Author:** Chris Johns 2017-07-05T03:42:13.000Z

Maybe we need a test for C++ that just includes a number of standard headers.

**Author:** Trac Migrate 2017-07-05T11:46:37.000Z

I guess this xilinx\_zynq\_zc706 installation has an installed libbsd? I removed some header files from libbsd which may be in your installation tree (e.g. you have now two bitset.h).

**Author:** Joel Sherrill 2017-07-05T11:56:05.000Z

It may be worth it to duplicate psxhdr for C++

Replying to [Sebastian Huber](#):

I guess this xilinx\_zynq\_zc706 installation has an installed libbsd? I removed some header files from libbsd which may in in your installation tree (e.g. you have now two bitset.h).

Doh! Yes it does. Removing the installed BSP and then installing again allowed libbsd to build.

Thanks.

Original author: sebastian.huber

Add support to the EDF SMP scheduler to honour one-to-one and one-to-all thread processor affinities. Use one ready queue for threads with a one-to-all affinity. Use one ready queue for each of the one-to-one threads for each processor. Since a red-black tree is used for the ready queues, the space overhead of one pointer per ready queue is small.

Original author: AndiK

7.12.1 does not compile with latest guile As already stated here: [https://sourceware.org/bugzilla/show\\_bug.cgi?id=21104](https://sourceware.org/bugzilla/show_bug.cgi?id=21104) GDB in version 7.12.1 fails when trying to compile on Archlinux. GDB uses deprecated functions of libguile which were gone in version 2.2 of libguile. As GDB states in its configure script to support version 2.2 of libguile it fails compiling.

Tested with the latest rtems source builder on master.

rtems source builder gdb report

**Author:** Joel Sherrill 2017-06-28T16:09:15.000Z

Original author: AndiK

I have no idea what guile is being used for but based on the comments in the gdb PR, it looks like it isn't getting fixed on the 7.12 branch. Looks like Freddie's suggestion is the most practical one.

Freddie Chopin 2017-05-02 21:23:58 UTC For me a "workaround" is to explicitly disable guile by passing `--with-guile=no` to GDB's configure script

A semi-proper solution for 7.12 would be to detect the newer guile version and disable guile.

The PR thread doesn't mention if this is fixed in a newer gdb which leads me to believe that it hasn't been.

**Author:** Joel Sherrill 2017-06-28T16:26:58.000Z

Original author: AndiK

Follow up based on discussions on the gdb PR. This is also broken with gdb 8.0. ArchLinux uses gdb 8.0 with guile 2.0.

We have two options:

- build a known guile version as a dependency for gdb
- disable guile

guile (Scheme) is used as an alternative to Python to program gdb from a user perspective.

My personal recommendation to you would be to disable guile in the RSB configuration files and submit a patch.

Whether or not this is the best permanent solution is up for discussion from an RTEMS community discussion. I suspect it is the best solution though.

In [changeset:"d413d7e228544e855b26502ec1d6517d45a3f8e8/rtems-source-builder" d413d7e/rtems-source-builder]:

```

1 Fix GDB build on ArchLinux
2
3 Archlinux provides both, libguile v2.0 and v2.2. GDB states in
4 configuration its compatibility with both versions of libguile which is
5 false. The SCM_port interface of libguile was removed in v2.2 and
6 therefore breaks GDB as a user.
7
8 RTEMS does not use libguile and therefore it can be compiled without
9 support.
10
11 https://sourceware.org/bugzilla/show_bug.cgi?id=21104
12
13 Close #3054.

The documentation has been moved to `rtems-docs.git` repo. Remove the docs directory and asciidocs from RTEMS.

**Author:** Chris Johns 2017-08-03T06:08:57.000Z

Removing the doc directory means I can remove asciidoc from the source-builder/sb directory and make the RSB smaller. This means I need to remove the asciidoc report type.

Any issues with this?

**Author:** Gedare Bloom 2017-08-03T11:58:28.000Z

No issues from me. I think it is time.

**Author:** Trac Migrate 2017-08-07T00:08:40.000Z

- **Resolution** set to ~"fixed"

- **Status** changed from *assigned* to *closed*

In [changeset:"8b96e17c8abf61d97dd224b23370dc148f32fe3c/rtems-source-builder" 8b96e17/rtems-source-builder]:

```

1 doc: Remove in source documentation and the asciidoc package
2
3 The RSB documentation is now in ReST format and part of the RTEMS
4 Documentation project. See https://docs.rtems.org/.
5
6 Remove support for the GPL based asciidoc tool and remove the
7 asciidoc package from the RSB.
8
9 Add the Python Markdown package and update the reporter to use
10 Markdown for HTML generation. The resulting HTML report is a single
11 self contained file.
12
13 Closes #3047.
```

**Author:** Trac Migrate 2017-11-09T06:27:14.000Z

The attached RSB report details the failure.

The path to ranlib is the cwd (see make[5] path) plus the relative path (see the report) which is 308 characters in length and this exceeds the max path length for the Win32 API and binutils reports this as a No such file.

Original author: sebastian.huber

According to the FreeBSD man page we have:

<https://www.freebsd.org/cgi/man.cgi?query=cpuset&sektion=9&apropos=0&manpath=FreeBSD+11.0-RELEASE+and+Ports>

The CPU\_CMP() macro returns true if cpuset1 is NOT equal to cpuset2.

However, in Newlib we had:

```

1 /* return 1 if the sets set1 and set2 are equal, otherwise return 0 */
2 static __inline int CPU_CMP( const cpu_set_t *set1, const cpu_set_t *set2 )
3 {
4 return CPU_EQUAL(set1, set2);
5 }

```

Original author: sebastian.huber

According to the FreeBSD man page we have:

<https://www.freebsd.org/cgi/man.cgi?query=cpuset&sektion=9&apropos=0&manpath=FreeBSD+11.0-RELEASE+and+Ports>

The CPU\_NAND() macro removes CPUs in src from dst. (It is the cpuset(9) equivalent of the scalar: `dst &= ~ src;`)

However, in Newlib we had:

```

1 static __inline void CPU_NAND_S(size_t setsize, cpu_set_t *destset,
2 const cpu_set_t *srcset1, const cpu_set_t *srcset2)
3 {
4 cpu_set_word_t *wdest = &destset->__bits[0];
5 const cpu_set_word_t *wsrc1 = &srcset1->__bits[0];
6 const cpu_set_word_t *wsrc2 = &srcset2->__bits[0];
7 size_t n = setsize / sizeof(*wdest);
8 size_t i;
9
10 for (i = 0; i < n; ++i)
11 wdest[i] = ~(wsrc1[i] & wsrc2[i]);
12 }

```

Disable it for this BSP. This test is almost certainly too large in some way for the m32c. I already disabled it for a number of other BSPs for similar reasons.

Original author: sebastian.huber

According to the FreeBSD man page we have:

<https://www.freebsd.org/cgi/man.cgi?query=cpuset&sektion=9&apropos=0&manpath=FreeBSD+11.0-RELEASE+and+Ports>

```
1 CPU_COPY(cpuset_t *from, cpuset_t *to);
```

However, in Newlib we have:

```
1 static __inline void CPU_COPY( cpu_set_t *dest, const cpu_set_t *src )
2 {
3 *dest = *src;
4 }
```

In CentOS 6.8, everything works fine. But in CentOS 7, it does not. Initial investigation (I did a while back around New Year time) looks like later version of texinfo has an issue with autoconf. Enclosed is the email Chris Johns replied but I didn't follow through since I switched to CentOS 6.8 for my work.

“Looks to me like the RSB is trying to download autoconf 2.69-1 and from <https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=711297>

Looks like this autoconf version has a bug. I also noticed my autoconf version is 2.69-11; however, from what I am reading, RSB will download its own version independent of what user has.”

Chris John replies:

“I guess a recent texinfo version has exposed the issue. I suggest you get the patch from the link in the bug report, create a patch for rtems-tools.git to add the autoconf patch, then create a patch to the RSB adding the patch to the autoconf build, finally ‘git send-email’ the patches to [devel@rtems.org](mailto:devel@rtems.org) for review.”

Original author: phongvanpham

In pci.h, there are references to BSP\_pci\_configuration data structure which is in pci.c. However, in this file, there are also references to detect\_host\_bridge () in detect\_raven\_bridge.c. For folks that are just interested in pci\_read\_config\_dword() + its brothers, all they need is to include pci.h and content for where BSP\_pci\_configuration is defined. The rest of the stuff in pci.c should be separate. Or in another word, data structures and #defines involving with BSP\_pci\_configuration needs to be in separate files rather all stuffed in pci.c

I currently do not need this functionality for my BSP (nor do I able to test it), so I cannot modify code and submit. It is best someone who can test the code to make the code change. Or else, just shelf it under the table and/or close this ticket.

This shouldn’t be an issue since we compile and link with per-function-sections. With this set of options, a function is only included in an executable if it is actually referenced – not just if it is in a file with a referenced symbol.

FWIW Users using this option with large C++ applications have reported seeing their executables drop in size by half. C applications did get smaller but the RTEMS tests didn’t show a huge improvement. Still it did drop some code out.

Replying to [Sebastian Huber](#):

Please generate the Git patch with your real name and a valid e-mail address. This ns16550\_p.h is a private header file, why do you have to change it?

The changes are b/c a couple of register names are missing. Yes one can use another name with the intended value; however, this is unmaintainable code. As you can see, there are different names of the same value (register number) in the file.

The reason to use #ifndef here is b/c I intend to use the file elsewhere in my BSP. Basically, I cherry pick code to maximize reuse in order to meet my needs. If you object to this particular change, (thus my needs are not

met,) I will copy the file to my BSP to resolve my problem; thus a lack of sharing/reusing.

Has the existing PPC 740 a performance monitor exception? Maybe use one category for both variants.

**Author:** Trac Migrate 2017-05-12T18:39:29.000Z

Original author: phongvanpham

- **Attachment** [0001-Add-support-for-IBM-PowerPC-750-chip.patch](#) added patch

**Author:** Trac Migrate 2017-05-17T16:12:53.000Z

Original author: phongvanpham

Replying to [Sebastian Huber](#):

Has the existing PPC 740 a performance monitor exception? Maybe use one category for both variants.

Current ppc\_booke\_category\_table (exception category for PPC 740) code does not have exception vector 0x1700 supported. Whether or not PPC 740 does have exception vector 0x1700 is unknown since I am not working on that chip nor do I have the datasheet for it. For IBM PowerPC750, exception 0x1700 is Thermal Management. ASM\_60X\_ITM\_VECTOR is defined to be 0x17

**Author:** Joel Sherrill 2017-05-17T16:25:08.000Z

Original author: phongvanpham

I did a quick google and turned up this:

<https://people.cs.clemson.edu/~mark/ppc750.pdf>

Which has 740 and 750 in the title. It lists 0x1700 as Thermal Management and doesn't appear to distinguish 740 from 750.

One odd thought is whether there is an MPC740 which is different from the PPC740. Clearly from the "About This Book" section, they are nearly identical:

```
1 The primary objective of this user\ |md_0_8217|\ s manual is to define_
  ↳ the functionality of the PowerPC
2 750\ |md_0_8482|\ and PowerPC 740\ |md_0_8482|\ microprocessors for_
  ↳ use by software and hardware developers.
3 Although the emphasis of this manual is upon the 750, unless otherwise_
  ↳ noted, all
4 information here applies to 740.
```

Maybe that reference helps.

Yes, that reference does help. Page 182 (where thermal exception management is described) states it is "750-specific".

Hi Developers,

What is your status on this ticket? Are you accepting the change and I am just waiting for the code to be merged to main line or you are rejecting the change or postponing it to another release at a TBD date?

If the variable names, etc. does not meet your standard, pls. change them to your liking.

Original author: phongvanpham

Its still not clear to me why you cannot use the mpc\_750\_category\_table for the IBM PPC750.

---

**Author:** Trac Migrate 2017-05-23T16:02:58.000Z

---

Original author: phongvanpham

I copy & paste the two data structures for you convenience.

```
static const ppc_exc_categories mpc_750_category_table = { PPC_BASIC_VECS,
[ASM_60X_SYSMGMT_VECTOR] = PPC_EXC_CLASSIC | PPC_EXC_ASYNC,
[ASM_60X_ADDR_VECTOR] = PPC_EXC_CLASSIC, [ASM_60X_ITM_VECTOR] =
PPC_EXC_CLASSIC, };

static const ppc_exc_categories ppc_750_category_table = { PPC_BASIC_VECS,
[ASM_60X_PERFMON_VECTOR] = PPC_EXC_CLASSIC,
[ASM_60X_SYSMGMT_VECTOR] = PPC_EXC_CLASSIC | PPC_EXC_ASYNC,
```

```
[ASM_60X_ADDR_VECTOR] = PPC_EXC_CLASSIC, [ASM_60X_ITM_VECTOR] =  
PPC_EXC_CLASSIC, };
```

There is 1 additional line in ppc\_750 that is not in mpc750.

Its still not clear to me why you cannot use the mpc\_750\_category\_table for the IBM PPC750.

Are you comfortable/Do you prefer that I add [ASM\_60X\_PERFMON\_VECTOR] = PPC\_EXC\_CLASSIC,

to mpc\_750\_category\_table data structure? From the datasheet, it looks like this exception is missing but I only have access to PowerPC 750 chip so I can't verify anything for folks using MPC750.

Original author: sebastian.huber

The global C++ IO stream objects are initialized here

[https://gcc.gnu.org/viewcvs/gcc/trunk/libstdc%2B%2B-v3/src/c%2B%2B98/ios\\_init.cc?view=markup#l85](https://gcc.gnu.org/viewcvs/gcc/trunk/libstdc%2B%2B-v3/src/c%2B%2B98/ios_init.cc?view=markup#l85)

via a placement new. The “stdout” etc. is thread-local in Newlib

```
1 #define      stdout      (_REENT->_stdout)
```

Using this for a global object like std::cout is quite broken. Which FILE object should be used instead? Potential fix:

```

This approach concerns me because it breaks `std::cout` in the other direction. If this is fine for C++'s `stdout` it should be ok for a thread's C `stdout` and given `newlib` has:

```
1 #define      stdout  (_REENT->_stdout)
```

we are not consistent.

Is moving at run-time the address of `stdout`, which `newlib` does, conflicting with another standard like C++? I assume the `stdc++` code is capturing a reference to `stdout` so closing and then opening a file and assigning it to `stdio` works.

This is a difficult issue.

---

**Author:** Trac Migrate 2017-05-10T05:08:39.000Z

---

Original author: sebastian.huber

Another option would be to use thread-local `cout`, etc. This would require that all RTEMS targets support thread-local storage.

---

**Author:** Chris Johns 2017-05-10T05:59:36.000Z

---

Original author: sebastian.huber

I have considered this and it is attractive. Is this something `libstdc++` supports out of the box or do we need to make changes?

I would like to understand the issue a little more and how `cygwin` solves the problem. Joel has been testing some code on `cygwin` and it would be nice to get it to run on RTEMS and see how it breaks.

I am concerned the current implementation's behavior is undefined if a thread calls `std::cout` and then is deleted leaving `libstdc++` with a reference to invalid memory.

---

Replying to [Chris Johns](#):

I have considered this and it is attractive. Is this something `libstdc++` supports out of the box or do we need to make changes?

No, I guess it needs a some work and it is not clear if this is acceptable for `libstdc++`. The maintainer have a strong view if it comes to standard compliance.

I would like to understand the issue a little more and how cygwin solves the problem.

I guess the main thread is never deleted, so cout can use its stdout safely.

Joel has been testing some code on cygwin and it would be nice to get it to run on RTEMS and see how it breaks. I am concerned the current implementation's behavior is undefined if a thread calls `std::cout` and then is deleted leaving `libstdc++` with a reference to invalid memory.

This is why one option is to use the `_GLOBAL_REENT`.

**Author:** Trac Migrate 2017-05-23T09:45:20.000Z

Original author: sebastian.huber

The Ada run-time support has the same problem (thread-local IO streams used like a global object).

**Author:** Trac Migrate 2017-06-22T06:36:49.000Z

Original author: sebastian.huber

Maybe we could add an RTEMS-specific change to Newlib so that we still have the thread-local stdio streams, but we initialize them to global FILE objects by default, e.g. remove struct `_reent::__sf` for RTEMS. This would also reduce the amount of per-thread storage.

If we do this, then we have to be careful with `fclose()`, since this would close the FILE for all threads. There is no reference counting in the FILE objects.

```

1 newlib01: Use fopen() instead of freopen()
2
3 With global stdio streams, a freopen() would close the global stream
4 object.
5
6 Update #3012.

```

**Author:** Chris Johns 2017-07-06T01:08:35.000Z

Original author: sebastian.huber

Has the recent change in newlib to have a single stdout, stderr, etc object and per thread references in the TLS fixed this problem?

If the first use of the C++ standard streams is before any code redirects and overwrites a thread TLS pointer the standard streams should be the global instance.

**Author:** Trac Migrate 2017-07-06T05:08:03.000Z

- **Milestone** changed from %"Indefinite" to %"4.12.0"
- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

From my point of view this problem is fixed.

The application could alter the stdio stream references in a attribute((constructor(123))) function if it knows what to do.

Original author: [Hass@Howard](#)

I have tried to install sparc bsp=erc32 on 4 different builds. 3 failed, and 1 flawlessly installed. The others all seem to fail somewhere during make install of test suites. Each reports one missing config problem or another.

I believe the problem resulted in a missing package, pax & libbsd-dev on Ubuntu 12.04.5 LTS (GNU/Linux 3.2.0-126-virtual x86\_64)

I hadn't seen this exact problem because I normally update & upgrade as soon as I get a new image. Pressed for time, I skipped it. So, I am not sure if we need to update the documentation to directly include pax, since it is directly called in configure and breaks if not present.

[https://docs.rtems.org/rsb/#\\_host\\_setups](https://docs.rtems.org/rsb/#_host_setups) Under this section, 11.1.5. Ubuntu

Add pax to this line \$ sudo apt-get build-dep binutils gcc g++ gdb unzip git python2.7-dev pax

**Author:** Chris Johns 2017-05-07T22:54:11.000Z

Original author: [Hass@Howard](#)

This looks like a duplicate of [#2437](#).

Solving this issue cleanly at the RSB level requires teaching the RSB about packages and then providing per host integration to the local packaging system if one is present. The RSB can build anything and so it is difficult to create a per host install list for everything that it could build. As a result there is currently a middle ground that is not cleanly covered leaving holes such as this one.

For pax please provide a documentation patch.

**Author:** Chris Johns 2017-05-07T22:58:24.000Z

Original author: [Hass@Howard](#)

Also the latest RSB documentation is <https://docs.rtems.org/branches/master/rsb/index.html>

I never had this problem until I rebased recently. It triggered on LEON3 since some drivers are looking at the RTEMS version information from headers.

This was fixed by Sebastian in commit: e0627c69b5bc2b669105525b1ce35f84abc3edf0

Original author: munster

When used with 64KiB clusters, the FAT driver will loop forever in cpukit/libfs/src/dosfs/fat.c, line 580. This happens because struct fat\_vol\_s declares bytes per cluster variable as **uint16\_t bpc**, whereas it can be as big as 256KiB.

Here is a link for Linux FAT driver which doesn't make any assumption about cluster size:  
[\[http://lxr.free-electrons.com/source/fs/fat/inode.c?v=2.6.24#L1262\]](http://lxr.free-electrons.com/source/fs/fat/inode.c?v=2.6.24#L1262)

Original author: munster

Do you have a test case?

Do you have a proposed solution? is it just to increase bpc type size?

The default setting for `CONFIGURE_MAXIMUM_PROCESSORS` is 1 and this means `rtems_configuration_is_smp_enabled()` returns false. Only the `smptests` set the maximum processor count to `CPU_COUNT` and therefore run in SMP mode.

If SMP is not running in an SMP build when running the tests are the tests really reporting a true indication of the of the system?

I would expect we have the API tests, libtests and fstests running with SMP enabled in an SMP build.

It looks like there are two issues in windows.py

- Probes for programs like bison and flex as required.
- tar - bsdtar must be on mingw. It doesn't appear to exist on cygwin.

I think the fix is pretty simple code-wise but I wanted to get some feedback on why there were a lot more required programs in this file than on other OS.py files.

---

**Author:** Chris Johns 2017-04-18T23:43:22.000Z

---

Replying to [Joel Sherrill](#):

It looks like there are two issues in windows.py \* Probes for programs like bison and flex as required. \* tar - bsdtar must be on mingw. It doesn't appear to exist on cygwin.

Correct. Getting a suitable bug free tar on Windows is not as easy as it looks.

I have no interest in supporting Cygwin. In the past it has never been able to complete a build of the tools in a reliable way while MSYS2 does. Cygwin complicates the Windows environment, machine set up, documentation and what user's should use.

I do not want to run parallel MSYS2 and Cygwin environments to check both are working. I have supported Cygwin the past and found it a major effort and distraction.

I think the new Microsoft Unix layer, what ever that is called, is a better path for us to follow.

I think the fix is pretty simple code-wise

If you wish to support Cygwin then I ask you test all changes to this file on MSYS2 as this is the primary set up for Windows.

but I wanted to get some feedback on why there were a lot more required programs in this file than on other OS.py files.

Typically a default entry is overridden by creating an entry in the host's OS file. Entries are overridden if the paths do not match.

Original author: [Hass@Howard](#)

When I went to rebuild based on 4.12, I cloned from github. I am no longer getting all of the b-sets that I was expecting. Specifically, 4.12/rtems-sparc

Chris Johns said to submit it as a bug. It must have happened within the last couple of weeks. As my scripts that automated these tasks were working as of around 3/1/2017

```
git clone git://git.rtems.org/rtems-source-builder.git $SETBLDRSCRIPTDIR/sb-set-builder --list-bsets
```

```
RTEMS Source Builder - Set Builder, 4.12 (2074bd1168ee) Examining: config Examining:
../rtems/src/rtems-source-builder/source-builder/config Examining: ../rtems/src/rtems-
source-builder/bare/config devel/autotools-base.bset devel/autotools-internal.bset devel/
autotools.bset devel/dtc.bset devel/libtool.bset devel/libusb.bset devel/or1ksim.bset
devel/qemu.bset gnu-tools-4.6.bset gnu-tools-4.8.2.bset lang/gcc491.bset
```

When you mentioned GitHub, I wondered if the mirroring was broken. It is not. And it looks like rtems/config/4.12 has the right content.

I will try the script in the morning to see what it lists on my computer.

**Author:** Trac Migrate 2017-04-17T03:44:58.000Z

Original author: [Hass@Howard](#)

What could I look for specifically by hand in the git repository?

---

**Author:** Joel Sherrill 2017-04-17T14:32:04.000Z

---

Original author: [Hass@Howard](#)

I don't think you need to look at anything. I can confirm the script doesn't find the RTEMS 4.12 bsets. It isn't seeing anything in the rtems/ directory.

```
$ ./source-builder/sb-set-builder --list-bsets RTEMS Source Builder - Set Builder,
4.12 (2074bd1168ee) Examining: config Examining: source-builder/config Ex-
amining: bare/config devel/autotools-base.bset devel/autotools-internal.bset
devel/autotools.bset devel/dtc.bset devel/libtool.bset devel/libusb.bset de-
vel/or1ksim.bset devel/qemu.bset gnu-tools-4.6.bset gnu-tools-4.8.2.bset
lang/gcc491.bset
```

The rtems 4.12 bset's are:

```
$ ls rtems/config/4.12 rtems-aarch64.bset rtems-i386.bset rtems-powerpc.bset
rtems-all.bset rtems-lm32.bset rtems-sh.bset rtems-arm.bset rtems-m32c.bset
rtems-sparc64.bset rtems-autotools-base.bset rtems-m68k.bset rtems-sparc.bset
rtems-autotools.bset rtems-microblaze.bset rtems-tools.bset rtems-autotools-
internal.bset rtems-mips.bset rtems-v850.bset rtems-bfin.bset rtems-moxie.bset
rtems-x86_64.bset rtems-default.bset rtems-nios2.bset rtems-epiphany.bset rtems-
or1k.bset
```

cd into rtems/ and then run set-builder using any of those. This is just a problem with the --list-bsets.

The target code in libdebugger has support to recover from exceptions related to invalid memory accesses. GDB may request the server access memory on the target that results in an exception. The exception occurs on the server's remote connection thread and the server needs to recover and return an error to GDB.

Running the debugger01 test with an SMP build of RTEMS and libbsd for xilinx\_zedboard and issuing bt in GDB results in:

```

- Attachment [die-on-assert.patch](#) added

Die on assert patch to test.

**Author:** Trac Migrate 2017-04-15T00:44:35.000Z

In [changeset:"b53ad4615a16f65119e40f7084f9bacd88dc42cd/rtems" b53ad46/rtems]:

```

1 libdebugger: Work around assert when using _Thread_Executing.
2
3 Using _Thread_Executing with RTEMS_DEBUG results in an `assert` if
4 the server accesses invalid memory.
5
6 Updates #2993.

```

**Author:** Trac Migrate 2017-05-02T05:27:20.000Z

What prevents a thread dispatch in this context?

**Author:** Chris Johns 2017-05-02T06:27:02.000Z

I think it was the mode and attributes being the wrong way around in the create call.

Maybe the create call should detect this and return an error rather than the internal error.

**Author:** Joel Sherrill 2017-05-02T14:17:14.000Z

It would take making the attribute and mode bits mutually exclusive so overlap can be detected. I considered this also. We would have to be careful to document/check that they stay overlapping.

Per discussion at <https://lists.rtems.org/pipermail/devel/2017-April/017483.html>, create <rtems/inttypes.h> to consolidate extensions to the C99 <inttypes.h> file. A quick search shows that there are the following set of defines which could be consolidated as a starting point. Then these are available to address other printf() format warnings.

```
$ grep -r "#define PRI" . | grep -v PRIORITY | grep -v PRINT
```

```
./cpukit/libmisc/shell/main_time.c:#define PRIldtime_t PRIld64
./cpukit/libmisc/shell/main_time.c:#define PRIldtime_t PRIld32

The RTEMS Header test is libbsd is broken. I assume including <rtems.h> and no other is still a requirement. Maybe we need a test for this.

The example code is:

```

1 $ cat t.c
2 /*
3
4 /opt/work/rtems/4.12/bin/arm-rtems4.12-gcc -qrtems -B/opt/work/si/rtems/4.12/arm-

It looks like the includes do not always work for .tcfg files. So far these BSPs do not appear to honor the excludes in an included file:

log/m32c-m32csim.log log/mips-hurricane.log log/mips-rbt4925.log log/mips-rbt4938.log  
log/moxie-moxiesim.log

mips and moxie are dl tests.

The following BSPs do not successfully build on the master because they use UBoot's mkimage which is not part of the standard RTEMS tools.

qorIQ\_core\_0 qorIQ\_core\_1 qorIQ\_p1020rdb

Ok, now I know why I didn't commit this patch years ago.

Should we add the U-Boot mkimage to the RTEMS tools? It is GPL software.

---

**Author:** Chris Johns 2017-04-04T06:04:04.000Z

---

Replying to [Sebastian Huber](#):

Should we add the U-Boot mkimage to the RTEMS tools? It is GPL software.

No. The RSB is fine, maybe a `rtems/config/bsps/qoriq` build set could be added which builds everything for the user of the BSP including uboot.

You could see if you can craft a configure test to detect the tool then update the build rule. This would allow those who do not have the tool to build and regression test building.

I also suggest you provide instructions in the Wiki under <https://devel.rtems.org/wiki/Boards> on how to get and build uboot, create images etc.

I see any post rules or stages as a wasted effort, even the size command. This should be handled outside of RTEMS. It is difficult to handle generically.

**Author:** Trac Migrate 2017-04-04T06:08:25.000Z

---

I am not sure if its easily possible to adjust anything in `make/custom/*` via the configure script.

---

---

Replying to [Sebastian Huber](#):

I am not sure if its easily possible to adjust anything in `make/custom/*` via the configure script.

I am sure a bit of `m4` and whole lot of `./` is all you need ;)

Original author: sebastian.huber

Whether enums are short or not is left open in the ARM EABI. On Linux and FreeBSD no short enums are used. Otherwise short enums are enabled by default.

Short enums may cause hard to find issues with 3rd party software, since the are quite unusual in general, e.g.

<https://git.rtems.org/rtems-libbsd/commit/freebsd/include/rpc?id=9880635f2e642380b69b85e00271649b3a2fc2de>

The data and structure layout may suddenly change in case enumeration values are added/removed. The benefit of short enums is probably not worth the trouble, since the packed compiler attribute can be used to individually make an enum short.

The reason for not choosing no short enums during the ARM EABI introduction was an issue with Newlib. This is addressed with the following patch:

<https://sourceware.org/ml/newlib/2017/msg00238.html>

The output of bootstrap does not use a consistent sort order with sb-bootstrap. The difference appears to be in the default behavior of the sort command versus Python's sorted. By forcing the locale to C, sort should have a consistent behavior.

Add dhrystone, whetstone and linpack benchmark programs to the testsuite. This may help to evaluate compiler settings, compiler versions and processors.

Original author: sebastian.huber

The top level lock is an ISR lock (interrupt disable/enable or SMP lock) and the low level lock is potentially a mutex. The problem is exposed by test psxshm02:

```

Yes: the shm code has some rather questionable design choices in its locking patterns. Here it acquires a thread\_queue and then calls a user plugin function, in this case malloc is called which eventually leads to the error shown.

Is there somewhere with guidance written for how to use the various lock constructs available in RTEMS? Or what are their constraints on use. Because I didn't even know this was a problem, and apparently did not spend much time thinking about this while writing the code.

The shm code uses 2 locking patterns. The one causing a problem here is the use of a thread\_queue to protect the invocations to operations on the shared-memory object.

This should be some fine-grained mutex lock that allows the operation invoked to also acquire/release internal locks such as is needed by malloc.

The other lock used is the `_Objects_Allocator_lock` to protect the integrity of the `POSIX_Shm_Control` Object. I think this one is fine.

Replying to [Gedare](#):

Yes: the shm code has some rather questionable design choices in its locking patterns. Here it acquires a `thread_queue` and then calls a user plugin function, in this case malloc is called which eventually leads to the error shown. Is there somewhere with guidance written for how to use the various lock constructs available in RTEMS? Or what are their constraints on use. Because I didn't even know this was a problem, and apparently did not spend much time thinking about this while writing the code.

Good question, maybe we should something add to the manual, e.g. in Key Concepts, 3.3 Communication and Synchronization.

The shm code uses 2 locking patterns. The one causing a problem here is the use of a `thread_queue` to protect the invocations to operations on the shared-memory object. This should be some fine-grained mutex lock that allows the operation invoked to also acquire/release internal locks such as is needed by malloc.

The thread queue should be replaced with a mutex. For simplicity, maybe just the allocator mutex. We really need the self-contained mutexes for internal use.

The other lock used is the `_Objects_Allocator_lock` to protect the integrity of the `POSIX_Shm_Control` Object. I think this one is fine.

Yes.

Set CPU\_ENABLE\_ROBUST\_THREAD\_DISPATCH to TRUE. In this case the interrupts are always enabled during a context switch even after interrupt processing (see #2751). Remove the CPSR from the context control since it contains only volatile bits.

Adding a top level testsuite configuration file lets us specify tests that have a common test state across all BSPs.

Adding the test state ‘user-input’ clearly tags the test as needing user input and test result tools can correctly determine the test result. The current practice of passing a test needing user input is actually hiding the real result of the test.

Replying to [Joel Sherrill](#):

There are approximately ~100 failures, timeouts, etc on the LEON3 BSP. See this thread for some discussion where Jiri notes it is broken on his checkout from December: <https://lists.rtems.org/pipermail/devel/2017-March/017277.html> Passed: 458 Failed: 20 Timeouts: 73 Invalid: 3 ————— Total: 554

What are the results with SMP enabled?

**Author:** Trac Migrate 2017-05-11T07:31:02.000Z

- **Milestone** changed from %"4.12" to %"4.12.0"

**Author:** Trac Migrate 2017-05-12T09:42:39.000Z

I have not managed to reproduce so many failures on GR712RC, GR740 or TSIM. Below are the failures I get from the run yesterday on non-SMP RTEMS configuration at GR712RC LEON3. The five fstests below have been discussed before and I believe they are related to the same faulty newlib configure used when the toolchain was built. Left is 4 tests which we will have to analyse.

I'm would argue that this should not block the 4.12 branching?

```
[usr1] #####
[usr1] # RTEMS TESTSUITE FAILURE SUMMARY [usr1] # [usr1] # Result Test
ExecRes ConsoleRes ExitCode1 ExitCode2 [usr1] # FAIL: ./fstests/imfs_fsscandir01

- **Resolution** set to ~"worksforme"
- **Status** changed from *assigned* to *closed*

**Author:** Trac Migrate 2017-05-12T09:53:58.000Z

Which tool chain did you use?

Why are there fsscandir01 failures?

**Author:** Trac Migrate 2017-05-12T10:03:05.000Z

It happens on both GCC-6 and GCC-7 series. It is our own build, I think it is the configuration of it that is an issue.

```
[usr1] # FAIL: ./fstests/imfs_fsscandir01 OK FAIL 5 0 [usr1] # FAIL:
./fstests/jffs2_fsscandir01 OK FAIL 5 0 [usr1] # FAIL: ./fstests/mdosfs_fsscandir01
OK FAIL 5 0 [usr1] # FAIL: ./fstests/mimfs_fsscandir01 OK FAIL 5 0 [usr1] # FAIL:
./fstests/mrfs_fsscandir01 OK FAIL 5 0
```

all fail with similar error message:

```
[term1] * BEGIN OF TEST FSSCANDIR ROOT IMFS * [term1] Initializing filesystem
ROOT IMFS [term1] scandir: Success [term1] /opt/rtems-4.12/src/rtems-4.12/c/src/../../testsuites/fstests/imfs_fsscandir01/../../fsscandir01/init.c: 47
MAXNAMLEN == NAME_MAX
```

**Author:** Trac Migrate 2017-05-12T10:08:13.000Z

It would be quite nice if your RCC is next to identical to the tool chain produced by the RSB. This issue was fixed in January 2017 in the RTEMS master.

```

---

**Author:** Gedare Bloom 2017-03-17T19:37:30.000Z

---

Original author: hunk3749

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

This says there is no file found at the location of \$HOME/development/rtems/rsb/source-builder/sb-bootstrap

Please check your file system to see where you have checked out RSB. (I see from your other ticket you filed that it is in fact \$HOME/development/rtems/rsb/rtems-source-builder/source-builder/sb-bootstrap that you need.

Also, it is not recommended to run the source builder as the root user, or even as sudo.

Depending on the speed of the computer, building tools for an architecture can easily take an hour. You should run top in another windows land see how active your computer is. There is also a detailed log file you can tail. But I don't remember the details of that offhand.

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

Yeah this looks perfectly normal so far. Let it continue going.

I'm closing this. OP can re-open and post an rsb-error / log file if there is a problem.

Coverity URL:

<https://scan5.coverity.com/reports.htm#v29808/p10069/fileInstanceId=108958257&defectInstanceId=30877219&mergedDefectId=1399703>

Coverity Scan doesn’t like taking the address of a single `uint32_t` and then treating it as an array pointer. I think the code is likely doing what is intended but there is an implicit linkable between the order of the fields in the structure here and the class numbers used in the object IDs. Is there a way to improve this code and reduce the linkage?

```
141 1. address_of: Taking address with &snapshot->active_posix_keys yields a singleton pointer.
2. assign: Assigning: active = &snapshot->active_posix_keys.
142 active = &snapshot->active_posix_keys;
143 3. Condition i < 19U /* sizeof (objects_info_table) / sizeof (objects_info_table[0]) */, taking true branch.
144 for (i = 0; i < RTEMS_ARRAY_SIZE(objects_info_table); ++i) {
145 const Objects_Information *information;
146 147 information = _Objects_Get_information(
148 objects_info_table[i].api,
149 objects_info_table[i].cls
150 );
151 4. Condition information != NULL, taking true branch.
152 if (information != NULL) {
```

CID 1399703 (#1 of 1): Out-of-bounds access (ARRAY\_VS\_SINGLETON) 5. ptr\_arith: Using active as an array. This might corrupt or misinterpret adjacent memory locations. 153 active[i] = \_Objects\_Active\_count(information);

---

Yes, the code is ugly, but it works quite well.

---

**Author:** Gedare Bloom 2017-03-13T15:08:59.000Z

---

Very ugly. The hack might be a bit more clear if we use

```

1 typedef struct {
2   Heap_Information_block workspace_info;
3   Heap_Information_block heap_info;
4   uint32_t active_posix_key_value_pairs;
5   union {
6     uint32_t anonymous[ 1 + ( sizeof(rtems_resource_rtems_api) +
7     ↪ sizeof(rtems_resource_posix_api) ) / sizeof(uint32_t) ];
8   }
9   struct {
10    uint32_t active_posix_keys;
11    rtems_resource_rtems_api rtems_api;
12    rtems_resource_posix_api posix_api;
13  }
14  int open_files;
15 } rtems_resource_snapshot;

```

---

**Author:** Trac Migrate 2017-03-14T06:28:40.000Z

---

Replying to [Gedare](#):

Very ugly. The hack might be a bit more clear if we use {{{ typedef struct { Heap\_Information\_block workspace\_info; Heap\_Information\_block heap\_info; uint32\_t active\_posix\_key\_value\_pairs; union { uint32\_t anonymous[ 1 + ( sizeof(rtems\_resource\_rtems\_api) + sizeof(rtems\_resource\_posix\_api) ) / sizeof(uint32\_t) ]; struct { uint32\_t active\_posix\_keys; rtems\_resource\_rtems\_api rtems\_api; rtems\_resource\_posix\_api posix\_api; } } int open\_files; } rtems\_resource\_snapshot; }}}}

The rtems\_resource\_snapshot structure is supposed to be easy to understand for the user and should not make implementation details visible. With the union you still assume a certain mapping of array elements and normal structure members. It is an out-of-bounds access, so Coverity is right, but it is intentional. I don't think this should be changed.

Original author: sebastian.huber

Currently only blocking read/write operations are implemented. A blocking write must transfer at least one character. It should not wait for the device for the second character and so on.

Original author: sebastian.huber

Call the receive callback in case a read will succeed without to block. This enables the use of the receive callback for a poll() and select() support. Increase raw input buffer size to allow buffering of one line.

Original author: sebastian.huber

This leads to:

```
../../../../../../../../rtems/c/src/../../../../cpukit/libmisc/xz/xz_crc64.c:21:16: warning: no previous prototype for 'xz_crc64_init' [-Wmissing-prototypes]
../../../../../../../../rtems/c/src/../../../../cpukit/libmisc/xz/xz_crc64.c:40:20: warning: no previous prototype for 'xz_crc64' [-Wmissing-prototypes]
```

We should enable the 64-bit CRC or remove this file from the build.

The rtems-docs requires the Sphinx contribution extension for bibtex to build.

A configure check should be added to see if the extension is installed and an error raised or the documentation conditionally built.

It is not clear to me if bibtex needs Tex Alive. Requiring Tex on all hosts to build the documentation is a regression so the extension will need to be removed or a fall back position taken where degraded quality documentation in HTML is created.

Original author: kirspclk

The FreeBSD struct termios separates out the input and output baud rates into individual speed\_t variables. It also supports more flag options. The big benefit is that the rtems-libbsd tty code can be ported cleanly without the need to fixup the input and output baud rates. This should be a transparent change unless someone was manipulating the baud rates directly through the c\_cflags (not using the cfgetispeed, cfgetospeed, cfsetispeed, cfsetospeed functions).

I have made the modifications to termios. There were a bunch of files to change in the BSPs to use the new baud rate fields. I think I updated all the necessary BSPs. I only tested the xilinx\_zynq\_a9\_qemu BSP. I am attaching the patch file and testsuite log.

Loading a new VM, I noticed that pax is needed. It isn't mentioned in the RSB manual at all.

I can only accurately fix this for Centos 7 but we can safely assume that advice applies to Centos 6, Fedora, and RHEL.

Can users of other distributions check about pax. Please

The RSB needs a better way to manage this type of problem as well as packages.

It a reasonably sized change which will have to happen. I do not think it can be avoided anymore.

Original author: sebastian.huber

Prefix the confdefs.h internal defines with an underscore to simplify the review of this extremely complex header file.

---

**Author:** Chris Johns 2017-02-01T23:51:32.000Z

---

Original author: sebastian.huber

Could you please provide more detail about this change, why it helps and the user impact?

Thanks

---

**Author:** Trac Migrate 2017-02-02T05:45:24.000Z

---

Original author: sebastian.huber

It is common practice in RTEMS to prefix internal things with an underscore. The confdefs.h header file became quite complex over time. It uses a lot of internal

defines and up to now everything starts with `CONFIGURE_*`. It has no user impact. It helps to identify undocumented configuration options.

Original author: stavros.passas

Currently, when `_RBTREE_Initialize_node` is used, it generates warnings of unused variables. I traced the issue down to the variable being used only if `RTEMS_DEBUG` is set.

Thus, the argument should be marked as `RTEMS_UNUSED`, if `RTEMS_DEBUG` is not set.

Original author: stavros.passas

The extension for the stack checker defines 8 entries, while the structure for RTEMS extensions gets 9 arguments. This causes warnings to appear on applications compiled with -Werror, or similar flags.

The handler that is missing is for the terminate callback, so a 0 entry would be enough to fix this error.

Original author: sebastian.huber

`rtems_rate_monotonic_postponed_job_count()` should return an RTEMS status code. It should be renamed to `rtems_rate_monotonic_get_postponed_job_count()` or `rtems_rate_monotonic_get_postponed_jobs()` (similar to `rtems_rate_monotonic_get_statistics()`).

**Author:** Trac Migrate 2017-01-24T14:13:27.000Z

Original author: sebastian.huber

There is no test case for this function.

---

**Author:** Trac Migrate 2017-01-24T15:44:34.000Z

---

Original author: sebastian.huber

I think we should rename it as `rtems_rate_monotonic_get_postponed_job_count(uint32_t *count)`, though the name is really long. The RTEMS status codes could be: RTEMS\_SUCCESSFUL - count returned successfully RTEMS\_INVALID\_ID - invalid rate monotonic period id RTEMS\_INVALID\_ADDRESS - invalid address of count

---

**Author:** Trac Migrate 2017-01-25T06:28:28.000Z

---

Original author: sebastian.huber

My preferred option: just add this to `rtems_rate_monotonic_period_status` and return it via `rtems_rate_monotonic_get_status()`.

---

**Author:** Trac Migrate 2017-01-25T08:28:16.000Z

---

Original author: sebastian.huber

I can do this. I will add the count into the structure of `rtems_rate_monotonic_period_status`, remove `rtems_rate_monotonic_get_postponed_job_count()`, and extend `rtems_rate_monotonic_get_status()`.

---

**Author:** Trac Migrate 2017-01-25T13:19:19.000Z

---

Original author: sebastian.huber

Sp69 is also planned to be updated, which is the test for `rtems_rate_monotonic_get_status()`

---

**Author:** Trac Migrate 2017-01-30T06:53:30.000Z

---

Original author: sebastian.huber

In changeset 0794197f729f5ee9551dc7b2e14867f394cbc327:

rtems: Fix `_Rate_monotonic_Renew_deadline()` Prepare a precondition to prevent the potential integer overflow. Remove one redundant parameter in `_Rate_monotonic_Renew_deadline()`. `sptests/sprmsched02`: Create A test case for checking the overflow condition of postponed jobs in `rtems_rate_monotonic_period_status`. Update [#2885](#).

Original author: dcb

src/c/src/lib/libbsp/sparc/shared/can/occan.c:1573]: (style) Checking if unsigned variable ‘speed=pelican\_speed\_auto(can)’ is less than zero.

Source code is

```
if ( (speed=pelican_speed_auto(can)) < 0 ){ /* failed */ return RTEMS_IO_ERROR; }
```

but

```
unsigned int speed;
```

and

```
static int pelican_speed_auto(occan_priv *priv);
```

I am not sure which C compiler gets using in rtems, but I do know that gcc compiler flag -Wtype-limits will flag this kind of problem.

Hi, This might not generated a warning because it is part of dead code that will never be reached due to the return statement just above. I have made a patch to remove this dead code, it will close this ticket.

Original author: stavros.passas

What happens is that on networks with more than one DHCP servers, or on networks that use multiple vlans it can happen that After a DHCP discover our client broadcasts, it receives multiple offers, which is perfectly fine based on the DHCP RFC.

However our implementation of a DHCP client, expects a linear execution flow: 1. Broadcast a DHCP discover; 2. Wait for a DHCP offer; 3. Transmit a DHCP request; 4. Wait for a DHCP ack;

However the network stack is not cleaned between the reception of a DHCP offer and a DHCP ack, so if multiple offers are received, just the first one will be processed during the "Receive

DHCP offer” phase, and the next one will be received when we expect a “DHCP ack”, which makes our implementation assume the DHCP handshake is invalid and fail. Thus we restart the network and retry the whole process from the beginning which will cause the same issue again.

This issue that is present from when I remember in RTEMS, definitely from 4.10 up to now.

---

**Author:** Trac Migrate 2017-01-20T09:25:37.000Z

---

Original author: stavros.passas

The DHCP client used by libbsd is probably not affected by this problem.

---

**Author:** Trac Migrate 2017-01-20T09:27:16.000Z

---

Original author: stavros.passas

Correct, this affects just cpukit/libnetworking/rtems/rtems\_dhcp.c

Original author: stavros.passas

I attach a file with a proposed fix for this DHCP client. mainly what the fix does is extend bootp\_call to be able to expect a specific message as response. If it receives any other message, it will just ignore it, and it will timeout as it is expected to do in the first place.

Then with the extended bootp\_call, I extended the dhcp client implementation to strictly expect a dhcp offer after a discover message and a DHCP ack after a request message. This way, the DHCP protocol does not fail if there are multiple DHCP messages on the network and it will finish successfully a DHCP handshake even when multiple messages are received from our client.

[src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt_timer.c:117]: (style)
Checking if unsigned variable 'timer' is less than zero.
[src/c/src/lib/libbsp/powerpc/beatnik/marvell/gt_timer.c:128]: (style) Checking if unsigned
variable 'timer' is less than zero.
```

Parameter “timer” is only ever type `uint32_t`, so any check `< 0` seem pointless.

Original author: dcb

src/c/src/lib/libbsp/arm/raspberrypi/i2c/i2c.c:320]: (style) Checking if unsigned variable ‘rv’ is less than zero.

Source code is

```
rv = rpi_i2c_setup_transfer(bus);  
if ( rv < 0 ) {  
    but  
    uint32_t rv = 0;  
    and  
    static int rpi_i2c_setup_transfer(rpi_i2c_bus *bus)
```

Suggest put return value into an int local variable, then sanity check it, then assign it to rv.

Original author: dcb

I would like to know what you are running to spot these issues and what settings.

I run a static C / C++ analyser called cppcheck, available from sourceforge.

<http://cppcheck.sourceforge.net/>

The latest released version would probably work ok, but I use the current development version. I use flag `-enable=all` and I've tweaked the source of cppcheck as well.

BTW, if I could figure out how to build rtems on Linux, then I could run the latest development versions of clang and gcc over rtems and possibly get some interesting warnings.

I would like to make sure that eventually we are running the same thing as a project.

I have been doing this myself for about a year or so. I'd be more than happy to help and share my results.

I would have emailed directly but couldn't find your email.

dcb 314 at hotmail dot com. Feel free to chat offline.

Original author: stavros.passas

rtems-test-check is responsible of checking the testsuite configuration of a given BSP and adapt it based on a given "command". Currently for the "exclude" command, we never exclude anything, the output of the script is always the whole list of the input tests.

This happens because the script always starts with `output = $tests` and appends on the list the tests that are not excluded, so the output is always all the tests.

Original author: stavros.passas

I attached a simple fix that would solve the described issue. The issue is created because we want to provide a full list of tests in case the exclude file from the BSP is non-existing, thus a simple fix would be to start with an empty list if the BSP file exists, or with a full list there is nothing to exclude.

Original author: stavros.passas

Hi Joel, no this will not work, because for the BSPs that do not have an exclude testsuite list, the output will be returned immediately as `${output}` (that will be ""), and the BSP will not compile any test!

---

**Author:** Joel Sherrill 2017-01-16T18:23:31.000Z

---

Original author: stavros.passas

Unfortunately, it looks like this script has grown complicated enough where some test cases are needed that are independent of the BSPs and testsuite.

I will try to look at it some more but am assigning this to Chris since he wrote the script.

I have built all BSPs with your patch and my additions to some .tcfg files.

The only BSPs with build issues are those which are gcc < 5.0 due to using restrict and not \_\_restrict in devctl.h. This is fixed in newlib and the next newlib snapshot and tool bump will fix those.

Reopen if you think this isn't OK.

Add support to automatically update the branches when a git commit happens.

**Author:** Amar Takhar 2017-01-16T06:00:41.000Z

You mean automatically build the docs when someone makes a commit to them?

A little confused by the description. :)

**Author:** Chris Johns 2017-01-16T06:23:20.000Z

- **Summary** changed from *docs.rtems.org Automatic update of branches.* to *docs.rtems.org Automatic update of branches content when a rtems-doc.git change is made.*

Replying to [amar](#):

You mean automatically build the docs when someone makes a commit to them?

Yes and publish the build on the docs.rtems.org website. The website is driven off an XML catalogue created when building the docs so document changes, additions, renames and removals are handled within the built package.

A little confused by the description. :)

Sorry, I have amended the Summary. I hope this is better.

I intend to build on sync.rtems.org when a hash on a branch changes, tar the content then transfer to docs.rtems.org. I have a script to manage the git hash checking and to build the content. A job on docs will pick up the new package and install it. All I need a way to move the package from sync to docs.

**Author:** Amar Takhar 2017-01-16T14:09:42.000Z

I have already written something like this for the new docs.rtems.org. Incremental builds (by commit) and release builds.

It needs to be managed properly, most projects overwrite their 'devel' documentation with new versions. I want to keep around every single built version for comparison this is more useful for contributors.

I have already written something like this for the new docs.rtems.org. Incremental builds (by commit) and release builds.

Release builds are part of the release process which is a separate from this web site. The released documents are loaded on the the web site and the website's configuration updated to include the release details and the site is regenerated.

For building from git I was told to sort out building by cron so this is what I have done.

Is it possible to set up a share on the TrueNAS to be a clearing house between sync and docs?

It needs to be managed properly, most projects overwrite their 'devel' documentation with new versions.

I am concerned it places extra stress on the limit resources we have so do not see holding builds as a priority. We have the source in git so someone can get that release and build it.

I want to keep around every single built version for comparison this is more useful for contributors.

How is this more useful for contributors?

Release builds are part of the release process which is a separate from this web site. The released documents are loaded on the the web site and the website's configuration updated to include the release details and the site is regenerated.

They'll all be built from the same location using the same tools and same process the only difference is one will be a tag and the other a branch. If you are talking about what 'triggers' a build then yes they are different.

For building from git I was told to sort out building by cron so this is what I have done. Is it possible to set up a share on the TrueNAS to be a clearing house between sync and docs?

How long is this going to be setup for? I suggested this before you mentioned building after every commit. . .

It needs to be managed properly, most projects overwrite their ‘devel’ documentation with new versions.

I am concerned it places extra stress on the limit resources we have so do not see holding builds as a priority. We have the source in git so someone can get that release and build it.

Space isn’t an issue it will be a decade worth of builds before it will be a problem.

The other nice feature is if someone builds from a commit in source they’ll have the corresponding documentation available that is as close to that version as possible – I have a way to track this it’s a tool I wrote some time ago.

I want to keep around every single built version for comparison this is more useful for contributors.

How is this more useful for contributors?

Not all errors are build errors some are formatting/syntax. Lots of contributors don’t have the ability to build docs from source – I don’t think that is a pre requisit to make changes since they need to be tested before commit anyway.

Docs are unique in that regard.

---

What is the problem with providing a way to get content from a “build jail” to a “offer to the world jail”? AFAIK all solutions include either making a directory on the TrueNAS available to the “offer to the world jail” or push via ssh. Please help Chris.

Providing this path from “build to “offer to the world” is not an unusual requirement. It is needed for multiple offerings.

There is negative value in keeping builds of documentation on every commit.

I am not sure if we are saying the same thing or not.

A release of RTEMS contains released documentation and the formally released procedure creates that tar file of documentation. The `rtems-release.git` repo contains the format release scripts. Released documentation must be created as part of that formal release procedure.

For building from git I was told to sort out building by cron so this is what I have done. Is it possible to set up a share on the TrueNAS to be a clearing house between sync and docs?

How long is this going to be setup for?

I am sorry I have no idea how long. I am just wanting to fill a gap that currently exists as best I can. I am after a simple, secure method to complete this task. As Joel says, if a simple solution can be found and this can be done that would be excellent. We would also be free to move on and sort other issues out, eg buildbot of the RTEMS code, new website, etc and we can come back to this when we have time, funding etc. We are working hard and openly to try to get this to happen but is hard.

I suggested this before you mentioned building after every commit...

I did not know sphinx could not be installed on `docs.rtems.org` and the docs built in that jail. I just assumed the docs could be built on each commit on `docs.rtems.org`. When I looked at the jail I saw you had installed tex alive and other packages and you had been building documentation there.

It needs to be managed properly, most projects overwrite their 'devel' documentation with new versions.

I am concerned it places extra stress on the limited resources we have so do not see holding builds as a priority. We have

the source in git so someone can get that release and build it.

Space isn't an issue it will be a decade worth of builds before it will be a problem. The other nice feature is if someone builds from a commit in source they'll have the corresponding documentation available that is as close to that version as possible – I have a way to track this it's a tool I wrote some time ago.

Sorry, I do not follow. How would someone with a local build compare and what would the value be in doing this?

I want to keep around every single built version for comparison this is more useful for contributors.

How is this more useful for contributors?

Not all errors are build errors some are formatting/syntax. Lots of contributors don't have the ability to build docs from source – I don't think that is a pre requisit to make changes since they need to be tested before commit anyway. Docs are unique in that regard.

We have been testing on a number of hosts and it builds ok. I have not built PDF on OS X as tex alive is too hard without something like brew or macports, HTML works.

The POSIX 1003.1 Compliance Guide should be auto-generated from a spreadsheet into the ReST format. My vague recollection is that we used shell scripts to do this for texinfo output.

I will have to decipher what we used to do and define a new procedure.

This impacts 4.11 and newer. One issue is having correct information for what methods are present on a branch. The FACE Conformance Test Suite can be used for ~800 of the methods.

Add support to the releases section of the web site to handle ReST packages. The catalogues have a legacy field for texinfo docs.

The 4.11.0 and 4.11.1 releases need to have a catalogue added because this did not exist when those releases were created.

Original author: sebastian.huber

Add user defined thread names to ease debugging, enhance the system diagnostics and improve compatibility to other systems, e.g. Linux and FreeBSD.

Implement `pthread_setname_np()` and `pthread_getname_np()`. Add `CONFIGURE_MAXIMUM_THREAD_NAME_SIZE` to the application configuration options. Add a application configuration dependent storage area for thread names to the thread control block.

**Author:** Joel Sherrill 2017-01-12T13:41:01.000Z

Original author: sebastian.huber

This shouldn't be hard to add since `rtems_object_[gs]et_name()` were added to do the same thing. These have been in since before 4.10. See `psx14` for an example usage of `rtems_object_set_name()` on a pthread.

**Author:** Trac Migrate 2017-01-12T14:50:47.000Z

Original author: sebastian.huber

The problem with the object set/get name is that the interpretation of the `Objects_Name` depends on `Objects_Information::is_string` which is false for Classic and true for POSIX.

**Author:** Trac Migrate 2017-01-12T14:53:20.000Z

Original author: sebastian.huber

With the new thread name support I get now

```

Before all the libbsd threads had the name “\_BSD”.

**Author:** Joel Sherrill 2017-01-12T16:18:27.000Z

Original author: sebastian.huber

I am missing something in the code about how a Classic API task can have a string name.

What about names for threads created using the new lightweight API? And do they show up in these lists.

**Author:** Trac Migrate 2017-01-12T16:33:21.000Z

Original author: sebastian.huber

See patch:

<https://lists.rtems.org/pipermail/devel/2017-January/016680.html>

The optional string name is accessible via Thread\_Control::Join\_queue::Queue::name.

Original author: sebastian.huber

The ATA/IDE support in RTEMS is out-dated. New platforms should consider to use the SATA support provided by FreeBSD via libbsd.

Update the documentation accordingly.

Original author: sebastian.huber

Some applications need to control the garbage collection of the JFFS2 filesystem. For example during bootloader to application transitions with execute in place flashes (XIP).

**Author:** Chris Johns 2016-12-19T21:28:42.000Z

Original author: sebastian.huber

When does JFFS2 garbage collect at the moment?

Does this mean we can mount a JFFS2 disk and not start the garbage collection and defer it to later?

If so does this mean a user needs to enable garage collection at some later time or will the JFFS be configured to start garbage collection automatically?

**Author:** Trac Migrate 2016-12-20T06:29:55.000Z

Original author: sebastian.huber

Garbage collection is done on demand automatically as late as possible. Every operation can result in a garbage collection. We don't have a garbage collection thread like on Linux.

This operation gives you a bit more control when the garbage collection takes place.

Garbage collection is done on demand automatically as late as possible. Every operation can result in a garbage collection. We don't have a garbage collection thread like on Linux.

Is there a special reason we do not have a thread?

This operation gives you a bit more control when the garbage collection takes place.

I see it forces a garbage collection so how do you suspend it?

Your original post suggested it could be suspended and this would be good. After a large delete and reboot the start up can hang on the mount. It would be nice to hold this until we have initialised and then let the clean up happen.

Garbage collection is done on demand automatically as late as possible. Every operation can result in a garbage collection. We don't have a garbage collection thread like on Linux.

Is there a special reason we do not have a thread?

Nobody needed it up to now.

This operation gives you a bit more control when the garbage collection takes place.

I see it forces a garbage collection so how do you suspend it? Your original post suggested it could be suspended and this would be good. After a large delete and reboot the start up can hang on the mount. It would be nice to hold this until we have initialised and then let the clean up happen.

With the `RTEMS_JFFS2_ON_DEMAND_GARBAGE_COLLECTION` and the `rtems_jffs2_control::trigger_garbage_collection` you have now the ability to use a garbage collection thread in your application.

Nobody needed it up to now.

Great, that is fine.

This operation gives you a bit more control when the garbage collection takes place.

I see it forces a garbage collection so how do you suspend it? Your original post suggested it could

be suspended and this would be good. After a large delete and reboot the start up can hang on the mount. It would be nice to hold this until we have initialised and then let the clean up happen.

With the RTEMS\_JFFS2\_ON\_DEMAND\_GARBAGE\_COLLECTION and the rtems\_jffs2\_control::trigger\_garbage\_collection you have now the ability to use a garbage collection thread in your application.

OK. I will take a look. It would be good to have an example of doing this or even something a user can pull in.

Add a new new interrupt server driven Termios mode (TERMIOS\_IRQ\_DRIVEN). This mode is identical to the interrupt driven mode except that a mutex is used for device level locking. The intended use case for this mode are device drivers that use the interrupt server, e.g. SPI or I2C connected devices.

Original author: sebastian.huber

Termios has a task driven mode (`TERMIO_TASK_DRIVEN`). This mode aims to avoid long sections with disabled interrupts. This is only partly implemented since the device level state is still protected by disabled interrupts. Use a mutex to protect the device level state in task driven mode to fix this issue.

Original author: sebastian.huber

The Ada support is the last user of a task variable: `rtems_ada_self`. This doesn't work on SMP configurations. The Ada support in GCC should be changed to use a function call or C11 thread-local storage.

In changeset a550b3f35a32e6c74c78aeda1154b1d901574168:

score: Force Per\_CPU\_Control::executing alignment This fixes the CPU  
 ports with relaxed alignment restrictions, e.g. type alignment is less than  
 the type size. Close #2822. Close #2823.

Replying to [joel.sherrill](#):

I have the latest tools. All BSPs appear to fail like this:

```
powerpc-rtems4.11-gcc -pipe -DHAVE_CONFIG_H -I. -
I../cpukit/../../psim/lib/include [...]
```

Maybe you tried to build the master with the 4.11 tool chain?

**Author:** Joel Sherrill 2016-11-22T16:58:06.000Z

- **Resolution** set to ~"invalid"

- **Status** changed from *new* to *closed*

Slaps head.. Doh! I switched the testing scripts over to 4.11 to get a warnings report and forgot to switch them back.

Thanks.

Hi

With the recent commits, many BSPs on the master do not build. They error out with this static assert:

```
In file included from ../../../../cpukit/../../gumstix/lib/include/rtems/score/types.h:23:0,
from
        ../../../../cpukit/../../gumstix/lib/include/rtems/score/cpu.h:32,
from
        ../../../../cpukit/../../gumstix/lib/include/rtems/system.h:23,
from
        ../../../../rtems/c/src/../../cpukit/score/cpu/arm/cpu.c:29:
../../../../cpukit/../../gumstix/lib/include/rtems/score/basedefs.h:241:5: error: static
assertion failed: "ARM_CONTEXT_CONTROL_ISR_DISPATCH_DISABLE" _Static_assert(cond,
# msg) ^ ../../../../rtems/c/src/../../cpukit/score/cpu/arm/cpu.c:54:3: note: in
expansion of macro 'RTEMS_STATIC_ASSERT' RTEMS_STATIC_ASSERT(
```

The list of BSPs is:

```
arm1136jfs arm1136js arm7tdmi arm920 csb336 csb337 csb637 edb7312 gumstix
kit637_v6 lpc2362 lpc23xx_tli800 lpc24xx_ea lpc24xx_ncs_ram lpc24xx_ncs_rom_ext

Original author: sebastian.huber

On SMP configurations, it is a fatal error to call blocking operating system with interrupts disabled, since this prevents delivery of inter-processor interrupts. This could lead to executing threads which are not allowed to execute resulting in undefined behaviour.

The ARM Cortex-M port has a similar problem, since the interrupt state is not a part of the thread context.

Add a new CPU port function:

```

1 /**
2  * @brief Returns true if interrupts are enabled in the specified ISR level,
3  * otherwise returns false.
4  *
5  * @param[in] level The ISR level.
6  *
7  * @retval true Interrupts are enabled in the ISR level.
8  * @retval false Otherwise.
9  */
10 RTEMS_INLINE_ROUTINE bool _CPU_ISR_Is_enabled( uint32_t level )
11 {

```

(continues on next page)

(continued from previous page)

```
12 return false;  
13 }
```

Use this function to ensure that `_Thread_Do_dispatch()` is called with an interrupt level with enabled interrupts, otherwise call `_Terminate()`.

**Author:** Chris Johns 2016-11-15T06:47:40.000Z

Original author: sebastian.huber

Is this specific to an SMP build?

**Author:** Trac Migrate 2016-11-15T06:50:03.000Z

Original author: sebastian.huber

I will add `_CPU_ISR_Is_enabled()` unconditionally. The fatal error will be limited to SMP and ARM Cortex-M. However, its an application bug in general to call blocking operations with interrupts disabled.

**Author:** Chris Johns 2016-11-15T20:54:24.000Z

Original author: sebastian.huber

Replying to [sebastian.huber](#):

I will add `_CPU_ISR_Is_enabled()` unconditionally. The fatal error will be limited to SMP and ARM Cortex-M.

I would prefer to see an error code returned. Fatal errors should be limited to internal issues like inconsistencies where the kernel cannot reasonable continue and not user errors with an API. Fatal errors can also be difficult to track down with threading unless you have a thread aware debugger. Not all users or BSPs have this support.

However, its an application bug in general to call blocking operations with interrupts disabled.

Yes I would agree and if a user makes a call to RTEMS that is not valid we should return a suitable error or status code. For a single core system we have allowed this in past release so as a general change this is something that changes our current behavior.

**Author:** Trac Migrate 2016-11-16T06:17:31.000Z

Original author: sebastian.huber

I think a fatal error is more appropriate here.

- Applications which have this usage error needs to be fixed at compile-time. It makes no sense to ship an SMP application with this bug.
- Return codes can be ignored. I definitely have seen code like this before:

```
1 /* This cannot fail, we know the identifier is valid */
2 (void) pthread_mutex_lock(&mtx);
```

- This ticket is a result of porting a real world application from uni-processor to SMP. If you are not an expert of the operating system internals and your application has this bug, then you need easily a couple of days to figure out the problem. So, it is important to make sure it gets detected.
- To figure out what caused a fatal error is easy. The (source, error) pair uniquely identifies the source code location of the error. With a stack trace and the executing thread you get enough information to locate the problem in the code. There is no need for a thread aware debugger.
- This is a new constraint specific to SMP. Existing software may be simply unaware of this issue. However, its important to detect this constraint violation.
- `_Thread_Do_dispatch()` has no return value. Adding this check to other places would be much more difficult, error prone. with more space and time overhead, and labour intensive to test.

I think a fatal error is more appropriate here. \* Applications which have this usage error needs to be fixed at compile-time. It makes no sense to ship an SMP application with this bug.

A fatal error is still run-time and not a compile time error so you have lost me here.

- Return codes can be ignored. I definitely have seen code like this before:

```
{{{
/* This cannot fail, we know the identifier is valid */ (void)
pthread_mutex_lock(&mtx); }}}}
```

This is a different issue and a change of topic. We provide the means for errors to be analyzed and that is our boundary.

- This ticket is a result of porting a real world application from uni-processor to SMP. If you are not an expert of the operating system internals and your application has this bug, then you need easily a couple of days to figure out the problem. So, it is important to make sure it gets detected.

I agree with detecting the issue and there being an error. It is the delivery we are discussing.

The error code should provide some help just like the fatal error code. If one can the other can.

How many fatal errors instance are there in RTEMS in the kernel? Not the number of error code, but the specific locations a fatal error can appear, ie code/line pairs? I have never audited this.

- To figure out what caused a fatal error is easy. The (source, error) pair uniquely identifies the source code location of the error.

The source location is a line the kernel's core code which means users need to step into this code and figure out the answer. I have been hit by this with SMP and it is hard.

With a stack trace and the executing thread you get enough information to locate the problem in the code. There is no need for a thread aware debugger.

This implies testing will highlight the issue because you have a debugger to give you this data. Currently RTEMS standard or default stack traces that get called on a fatal error provide little if any information that could be used to resolve the exact source, eg the thread id executing or even better an unwinder (dreaming here). Better support for tier 1 archs would help.

- This is a new constraint specific to SMP. Existing software may be simply unaware of this issue. However, its important to detect this constraint violation.

I agree it is important.

- \_thread\_Do\_dispatch()  
     has no return  
     value. Adding  
     this check to  
     other places  
     would be much  
     more difficult,  
     error prone.  
     with more  
     space and  
     time overhead,  
     and labour  
     intensive to  
     test.

There are no  
 other similar tests  
 happening now  
 on the blocking  
 paths?

A fatal error is still run-time and not a compile time error so you have lost me here.

It is an error that must be fixed during development. Otherwise you have a broken product.

- Return codes can be ignored. I definitely have seen code like this before:

```
{{{
/* This cannot fail, we know the identifier is valid
*/ (void) pthread_mutex_lock(&mtx); }}}}
```

This is a different issue and a change of topic. We provide the means for errors to be analyzed and that is our boundary.

- This ticket is a result of porting a real world application from uni-processor to SMP. If you are not an expert of

Currently RTEMS standard or default stack traces that get called on a fatal error provide little if any information that could be used to resolve the exact source, eg the thread id executing or even better an unwinder (dreaming here). Better support for tier 1 archs would help.

Improved fatal error diagnostics is a different topic. With a debugger is a matter of seconds to figure out the problem spot of a fatal error.

- This is a new constraint specific to SMP. Existing software may be simply unaware of this issue. However, its important to detect this constraint violation.

I agree it is important.

- `_Thread_Do_dispatch()` has no return value. Adding this check to other places would be much more difficult, error prone. with

more space and time overhead,  
and labour intensive to test.

There are no other similar tests happening now on the blocking paths?

No, this is a weak area in RTEMS. For example call `rtems_task_wake_after()` in an interrupt service routine. You don't get any status information that this is stupid.

For now, I think a fatal error is sufficient. In case there is really a problem with this in the field, we can still improve things. What matters is that this constraint violation gets detected, otherwise you can spend hours on debugging.

I think a fatal error is more appropriate here. \*  
Applications which have this usage error needs  
to be fixed at compile-time. It makes no sense to  
ship an SMP application with this bug.

A fatal error is still run-time and not a compile time error so  
you have lost me here.

It is an error that must be fixed during development. Otherwise you have  
a broken product.

This goes for checking returned error codes as well.

The logical end to this path of discussion is to remove all fatal error  
checks from the kernel in production because they should never appear.  
I am sure you would agree this is not practical therefore there is always a  
finite chance of a fatal error happening and robust systems need to take  
this issue seriously.

In the case of this specific check or test we need to find what is practical.  
The issues are how it effects a user who encounters it, what it does  
to the kernel in terms of overhead and complexity, and what can be  
implemented now and and what could be implemented given the time  
and resources.

How many fatal errors instance are there in  
RTEMS in the kernel? Not the number of error

code, but the specific locations a fatal error can appear, ie code/line pairs? I have never audited this.

See `Internal_errors_Core_list`, we have a test for every fatal internal error.

Where is the user documentation? The C User guide is lacking detail for this and the other generic errors cases.

Looking further into this we have around 300 calls to `rtems_fatal_error_occurred` less some for noise due to an approximate count. Of this around 200 are in the `c/src` tree with about 50 under the `cpukit`. For example we have `rtems_fatal_error_occurred(0xdeadbeef);` in `cpukit/libfs/src/nfsclient/src/nfs.c`.

The we have the family of `*_Fatal*` calls. Getting decent counts is not easy so I will not put them there. We have `_CPU_Fatal_halt`, `_BSP_Fatal_error`, ```_POSIX_Fatal_error```, `MPCI_Fatal`, and `_SMP_Fatal`. Without decent control we end up with `_CPU_Fatal_halt(RTEMS_FATAL_SOURCE_EXCEPTION, 0xECC0);` which is in the NIOS2 interrupt handler.

I am concerned about adding to this without a suitable means to provide accessible user documentation on what we do.

This implies testing will highlight the issue because you have a debugger to give you this data. Currently RTEMS standard or default stack traces that get called on a fatal error provide little if any information that could be used to resolve the exact source, eg the thread id executing or even better an unwinder (dreaming here). Better support for tier 1 archs would help.

Improved fatal error diagnostics is a different topic.

I do not agree. If you argue a case for using fatal errors then I see it as reasonable we discuss how this impacts users.

With a debugger is a matter of seconds to figure out the problem spot of a fatal error.

Yes, however the time needed to understand the issue depends on the person looking and you and I are not suitable to judge this.

A fatal error could occur in production simply due to the fact there is code in

the build that can generate them, and they do happen when performing system integration when there are no debuggers connected. How the error gets translated by a user with no knowledge of the RTEMS internals is the question being proposed. The more fatal errors we add the more of a problem this becomes and this ticket wants to add another.

- This is a new constraint specific to SMP. Existing software may be simply unaware of this issue. However, its important to detect this constraint violation.

I agree it is important.

- \_Thread\_Do\_dispatch()  
has no return value.  
Adding this check to  
other places would  
be much more difficult,  
error prone.  
with more space  
and time overhead,  
and labour intensive  
to test.

There are no other  
similar tests happening  
now on the blocking  
paths?

No, this is a weak area  
in RTEMS. For example call  
rtems\_task\_wake\_after() in an  
interrupt service routine. You  
don't get any status information  
that this is stupid.

Yes we have a few cases like  
this.

For now, I think a fatal  
error is sufficient.

Ok, however there is  
a need for documen-

tation on the error aimed at the user being added to our user manuals.

I would like to see better default exception output and after this discussion I can see a real need for the debug server needing to catch any fatal errors and break the system leaving the user in the thread stack frame with the error.

In case there is really a problem with this in the field, we can still improve things.

In terms of the implementation, sure, in terms of supporting users with suitable documentation I believe we have a problem now.

What matters is that this constraint violation gets detected, otherwise you can spend hours on debugging.

Yes this is the most important item to get resolved.

As discussed in the following thread, the sparc/sis BSP variant is no longer necessary and can be removed.

<https://lists.rtems.org/pipermail/devel/2016-November/016383.html>

This ticket is to track that removal.

Original author: sebastian.huber

Currently we have this situation:

[https://docs.rtems.org/doc-current/share/rtems/html/c\\_user/Symmetric-Multiprocessing-Services-Thread-Dispatch-Details.html#Symmetric-Multiprocessing-Services-Thread-Dispatch-Details](https://docs.rtems.org/doc-current/share/rtems/html/c_user/Symmetric-Multiprocessing-Services-Thread-Dispatch-Details.html#Symmetric-Multiprocessing-Services-Thread-Dispatch-Details)

“On SMP systems, scheduling decisions on one processor must be propagated to other processors through inter-processor interrupts. So, a thread dispatch which must be carried out on another processor happens not instantaneous. Thus several thread dispatch requests might be in the air and it is possible that some of them may be out of date before the corresponding processor has time to deal with them. The thread dispatch mechanism uses three per-processor variables,

- the executing thread,
- the heir thread, and
- an boolean flag indicating if a thread dispatch is necessary or not.

Updates of the heir thread and the thread dispatch necessary indicator are synchronized via explicit memory barriers without the use of locks. A thread can be an heir thread on at most one processor in the system. The thread context is protected by a TTAS lock embedded in the context to ensure that it is used on at most one processor at a time. The thread post-switch actions use a per-processor lock. This implementation turned out to be quite efficient and no lock contention was observed in the test suite.

The current implementation of thread dispatching has some implications with respect to the interrupt latency. It is crucial to preserve the system invariant that a thread can execute on at most one processor in the system at a time. This is accomplished with a boolean indicator in the thread context. The processor architecture specific context switch code will mark that a thread context is no longer executing and waits that the heir context stopped execution before it restores the heir context and resumes execution of the heir thread (the boolean indicator is basically a TTAS lock). So, there is one point in time in which a processor is without a thread. This is essential to avoid cyclic dependencies in case multiple threads migrate at once. Otherwise some supervising entity is necessary to prevent deadlocks. Such a global supervisor would lead to scalability problems so this approach is not used. Currently the context switch is performed with interrupts disabled. Thus in case the heir thread is currently executing on

another processor, the time of disabled interrupts is prolonged since one processor has to wait for another processor to make progress.

It is difficult to avoid this issue with the interrupt latency since interrupts normally store the context of the interrupted thread on its stack. In case a thread is marked as not executing, we must not use its thread stack to store such an interrupt context. We cannot use the heir stack before it stopped execution on another processor. If we enable interrupts during this transition, then we have to provide an alternative thread independent stack for interrupts in this time frame. This issue needs further investigation.

The problematic situation occurs in case we have a thread which executes with thread dispatching disabled and should execute on another processor (e.g. it is an heir thread on another processor). In this case the interrupts on this other processor are disabled until the thread enables thread dispatching and starts the thread dispatch sequence. The scheduler (an exception is the scheduler with thread processor affinity support) tries to avoid such a situation and checks if a new scheduled thread already executes on a processor. In case the assigned processor differs from the processor on which the thread already executes and this processor is a member of the processor set managed by this scheduler instance, it will reassign the processors to keep the already executing thread in place. Therefore normal scheduler requests will not lead to such a situation. Explicit thread migration requests, however, can lead to this situation. Explicit thread migrations may occur due to the scheduler helping protocol or explicit scheduler instance changes. The situation can also be provoked by interrupts which suspend and resume threads multiple times and produce stale asynchronous thread dispatch requests in the system.”

Add an interrupt frame to the per-CPU control which can be used during context switches on SMP configurations.

Provide rtems\_interrupt\_frame only if CPU\_ISR\_PASSES\_FRAME\_POINTER is defined to TRUE.

**Author:** Trac Migrate 2016-11-11T10:08:04.000Z

Original author: sebastian.huber

Original author: sebastian.huber

- **Description** changed

```

1 - The type rtems_interrupt_frame is provided without an API. Define it_
   ↳ to int and add the deprecated attribute. This makes it possible to_
   ↳ move CPU_interrupt_frame to <rtems/score/cpuimpl.h>.
2 + Provide rtems_interrupt_frame only if CPU_ISR_PASSES_FRAME_POINTER is_
   ↳ defined to TRUE.

```

- **Summary** changed from *Deprecate rtems\_interrupt\_frame* to *Conditionally provide rtems\_interrupt\_frame*

Some CPU ports require CPU\_interrupt\_frame due to CPU\_ISR\_PASSES\_FRAME\_POINTER defined to TRUE.

Original author: sebastian.huber

Add `_CPU_Get_current_per_CPU_control()` on SMP configurations as an optimization for PowerPC. Use SPRG0 for the current per-CPU control. This reduces the code size a bit and is slightly faster in some benchmarks.

<https://git.rtems.org/rtems-docs/tree/porting>

---

**Author:** Trac Migrate 2017-01-25T10:23:37.000Z

---

Original author: sebastian.huber

I never used this guide before. My main reference for CPU ports is [https://git.rtems.org/rtems/tree/cpukit/score/cpu/no\\_cpu/rtems/score/cpu.h](https://git.rtems.org/rtems/tree/cpukit/score/cpu/no_cpu/rtems/score/cpu.h). It seems that it is not even built in the rtems-docs. Without looking at it, I guess it is out of date and I would need several days to fix this.

Original author: sebastian.huber

On GR740 I get:

```

1 rtl: RELOC_32 0x60ae8 @ 0x86edc in /dl-o5.o
2 rtl: relocation: .rela.eh_frame, syms:.symtab
3 rtl: rela: sym:__gxx_personality_v0(20)=00001dec type:3 off:00000013 addend:0
4
5 CPU 0: IU in error mode (tt = 0x07, mem address not aligned)
6 0x0001fa9c: c4040000 ld [%l0], %g2 <rtems_rtl_elf_relocate_rela+204>
7 CPU 1: Power down mode
8 CPU 2: Power down mode
9 CPU 3: Power down mode

```

On GR712RC I get:

```

1 rtl: WDISP_30 0x7ffe2ccd @ 0x40087108 in /dl-o5.o
2 rtl: relocation: .rela.gcc_except_table.exception_dl, syms:.symtab
3 rtl: rela: sym:_ZTISt9exception(32)=40060ae8 type:3 off:00000034 addend:0
4 rtl: RELOC_32 0x40060ae8 @ 0x400871b4 in /dl-o5.o
5 rtl: relocation: .rela.eh_frame, syms:.symtab
6 rtl: rela: sym:__gxx_personality_v0(20)=40001dec type:3 off:00000013 addend:0

```

Target resets now.

- [libdl-sparc-R\\_SPARC\\_32-missaligned.patch](#)

**Author:** Chris Johns 2016-11-10T05:39:59.000Z

Original author: sebastian.huber

This is due to the following relocation record:

```

1 Relocation section '.rela.eh_frame' at offset 0x5fe8 contains 3 entries:
2 Offset      Info      Type           Sym.Value  Sym. Name + Addend
3 00000013  00001403  R_SPARC_32      00000000  __gxx_personality_v0 + 0

```

The type is R\_SPARC\_32 is declared as being aligned however the offset is 0x13 and this causes a misaligned access.

**Author:** Trac Migrate 2016-11-10T07:32:09.000Z

Original author: sebastian.huber

Is this a bug in the tool chain or the libdl?

**Author:** Chris Johns 2016-11-10T07:46:01.000Z

Original author: sebastian.huber

I am investigating. At this stage it looks like a bug in gas. Binutils contain code that checks the lower bits of the address and selects either R\_SPARC\_32 or UA32. I am looking to make a suitable test case so I can see what is happening.

The following qorIQ variants fail to build:

powerpc-qorIQ\_core\_0 powerpc-qorIQ\_core\_1 powerpc-qorIQ\_p1020rdb

All fail with this error:

```

1 ../../../../../../qorIQ_core_0/lib/include/bsp/qorIQ.h:407:3: error:
  ↳ conflicting types for 'qorIQ_gpio'
2 } qorIQ_gpio;
3 ~~~~~
4 ../../../../../../qorIQ_core_0/lib/include/bsp/qorIQ.h:184:3: note: previous
  ↳ declaration of 'qorIQ_gpio' was here
5 } qorIQ_gpio;
6 ~~~~~

```

Found during full build sweep based on this commit:

```

1 commit bb9f09f34c9bdcf4d2631a1fd317bcefd8426efb
2 Author: Sebastian Huber <sebastian.huber@embedded-brains.de>
3 Date: Mon Oct 31 13:07:34 2016 +0100
4
5 posix: Fix timer interval
6
7 Do not overwrite timer interval with initial interval in
8 _POSIX_Timer_Insert().
9
10 Close #2798.

```

**Author:** Joel Sherrill 2016-11-02T22:13:42.000Z

Confirmed to still be broken on this commit:

```

1 commit 63e2ca1b8b0a651a733d4ac3e0517397d0681214
2 Author: Sebastian Huber <sebastian.huber@embedded-brains.de>
3 Date: Mon Oct 31 09:13:35 2016 +0100
4
5 score: Simplify yield and unblock scheduler ops
6
7 Update #2556.

```

```

1 Just back to RTEMS after a long time. I've build the last version (Git)
2 with last compiler (4.12) and looks like a simple POSIX timer doesn't
3 work anymore... It should display "Signal 14" every second but period is
4 veryyyy short...and display very fast :(
5
6 Any idea? any change in the way to use POSIX with RTEMS?
7
8 See my program attached (it works fine with Linux).
9
10 I have tested with Raspberry Pi and QEMU/i386.
11
12 thx by advance

```

Original author: sebastian.huber

The scheduler configuration is done at link-time. In order to support run-time re-configuration add functions to `dd/remove` processors to/from a scheduler instance.

```

1 /**
2 * @brief Adds a processor the set of processors owned by the scheduler.
3 *
4 * Must be called from task context. This operation obtains and releases the
5 * objects allocator lock.
6 *
7 * @param[in] scheduler_id Identifier of the scheduler.

```

(continues on next page)

(continued from previous page)

```

8 * @param[in] cpu_index Index of the processor to add.
9 *
10 * @retval RTEMS_SUCCESSFUL Successful operation.
11 * @retval RTEMS_INVALID_ID Invalid scheduler identifier.
12 * @retval RTEMS_NOT_CONFIGURED The processor is not configured to be used by
13 *   the application.
14 * @retval RTEMS_INCORRECT_STATE The processor is configured to be used by
15 *   the application, however, it is not available.
16 */
17 rtems_status_code rtems_scheduler_add_processor(
18   rtems_id scheduler_id,
19   uint32_t cpu_index
20 );
21
22 /**
23 * @brief Removes a processor from set of processors owned by the scheduler.
24 *
25 * Must be called from task context. This operation obtains and releases the
26 * objects allocator lock. Removing a processor from a scheduler is a complex
27 * operation that involves all tasks in the system.
28 *
29 * @param[in] scheduler_id Identifier of the scheduler.
30 * @param[in] cpu_index Index of the processor to add.
31 *
32 * @retval RTEMS_SUCCESSFUL Successful operation.
33 * @retval RTEMS_INVALID_ID Invalid scheduler identifier.
34 * @retval RTEMS_INVALID_NUMBER The processor is not owned by the scheduler.
35 * @retval RTEMS_RESOURCE_IN_USE The set of processors owned by the scheduler
36 *   would be empty after the processor removal and there exists a non-idle
37 *   task that uses this scheduler as its home scheduler.
38 */
39 rtems_status_code rtems_scheduler_remove_processor(
40   rtems_id scheduler_id,
41   uint32_t cpu_index

Original author: khchen

In the current implementation, if a task period is time out, the next call of `rtems_rate_monotonic_period()` will only release one following job and manipulate the task period with the calling moment + the next length of period. With the assumption that implicit/constraint deadline and hard real-time model, the above mechanism is okay.

However, it may not be applicable for general task models, e.g., soft real-time task, arbitrary deadline, mixed-criticality system [None..None](#). It is usually assumed that multiple task jobs of a task are executed in a first-come-first-serve manner. Thus, it is sufficient to release the second task job at the moment the first task job finishes according to a strictly periodic release pattern. The current design in fact shifts the release pattern of periodic/sporadic tasks. Since there maybe more than one postponed jobs due to the preemption, these postponed jobs that should be released are never released to the system.

Although there is no standard requirement in reality for deadline misses, with this enhancement, the postponed jobs will be released with the correct number without periodic release shifting. This way of handling is already widely considered in academia from 90s [2] until now [3] or even on multicores as well [4].

I refine the following four files and handle this requirement individually. The overhead seems to me negligible. `cpukit/rtems/include/rtems/rtems/ratemon.h`  
`cpukit/rtems/include/rtems/rtems/ratemonimpl.h` `cpukit/rtems/src/ratemontimeout.c`  
`cpukit/rtems/src/ratemonperiod.c` I have tested the enhancement on Qemu and Raspberry Pi Model B+ with corresponding BSPs.

I believe this patch as a basis is required for further use for more general real-time task models. This enhancement only affect those timeout cases without changing any behaviour in normal cases. This enhancement is accepted in workshop mixed-criticality (WMC 2016) along with RTSS'16 this year [5].

To demonstrate the differences, a heuristic example is prepared in test-suites/sptests/sprmsched01 to show the benefit of the enhancement: Given two tasks with implicit deadline that task deadline is equal to its period. Task 1 period is 10000 ticks, whereas task 2 is 2000 ticks. Task 1 has the execution time 6000 ticks, and task 2 has 1000 ticks. Assume Task 1 has a higher priority than task 2. Task 1 only executes 2 times. In the expected result, we can observe that the postponed jobs are continuously released till there is no postponed job left, and the task period will still keep as it is. (Job 3-7 in task 2 are postponed jobs)

Diff patch

**Author:** Trac Migrate 2016-10-12T06:01:30.000Z

Original author: khchen

In RTEMS the behaviour of the rate-monotonic periods depends on the scheduler. We have a fix-priority scheduler (default scheduler) and a job-level fixed-priority scheduler (EDF).

In your test case you have  $6000/10000 + 1000/2000 = 110\%$  processor utilization, so your task set is not schedulable.

In case of the default scheduler, the priority assignment is not according to the rules:

[https://docs.rtems.org/doc-current/share/rtems/html/c\\_user/Rate-Monotonic-Manager-Rate-Monotonic-Scheduling-Algorithm.html#Rate-Monotonic-Manager-Rate-Monotonic-Scheduling-Algorithm](https://docs.rtems.org/doc-current/share/rtems/html/c_user/Rate-Monotonic-Manager-Rate-Monotonic-Scheduling-Algorithm.html#Rate-Monotonic-Manager-Rate-Monotonic-Scheduling-Algorithm)

Task 2 has a shorter period compared to task 1, so it must have a higher priority.

What changes your patch? You automatically restart the watchdog in case of a timeout and count the number of timeouts?

**Author:** Trac Migrate 2016-10-12T08:04:20.000Z

Original author: khchen

Yes, as the utilization is over 100%, my test case has deadline misses definitely. However, the test case is designed on purpose to present what is the proper overrun handling within 30000 ticks. (Otherwise, domino effect will hide the enhancement in the worst case.) Please note that, **Task 1 only executes 2 times** in my test case. Let's only focus on the periodic behavior of task 2.

Please refer to my paper [5]: [<http://ls12-www.cs.tu-dortmund.de/daes/media/documents/publications/downloads/2016-wmc.pdf>] In the following examples, the time unit is 1000 ticks. (1 = 1000 ticks)

With the original design of overrun handing, there is only one postponed job and the release pattern is not periodic. As shown in Fig.2 (a) of [5], the arrival pattern from 16 is changed due to the lateness of the red job, by which the orange job and the following jobs are all released earlier.

With this enhancement, the behaviour of task 2 with the enhancement is shown in Fig. 2 (b) of [5]. The postponed jobs due to the execution of task 1 are marked red. The jobs postponed due to the execution of previous jobs of task 2 are marked orange. The yellow job is postponed due to the orange job in the same period but can still finish its execution on time.

In fact the example can be `_schedule_` if the system has dynamic real-time guarantees [3] for mixed-criticality system. Suppose that task 1 requires a full timing guarantee with the abnormal execution time  $C_{\{1,A\}} = 6$ , and the normal execution time  $C_{\{1,N\}} = 1$ . Task 2 is a timing tolerable task with  $C_{\{2,A\}} = C_{\{2,N\}} = 1$  as shown in Fig. 2 (c) of [5]. The second job of task 1 needs 6 time units for its execution time due to fault detection and recovery. We can see that after all the postponed jobs of task 2 are finished at 24, the release of task 2 turns back according to the original periodic pattern again. Since this example is a bit complicated for normal users, I didn't implement it in the example case.

In my patch. I automatically **restart the watchdog** in case of a timeout and **keep updating the number of postponed jobs** (increase). If the number of postponed jobs is not 0, the default scheduler will decrease the number of postponed jobs and release the postponed jobs accordingly. Please note that, **the deadline of watchdog is not updated by the job releasing unless the targeted task has no more postponed jobs.**

We all know that the schedulability researches always talking about WCET and the worst case rarely happens in reality. However the overrun handling is still useful to isolate the effect of the abrupt overrun without disturbing the other normal tasks.

Ok, I will have a closer look at your paper and the patch. However, I am on a business trip next week, so this will take at least two weeks.

Your patch changes the existing behaviour. We must decide if this is acceptable or if we need a new option, e.g. explicitly enable the watchdog restart plus counter.

The output of sprmsched01 depends on the target timing:

```

1 *** BEGIN OF TEST SPRMSCHED 1 ***
2
3 Ticks per second in your system: 1000
4 Task 0 starts at tick 10.
5 Job 1 Task 0 ends at tick 6141.
6 Job 1 Task 1 starts at tick 6144.
7 Job 1 Task 1 ends at tick 7169.
8 Job 2 Task 1 starts at tick 8144.
9 Job 2 Task 1 ends at tick 9168.
10 Task 0 starts at tick 10009.
11 Job 2 Task 0 ends at tick 16140.
12 Job 3 Task 1 starts at tick 16145.
13 Job 3 Task 1 ends at tick 17169.
14 RTEMS_TIMEOUT
15 Job 4 Task 1 starts at tick 17172.
16 Job 4 Task 1 ends at tick 18196.
17 Job 5 Task 1 starts at tick 18199.
18 Job 5 Task 1 ends at tick 19223.
19 Job 6 Task 1 starts at tick 19226.
20 Job 6 Task 1 ends at tick 20250.
21 Job 7 Task 1 starts at tick 20253.
22 Job 7 Task 1 ends at tick 21277.
23 Job 8 Task 1 starts at tick 21280.
24 Job 8 Task 1 ends at tick 22304.
25 Job 9 Task 1 starts at tick 22307.
26 Job 9 Task 1 ends at tick 23331.
```

(continues on next page)

(continued from previous page)

```

27 RTEMS_SUCCESSFUL
28 Job 10 Task 1 starts at tick 24145.
29 Job 10 Task 1 ends at tick 25169.
30 Job 11 Task 1 starts at tick 26144.
31 Job 11 Task 1 ends at tick 27168.
32 Job 12 Task 1 starts at tick 28144.
33 Job 12 Task 1 ends at tick 29168.
34 *** END OF TEST SPRMSCHED 1 ***

```

Its not clear if the test objectives are checked. Why is `rtems_rate_monotonic_postponed_jobs_count()` not used at all?

**Author:** Trac Migrate 2017-01-24T14:46:59.000Z

Original author: khchen

Replying to [sebastian.huber](#):

The output of `sprmsched01` depends on the target timing: {{{ \* **BEGIN OF TEST SPRMSCHED 1** \* Ticks per second in your system: 1000 Task 0 starts at tick 10. Job 1 Task 0 ends at tick 6141. Job 1 Task 1 starts at tick 6144. Job 1 Task 1 ends at tick 7169. Job 2 Task 1 starts at tick 8144. Job 2 Task 1 ends at tick 9168. Task 0 starts at tick 10009. Job 2 Task 0 ends at tick 16140. Job 3 Task 1 starts at tick 16145. Job 3 Task 1 ends at tick 17169. RTEMS\_TIMEOUT Job 4 Task 1 starts at tick 17172. Job 4 Task 1 ends at tick 18196. Job 5 Task 1 starts at tick 18199. Job 5 Task 1 ends at tick 19223. Job 6 Task 1 starts at tick 19226. Job 6 Task 1 ends at tick 20250. Job 7 Task 1 starts at tick 20253. Job 7 Task 1 ends at tick 21277. Job 10 Task 1 ends at tick 25169. Job 11 Task 1 starts at tick 26144. Job 11 Task 1 ends at tick 27168. Job 12 Task 1 starts at tick 28144. Job 12 Task 1 ends at tick 29168. \* **END OF TEST SPRMSCHED 1** \* }}} Its not clear if the test objectives are checked. Why is `rtems_rate_monotonic_postponed_jobs_count()` not used at all? That function I prepared is for the requirement from the application layer. It will not be used directly within the overrun handling. Since I only focused on the timing behaviors before, so I prepared this test without testing that.

Now I can add in the test and print out the number of postponed jobs.

**Author:** Trac Migrate 2017-01-24T14:53:07.000Z

Original author: khchen

The `rtems_rate_monotonic_postponed_jobs_count()` is not tested at all, see [#2885](#).

There is a potential integer overflow in `_Rate_monotonic_Renew_deadline()`. It should be documented what happens in this case.

---

**Author:** Trac Migrate 2017-01-24T15:07:46.000Z

---

Original author: khchen

How about the potential overflow for `uint32_t` variables “missed\_count” and “count” in `rtems_rate_monotonic_period_statistics`? I didn’t find related means in the current version. `stats->missed_count++` in `cpukit/rtems/src/ratemonperiod.c` could also incur this problem right?

The trivial solution is to add assertion to avoid this situation or shut down the system. . .

---

**Author:** Trac Migrate 2017-01-25T06:33:58.000Z

---

Original author: khchen

The missed count is just a statistic.

For the integer overflow in

```
1 static void _Rate_monotonic_Renew_deadline(  
2 Rate_monotonic_Control *the_period,  
3 Thread_Control          *owner,  
4 ISR_lock_Context        *lock_context  
5 )  
6 {  
7     uint64_t deadline;  
8  
9     ++the_period->postponed_jobs;  
10    the_period->state = RATE_MONOTONIC_EXPIRED;  
11  
12    deadline = _Watchdog_Per_CPU_insert_relative(  
13    &the_period->Timer,  
14    _Per_CPU_Get(),  
15    the_period->next_length  
16    );  
17    the_period->latest_deadline = deadline;  
18  
19    _Rate_monotonic_Release( the_period, lock_context );  
20 }
```

we have some options.

1. Ignore it, then postponed jobs count will be zero again.
2. Issue a new fatal error.
3. Saturate, e.g. stay at `0xffffffff`.

I am in favour of 3. It should be documented in any way.

---

**Author:** Trac Migrate 2017-01-25T07:33:32.000Z

---

Original author: khchen

The references mentioned in the ticket should be added to the documentation:

<https://git.rtems.org/rtems-docs/tree/common/refs.bib>

They should show up in the documentation somewhere:

The

```
define MAKEGCCNOTKNOWTHEADDRESS(ptr) asm(“.”+r”(ptr))
```

is probably the best option. It works probably also with link-time optimization.

The RTEMS I2C API as defined in cpukit/dev/include/dev/i2c/i2c.h only defines the bus speed as Standard-mode (Sm) as defined by the I2C standard. This is set as I2C\_BUS\_CLOCK\_DEFAULT. The default speed is defined by the hardware, ie the devices connected, and not this API.

The API should define the speeds as defined in the I2C standard and there should be no default. Drivers like the Cadence driver for the Zynq should be modified to require the bus speed be provided and all future drivers need to provide the speed.

**Author:** Trac Migrate 2016-09-21T08:19:21.000Z

The `cpukit/dev/include/dev/i2c/i2c.h` is an I2C bus implementation header file not a part of the user API (`<linux/i2c.h>` and `<linux/i2c-dev.h>`). A driver must have an initial speed. The `I2C_BUS_CLOCK_DEFAULT` is the recommended initial speed.

**Author:** Chris Johns 2016-09-21T08:21:58.000Z

A driver's initial speed needs to match the hardware. There is nothing that can be recommended. It requires analysis and a real value.

**Author:** Trac Migrate 2016-09-21T08:28:57.000Z

Ok, the set clock IO control is not part of the Linux user-space API. You can set it via the RTEMS specific `I2C_BUS_SET_CLOCK` IO control.

It is up to the application/board initialization code to set the right speed for a particular I2C bus. The generic I2C bus driver cannot and should not know this. They have to choose an arbitrary initial value.

**Author:** Chris Johns 2016-09-21T22:38:07.000Z

- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

Replying to [sebastian.huber](#):

Ok, the set clock IO control is not part of the Linux user-space API. You can set it via the RTEMS specific `I2C_BUS_SET_CLOCK` IO control.

I did not pick up this interface to control the clock speed.

This approach fits with the Xilinx AXI I2C controller where the bus speed is best handled by the IP integrator placing the IP into the FPGA. There is no point having software control the clock speed, the FPGA needs to do this. In this case setting the clock speed will fail, which is the default.

Thanks.

**Author:** Trac Migrate 2016-09-27T05:36:27.000Z

There is an I2C bus driver handler for the clock setting. You can return an error code, if the user wants an unavailable clock frequency:

```

1 /**
2  * @brief Sets the bus clock.
3  *
4  * @param[in] bus The bus control.
5  * @param[in] clock The desired bus clock in Hz.
6  *
7  * @retval 0 Successful operation.
8  * @retval negative Negative error number in case of an error.

```

(continues on next page)

(continued from previous page)

```

9 */
10 int (*set_clock)(i2c_bus *bus, unsigned long clock);

```

This is old and there are better design patterns for threading and C++. We recommend you use the new C++ standards based support.

I have an application that does not build.

The following C++ file:

```
1 $ cat t1.cpp
2 #include <rtems.h>
```

does not compile with git head 5fe6d07ad5690e3d9c6445ca3a465a700a5a5015 on Zynq ARM.  
Build with:

```
1 $ /opt/work/rtems/4.12/bin/arm-rtems4.12-g++ \\  
2 -B/opt/work/rtems/4.12/arm-rtems4.12/xilinx_zynq_zc706/lib \\  
3 -B/opt/work/bsps/rtems/4.12/arm-rtems4.12/xilinx_zynq_zc706/lib \\  
4 -specs bsp_specs -qrtems \\  
5 -march=armv7-a -mthumb -mfpu=neon -mfloat-abi=hard -mtune=cortex-a9 \\  
6 -g -O2 -DNDEBUG -std=c++11 \\  
7 -Werror -Wall -Wextra \\  
8 -o t1.o \\  
9 -c t1.cpp
```

Some (too much to post) of the output is:

```

1 In file included from /opt/work/bsps/rtems/4.12/arm-rtems4.12/xilinx_zynq_zc706/

I cannot reproduce this problem.

Is this your build or the RSB?

The C++ tests build fine.

Which tests?

**Author:** Trac Migrate 2016-08-04T05:40:29.000Z

Replying to [chrisj](#):

Replying to [sebastian.huber](#):

I cannot reproduce this problem.

Is this your build or the RSB?

```

arm-rtems4.12-g++      -version      arm-rtems4.12-g++
(GCC)      6.1.1      20160609      (RTEMS      4.12,      RSB
c476de6150f39afdf142c6f4420c59ba2f1aa2fe, Newlib 2.4.0.20160527)

```

The C++ tests build fine.

Which tests?

For example the iostream test (`--enable-tests --enable-cxx`).

---

**Author:** Chris Johns 2016-08-04T05:50:55.000Z

---

I have:

arm-rtems4.12-g++ (GCC) 6.1.1 20160609 (RTEMS 4.12, RSB  
cac72a2aea711f671816d7c41bb1cfe66d54ee37, Newlib 2.4.0.20160527)

and the tests build OK as well. The problem still exists.

---

**Author:** Trac Migrate 2016-08-04T05:54:46.000Z

---

I guess it is a problem with your local BSP/RTEMS installation or command line.  
Do you have a double “-specs bsp\_specs” for example? You must specify the specs  
exactly once on the command line.

---

**Author:** Chris Johns 2016-08-04T05:56:02.000Z

---

The second issue with the bsp\_specs was a command issue where it was not being  
shown correctly on the terminal. The first issue exists. I will update a .i file.

---

**Author:** Trac Migrate 2016-08-04T05:59:24.000Z

---

The <rtems.h> uses BSD extensions, e.g. struct bintime, thus it doesn't work with  
-std=c++11.

The main problem is that <rtems.h> includes way too many implementation de-  
tails.

---

**Author:** Chris Johns 2016-08-04T06:00:11.000Z

---

Ah ok this is the problem. Is this something that needs to be fixed?

---

**Author:** Trac Migrate 2016-08-04T06:03:08.000Z

---

Yes, but it has very low priority for me. It's probably something for the new-build-  
system era.

Currently the two macros

RTEMS\_LINKER\_ROSET\_CONTENT RTEMS\_LINKER\_RWSET\_CONTENT

are not documented. This should be added as soon as the doc repo is ready for it.

The macros have been introduced in this commit:

<https://git.rtems.org/rtems/commit/?id=5fe6d07ad5690e3d9c6445ca3a465a700a5a5015>

On disk I have 'x' with:

```
1 $ ls -las x
2 4 -rwxr-xr-x 1 chris caeng 48 Jul 14 11:46 x
```

the tar file shows:

```
1 $ tar tvf rootfs.tar
2 -rwxr-xr-x 0 chris caeng 48 Jul 14 11:46 x
```

and in the IMFS it shows:

```
1 [/] # ls -las x
2 0 -rw-r--r-- 1 root root 48 Jan 1 00:00 x
```

The makes adding 'joel' scripts difficult.

Original author: sebastian.huber

Currently, the thread begin extensions are invoked with thread dispatching disabled. There is an explanation for this in the code

```

1 /*
2  * Take care that 'begin' extensions get to complete before
3  * 'switch' extensions can run. This means must keep dispatch
4  * disabled until all 'begin' extensions complete.
5  */
6 _User_extensions_Thread_begin( executing );

```

However, the switch extension is always invoked before the thread begin extension for all threads except the initialization thread. A thread dispatch disabled contexts drastically limits the work which can be carried out in the thread begin extensions. It is for example not possible to call `malloc()`, create POSIX keys or access C++ thread local storage.

The thread begin extension should execute in a normal thread context. Thread begin extensions that are disturbed by a thread dispatch should deal with this locally.

With the availability of C++ thread local storage in RTEMS being able to pre-initialize such objects in the thread begin extension would be quite handy.

In changeset c0bd0064ac41f0602c0abfe494dbe140d7c5282f:

rtems: Fix rtems\_task\_set\_scheduler() API Task priorities are only valid within a scheduler instance. The rtems\_task\_set\_scheduler() directive moves a task from one scheduler instance to another using the current priority of the thread. However, the current task priority of the source scheduler instance is undefined in the target scheduler instance. Add a third parameter to specify the priority. Close [#2749](#).

Original author: sebastian.huber

The <sys/socket.h> contains definitions for the RTEMS-specific socket wake-up support. Move this stuff to <rtems/rtems\_bsdnet.h> since this feature is not present in standard network stacks. Portable applications should not use it.

**Author:** Chris Johns 2016-06-28T05:57:45.000Z

Original author: sebastian.huber

Will this break existing applications?

**Author:** Trac Migrate 2016-06-28T06:07:06.000Z

Original author: sebastian.huber

Yes, if they use the old network stack and include only <sys/socket.h>.

For pthread\_cond\_timedwait, the condition variable shall have a clock attribute which specifies the clock that shall be used to measure the time specified by the abstime argument. RTEMS currently does not honor the clock attribute.

See [http://pubs.opengroup.org/onlinepubs/9699919799/functions/pthread\\_cond\\_timedwait.html](http://pubs.opengroup.org/onlinepubs/9699919799/functions/pthread_cond_timedwait.html)

Original author: sebastian.huber

Currently we have

```
1 typedef struct bintime Timestamp_Control;
```

this type offers more precision than needed. Maybe use sbintime\_t (also known as int64\_t) instead to simplify computations.

Original author: sebastian.huber

Add CLOCK\_DRIVER\_USE\_ONLY\_BOOT\_PROCESSOR clock driver option. If defined, then do the clock tick processing on the boot processor on behalf of all other processors. Currently, this is intended as a workaround for a Qemu shortcoming on ARM.

Original author: sebastian.huber

The Classic binary semaphores without a locking protocol can be released by everyone, e.g. in contrast to the POSIX mutexes (all variants) or the Classic binary semphores with priority inheritance or ceiling, there is no owner check in the release path.

This behaviour is a bit unexpected and not documented.

The following test case fails in case an owner check is added:

```

1 *** BEGIN OF TEST SP 42 ***
2 Exercising blocking discipline w/extract in FIFO order
3 Exercising blocking discipline w/unblock in FIFO order
4 TA00 - unblocked - OK
5
6 rtems_semaphore_delete FAILED -- expected (RTEMS_SUCCESSFUL) got (RTEMS_RESOURCE_
  ↳ IN_USE)

```

This is actually a bug in the test, since an available mutex is released again.

In changeset 3ad5f86cf6803204b98760cdce0c56ef6d79bccd:

rtems: Fix no protocol mutex release The Classic binary semaphores without a locking protocol (RTEMS\_BINARY\_SEMAPHORE) could be released by everyone, e.g. in contrast to the POSIX mutexes (all variants) or the Classic binary semaphores with priority inheritance or ceiling, there was no owner check in the release path. This behaviour was a bit unexpected and not documented. Add an owner check to the release path. Update sptests/sp42 accordingly. This change has nothing to do with the simple binary semaphores (RTEMS\_SIMPLE\_BINARY\_SEMAPHORE) which have no owner at all. Update [#2725](#)

RTEMS defines SEM\_VALUE\_MAX to 32767 in Newlib

newlib/libc/sys/rtems/include/limits.h

Other systems use INT\_MAX or 2147483647.

20160415/newlib/libc/include      -B/build/rtems-4.12/microblaze-rtems4.12/bin/      -
B/build/rtems-4.12/microblaze-rtems4.12/lib/      -isystem      /build/rtems-4.12/microblaze-
rtems4.12/include      -isystem      /build/rtems-4.12/microblaze-rtems4.12/sys-include      -g      -O2
conftest.c >&5 /build/rtems-4.12/microblaze-rtems4.12/bin/ld: cannot open linker script file
xilinx.ld: No such file or directory collect2: error: ld returned 1 exit status
```

Reason:

```
gcc/config/microblaze/microblaze.h: %{!T*: -dT xilinx.ld%s}"
```

This should be somehow fixed in the RTEMS GCC configuration for microblaze.

**Author:** Joel Sherrill 2016-04-21T14:54:47.000Z

Original author: sebastian.huber

This is in gcc/config/microblaze/microblaze.h:

```
/* Extra switches sometimes passed to the linker. // -xl-mode-xmdstub translated
to -Zxl-mode-xmdstub – deprecated. */
```

```
%{mbig-endian:-EB      -oformat=elf32-microblaze}      %{mlittle-
endian:-EL      -oformat=elf32-microblazeel}      %{Zxl-mode-
xmdstub:-defsym      _TEXT_START_ADDR=0x800}      %{mxl-mode-
xmdstub:-defsym      _TEXT_START_ADDR=0x800}      %{mxl-gp-
opt:%{G*}}      %{!mxl-gp-opt:      -G      0}      %{!T*:      -dT      xilinx.ld%s}"
=====
```

We can add an undef of LINK\_SPEC to gcc/config/microblaze/rtems.h as a minimum. Or we can redefine it to a subset of what it is by default.

Based on the set of libc.a's installed, I think we need at least the endian flags. I would tend to keep the mxl-gp-opt since it looks harmless enough. But I would redefine and drop the xmdstub and xilinx.ld ones (drop 3, keep rest). That results in:

```
%{mbig-endian:-EB      -oformat=elf32-microblaze}      %{mlittle-endian:-EL
-oformat=elf32-microblazeel}      %{mxl-gp-opt:%{G*}}      %{!mxl-gp-opt: -G 0}
```

How does that look?

**Author:** Joel Sherrill 2016-04-21T15:41:04.000Z

Original author: sebastian.huber

I posted a patch which builds but I haven't tested it with RTEMS. Give this a try:

Original author: sebastian.huber

\_POSIX\_Semaphore\_Delete() used -1 for the thread queue flush status which in turn resulted in an invalid memory access in \_POSIX\_Semaphore\_Translate\_core\_semaphore\_return\_code().

**Author:** Joel Sherrill 2016-04-19T13:10:50.000Z

Original author: sebastian.huber

I went back to the 4.8 branch and the translation was a switch in semaphore-waitsupp.c which covered all cases. Also the error returned was not -1 but CORE\_SEMAPHORE\_WAS\_DELETED.

Somewhere along the line, the code was changed to a table lookup and range checking was moved to an ifdef DEBUG.

I have no idea why the status returned is no longer `CORE_SEMAPHORE_WAS_DELETED` which would likely not result in an out of range access.

Did the debug check catch this error? If not, then the debug check is insufficient.

---

**Author:** Trac Migrate 2016-04-19T13:14:45.000Z

---

Original author: sebastian.huber

There was no test case, so the debug check was simply not triggered.

Original author: sebastian.huber

The implemented and documented execution order of some user extensions disagree. Intended behaviour must be tested. Documentation must be updated accordingly.

Original author: sebastian.huber

POSIX key destructors must be called during thread restart. Just like the POSIX cleanup handlers. This ensures that the TLS object destructors are called during thread restart for example.

It is important for the global construction, which uses a thread restart to run the Init task in a clean environment.

Original author: sebastian.huber

Lets assume we have two tasks A and B. Task A acquires a CORE spinlock. Now B somehow executes and tries to acquire the same CORE spinlock, then no progress can be made.

Alternative implementation:

Disable thread dispatching and interrupts while owning the spinlock. Forbid blocking calls while owning the spinlock.

Drawback: The test cases of the Linux Test Project would fail:

[https://github.com/linux-test-project/ltp/blob/master/testcases/open\\_posix\\_testsuite/conformance/interfaces/pthread\\_spin\\_lock/1-2.c](https://github.com/linux-test-project/ltp/blob/master/testcases/open_posix_testsuite/conformance/interfaces/pthread_spin_lock/1-2.c)

Optimization: User provided storage space for pthread\_spin\_t. In line with POSIX:

“Only the object referenced by lock may be used for performing synchronization.”

[http://pubs.opengroup.org/onlinepubs/009695399/functions/pthread\\_spin\\_destroy.html](http://pubs.opengroup.org/onlinepubs/009695399/functions/pthread_spin_destroy.html)

In changeset c42be504c92d76d2e06d0fc8ebd05fc913376d2d:

posix: Add self-contained pthread spinlock Turn pthread\_spinlock\_t into a self-contained object. On uni-processor configurations, interrupts are disabled in the lock/trylock operations and the previous interrupt status is restored in the corresponding unlock operations. On SMP configurations, a ticket lock is acquired and released in addition. The self-contained pthread\_spinlock\_t object is defined by Newlib in <sys/\_pthreadtypes.h>. typedef struct { struct \_Ticket\_lock\_Control \_lock; \_\_uint32\_t \_interrupt\_state; } pthread\_spinlock\_t; This implementation is simple and efficient. However, this test case of the Linux Test Project would fail due to call of printf() and sleep() during spin lock ownership: [https://github.com/linux-test-project/ltp/blob/master/testcases/open\\_posix\\_testsuite/conformance/interfaces/pthread\\_spin\\_lock/1-2.c](https://github.com/linux-test-project/ltp/blob/master/testcases/open_posix_testsuite/conformance/interfaces/pthread_spin_lock/1-2.c) There is only limited support for profiling on SMP configurations. Delete CORE spinlock implementation. Update #2674.

In 4.11, the minimum executable did not include `open()` and `close()` because the methods `rtems_libio_post_driver()` and `rtems_libio_exit()` were not included in the executable. On the master, these two methods are showing up in minimum and pulling in these methods.

The dependency chain used to be if the console driver was installed, we needed to open and close `stdin`, `stdout`, and `stderr`. Now even without the console configured these are included.

FWIW the minimum size looks pretty good on the master for sis. Fixing this would likely drop it at least another 5%.

---

**Author:** Trac Migrate 2016-03-21T06:47:24.000Z

---

This looks like a BSP-specific issue. On which BSP do you see this?

---

**Author:** Chris Johns 2016-03-21T06:50:32.000Z

---

SIS by the looks of “FWIW the minimum size looks pretty good on the master for sis. ...”.

---

**Author:** Trac Migrate 2016-03-21T06:52:49.000Z

---

Yes, but I don’t see this problem on the sis BSP.

---

**Author:** Trac Migrate 2016-03-21T07:41:18.000Z

---

It seems to be the pc386 BSP. It pulls in a lot of stuff via `printk()` (e.g. `console_select.c`).

---

**Author:** Trac Migrate 2016-03-21T07:57:49.000Z

---

- **Version** changed from ~”4.12” to ~”4.11”

The pc386 BSP has this problem also in 4.11.

---

**Author:** Trac Migrate 2016-03-21T07:59:24.000Z

---

- **Summary** changed from *Dependency on `open()` and `close()` reintroduced to pc386 BSP has complex dependencies*

---

**Author:** Joel Sherrill 2016-03-21T12:35:15.000Z

---

I saw this on sis. I was teaching a class and wouldn’t use pc386 (or any BSP simulated on qemu) as my first choice since you want a simpler BSP and simpler way to execute it.

But I don’t see it in sis minimum.exe now. I am going to close this.

---

**Author:** Joel Sherrill 2016-03-21T12:36:24.000Z

---

The pc386 and motorola\_powerpc probe for a lot of features and don’t have them as optional. They aren’t focused on low size but flexibility. The pc386 can have the console changed by boot arguments and this is the intention. Most BSPs don’t have that kind of flexibility.

I know we reported this on the gdb list but we should have a ticket.

Neither gdb nor run works for sis on gdb 4.11. Checked against RTEMS 4.11 tools (gdb 4.9) and it will run sis.

Not sure about other simulators.

**Author:** Chris Johns 2016-03-15T22:24:32.000Z

- **Summary** changed from *sis does not run on gdb 4.11 but does on gdb 4.9* to *sis does not run on gdb 7.11 but does on gdb 7.9*

There is 2 separate problems:

1. the run command does not work any more 1. on Linux and OS X the simulator does not work

This patch <https://sourceware.org/git/gitweb.cgi?p=binutils-gdb.git;a=commit;h=465fb143> changed the sim/erc32 from the sim/common/run.c to sis.o for the run command so in effect made the run command the same as the sis command.

Our rtems-4.11 release uses gdb-7.9 with 23 patches (<https://git.rtems.org/rtems-tools/tree/tools/4.11/gdb/sparc/7.9?h=4.11>) so upgrading to gdb-7.11 was considered a better move than moving the rtems-4.11 patches to rtems-4.12. Of the 23 patches gdb-7.11 has patches 0001-0013 merged along with 0016 and the remaining patches are not merged. The 0014 patch is a gdb-7.9 version of my patch to clean up the output paths. Without that patch the erc32 does not support MI mode and can block on input locking up when run in the test framework. The remaining patches are LEON2 and LEON3 support which I am not sure about and watchpoints.

Running on FreeBSD works with the sparc/sis BSP. Running on Linux gives:

```

```

I am not sure what broken this.

Back to the run command. The run command should be using `sim/common/nrun.c` and this moves the simulator to the common structure and that conflicts with the `sim/erc32/inferf.c` code. The `erc32 sim_open` is broken and needs to be fixed to return a real `SIM_DESC` and that needs to be filled in correct. An issue I am not sure about is now the inferior's memory access routines link up with the SIS view of memory. I suspect they would be separate pieces of memory.

Also the `sim/erc32` makes lots of `printf` calls and these needs to via GDB's filtered print calls. The direct `printf` calls break MI support.

The pc386 BSP has an issue with “ld -r” when function-sections is enabled which does not seem to occur on any other BSP. The same lines were added to the custom .cfg file as on other BSPs. It is unknown at this point whether this is an x86 specific “ld -r” issue or a pc386 build configuration issue.

Per-function-section linking is disabled until this is addressed.

```

I have seen patches from H,J Lu from Intel recently on binutils about -r. Maybe ask him.

**Author:** Joel Sherrill 2016-03-10T23:14:21.000Z

Good idea. I emailed binutils@ and hopefully we will get a hint.

Proposed solution to make GCC happy and made code readable better than worse

**Author:** Trac Migrate 2016-03-09T19:53:24.000Z

Hello all, I have attached proposal for fixup. I have checked that it compiles against 4.11 without warning but I have not test that it by run of compiled code under QEMU. I need to find more time for that in some of next days.

**Author:** Joel Sherrill 2016-03-09T20:59:53.000Z

**Author:** Joel Sherrill 2016-03-09T21:03:07.000Z

---

Thanks. I don't know if I can test this or not.

The RSB build of qemu doesn't turn on the graphics module so I don't know if it hits this code or not. And from what my five minute at trying to turn it on made me think you needed Xen development files to use it and they were only available for 64-bit CentOS 6. If that's the case, the code isn't portable at all off of Linux so we should disable video, unfortunately.

The real PC I have been using to test on prints a message (from memory) that indicates it didn't initialize it or find it. Not sure which.

What setup is required to test this?

---

**Author:** Trac Migrate 2016-03-09T21:44:22.000Z

---

Hello Chris, I have minimal experience with RSB based RTEMS OS builds, but regular configure make builds of RTEMS is by default with VESA graphic support which can be then initialized at runtime by RTEMS kernel option `-video=auto`. This result in switch to graphic mode early in RTEMS boot. But you need some graphic application to open frame-buffer a draw to it. Regular standard output to video console does not emulate characters drawing/text mode yet. Initial version of such text mode emulation on graphic frame-buffer is implemented in experimental branch of RPi support only till now and is in shape that it could be adapted to be generic for more architectures.

I use Microwindows/Nano-X builds for testing (manual by RTEMS graphic toolkit `do_it -A`) or by RSB. Required packages recipes have been integrated to mainline RSB as a result of Qiao Yang GSoC project during 2015 autumn and previous work is already integrated to Micowindows mainline as well, so we can even switch scrips to use that directly instead of the Alex GSoC Microwindows fork. Microwindows demos can be run then on QEMU (VirtualBox not tested but should work too) a we have run some tests on real PC hardware during driver development as well.

Documentation for (now default) VESA configuration is there

<https://devel.rtems.org/wiki/Projects/GraphicsToolkit#RTEMS4.11andVESABIOSExtensionVBE>

RSB build of graphic libraries against regular configure make installed RTEMS in `/opt`

```
1 ../source-builder/sb-set-builder \\  
2 --log=graphic-build-log.txt \\  
3 --prefix=/opt/rtems4.11 \\  
4 --rtems-bsp=i386/pc686 \\  
5 --with-rtems-bsp=pc686 \\  
6 --pkg-tar-files \\  
7 4.11/graphics/graphics-all.bset
```

My QEMU command line

```

1 qemu-system-x86_64 -gdb tcp::1234 -enable-kvm -kernel $APP_BINARY \
2 -vga cirrus \
3 -net nic,vlan=0,model=e1000 -net user,vlan=0 \
4 -serial stdio \
5 -append "--console=com1 --video=auto"

```

where \$APP\_BINARY is RTEMS+application image.

I use serial output for messages and RTEMS standard output then and graphic frame-buffer for tested application.

Suitable QEMU (qemu-system-x86\_64 or qemu-system-i386) should be available in all GNU/Linux distributions.

---

**Author:** Trac Migrate 2016-03-09T22:04:38.000Z

---

I have tested patched 4.11 build with some of my experimental applications and video setup seems OK. I need build tool-chains and switch to 4.12, I have it on my TODO, but . . . .

---

**Author:** Joel Sherrill 2016-03-09T22:26:07.000Z

---

If you have tested this patch on 4.11, we should just apply it to both branches. You just seemed concern it would break something.

Chris pointed out that this means that unless the code as written is specific to 4.11. Thus it may be necessary to create a 4.11 branch at this point.

Hmm.. It has a 4.11 branch. Is it in sync as much as possible with the master?

Original author: sebastian.huber

The state of Classic Rate Monotonic is currently protected by the Giant lock and ISR disable sections. Use a per-object ISR lock to protect state changes instead.

**Author:** Trac Migrate 2016-03-22T06:28:14.000Z

Original author: sebastian.huber

The CPU time used of a thread is currently maintained per-processor mostly during `_Thread_Dispatch()`. However, on SMP configurations the actual processor of a thread is difficult to figure out since thread dispatching is a highly asynchronous process (e.g. via inter-processor interrupts). Only the intended processor of a thread is known to the scheduler easily. Do the CPU usage accounting during thread heir updates in the context of the scheduler operations. Provide a function to get the CPU usage of a thread using proper locks to get a consistent value.

**Author:** Chris Johns 2016-03-08T00:03:16.000Z

Original author: sebastian.huber

SMP introduces new challenges for users building applications.

I am struggling to understand what **standard** support RTEMS has for threads and processor performance accounting. When I last looked a while ago I found I needed to turn on profiling to get anything and I feel creating a special build is not a great option for some basic or **standard** performance accounting.

What do we consider as important?

Do we have things like context switches per core? Core idle time?

**Author:** Trac Migrate 2016-03-09T06:50:03.000Z

Original author: sebastian.huber

The profiling is optional since it may severely impact the performance of the operating system. Some SMP chips are not really well designed and offer no processor private access to timer and counter modules. Instead you must use on-chip peripheral over the system bus.

Adding some counters shouldn't be a big deal, but please create a new ticket for this. This ticket is about fixing an existing statistic so that it works on SMP.

Determining the per-processor idle time is difficult with the global fixed priority schedulers if they manage more than one processor and I don't think this value is interesting.

Replying to [sebastian.huber](#):

The profiling is optional since it may severely impact the performance of the operating system. Some SMP chips are not really well designed and offer no processor private access to timer and counter modules. Instead you must use on-chip peripheral over the system bus.

Yes I agree profiling is not a normal user activity and may place extra demands on the system. We need to track this variant with buildbot.

Adding some counters shouldn't be a big deal, but please create a new ticket for this. This ticket is about fixing an existing statistic so that it works on SMP.

Good idea, I will do this.

Determining the per-processor idle time is difficult with the global fixed priority schedulers if they manage more than one processor and I don't think this value is interesting.

Maybe the stats collected are per scheduler and reflect what is important.

Original author: sebastian.huber

The `rtems_task_delete()` is basically a `pthread_cancel()` plus `pthread_join()`. Unify the implementation and introduce a `_Thread_Cancel()` and `_Thread_Join()` to be used by both APIs. Get rid of the Giant lock for thread delete.

Original author: sebastian.huber

Currently a global lookup tree is used for all the POSIX key/value pairs. On SMP configurations this is a bottleneck. Use one lookup tree per thread instead.

The first parameter is `size_t` in the `.h` and `uintptr_t` in the body. This resulted in a compiler error on the m32c. But it is an inconsistency which should be fixed even if no architecture complained.

The `malloc.h` header file has this:

```
void *rtems_heap_allocate_aligned_with_boundary( size_t size, uintptr_t alignment, uintptr_t
boundary );
```

`malloc_deferred.c` has this:

```
void *rtems_heap_allocate_aligned_with_boundary( uintptr_t size, uintptr_t alignment,
uintptr_t boundary )
```

Original author: sebastian.huber

alarm() uses `_Watchdog_Insert_seconds()` and thus is affected by clock changes, e.g. via `_TOD_Set()`. This is wrong. The POSIX documentation is not that clear since it talks only about "realtime seconds". However, the FreeBSD implementation uses the uptime. This is also in line with the RTEMS `ualarm()` and `nanosleep()`.

#### Background

The O(m) Independence-Preserving Protocol (**OMIP**) is a generalization of the priority inheritance protocol to clustered scheduling which avoids the non-preemptive sections present with priority boosting. The *m* denotes the number of processors in the system. Its implementation requires an extension of the scheduler helping protocol already used for the [MrsP](MrsP) (<http://www-users.cs.york.ac.uk/~burns/MRSPpaper.pdf>) semaphores. However, the current implementation of the scheduler helping protocol has two major issues, see Catellani, Sebastiano, Luca Bonato, Sebastian Huber, and Enrico Mezzetti: Challenges in the Implementation of MrsP. In Reliable Software Technologies - Ada-Europe 2015, pages 179–195, 2015. Firstly, the run-time of some scheduler operations depend on the size of the resource dependency tree. Secondly, the scheduler operations of threads which don't use shared resources must deal with the scheduler helping protocol in case an owner of a shared resource is somehow involved.

To illustrate the second issue, let us look at the following example. We have a system with eight processors and two L2 caches. We assign processor 0 to a partition P for latency sensitive real-time tasks (e.g. sensor and actuator handling), processors 1, 2 and 3 are assigned to a cluster C<sub>A</sub>, and the remaining processors are assigned to a cluster C<sub>B</sub>, for soft real-time worker tasks. The worker tasks use a shared resource, e.g. a file system for data storage. Let us suppose a task R of partition P sends a message to the workers. This may make a waiting worker ready, which in turn pre-empts the owner of a shared resource. In this case the scheduler helping protocol takes action and is carried out by the task R. This contradicts the intended isolation of scheduler instances.

The reason for this unfortunate coupling is a design issue of the scheduler helping protocol implementation. Some scheduler operations may return a thread in need of help. For example, if a thread is unblocked which pre-empts an owner of a shared resource, then the pre-empted thread is returned. Once a thread in need of help is returned, the ask for help operation of the scheduler is executed. An alternative to this return value based approach is the introduction of a pre-emption intervention during thread dispatching. Threads taking part in the scheduler helping protocol indicate this with a positive resource count value. In case a thread dispatch occurs and pre-empts an owner of a shared resource, the scheduler ask for help operation is invoked. So, the work is carried out on behalf of the thread which takes part in the scheduler helping protocol.

To overcome the first issue, an improved resource dependency tracking is required. One approach is to use a recursive red-black tree based data structure, see [#2412](#).

## Implementation

There are several steps necessary to implement OMIP. \* Introduce per-scheduler locks. \* Enable context switches with interrupts enabled. \* Add a pre-emption intervention to the thread dispatch. \* Add a table for priority nodes to the thread control block. For each scheduler instance there is one priority node. \* Update the table in case the thread blocks on a resource, a timeout while waiting for a resource occurs, or ownership of a resource is transferred to the thread. \* Use this table in the pre-emption intervention. \* Update the MrsP implementation to the new infrastructure.

Currently, only one scheduler lock for all scheduler instances is used. This simplified the MrsP implementation and due to the presence of a Giant lock, this was not an issue. With the elimination of the Giant lock, however, we need one scheduler lock per scheduler instance to really profit from a decoupled system due to clustered scheduling.

The current implementation of thread dispatching has some implications with respect to the interrupt latency. It is crucial to preserve the system invariant that a thread can execute on at most one processor in the system at a time. This is accomplished with a boolean indicator in the thread context. The processor architecture specific context switch code will mark that a thread context is no longer executing and waits that the heir context stopped execution before it restores the heir context and resumes execution of the heir thread (the boolean indicator is basically a TTAS lock). So, there is one point in time in which a processor is without a thread. This is essential to avoid cyclic dependencies in case multiple threads migrate at once. Otherwise some supervising entity is necessary to prevent deadlocks. Such a global supervisor would lead to scalability problems so this approach is not used. Currently the context switch is performed with interrupts disabled. Thus in case the heir thread is currently executing on another processor, the time of disabled interrupts is prolonged since one processor has to wait for another processor to make progress.

If we add pre-emption intervention to the thread dispatch sequence, then there is an even

greater need to avoid this issue with the interrupt latency. Interrupts normally store the context of the interrupted thread on its stack. In case a thread is marked as not executing, we must not use its thread stack to store such an interrupt context. We cannot use the heir stack before it stopped execution on another processor. If we enable interrupts during this transition, then we have to provide an alternative thread independent stack for interrupts in this time frame.

The pre-emption intervention should be added to `_Thread_Do_dispatch()` before the heir is read and perform the following pseudo-code actions.

```

1 pre_emption_intervention(executing):
2 if executing.resource_count > 0:
3   executing.lock()
4   if executing.is_ready():
5     for scheduler in executing.schedulers:
6       scheduler.lock()
7       if !executing.is_scheduled():
8         for scheduler in executing.schedulers:
9           scheduler.ask_for_help(executing)
10        for scheduler in executing.schedulers:
11          scheduler.unlock()
12      else if executing.active_help_level > 0:
13        idle.use(executing.scheduler_node)
14      executing.unlock()

```

The scheduler help operation affects multiple scheduler instances. In terms of locking we have only two options, \* use a global scheduler lock, or \* obtain multiple per-scheduler locks at once. A global scheduler lock is not an option. To avoid deadlocks obtain the per-scheduler locks in a fixed order. However, in this case the per-scheduler locks will observe different worst-case and average-case acquire times (depending on the order).

Use a recursive data structure to determine the highest priority available to a thread for each scheduler instance, e.g.

```

1 typedef struct Thread_Priority_node {
2   Priority_Control current_priority;
3   Priority_Control real_priority;
4   struct Thread_Priority_node *owner;
5   RBTNode Node;
6   RBTControl Inherited_priorities;
7 } Thread_Priority_node;
8
9 typedef struct {
10  ...
11  Thread_Priority_node *priority_nodes; /* One per scheduler instances */
12  ...
13 } Thread_Control;

```

Initially a thread has a priority node reflecting its real priority. The `Thread_Priority_node::owner` is NULL. The `Thread_Priority_node::current_priority` is set to the real priority. The `Thread_Priority_node::Inherited_priorities` is empty.

In case the thread must wait for ownership of a mutex, then it enqueues its priority node in `Thread_Priority_node::Inherited_priorities` of the mutex owner.

In case the thread is dequeued from the wait queue of a mutex, then it dequeues its priority node in `Thread_Priority_node::Inherited_priorities` of the previous mutex owner (ownership transfer) or the current mutex owner (acquire timeout).

In case the minimum of the `Thread_Priority_node::real_priority` and the `Thread_Priority_node::Inherited_priorities` changes, then `Thread_Priority_node::current_priority` is updated. In case the `Thread_Priority_node::owner` is not NULL, the priority change propagates to the owner, and so on. In case `Thread_Priority_node::current_priority` changes, the corresponding scheduler is notified.

Use the thread lock to protect the priority nodes.

 ↪ a shared resource, e.g. a file system for data storage. Let us  
 ↪ suppose a task R of partition P sends a message to the workers. This  
 ↪ may make a waiting worker ready, which in turn pre-empts the owner of  
 ↪ a shared resource. In this case the scheduler helping protocol takes  
 ↪ action and is carried out by the task R. This contradicts the  
 ↪ intended isolation of scheduler instances.

9

10 The reason for this unfortunate coupling is a design issue of the

↪ scheduler helping protocol implementation. Some scheduler operations  
 ↪ may return a thread in need of help. For example, if a thread is  
 ↪ unblocked which pre-empts an owner of a shared resource, then the pre-  
 ↪ empted thread is returned. Once a thread in need of help is returned,  
 ↪ the ask for help operation of the scheduler is executed. An  
 ↪ alternative to this return value based approach is the introduction  
 ↪ of a pre-emption intervention during thread dispatching. Threads  
 ↪ taking part in the scheduler helping protocol indicate this with a  
 ↪ positive resource count value. In case a thread dispatch occurs and  
 ↪ pre-empts an owner of a shared resource, the scheduler ask for help  
 ↪ operation is invoked. So, the work is carried out on behalf of the  
 ↪ thread which takes part in the scheduler helping protocol.

11

12 To overcome the first issue, an improved resource dependency tracking

↪ is required. One approach is to use a recursive red-black tree based  
 ↪ data structure, see #2412.

13

14 = Implementation =

15

16 There are several steps necessary to implement OMIP.

17 \* Introduce per-scheduler locks.

18 \* Enable context switches with interrupts enabled.

19 \* Add a pre-emption intervention to the thread dispatch.

20 \* Add a table for priority nodes to the thread control block. For each

(continues on next page)

(continued from previous page)

```

    ↪ scheduler instance there is one priority node.
21 * Update the table in case the thread blocks on a resource, a timeout_
    ↪ while waiting for a resource occurs, or ownership of a resource is_
    ↪ transferred to the thread.
22 * Use this table in the pre-emption intervention.
23 * Update the MrsP implementation to the new infrastructure.
24
25 Currently, only one scheduler lock for all scheduler instances is used._
    ↪ This simplified the MrsP implementation and due to the presence of a_
    ↪ Giant lock, this was not an issue. With the elimination of the Giant_
    ↪ lock, however, we need one scheduler lock per scheduler instance to_
    ↪ really profit from a decoupled system due to clustered scheduling.
26
27 The current implementation of thread dispatching has some implications_
    ↪ with respect to the interrupt latency. It is crucial to preserve the_
    ↪ system invariant that a thread can execute on at most one processor_
    ↪ in the system at a time. This is accomplished with a boolean_
    ↪ indicator in the thread context. The processor architecture specific_
    ↪ context switch code will mark that a thread context is no longer_
    ↪ executing and waits that the heir context stopped execution before it_
    ↪ restores the heir context and resumes execution of the heir thread_
    ↪ (the boolean indicator is basically a TTAS lock). So, there is one_
    ↪ point in time in which a processor is without a thread. This is_
    ↪ essential to avoid cyclic dependencies in case multiple threads_
    ↪ migrate at once. Otherwise some supervising entity is necessary to_
    ↪ prevent deadlocks. Such a global supervisor would lead to_
    ↪ scalability problems so this approach is not used. Currently the_
    ↪ context switch is performed with interrupts disabled. Thus in case_
    ↪ the heir thread is currently executing on another processor, the time_
    ↪ of disabled interrupts is prolonged since one processor has to wait_
    ↪ for another processor to make progress.
28
29 If we add pre-emption intervention to the thread dispatch sequence,_
    ↪ then there is an even greater need to avoid this issue with the_
    ↪ interrupt latency. Interrupts normally store the context of the_
    ↪ interrupted thread on its stack. In case a thread is marked as not_
    ↪ executing, we must not use its thread stack to store such an_
    ↪ interrupt context. We cannot use the heir stack before it stopped_
    ↪ execution on another processor. If we enable interrupts during this_
    ↪ transition, then we have to provide an alternative thread independent_
    ↪ stack for interrupts in this time frame.
30
31 The pre-emption intervention should be added to `_Thread_Do_dispatch()`_
    ↪ before the heir is read and perform the following pseudo-code actions.
32 {{{
33 pre_emption_intervention(executing):
34 if executing.resource_count > 0:
35     executing.lock()
36 if executing.is_ready():

```

(continues on next page)

(continued from previous page)

```

37 for scheduler in executing.schedulers:
38     scheduler.lock()
39     if !executing.is_scheduled():
40         for scheduler in executing.schedulers:
41             scheduler.ask_for_help(executing)
42         for scheduler in executing.schedulers:
43             scheduler.unlock()
44     else if executing.active_help_level > 0:
45         idle.use(executing.scheduler_node)
46     executing.unlock()
47 }}}

```

48 The scheduler help operation affects multiple scheduler instances. In\_
 ↪ terms of locking we have only two options,
 49 \* use a global scheduler lock, or
 50 \* obtain multiple per-scheduler locks at once.
 51 A global scheduler lock is not an option. To avoid deadlocks obtain\_
 ↪ the per-scheduler locks in a fixed order. However, in this case the\_
 ↪ per-scheduler locks will observe different worst-case and average-
 ↪ case acquire times (depending on the order).
 52
 53 Use a recursive data structure to determine the highest priority\_
 ↪ available to a thread for each scheduler instance, e.g.
 54 {{{
 55 typedef struct Thread\_Priority\_node {
 56 Priority\_Control current\_priority;
 57 Priority\_Control real\_priority;
 58 struct Thread\_Priority\_node \*owner;
 59 RBTNode Node;
 60 RBTControl Inherited\_priorities;
 61 } Thread\_Priority\_node;
 62
 63 typedef struct {
 64 ...
 65 Thread\_Priority\_node \*priority\_nodes; /\* One per scheduler instances \*/
 66 ...
 67 } Thread\_Control;
 68 }}}
 69
 70 Initially a thread has a priority node reflecting its real priority.\_
 ↪ The `Thread\_Priority\_node::owner` is `NULL`. The `Thread\_Priority\_
 ↪ node::current\_priority` is set to the real priority. The `Thread\_
 ↪ Priority\_node::Inherited\_priorities` is empty.
 71
 72 In case the thread must wait for ownership of a mutex, then it enqueues\_
 ↪ its priority node in `Thread\_Priority\_node::Inherited\_priorities` of\_
 ↪ the mutex owner.
 73
 74 In case the thread is dequeued from the wait queue of a mutex, then it\_
 ↪ dequeues its priority node in `Thread\_Priority\_node::Inherited\_

(continues on next page)

(continued from previous page)

```

75 ↪priorities` of the previous mutex owner (ownership transfer) or the
76 ↪current mutex owner (acquire timeout).
77
78 In case the minimum of the `Thread_Priority_node::real_priority` and
  ↪the `Thread_Priority_node::Inherited_priorities` changes, then
  ↪`Thread_Priority_node::current_priority` is updated. In case the
  ↪`Thread_Priority_node::owner` its not `NULL`, the priority change
  ↪propagates to the owner, and so on. In case `Thread_Priority_
  ↪node::current_priority` changes, the corresponding scheduler is
  ↪notified.
77
78 Use the thread lock to protect the priority nodes.

```

!`resource.png, center, 60% <<https://gitlab.rtems.org/-/project/uploads/migrated/resource.png>, center, 60%>`\_ This is an example resource dependency tree with sixteen threads t0 up to t15 and sixteen resources r0 up to r15. The root of this tree is t0. The thread t0 owns the resources r0, r1, r2, r3, r6, r11 and r12 and is in the ready state. The threads t1 up to t15 wait directly or indirectly via resources owned by t0 and are in a blocked state. The colour of the thread nodes indicate the scheduler instance.

**Author:** Trac Migrate 2016-01-27T08:54:45.000Z

Original author: sebastian.huber

!`help.png, center, 90% <<https://gitlab.rtems.org/-/project/uploads/migrated/help.png>, center, 90%>`\_ This is an example of a table of priority nodes with sixteen threads t0 up to t15 and three scheduler instances s0 up to s2 corresponding to the previous example. The overall resource owner is t0. The colour of the nodes indicate the scheduler instance. Several threads of different scheduler instances depend on thread t10. So, the thread t10 contributes for example the highest priority

node of scheduler instance s2 to thread t0 even though it uses scheduler instance s0.

In changeset 9bfad8cd519f17cbb26a672868169fcd304d5bd5:

score: Add thread priority to scheduler nodes The thread priority is manifest in two independent areas. One area is the user visible thread priority along with a potential thread queue. The other is the scheduler. Currently, a thread priority update via `_Thread_Change_priority()` first updates the user visible thread priority and the thread queue, then the scheduler is notified if necessary. The priority is passed to the scheduler via a local variable. A generation counter ensures that the scheduler discards out-of-date priorities. This use of a local variable ties the update in these two areas close together. For later enhancements and the OMIP locking protocol implementation we need more flexibility. Add a thread priority information block to `Scheduler_Node` and synchronize priority value updates via a sequence lock on SMP configurations. Update [#2556](#).

#### Background

The watchdog handler uses delta chains. The insert operation has a  $O(n)$  worst-case time complexity with  $n$  being the count of watchdogs in the delta chain. In each step of the insert operation, the SMP lock of the corresponding watchdog header is acquired and released. The profiling data obtain by test program `smptests/smpwakeafter01` showed that the current implementation leads to unacceptable latencies, thus it should be replaced by something else.

The use cases for the watchdog handler fall roughly into two categories. \* Timeouts - used to detect if some operations needs more time than expected. Since the unexpected happens hopefully rarely, timeout timers are usually removed before they expire. The critical operations are insert and removal. They are important for the performance of a network stack. \* Timers - used to carry out some work in the future. They usually expire and need a high resolution. An example user is a time driven scheduler, e.g. rate-monotonic or EDF.

One approach is to use a red-black tree with the expiration time as the key. This leads to  $O(\log(n))$  worst-case insert and removal operations. For each operation it is sufficient to acquire and release the lock only once. The drawback is that a 64-bit integer type must be used for the intervals to avoid a potential overflow of the key values. With a system tick interval of 1ns the system could run more than 500 years before an overflow happens. The EDF scheduler would also profit from a 64-bit interval representation, see [#2173](#).

An alternative is the use of a [timer wheel](#) based algorithm which is used in Linux and [FreeBSD](FreeBSD)(<http://web.mit.edu/afs.new/sipb/user/daveg/ATHENA/Info/>

[wucs-95-23.ps](#)) for example. A timer wheel based algorithm offers  $O(1)$  worst-case time complexity for insert and removal operations. The drawback is that the run-time of the watchdog tick procedure is somewhat unpredictable due to the use of a hash table or cascading.

Which approach should we choose? Since the watchdog serves the timeout and timer services in RTEMS we have to make some trade-offs. We recommend to use the red-black tree approach which offers a more predictable run-time behaviour and sacrifice the constant insert and removal operations offered by the timer wheel algorithms, see also <https://www.kernel.org/doc/ols/2006/ols2006v1-pages-333-346.pdf>. We can reuse the red-black tree support already used for the thread priority queues.

The new watchdog handler implementation is a prerequisite to eliminate the Giant lock in the Classic Timer manager.

## Implementation

Change the `_Watchdog_Ticks_since_boot` to a 64-bit integer type. Keep the `Watchdog_Interval` at 32-bit for backward compatibility. Replace the delta chains with a red-black tree. Use the ticks for timers with a relative expiration time. Use `struct timespec` or `struct bintime` for timers with an absolute expiration time. This has the benefit that we do not have to adjust the data structures in case the absolute time changes, e.g. due to NTP. It simplifies the POSIX timer services, since no conversion to ticks is necessary.

```

The clock tick interval is 1ms (1000 ticks per second). We observe a maximum thread dispatch disabled time of 3.1ms on the first processor which serves the clock interrupt and 1.5ms on the other processors. There is no contention on the Giant lock. However, the watchdog lock is highly contended. The maximum acquire and section times are small compared to the maximum thread dispatch disabled time. The maximum interrupt time on the first processor is 0.012ms, so serving the clock interrupt is no a big deal This clearly indicates that the loop based updates of the delta chains are the main issue.

Original author: sebastian.huber

I am not opposed to the use of RB Trees or the use of 64 bit time for absolute/calendar time.

I would like to see us move away from ticks on the relative timer and move to something more like CLOCK\_MONOTONIC based on uptime.

I assume the new ticks key value will be the “watchdog ticks since boot” value to trigger the watchdogs on. I think this is really still OK based on the math but limits the durations one can delay and the granularity.

The extra granularity may allow us to move to a tickless or variable clock tick in the future. Although I am still concerned that reprogramming the timer on the fly is potentially more dangerous and error prone than a fixed tick.

```

The maximum thread dispatch disabled time drops from 3ms to about 100us. There is now one watchdog header per-CPU. Profiling data is only shown for one of the watchdog locks. No contention is visible here. The new bottle neck is the scheduler lock, but this is a different issue. In addition the interrupt count on scheduler A is about two times the clock tick interrupt count. This means that each clock tick service results in an inter-processor interrupt. This highlights one of the known problems of a global priority based scheduler: massive thread migrations.

It looks like some BSPs with their own linkcmds may have shrunk too much. Norm appears to be 50% while some went to 75-80%. A second look after catching the pattern indicates that the KEEP() section requirements in the linker scripts were not correct and it was missed.

Rather than reverting a bunch of patches, this ticket is to review all function-section patches from this one back in time for cxx\_iostream shrinking too much.

commit 6d21c13e5094d490280a941cf0e8333f91f85715 Author: Ralph Holmes  
<[ralph@ybden.com](mailto:ralph@ybden.com)> Date: Sat Jan 23 21:15:40 2016 +0000

powerpc/gen5200: Add per-section compilation and linking support.

For the brs5l BSP variant:

**Author:** Joel Sherrill 2016-01-23T22:25:02.000Z

The following commits were made before this was noticed. Only those with a large cxx\_iostream shrinkage or no cxx\_iostream size need review.

After a review of all potential BSPs, I have determined that these are the ones which are almost certainly missing KEEP() sections. This drops the set considerably.

As a practical matter, the BSPs will be converted to use a shared linkcmds.base or have the use of function-sections disabled by commenting out the added lines. We need to work out the details but the same comment should be added above those lines like this (review and approve):

powerpc/mbx8xx: Add per-section compilation and linking support. - removed per [#2545](#). powerpc/haleakala: Add per-section compilation and linking support. - [#2561](#). powerpc/ss555: Add per-section compilation and linking support. - [#2563](#). powerpc/qemuppc: Add per-section compilation and linking support. - [#2564](#). powerpc/mpc8260ads: Add per-section compilation and linking support. In reviewing RTEMS+newlib POSIX conformance, I noticed that our newlib configuration does include the exec\*() variants. All of these call `_execve()` which we already provided.

This ticket is just to explain the removal of the RTEMS copies. The functional behavior to the user is still to return ENOSYS.

This appears to be an obsolete boot format. This utility isn't causing issues in its current location. Unless someone complains, it should remain here and be removed as part of moving to the new build system.

**Author:** Trac Migrate 2017-10-12T05:31:00.000Z

This is one item that forces you to install a native compiler to build RTEMS.

Original author: aunali1

The MVME5500 BSP uses Notepads in its exception handler and [#2493](#) removes them. This is obviously not portable and requires a rewrite.

Original author: sebastian.huber

Notepads were marked as obsolete in 4.11. Next step is to remove them. Documentation should mention that notepads are removed and list the alternatives, e.g. POSIX keys or thread local storage.

- Remove `_Thread_Control::task_variables`.
- Remove all `rtems_task_*variable*()` functions and now unused dependencies.
- Build with all tests enabled and fix all compile and link time errors.
- Run tests without regressions.
- Update documentation, to be defined.

Ben.. someone posted on IRC that they used your scripts but the clones point to your personal repos which are out of date I am guessing.

Also is this discussed anywhere on the RTEMS wiki?

**Author:** Trac Migrate 2015-12-11T11:43:05.000Z

Drat. OK I am going to look into this.

**Author:** Trac Migrate 2015-12-12T20:47:43.000Z

I have . reproduced the problem

To fix some encountered problems, I . rebased my RSB repo . changed to the 4.12 ARM bset . updated the qemu linaro commit id to accept newly passed configure options . rebased my rtems-tools repo . hard-coded an RTEMS module location in rtems-test so it could find rtemstoolkit - not sure what a clean fix is there

As a result, tests are passing using the bbxm linaro qemu, making it Very Likely that everything is fixed.

I have to go now but as far as I'm concerned this ticket can be closed once I (or anyone) verified with their own eyes that this newly built BSP boots on real hardware. All changes are pushed so anyone can try.

**Author:** Trac Migrate 2015-12-13T04:35:16.000Z

Replying to [chrisj](#):

. hard-coded an RTEMS module location in rtems-test so it could find rtemstoolkit - not sure what a clean fix is there

This has been fixed in a recent path in the rtems-tools. Can you please test it?

Got it. It seemed to me I had fully rebased but I will re-investigate when I have some more time.

---

---

These are the patches on master and 4.11:

<https://git.rtems.org/rtems-tools/commit/?id=a6f5f188ce61d586136c643125dfb857da64169f>  
<https://git.rtems.org/rtems-tools/commit/?h=4.11&id=3b9bfa4dfe6fe10fbaf1ebbf1ddca660c2f33167>

---

**Author:** Trac Migrate 2015-12-13T04:53:13.000Z

---

Acknowledged. I have to get to bed, please let me update later..

---

**Author:** Trac Migrate 2015-12-27T02:33:17.000Z

---

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

All build problems are fixed in my RSB repo. I have verified it works from scratch on real hw. I had to fix an additional build problem in uboot now that gcc has major version 6.

I am going to resolve this ticket and retry the tools test.

---

**Author:** Trac Migrate 2015-12-27T03:18:58.000Z

---

@chris, it seems your later commit of running the tester from a git clone did the trick - i rebased and the tester works now too.

Unfortunately there is now yet another problem with a new uboot for the bbxm so the actual tests have started failing :(.

Original author: sebastian.huber

RTEMS has an API for dynamic debug support in <rtems/debug.h>. This feature is sparsely used:

```

1 cpukit/sapi/src/debug.c: rtems_debug_disable( RTEMS_DEBUG_ALL_MASK );
2 cpukit/sapi/src/debug.c: void rtems_debug_enable (
3 cpukit/sapi/src/debug.c: rtems_debug_control to_be_enabled
4 cpukit/sapi/src/debug.c: void rtems_debug_disable (
5 cpukit/sapi/src/debug.c: rtems_debug_control to_be_disabled
6 cpukit/sapi/src/debug.c: bool rtems_debug_is_enabled(
7 cpukit/sapi/src/debug.c: rtems_debug_control level
8 cpukit/rtems/include/rtems/rtems/regionimpl.h: if ( rtems_debug_is_enabled(_
  ↳ RTEMS_DEBUG_REGION ) ) \
9 cpukit/score/include/rtems/debug.h: typedef uint32_t rtems_debug_control;
10 cpukit/score/include/rtems/debug.h: SCORE_EXTERN rtems_debug_control _Debug_Level;
11 cpukit/score/include/rtems/debug.h: void rtems_debug_enable(
12 cpukit/score/include/rtems/debug.h: rtems_debug_control to_be_enabled
13 cpukit/score/include/rtems/debug.h: void rtems_debug_disable(
14 cpukit/score/include/rtems/debug.h: rtems_debug_control to_be_disabled
15 cpukit/score/include/rtems/debug.h: bool rtems_debug_is_enabled(
16 cpukit/score/include/rtems/debug.h: rtems_debug_control level
17 c/src/lib/libbsp/shared/bootcard.c: * - rtems_debug_enable( RTEMS_DEBUG_
  ↳ ALL_MASK );
18 c/src/lib/libbsp/shared/bootcard.c: rtems_debug_enable( RTEMS_DEBUG_ALL_MASK );
19 c/src/lib/libbsp/shared/include/bootcard.h: * - rtems_debug_enable( RTEMS_DEBUG_
  ↳ ALL_MASK )
20 testsuites/sptests/spregion_err01/init.c: puts( "TA1 - rtems_debug_disable - _
  ↳ RTEMS_DEBUG_REGION" );
21 testsuites/sptests/spregion_err01/init.c: rtems_debug_disable( RTEMS_DEBUG_
  ↳ REGION );
22 testsuites/sptests/spregion_err01/init.c: puts( "TA1 - rtems_debug_enable - _
  ↳ RTEMS_DEBUG_REGION" );
23 testsuites/sptests/spregion_err01/init.c: rtems_debug_enable( RTEMS_DEBUG_REGION_
  ↳ );
24 testsuites/sptests/sp10/init.c: puts( "Init - rtems_debug_is_enabled - is 0x1_
  ↳ set? No" );
25 testsuites/sptests/sp10/init.c: is_set = rtems_debug_is_enabled( 0x1 );
26 testsuites/sptests/sp10/init.c: puts( "Init - rtems_debug_enable - set 0x1" );
27 testsuites/sptests/sp10/init.c: rtems_debug_enable(0x1);
28 testsuites/sptests/sp10/init.c: puts( "Init - rtems_debug_is_enabled - is 0x1_
  ↳ set? Yes" );
29 testsuites/sptests/sp10/init.c: is_set = rtems_debug_is_enabled( 0x1 );
30 testsuites/sptests/sp10/init.c: puts( "Init - rtems_debug_disable - clear 0x1" );
31 testsuites/sptests/sp10/init.c: rtems_debug_disable(0x1);
32 testsuites/sptests/sp10/init.c: puts( "Init - rtems_debug_is_enabled - is 0x1_
  ↳ set? No" );
33 testsuites/sptests/sp10/init.c: is_set = rtems_debug_is_enabled( 0x1 );

```

The only user is the Classic Region and it is only active in case RTEMS\_DEBUG is defined. Due to the heap protection support which is also available in case RTEMS\_DEBUG is defined, the expensive heap walks are superfluous.

We should remove this API entirely to simplify the code base.

Original author: sebastian.huber

In `rtems/conifg/rtems-urls.bset` the tool patches are set to an RTEMS version dependent directory. This makes re-use of the general purpose files quite difficult.

We should use patches from tickets rather than using the `rtems-tools.git` repo. This means this any changed in the RSB can be avoided.

Remove the M32R port per the instructions at [https://devel.rtems.org/wiki/Developer/Removing\\_a\\_Port](https://devel.rtems.org/wiki/Developer/Removing_a_Port).

All BSPa must be removed before the architectural port can be removed. These are tracked by the following tickets:

#### 2447 - m32rsim

Rationale: The M32R port is incomplete, appears to have no users, and the CPU architecture is end-of-lifed.

**Author:** Joel Sherrill 2015-11-03T14:42:47.000Z

- **Description** changed

Remove the AVR port per the instructions at [https://devel.rtems.org/wiki/Developer/Removing\\_a\\_Port](https://devel.rtems.org/wiki/Developer/Removing_a_Port).

All BSPa must be removed before the architectural port can be removed. These are tracked by the following tickets:

-

## 2442 - avrtest

Rationale: The AVR port is incomplete and the largest AVR CPU models are just barely large enough to run RTEMS. This by itself is not enough to drop the port. However, the state of GCC for this target is poor. It is marginally maintained. Atmel maintains their own patch set independent of GCC. Plus they use their own small (and unique) C Library. This makes avr-rtems the only user of AVR+newlib. The target size is a challenge but that was why the port was initially interesting. It provided a real goal. But the tool state is painful for a port which is incomplete and has neither users nor anyone interested in actively maintaining it for GCC or RTEMS.

**Author:** Joel Sherrill 2015-11-03T14:38:42.000Z

In changeset 1d55e157ca9f4a9ff806f8fa5fcc79b03a7b8178:

LPC1768: Fix compilation error The LPC1768 variants have a gpio.h file whose name clashes with the gpio.h from the new GPIO API. This results on the BSPs failing to compile. This patch renames the LPC1768 gpio.\* files to lpc-gpio.\*, as it's done on other BSPs (e.g. Beaglebone). Closes [#2441](#).

Original author: johill

Typically when designing an API that calls a user callback there is a user private “void \*” pointer transparently passed through to the user callback so that the user can access his private state inside of his callback without being forced to employ a global variable. A global variable doesn't work very well if there are multiple objects instances created each of them using the same method with rtems\_iterate\_over\_all\_threads. This type of “void \*” private pointer is of course a standard approach allowing the users callback to behave much the same way as a virtual method in C++, but nevertheless retaining a compatible C based API.

An enhanced version of the API might look like this.

```
void rtems_iterate_over_all_threads_xxx( rtems_per_thread_routine routine, void * const
pUserPrivatePassThrogh );
```

```
typedef void (*rtems_per_thread_routine_xxx)( Thread_Control *the_thread, void * const
pUserPrivatePassThrogh );
```

The pUserPrivatePassThrogh is not used by the library; it is retained for the duration of the rtems\_iterate\_over\_all\_threads\_xxx function only so that it can be passed through to the user's callback.

thanks for your consideration of this matter

PS: I am using rtems\_iterate\_over\_all\_threads to implement a task mode, thread aware, Ethernet connected GDB stub. When GDB attaches it stops certain threads and sends their status depending on its operating modes, but this of course should not apply to the GDB communication threads. Therefore there needs to be a way to iterate through all of the threads checking each of them to determine if they are tagged as being GDB stop-mode immune.

PPS: In thread.h and iterateoverthreads.c one could create some code like this. A possible implementation.

```
/** This defines the type for a method which operates on a single thread.
 */ typedef void (*rtems_per_thread_routine)( Thread_Control * ); typedef void
(*rtems_per_task_function)( Thread_Control *, void * const pUserPrivate );

/** * This routine iterates over all threads regardless of API and * invokes the spec-
ified routine. */ void rtems_iterate_over_all_threads( rtems_per_thread_routine
routine );

void rtems_thread_per_each_callback(rtems_per_task_function pFunction, void *
const pUserPrivate );

void rtems_thread_per_each_callback(rtems_per_task_function pFunction, void *
const pUserPrivate ) { uint32_t i; uint32_t api_index; Thread_Control *the_thread;
Objects_Information *information;

if ( !pFunction ) return;

for ( api_index = 1 ; api_index <= OBJECTS_APIS_LAST ; api_index++ ) { if (
!_Objects_Information_table[ api_index ] ) continue;

information = _Objects_Information_table[ api_index ][ 1 ]; if ( !information ) con-
tinue;

for ( i=1 ; i <= information->maximum ; i++ ) { the_thread = (Thread_Control
*)information->local_table[ i ];

if ( !the_thread ) continue;

(*pFunction)(the_thread,pUserPrivate); } }

}
```

Original author: sebastian.huber

In order to reduce the size of executables it is beneficial to put all global functions and data into separate sections. This enables the linker to perform a garbage collection which removes all items not directly referenced. The following steps are necessary:

1. Modify the build system to use the following compiler and linker flags:

CFLAGS += -ffunction-sections -fdata-sections LDFLAGS += -Wl,-gc-sections

2. Review all linker command files and ensure that linker sets and global constructor sections are not affected by the garbage collection (e.g. use the KEEP() directive of GNU ld).

I do not understand the issue. What does tools without a version mean ?

**Author:** Trac Migrate 2015-09-11T09:03:45.000Z

Original author: sebastian.huber

For example sparc-rtems-gcc, etc.

This is used by some third-party tools, like the Gaisler RCC.

**Author:** Chris Johns 2015-09-13T22:49:42.000Z

Original author: sebastian.huber

The rtems\_waf module is designed to look at a standard versioned RTEMS tree that is built and installed. We have had versioning since 4.7. The module checks for the architectures requested are installed versioned. Changes to stop this adds complexity and increase testing in an area I would prefer not to do.

I understood Gaisler is supporting versioned tools. What other 3rd party tool set are you referring to ?

**Author:** Trac Migrate 2015-09-14T06:18:41.000Z

Original author: sebastian.huber

The RCC archives use a version:

<http://gaisler.com/anonftp/rcc/bin/linux/>

However, the tools use all a sparc-rtems- prefix without a version.

I found it convenient to use this scheme for the RTEMS master as well. You can build the tools with an arbitrary string after the target-rtems, e.g. sparc-rtemsfoobarblug99.abc is also allowed.

---

Replying to [sebastian.huber](#):

The RCC archives use a version: <http://gaisler.com/anonftp/rcc/bin/linux/>

These look like old tools. My understanding is un-versioned tools would not be be part of any 4.11 version and the last un-versioned tools by Gaisler was 4.10.

However, the tools use all a sparc-rtems- prefix without a version.

We should not and really cannot support un-versioned tools in the project. I will discourage any efforts to make it supported.

I found it convenient to use this scheme for the RTEMS master as well. You can build the tools with an arbitrary string after the target-rtems, e.g. sparc-rtemsfoobarblug99.abc is also allowed.

Did you try the `-rtems-version` option, ie `-rtems-version=foobarblug99.abc` ?

I support any version label and encourage custom ones for a specific user build. It is just no versioning I wish to discourage.

Note, the waf based rtems-config support has a bug with a hardcoded version.

The preliminary RCC for 4.11 has still un-versioned tools:

<http://www.gaisler.com/anonftp/rcc/smp/nov2014/sparc-rtems-4.11-gcc-4.9.2-1.2.99.1-linux.tar.bz2>

However, the tools use all a sparc-rtems- prefix without a version.

Ok, then Gaisler should adjust their RCC structure.

No, I didn't build the tools with such a version label.

Ok, then Gaisler should adjust their RCC structure.

Yes. We have to put an end to users appearing on the mailing list with questions and we are guessing the origin of the tools. This is the reason we have asked for the change. Joel and I are clear in our understanding of what was to happen. I checked with him last night his time.

Hi,

Joel has discussed this with us some time ago and we agreed that we need to change the RCC naming. The temporary toolchain you can find via the gaisler.com home-page used still the old prefix and built by the old build scripts we have had. We were planning on using RSB initially but has not converted to it yet, however the old build script was updated recently which generates a toolchain with the prefix "sparc-rcc-rtems4.11-" as previously discussed. So next RCC release on rtems-4.11 will have that prefix. Please let me know if you see any trouble with us using that prefix.

Regards, Daniel

Original author: sebastian.huber

The unversioned tools should still work with 4.11. There is no issue there because it is still only autoconf.

This is an issue with the waf build. That will be 4.12 or 5.x but not 4.11. We need to make sure the target used for the Gaisler tools (sparc-rcc-rtems4.11-) is accepted OK. That should only be a matter of the wildcard pattern recognizing the CPU-rtemsVERSION or CPU-vendor-rtemsVERSION form of the target. The is actually GNUitically correct since the target technically has three parts. When the vendor isn't provided, it is assumed to be unknown.

Original author: mw

The documentation for User Extension sets in the C User's Guide could use some clarification. It discusses the multiple sets of extensions, but it is unclear as to whether or not the extensions are

added or replaced when `rtems_extension_create()` is called. There is a section - 22.2.4 (Order of Invocation) that does discuss the operation of the sets, but it only makes sense once the reader understands that the sets are, in fact, additive.

Any other questions you would like to see answered? The points you mention are relatively straightforward to address but the email thread had a lot going on and I wanted to make sure all your questions got reflected in the changes.

**Author:** Trac Migrate 2015-06-17T16:53:23.000Z

Original author: mw

No, I think all of my questions were stemming from that initial confusion. I thought I had to somehow extract the extensions that were previously installed in order to call them back myself; once I realized that they were layered (and the OS was doing the sequential calling), it all fell into place and I understood what was going on.

Ticket #2364 regarded use of a pthread mutex in three graphics driver as basically an atomic flag to ensure only one open() was active at a time. This created an unnecessary dependency on the POSIX API being enabled. I changed the code to use score Atomic flags.

This highlighted the need for a public Atomic API.

The existing tests could be converted to the public API, a macro wrapper written for Classic API Atomics, and documentation added. This may be enough to be a small GSOC project.

Original author: sebastian.huber

The RTEMS red-black tree implementation is not as good as the BSD implementation which performs quite well in a benchmark:

<https://github.com/sebhub/rb-bench>

Proposal:

<https://github.com/sebhub/rb-bench/blob/master/test-rbtree-bsd-for-rtems.c>

One benefit is that the search/insert is done inline and the red-black tree fixup is done in a general purpose `_BSD_RBTree_Insert_color()` function (similar to the Linux red-black tree API).

This makes it possible to get rid of the red-black tree implementation used by the JFFS2 support.

Original author: sebastian.huber

Currently there is one watchdog header for all ticks based watchdogs. This is not scalable. For example on the Freescale T4240 platform with 24-processors we observe in the smptests/smpwakeafter01 test a maximum thread dispatch disabled time of 3.8ms on processor 0 and 1.7ms on the other processors.

```

1 <PerCPUProfilingReport processorIndex="0">
2 <MaxThreadDispatchDisabledTime unit="ns">3807457</MaxThreadDispatchDisabledTime>
3 <MeanThreadDispatchDisabledTime unit="ns">124091</MeanThreadDispatchDisabledTime>
4 <TotalThreadDispatchDisabledTime unit="ns">1706880473</
  ↳TotalThreadDispatchDisabledTime>
5 <ThreadDispatchDisabledCount>13755</ThreadDispatchDisabledCount>
6 <MaxInterruptDelay unit="ns">0</MaxInterruptDelay>
7 <MaxInterruptTime unit="ns">24661</MaxInterruptTime>

```

The watchdog lock is highly contended and since the watchdog insert procedure acquires and releases the lock during the iteration of the watchdog chain several times, this yields the high thread dispatch disabled times.

To get rid of this bottleneck we should move the watchdog context into the scheduler context to use one watchdog context per scheduler instance. Take care that active watchdogs move in case of a scheduler change of a thread.

Original author: sebastian.huber

I don't think this is in line with POSIX.

**Author:** Joel Sherrill 2015-05-12T22:32:45.000Z

Original author: sebastian.huber

Would converting the second argument (interval) to ticks, saving it in a static variable, and using `_Watchdog_Insert_ticks()` in the TSR instead of `_Watchdog_Reset_ticks()` be enough to solve this?

Also this method was deprecated/obsoleted in one edition of POSIX but the current edition doesn't appear to mention that if I read the pages correctly.

The stuff in "c/src/lib/libbsp/sparc/shared/uart/cons.c" should get removed and the new Termios device API should be used instead (see also `rtems_termios_device_install()`).

---

**Author:** Trac Migrate 2015-05-28T08:02:11.000Z

---

Original author: sebastian.huber

- **Summary** changed from *Superfluous console driver infrastructure for SPARC* to *Broken console driver infrastructure for SPARC*

The console devices installed with this driver are broken on SMP (attribute changes are not properly synchronized). In case RTEMS\_DRVMGR\_STARTUP is defined, then the SMP capable console driver “c/src/lib/libbsp/sparc/leon3/console/console.c” is disabled.

---

**Author:** Trac Migrate 2015-12-30T18:46:26.000Z

---

Original author: sebastian.huber

Upon further inspection, c/src/lib/libbsp/sparc/shared/uart/cons.c and c/src/lib/libbsp/sparc/shared/include/cons.h do not appear to be referenced from anywhere, and contain dead code. These can be removed safely.

---

The file cons.c defines console\_initialize() etc., so it is referenced in case you add a console driver to your application configuration.

Any updates for this ticket? The severity is blocker

**Author:** Trac Migrate 2017-08-22T08:24:51.000Z

Original author: sebastian.huber

The cons.c is used by the apbuart\_cons.c driver used with the driver manager. cons.c and apbuart\_cons.c were updated for SMP and to use the new termios device registration in H1 2017 (see patches from –author="maberg@gaisler.com"). Therefore I think we can close this ticket now.

The current INIT task mode for a uni-processor build is NO\_PREEMPT. This is not possible on an SMP system and so the default mode is PREEMPT. Both system should be the same and so the uniprocessor mode should be changed.

I am addressing almost all uses of deprecated methods. They are mostly calls to `rtems_clock_get()` which can be easily corrected or test code which will be removed when the deprecated feature is removed.

This BSP however has what appears to be a unique feature – the ability for a thread to add a unique exception fault handler. My inclination is to rip this out but I am not doing it now. I am just turning off deprecated warnings for the file.

---

**Author:** Trac Migrate 2015-12-15T10:51:25.000Z

---

I suggest to remove the functionality of task specific exception handlers. In a multi-threaded environment exceptions affect the overall program, e.g. memory corruption.

---

**Author:** Joel Sherrill 2015-12-29T17:30:08.000Z

---

This code is disabled. It can't use notepads because they are obsoleted in 4.11 and removed after.

I was reviewing all code in the tree which uses deprecated methods. I will fix most of the cases. This is going to take a little more time. This test needs to be split apart. I think the notepad usage can go into a new test spnotepad02. It is primarily ensuring that two threads can exchange values through notepads.

The remaining use of notepads in sp07 can probably just be a count down on the priority.

I am starting to move code to spnotepad02 from sp07 that is not related to the tasks counting down.

Hopefully I can resolve this without much feedback.

Original author: sebastian.huber

The global variable `rtems_ada_self` is broken on SMP (similar to the task variables) and should be replaced with a function call or thread specific data.

One option is to use TLS, e.g.

```
1 diff --git a/gcc/ada/gcc-interface/Makefile.in b/gcc/ada/gcc-interface/
  ↪Makefile.in
2 index 598b262d914..5e1c5286d63 100644
3 --- a/gcc/ada/gcc-interface/Makefile.in
4 +++ b/gcc/ada/gcc-interface/Makefile.in
5 @@ -1743,7 +1743,7 @@ ifeq ($(strip $(filter-out rtems%, $(target_os))),)
6 s-parame.adb<s-parame-rtems.adb \
7 s-taprop.adb<s-taprop-posix.adb \
8 s-taspri.ads<s-taspri-posix.ads \
9 - s-tpopsp.adb<s-tpopsp-rtems.adb \
10 + s-tpopsp.adb<s-tpopsp-tls.adb \
11 s-stchop.adb<s-stchop-rtems.adb \
12 s-interr.adb<s-interr-hwint.adb
13 endif
```

Another option is to use POSIX keys:

```
1 diff --git a/gcc/ada/gcc-interface/Makefile.in b/gcc/ada/gcc-interface/
  ↪Makefile.in
2 index 598b262d914..5e1c5286d63 100644
3 --- a/gcc/ada/gcc-interface/Makefile.in
4 +++ b/gcc/ada/gcc-interface/Makefile.in
5 @@ -1743,7 +1743,7 @@ ifeq ($(strip $(filter-out rtems%, $(target_os))),)
6 s-parame.adb<s-parame-rtems.adb \
7 s-taprop.adb<s-taprop-posix.adb \
8 s-taspri.ads<s-taspri-posix.ads \
9 - s-tpopsp.adb<s-tpopsp-rtems.adb \
10 + s-tpopsp.adb<s-tpopsp-posix.adb \
11 s-stchop.adb<s-stchop-rtems.adb \
12 s-interr.adb<s-interr-hwint.adb
13 endif
```

I tend to use TLS since it has less overhead.

Just to be clear. We are using keys now for Ada. Does confdefs.h reflect this?

---

**Author:** Trac Migrate 2017-06-07T13:19:36.000Z

---

Original author: sebastian.huber

No, we used a hand crafted task variable for this. I will update RTEMS once the RSB is updated. Need to backport the GCC change to GCC 7 branch before.

---

**Author:** Trac Migrate 2017-06-07T13:52:17.000Z

---

Original author: sebastian.huber

This change breaks the x86 Ada support as long as x86 has no TLS support.

---

**Author:** Joel Sherrill 2017-06-07T17:49:23.000Z

---

Original author: sebastian.huber

So we are now using TLS for Ada.Self. I was thinking the POSIX default code used keys. That was the original implementation in GNAT. Is it TLS or POSIX keys?

---

**Author:** Trac Migrate 2017-06-08T05:29:44.000Z

---

Original author: sebastian.huber

On Linux and vxWorks TLS is used.

Over the past few years, we have split out the BSP required methods into their own files with consistent names. bsp\_pretasking\_hook() is next on the list.

```
$ grep -rl bsp_pretasking_hook .
./sparc/shared/bsppretaskinghook.c
./powerpc/score603e/startup/bspstart.c
./powerpc/beatnik/startup/bspstart.c
./powerpc/virtex5/startup/bspstart.c
./powerpc/virtex5/start/start.S
./powerpc/virtex4/startup/bspstart.c
./powerpc/virtex4/start/start.S
./powerpc/ep1a/startup/bspstart.c
./arm/lpc176x/startup/bspstart.c
./arm/lpc24xx/startup/bspstart.c
./bfin/bf537Stamp/startup/bspstart.c
./bfin/TLL6527M/startup/bspstart.c
./bfin/eZKit533/startup/bspstart.c
./shared/include/bootcard.h
./shared/bsppretaskinghook.c
./shared/bootcard.c
```

| <b>Link</b>        | <a href="https://gitlab.rtems.org/rtems/rtems/-/issues/2261">https://gitlab.rtems.org/rtems/rtems/-/issues/2261</a> |
| <b>Merges</b>      | 0                                                                                                                   |

This ticket is to capture the current state of the project started by Krzysztof Mięśowicz <[krzysztof.miesowicz@gmail.com](mailto:krzysztof.miesowicz@gmail.com)>. The goals of the project were to:

- replace the existing shell scripts in rtems-testing with Python code integrated into rtems-tools
- add the capability to generate a report per directory. This is important because a large body of code with low coverage negatively impacts the overall coverage area and makes reports harder to read. Breaking the reports down by functional area lets us do coverage reporting on more code even when some of the areas are in need of testing improvement.

The remaining effort in conjunction with other activity related to coverage such as inclusion of gcov generated reports is a good “summer of code” type project. This is an important capability to add to the rtems-tools.

The attached tar file krzy-patches.tar.bz2 contains the current code. There may be other issues to resolve but writing from memory, the following are the highest priority ones:

- no default setting for coverage enable/disable
- configuration file has hard coded paths. This should be able to be a template which is adjusted by the tools at run-time.
- variable naming and coding style does not match that used in other Python code in rtems-tools

Krzysztof wrote some in his blog about this (<http://kmiesowicz.blogspot.com/p/esa-socis-2014.html>). Ensure that your base RTEMS tools are built with the RTEMS Source Builder and check on the development list if it builds a qemu with coverage support. This may have changed since he blogged.

Patches for rtems-tools to add current coverage support

**Author:** Joel Sherrill 2015-02-11T15:46:37.000Z

- **Description** changed

```

1 This ticket is to capture the current state of the project started by
2 - Krzysztof Mi\ |md_0_281|\ sowicz <krzysztof.miesowicz@gmail.com>. The
  ↳ remaining effort in conjunction with other activity related to
  ↳ coverage such as inclusion of gcov generated reports is a good
  ↳ "summer of code" type project. This is an important capability to add
  ↳ to the rtems-tools.
3 + Krzysztof Mi\ |md_0_281|\ sowicz <krzysztof.miesowicz@gmail.com>. The
  ↳ goals of the project were to:
4 +
5 + * replace the existing shell scripts in rtems-testing with Python
  ↳ code integrated into rtems-tools
6 + * add the capability to generate a report per directory. This is
  ↳ important because a large body of code with low coverage negatively
  ↳ impacts the overall coverage area and makes reports harder to read.
  ↳ Breaking the reports down by functional area lets us do coverage
  ↳ reporting on more code even when some of the areas are in need of
  ↳ testing improvement.
7 +
8 + The remaining effort in conjunction with other activity related to
  ↳ coverage such as inclusion of gcov generated reports is a good
  ↳ "summer of code" type project. This is an important capability to add
  ↳ to the rtems-tools.
9
10 The attached tar file krzy-patches.tar.bz2 contains the current code.

---

- **Milestone** set to %”5.0”

---

**Author:** Amar Takhar 2015-02-11T18:06:46.000Z

---

I think this should be added into the waf build rather than kept separately. The test suite is inside RTEMS it seems natural everything needed for coverage reporting is there too.

I know this requires modified tools – RSB can build the tools the rest should go into waf.

---

**Author:** Chris Johns 2017-08-13T23:52:30.000Z

---

- **Milestone** changed from %”5.0” to %”4.12.0”
- **Version** changed from ~”4.11” to ~”4.12”

Moving to 4.12.0 as a milestone. The ticket can be updated once this years GSoC project wraps up.

---

**Author:** Joel Sherrill 2017-10-12T02:51:36.000Z

---

- **Resolution** set to ~”fixed”
- **Status** changed from *new* to *closed*

All code is now merged after GSoC.

---

**Author:** Trac Migrate 2017-11-09T06:27:14.000Z

---

- **Milestone** changed from %”4.12.0” to %”5.1”

Milestone renamed

4.2.1.901 2213 - Decreased performance for whetstone benchmark using GCC >=4.5

Original author: daniel.cederman

Moving from GCC 4.4.2 to 4.9.2 increases the execution time of the whetstone benchmark on both SPARC and x86. The cause seems to be a single commit. I have submitted a bug report to the GCC bugzilla:

[https://gcc.gnu.org/bugzilla/show\\_bug.cgi?id=64193](https://gcc.gnu.org/bugzilla/show_bug.cgi?id=64193)

---

**Author:** Joel Sherrill 2015-01-22T15:15:04.000Z

---

Original author: daniel.cederman

Daniel.. did this get resolved? I recall discussions.

---

**Author:** Trac Migrate 2015-01-23T09:43:41.000Z

---

Original author: daniel.cederman

Richard Biener provided a patch that fixed it on trunk. It looks like it could be easy to backport, but I have not had time to test it yet.

Original author: daniel.cederman

A quick test shows that the performance for GCC 7 is about the same as for GCC 4.4.6.

GCC 4.4.6 => ~52 seconds GCC 4.9.4 => ~55 seconds GCC 7.0.0 (master at 20170116) => ~52 seconds Compiled with -O3 and -mcpu=leon3.

A host tar by default will overwrite the contents of a directory. A sort of refresh. The RTEMS tar requires you remove the existing files rather than overwrite. This is dangerous because you have to remove files yet you do not know if the tar will be successful and moving and saving files assumes you know the contents of the tar file before hand.

Tar should be changed to overwrite and so allow files to be refreshed.

Consistence of files should be managed outside of tar via hashes or checksums.

---

**Author:** Chris Johns 2014-12-03T10:15:43.000Z

---

Running some tests with tar on MacOS I see tar updates by removing files before outputting the new file. The example shown chowns x1/d1 to root while x1/d1/f1 is still owned by me:

```
$ tar xf z1.tar x1/d1/: Can't update time for x1/d1 x1/d1/f2: Can't unlink already-existing object tar: Error exit delayed from previous errors.
```

Looks like a delete tree needs to be added.

In changeset d84e346b26017f021c1a7d5c8ad078c7264240ab:

libmisc/untar: Support directory create and overwrites. Share the common code. Support creating directories for files with a path depth greater than 1. Some tar files can have files with a path depth greater than 1 and no directory entry in the tar file to create a directory. Support overwriting existing files and directories failing in a similar way to tar on common hosts. If a file is replaced with a file delete the file and create a new file. If a directory replaces a file remove the file and create the directory. If a file replaces a directory remove the directory, and if the directory is not empty and cannot be removed report an error. If a directory already exists do nothing leaving the contents untouched. The untar code now shares the common header parsing and initial processing with the actual writes still separate. No changes to the IMFS have been made. Updates [#2415](#). Closes [#2207](#).

Original author: johill

I have a look around in the drivers in the various BSPs and I notice that none of the termios drivers appear to transmit characters at task level even if they are running in termios task mode. Maybe all (most) of them send characters in the ISR. If there was a large frame of characters to send then this could lock out task activity for too long.

FWIW, I had a closer look at this today, and maybe something is fishy in the termios code when the TX part of termios runs in task driven mode. It seems that in task mode if the UART can accept characters immediately in the write routine then we wouldnt need to turn on any interrupts at all. The write routine would need to somehow tell termios how many characters it sent; presumably this would occur by calling `rtems_termios_dequeue_characters` in the driver's write function. I see in the code that this tries to work, `rtems_termios_dequeue_characters` posts the semaphore of termios tx and increases the characters sent count of termios. However after the write routine returns it goes badly.

If the transmitter runs in termios TASK mode and the driver's write routine does not immediately enable an interrupt, then it returns to the code below in `rtems_termios_puts` and it sets the transmitter to `rob_busy`. After that the termios tx daemon proceeds to step through all of the characters remaining (I think that I see this in the debugger) and discards them because the transmitter stays in `rob_busy` state.

It's also probably odd that termios calls the write function with interrupts disabled when it is in task driven mode; we could loop outputting a large frame of characters in the write routine at task level with interrupts globally disabled.

```
if (tty->rawOutBufState == rob_idle) { /* check, whether XOFF has been received
/ if (!(tty->flow_ctrl & FL_ORCVXOF)) { (*tty->device.write)(tty->minor, (char *)&tty-
>rawOutBuf.theBuf[tty->rawOutBuf.Tail],1); } else { / remember that output has been stopped
due to flow ctrl*/ tty->flow_ctrl |= FL_OSTOP; } tty->rawOutBufState = rob_busy; }
```

```
[debug]#0 rtems_termios_puts (_buf=0x9ca60, len=1, tty=0x11509c) at /home/hill/nios2-
rtems/rtems/rtems-git/rtems-4.10/c/src/../../cpukit/libcsupport/src/termios.c:677

Yes, the interrupt support for Termios is broken if you ask me. It is very unlikely that we will see an improvement here unless someone gets a budget for this.

**Author:** Trac Migrate 2014-12-18T12:35:42.000Z

- **Description** changed

```

1 I have a look around in the drivers in the various BSPs and I notice
  ↳ that none of the termios drivers appear to transmit characters at
  ↳ task level even if they are running in termios task mode. Maybe all
  ↳ (most) of them send characters in the ISR. If there was a large frame
  ↳ of characters to send then this could lock out task activity for too
  ↳ long.

2

3 FWIW, I had a closer look at this today, and maybe something is fishy
  ↳ in the termios code when the TX part of termios runs in task driven
  ↳ mode. It seems that in task mode if the UART can accept characters
  ↳ immediately in the write routine then we wouldn't need
  ↳ to turn on any interrupts at all. The write routine would need to
  ↳ somehow tell termios how many characters it sent; presumably this
  ↳ would occur by calling rtems_termios_dequeue_characters in the driver
  ↳ 's write function. I see in the code that this tries to work, rtems_
  ↳ termios_dequeue_characters posts the semaphore of termios tx and
  ↳ increases the characters sent count of termios. However after the
  ↳ write routine returns it goes badly.

4

5 If the transmitter runs in termios TASK mode and the driver's write
  ↳ routine does not immediately enable an interrupt, then it returns to
  ↳ the code below in rtems_termios_puts and it sets the transmitter to
  ↳ rob_busy. After that the termios tx daemon proceeds to step through
  ↳ all of the characters remaining (I think that I see this in the
  ↳ debugger) and discards them because the transmitter stays in rob_busy
  ↳ state.

6

7 It's also probably odd that termios calls the write function with
  ↳ interrupts disabled when it is in task driven mode; we could loop
  ↳ outputting a large frame of characters in the write routine at task
  ↳ level with interrupts globally disabled.

8

9 if (tty->rawOutBufState == rob_idle) {
10 /* check, whether XOFF has been received */
11 if (!(tty->flow_ctrl & FL_ORCVXOF)) {
12 (*tty->device.write)(tty->minor,
13 (char *)&tty->rawOutBuf.theBuf[tty->rawOutBuf.Tail],1);
14 }
15 else {
16 /* remember that output has been stopped due to flow ctrl*/
17 tty->flow_ctrl |= FL_OSTOP;
18 }
19 tty->rawOutBufState = rob_busy;
20 }

<[sebastian.huber@embedded-brains.de](mailto:sebastian.huber@embedded-brains.de)> wrote: [...]

I have another question regarding the EDF scheduler. Does this work in case `_Watchdog_Ticks_since_boot` overflows?

No. For this, I think we need to use “deadline folding” which is just modulo arithmetic.

```
void _Scheduler_EDF_Release_job( Thread_Control
the_thread, uint32_t deadline ) { Priority_Control
new_priority; if (deadline) { / Initializing or shifting
deadline. / new_priority = ( _Watchdog_Ticks_since_boot +
deadline) & ~SCHEDULER_EDF_PRIO_MSB; } else { / Switch
back to background priority. */ new_priority = the_thread-
>Start.initial_priority; } the_thread->real_priority =
new_priority; _Thread_Change_priority(the_thread,
new_priority, true); }
```

`_Watchdog_Ticks_since_boot` is `uint32_t` and overflows after 49 days with a one millisecond clock tick.

- **Resolution** ~"wontfix" deleted
- **Status** changed from *closed* to *reopened*

Actually the Bugzilla to trac conversion seems to have a lot of errors.

This was not a hardware problem. This is still an open issue.

Without much consideration I would fix it like this:

1. Make the tick since boot uint64\_t.
2. Make the Thread\_Control::current\_priority and Thread\_Control::real\_priority int64\_t (to support easy comparison operations for RB tree insert and search).
3. Remove the Scheduler\_Operations::priority\_compare operation.

With a system tick of 1ns the system can run 146years before something overflows.

Replace Version=HEAD with Version=4.11 for the tickets with Milestone >= 4.11

**Author:** Joel Sherrill 2014-11-24T19:35:19.000Z

Original author: sebastian.huber

The EDF scheduler should NOT use priority to store the deadline. That is one issue and it shows itself by bogus values being returned when you obtain the current priority. So #2 is **NOT** acceptable to me. The EDF scheduler should use its own internal stored value to sort the threads.

Why can't the scheduler use uptime and not ticks since boot?

The EDF scheduler is broken in assuming it can rewrite a thread priority with a deadline.

---

**Author:** Gedare Bloom 2014-11-24T19:44:23.000Z

---

Original author: sebastian.huber

Why not rewrite thread (current) priority?

Priority should be an opaque notion of a scheduler in general, which should export information needed for synchronization modules (locks) to implement PI/PC protocols. The priority of a thread being scheduled according to EDF increases (toward 0) as its deadline draws closer.

That said, I'm not opposed to putting the absolute deadline into the scheduler-specific portion of the TCB. I just don't understand the strong negative reaction to letting the scheduler determine what priority means.

I mean 7 weeks.

CentOS 6.4 has this has clock\_t as \_\_clock\_t which appears to be a long int. So no better.

Out of curiosity, why shouldn't we just remove these includes now? There is no way to warn a user at compile time that they will be impacted. All we are doing is delaying the inevitable random number of users who are impacted. Hopefully that number is higher in the future than now.

My proposal is:

- make a announcement to users@ and devel@ that these includes were removed and any

code that unintentionally depended on them will have compile errors or warnings. This will serve as a hit in Google.

- Remove it and see what tests break. Make sure the commits for those issues include

enough information in the log so Google will see those as related.

Break and move forward.

All of these are moving in 5.0 anyway why bother moving it now when it works? I don't disagree with your reasoning but closing milestone:4.11 would be nice!

---

**Author:** Trac Migrate 2014-11-27T15:02:35.000Z

Original author: sebastian.huber

At the time I created the `*impl.h` header files, a lot of stuff broke due to the now missing indirect include. I guess this is also true for application code. Especially `<string.h>`. Maybe this include is a feature not a bug.

---

**Author:** Joel Sherrill 2014-11-27T15:32:18.000Z

Original author: sebastian.huber

In older RTEMS versions `<rtems.h>` provided `<limits.h>` indirectly. The include of `<limits.h>` was added to not break application source files that relied on this accidentally.

We may remove this include in the future.

The check in (cpukit/ChangeLog) states:

2010-06-07 Sebastian Huber <[sebastian.huber@embedded-brains.de](mailto:sebastian.huber@embedded-brains.de)>

- score/src/heapextend.c: Implemented support for scattered heap areas.

The heap cannot support scattered blocks because the `_Heap_Is_block_in_heap` assumes the region is continuous between the first and last blocks of the heap. Making the gaps in the regions passed to the heap extend call used is questionable and makes the `_Heap_Is_block_in_heap` test not really perform the task it's name states. This is an issue because it is this check that determines if a heap free of NULL should proceed. This issue is covered in another PR.

I also wonder about a heap free call to an address that maps to one of the “in-use” gap regions. The previous heap code knew if an address was in the heap and therefore it was kind of safe to probe for a valid block. This assumption is now not valid.

The former heap extend code:

<http://www.rtems.org/viewvc/rtems/cpukit/score/src/heapextend.c?revision=1.7&view=markup>

clearly states the type of memory that can be added to an existing heap. The current code has no restrictions. The user manual is not great in this area. It would also be useful if comments are added to the heap extend code.

The heap extend code is used by the `rtems_region_extend` call and this call clearly states in the manual that the memory region must be continuous. If this has changed we should discuss the API change and make better note of it. I also suspect the testsuite will need additions to test any API changes.

**Author:** Trac Migrate 2011-03-01T07:46:28.000Z

The support for scattered heap area does no harm for users of the continuous case. Only if you use the flexibility of a scattered heap area you have to live with a less effective `_Heap_Is_block_in_heap()` check.

Original author: daniel

I have been trying to use scandir() however the newlib one does not work due to MAXNAMELEN and NAMELEN differ. scandir in libcsupport seems to have a fix for this, however my libcsupport\_a-scandir.o is empty, I’m guessing because HAVE\_SCANDIR is defined.

It is used in scandir() (newlib-1.17.0/newlib/libc/posix/scandir.c:117) by the macro DIRSIZ. Where DIRSIZ uses the MAXNAMELEN define which is set incorrectly. It does not match the

sizeof(struct dirent) which makes the DIRSIZ return a negative number, then malloc(DIRSIZ(d)) will try to allocate 4GB which fail.

My guess is that MAXNAMELEN should be defined in newlib-1.17.0/newlib/libc/sys/rtems/sys/dirent.h or newlib-1.17.0/newlib/libc/sys/rtems/include/limits.h or in a new file.

I tried to run the code below on my FAT filesystem, taken directly from the scandir(3) man page.

```
/* print files in current directory in reverse order */
```

```
include <dirent.h>
```

```
main(){ struct dirent **namelist; int n;
```

```
n = scandir(".", &namelist, 0, NULL); if (n < 0) perror("scandir"); else { while(n--) {
printf("%sn", namelist[n]->d_name); free(namelist[n]); } free(namelist); } }
```

- Milestone set to %"4.11"

I just looked in the latest Newlib sources. The MAXNAMELEN vs. NAME\_MAX problem still exists:

```
./newlib/libc/sys/rtems/sys/syslimits.h:#define NAME_MAX 255 /* max bytes in a
file name */ ./newlib/libc/sys/rtems/sys/dirent.h: char d_name[NAME_MAX + 1];
```

```
./newlib/libc/include/dirent.h:#if !defined(MAXNAMELEN) && !de-
fined(_POSIX_SOURCE) ./newlib/libc/include/dirent.h:#define MAXNAMELEN
1024
```

```
0x0202acd0 in scandir (dirname=<optimized out>, namelist=0x203feb0,
select=0x200149c <select1>, dcomp=0x0) at /home/sh/archive/gcc-
4.6.3/newlib/libc/posix/scandir.c:117 117 p = (struct dirent *)malloc(DIRSIZ(d));
Value returned is $1 = 1 (gdb) s malloc (size=4294966555) at /home/sh/git-
rtems/c/src/../../cpukit/libcsupport/src/malloc.c:33 33 MSBUMP(malloc_calls,
1);
```

The psxtests/psxreaddir is quite sloppy since the scandir() return status is only printed:

```
scandir status: -1
```

Further examination in newlib shows that this bug should no longer manifest itself. However, we might want to consider adding the tests and even upstreaming the patch for making the two defines match to avoid any future problems. I don't have a fix for 4.10.

Original author: strauman

multi-threaded newlib protects a number of internal data structures (as of newlib-1.15 these comprise: \* global list of FILE objects \* stdio FILE object initializer \* individual FILEs [since FILEs with the exception of stdin/stdout/stderr are per-process entities] \* global hash table used by telldir/seekdir \* individual DIR structures (opendir/readdir) \* atexit list \* list of environment variables \* global timezone variable ) using mutexes. It expects the OS to implement these locks but defaults to not using locking if the OS does not provide an implementation. Currently, RTEMS does *not* provide its own implementation of 'sys/lock.h' and therefore vital data structures in newlib are currently *unprotected* (with the exception of environment variables

– ‘envlock.c’ had been added to RTEMS a while ago but since then, newlib has introduced more locks and a general OS interface which - once implemented - will obsolete ‘envlock.c’).

Note that while semantics of having no protection for individual FILE objects may be tolerable, having no protection for global newlib data structures such as lists of FILEs is not acceptable.

I am currently working on an implementation which should be available shortly.

*NEWLIB* - patch adding stubs to crt0.c required for RTEMS autoconf tests

---

**Author:** Trac Migrate 2009-03-07T00:18:24.000Z

---

Original author: strauman

This patch (to *newlib*) is required (in addition to the previously posted newlib patch) to help RTEMS autoconf tests. These tests try to link specific functions from newlib

in order to determine if newlib provides them. Some functions require the newlib locks, however, and linkage would fail unless stubs for the locking routines are present in crt0. Such stubs are what this patch provides.
