This port appears to be unused. No one has been testing it or reporting issues/success with it.

On top of that, this is a port which is still under the old GPL v2 w/exception license and we have been unable to locate the authors to obtain permission to relicense it.

Deprecate for RTEMS 6.x Remove in RTEMS 7.x

Merges	0

Summary

poll.h should only come from one place.

```
$ find tools rtems/cpukit/include/ -name poll*.h
tools/6/sparc-rtems6/include/sys/poll.h
tools/6/sparc-rtems6/include/poll.h
rtems/cpukit/include/poll.h
rtems/cpukit/include/sys/poll.h
```

Steps to reproduce

Author: Sebastian Huber 2024-09-11T03:44:03.213Z

I would remove poll.h from RTEMS.

Author: Chris Johns 2024-09-11T04:16:36.538Z

There is no networking in rtems.git any more. Maybe it is left over?

I see no reason or use case for it being in ether place. Why is it part of newlib?

Author: Chris Johns 2024-09-11T04:24:05.762Z

Is this due to poll?

Author: Sebastian Huber 2024-09-11T04:29:09.423Z

Most of the network header files belong to POSIX and having them in Newlib enables for example the Ada and C++ support in GCC to use them.

Author: Chris Johns 2024-09-11T04:48:17.821Z

If there is standards and newlib is happy then that works.

I did not know C++ had networking support and I cannot find anything here ... https://en.cppreference.com/w/cpp ? I know nothing about Ada.

Author: Sebastian Huber 2024-09-11T04:48:17.782Z

GCC supports more than the current standard revisions and has also stuff for future revisions in the pipeline.

Author: Joel Sherrill 2024-09-11T13:57:45.043Z

poll.h is from POSIX and was already there by the mid-90s (Issue 4, Version 2).

There is a proposal which has been around a while for C++ networking "extensions". This is supposed to be on track for C++23 or the next version per some discussion I found.

https://en.cppreference.com/w/cpp/experimental/networking

Ultimately, including as many POSIX headers as possible in newlib lets us build runtimes and support packages without building the BSP first. We used to have to do that for some GNU languages.

It also has a maintenance benefit as, in some cases, we end up sharing the header with Cygwin.

I will post an MR to remove poll.h from RTEMS before the end of the week.

Author: Joel Sherrill 2024-09-11T16:44:17.858Z

mentioned in merge request !212

Author: Joel Sherrill 2024-09-12T17:08:47.944Z

https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/212 included the fix.

3.9.1.249 5123 - ZynqMP Cortex-R5 RPU BSP broken

Id	5123
State	closed
Type	ISSUE
Author	Kinsey Moore
Closed by	Kinsey Moore

Merges	1

Summary

Coverity CID 1512532

Coverity notes that the rtems_aio_enqueue() call is using a field in the allocated _req_. Tracing the rtems_aio_enqueue() down through the layers, it eventually needs _req->next_prio.next_ to be NULL. The safest thing to do is likely to change malloc() to calloc().

```
87
6. alloc_fn: Calling malloc which returns uninitialized memory. [Note: The source code implementation of the function has been overridden by a builtin model.]
7. assign: Assigning: req = malloc(28U), which points to uninitialized data.
88  req = malloc( sizeof( rtems_aio_request ) );
8. Condition req == NULL, taking false branch.
89  if ( req == NULL )
90    rtems_set_errno_and_return_minus_one( EAGAIN );
91
92  /*
93   * If O_SYNC != O_DSYNC, then this code needs to check for each individually.
94   */
95  req->aiocbp = aiocbp;
96  req->op_type = AIO_OP_SYNC;
97

CID 1512532: (#1 of 1): Uninitialized pointer read (UNINIT)
9. uninit_use_in_call: Using uninitialized value req->next_prio.next when calling rtems_aio_enqueue.[show details]
98  return rtems_aio_enqueue( req );
```

mentioned in merge request !172

Author: Joel Sherrill 2024-08-28T13:23:16.688Z

Confirming that Coverity reported that this is resolved.

3.9.1.251 5114 - Is xilinx-zynqmp console.c specific to the aarch64/xilinx_zynqmp_lp64_cfc400x BSP?

Merges	0

The file `bsps/aarch64/xilinx-zynqmp/console/console.c` name would indicate it is the console driver for the ZynqMP BSP. Examination of the code shows it supports a the NS16550 UART which is not present in the hard IP of any Xilinx Ultrascale devices.

1. Why this name? Should the console driver file be named in a BSP specific way?
2. Why are we supporting PL (FPGA logic) drivers and configurations in our BSP drivers?

It can be convenient to have this support in RTEMS and if a board is publicly available there is a case however Xilinx ecosystem integration is complex and we need to be careful around PL resident functionality.

Author: Chris Johns 2024-08-09T01:05:05.405Z

assigned to @opticron

Author: Chris Johns 2024-08-09T01:07:31.951Z

changed the description

Author: Kinsey Moore 2024-08-12T01:57:05.895Z

To be clear, console.c supports both the hard UARTs as well as the soft 16550 management UART for the CFC-400X. The 16550 code is only used if it is present in the DTB.

Author: Chris Johns 2024-08-12T01:57:05.895Z

Which BSPs use it it?

If it is bespoke to the space board BSP and IP that has to be loaded into its PL why not reflect this in the name?

I initially assumed the ZynqMP `a53` had the wrong driver.

If the driver is for your specific BSP do we need the complexity of a DTB switch?

Is this board COTS?

Author: Joel Sherrill 2024-08-12T01:57:05.895Z

Kinsey can answer more to this but the board is COTS.

https://www.satcatalog.com/component/cfc-400/

The watchdog has to be touched or you can not run the tests.

Author: Kinsey Moore 2024-08-12T01:57:05.895Z

It's just the CFC-400X that uses it. When I was building this up it didn't initially have DTB hooks, but that was suggested (by @chris, I think) to prevent a hard dependency on that interface being in place. That conversation would have been in November 2022 with the title "zynqmp: Add support for the CFC-400X".

Author: Chris Johns 2024-08-12T01:57:05.895Z

Thanks for the link to the board and for the clarification. What has confused me are:

1. https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/spec/build/bsps/aarch64/xilinx-zynqmp/obj.yml?ref_type=heads#L22
2. https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/spec/build/bsps/aarch64/a53/obj.yml?ref_type=heads#L19

and this:

https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/spec/build/bsps/aarch64/xilinx-zynqmp/bspa53lp64.yml?ref_type=heads

We now have:

1. `aarch64/xilinx_zynqmp_lp64_a53`
2. `aarch64/xilinx_zynqmp_lp64_zu3eg`

that appear similar but use different console drivers?

Author: Chris Johns 2024-08-12T01:57:05.895Z

My close review shows the approach for the `xilinx_zynqmp_lp64_cfc400x` is inline with `xilinx_zynqmp_lp64_zu3eg` that existed. It is `xilinx_zynqmp_lp64_a53` that appears to be different.

Author: Kinsey Moore 2024-08-12T02:00:43.966Z

Ah, there's still some confusion here. There is a generic A53 BSP for AArch64 (the second thing you linked) that is intended to be used with QEMU, then there is the new ZynqMP A53 BSP (the last thing you linked) which is a clone of the ZU3EG BSP but is intended to be ZynqMP variant agnostic.

The generic A53 QEMU BSP uses GICv3 and the pl011 driver which is standard for generic QEMU targets.

Author: Chris Johns 2024-08-09T22:52:55.965Z

Looking close the driver name is fine and it used by almost all ZynqMP BSPs.

3.9.1.252 5111 - kern_ntptime.c: Assigning time_t to 32-bit variable truncates time

Id	5111

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5111
Merges	1

Summary

Coverity CID 1512505

Line 983 assigns the tv_sec (time_t) value to pps_lastsec (long). long is 32-bits on RTEMS 32-bit targets and time_t is always 64-bits. The solution should be to use time_t for pps_lastsec.

```
981         pps_calcnt++;
982         v_nsec = -pps_fcount;

CID 1512505: (#2 of 2): Use of 32-bit time_t (Y2K38_SAFETY)
1. store_truncates_time_t: A time_t value is stored in an integer with too few␣
↪bits to accommodate it. The expression pps_tf[0].tv_sec is cast to long.
983         pps_lastsec = pps_tf[0].tv_sec;
```

Summary

Coverity CID 1616018

This one is not immediately obvious. The problem stems from O_SYNC and O_DSYNC having the same value. The solution is to:

1. add preprocessor checks that they are the same,
2. add comments that if the cpp test ever fails, the code needs updating
3. consolidate references to the first test so there is only once place to update in the future.

```
59
cond_const: Condition op != 8192, taking false branch. Now the value of op is␣
↪equal to 8192.
60  if ( op != O_SYNC && op != O_DSYNC )
61    rtems_set_errno_and_return_minus_one( EINVAL );
62
63  if ( rtems_aio_check_sigevent( &aiocbp->aio_sigevent ) == 0 )
64    rtems_set_errno_and_return_minus_one( EINVAL );
65
66  mode = fcntl( aiocbp->aio_fildes, F_GETFL );
67  if (
68    !(
69      ((mode & O_ACCMODE) == O_WRONLY) ||
70      ((mode & O_ACCMODE) == O_RDWR)
71    )
72  )
73    rtems_set_errno_and_return_minus_one( EBADF );
74
75  req = malloc( sizeof( rtems_aio_request ) );
76  if ( req == NULL )
77    rtems_set_errno_and_return_minus_one( EAGAIN );
78
79  req->aiocbp = aiocbp;
const: At condition op == 8192, the value of op must be equal to 8192.
dead_error_condition: The condition op == 8192 must be true.
80  if ( op == O_SYNC ) {
81    req->op_type = AIO_OP_SYNC;
82  } else {

By re-applying Hesham's earlier patch (above), dl06 builds again. The program fails however on griscv bsp:

```
*** BEGIN OF TEST libdl (RTL) 6 ***
*** TEST VERSION: 6.0.0.aedd92d1477df0025821b77c06b2f2b2dc7aaf67
```

(continues on next page)

(continued from previous page)

```

In [changeset:"764ea5787926ee50d2c1df8db2eede5d31e427eb/rtems" 764ea578/rtems]:

```
htif_console_handler is defined in htif.c

closes #4069.
```

Author: Trac Migrate 2020-09-07T14:00:52.000Z

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

The HTIF fix doesn't fix this error. The new run-time error (after Jiri applied my patch) is probably because of:

1) Some relocations not being supported in libdl/RISC-V implementation (e.g., RELAX)
2) I haven't tested/supported RAP format when I ported libdl for RISC-V.

Author: Chris Johns 2020-09-08T07:26:07.000Z

If Jiri's patch builds `dl06` then it can be pushed. The patch looks reasonable.

Author: Trac Migrate 2020-09-08T07:32:41.000Z

The patch fixes the build of dl06, but several of the dlxx test then will fail during execution. If we push this patch, the the dl test must be marked as expected-fail for RISC-V. I would think that disabling building of dl tests is cleaner, see new suggested patch.

Author: Trac Migrate 2020-09-08T07:33:22.000Z

- **Attachment** disable-dl-for-riscv.patch added

Disable building dl tests for RISC-V

Author: Chris Johns 2020-09-09T02:11:01.000Z

Replying to Jiri Gaisler:

> The patch fixes the build of dl06, but several of the dlxx test then will fail during execution. If we push this patch, the the dl test must be marked as expected-fail for RISC-V.
>
> Tagging the tests with `expected-fail` is my preferred approach.
>
> > I would think that disabling building of dl tests is cleaner, see new suggested patch.
> >
> > I do not support doing this. Disabling or excluding tests because they fail hides the failures and does not encourage fixes. Why should RISCV be treated as special? I feel disabling tests sends the wrong message.
> >
> > I assume they passed once so regressions like this happen. I suspect if you wind back the tool sets to a previous version the tests might past. Should tools upgrades be linked to regressions? I do not think that would be helpful.

Author: Chris Johns 2020-09-09T04:06:29.000Z

I built the tests and `dl01` to `dl04` pass and `dl05` to `dl09` fail. I tried to have a look at `dl05` however gdb reported:

```
(gdb) target remote :1234
Remote debugging using :1234
Truncated register 52 in remote 'g' packet
```

then disconnected me from `sis`.

Author: Trac Migrate 2024-08-02T01:37:07.226Z

Replying to Chris Johns:

I built the tests and `dl01` to `dl04` pass and `dl05` to `dl09` fail. I tried to have a look at `dl05` however gdb reported:

```
(gdb) target remote :1234
Remote debugging using :1234
Truncated register 52 in remote 'g' packet
```

then disconnected me from `sis`.

Make sure you use the extended-remote target, and riscv-rtems5-sis:

```
$ riscv-rtems5-sis -gdb . .

$ riscv-rtems6-gdb ./riscv-rtems6/c/griscv/testsuites/
↪psxtests/psxfenv01.exe

$ (gdb) tar extended-remote localhost:1234

```

then disconnected me from `sis`.

Make sure you use the extended-remote target, and riscv-rtems5-sis:

```
$ riscv-rtems5-sis -gdb .
```

I built it using the `devel/sis` RSB package and I only got an `sis` executable installed.

```
$ ../source-builder/sb-set-builder --list-bsets | grep sis␣
↪devel/sis.bset $ ls /opt/work/rtems/6/bin/ | grep sis sis␣
↪sparc-rtems6-sis
```

I checked the build log and there is no `riscv-rtems[56]-sis` installed. I see a `sparc-rtems-sis` installed. Where do the those come from?

I will push a change to the RSB to build 2.22.

```
$ riscv-rtems6-gdb ./riscv-rtems6/c/griscv/
↪testsuites/psxtests/psxfenv01.exe
$ (gdb) tar extended-remote localhost:1234
```

I added `-riscv` to the `sis` command line and it works. It must have been defaulting to the `sparc` simulation.

Note, the `-riscv` option is spelt wrong in the usage help.

Author: Chris Johns 2020-09-10T04:17:07.000Z

I have looked into the crash in `dl05` and it is a misaligned access because the rela record has an offset of `7`. You can see this here:

```
$ riscv-rtems6-readelf -r riscv-rtems6/c/griscv/testsuites/libtests/
↪dl05-o5.o
[snip]

Relocation section '.rela.gcc_except_table.exception_dl' at offset␣
↪0x8b98 contains 58 entries:
Offset     Info    Type            Sym.Value  Sym. Name + Addend
00000007  00006423 R_RISCV_ADD32     0000002c   .LEHB0 + 0

[snip]
```

This is a relocation record for exception table.

I have added reloc tracing to the RISCV backend the reloc that crashes is:

```
rtl: reloc base_rel(/dl05-o5.o): ADD32: where=0x4006cc67,␣
↪*where=0xdedeeded, addend=0x0, base 0x4006cc60
```

The `*where=0xdedeeded` can be ignored, the value is invalid because the address was detected as odd.

I do not know the RISCV so does the write needs to be smarter or is the problem else where.

I am wondering if a number of other crashes are the same or a similar issue.

Author: Chris Johns 2020-09-10T05:07:34.000Z

- **Attachment** 0001-libdl-riscv-Support-misaligned-read-and-write-access.patch added

libdl/risc: Support misaligned acesses for updates to the loaded code

Author: Chris Johns 2020-09-10T05:08:43.000Z

The patch lets things get further along however there are other issues with the libdl tests 5 thru 9. I have no more time available to look into this.

Author: Trac Migrate 2020-09-11T07:08:33.000Z

The riscv-rtl-empty-symbols.diff patch gives me the following failures:

Failures: dl01.exe dl02.exe dl05.exe dl08.exe User Input: dl10.exe monitor.exe termios.exe top.exe

dl01, dl02 and dl08 now times-out rather than fails....

Author: Chris Johns 2020-09-11T07:36:26.000Z

Yeah, something is wrong with the patch. I was seeing an unresolved symbol with a symbol name of `""` being added and as you can imagine it is never resolved.

Author: Chris Johns 2020-09-11T08:07:21.000Z

I am starting to suspect the issue is the `R_RISCV_RELAX` reloc records and the call sites. The simplest approach is to ignore those relocs and just use 32bit destinations or implement the 21bit relative offset if the target is in range.

The RISCV relax approach is nicer to libdl than the ARM or PowerPC trampoline support.

Author: Chris Johns 2020-09-11T08:24:12.000Z

- **Attachment** v2-0001-libdl-riscv-Fix-RISCV-issues-with-libdl-tests.patch added

Tests dl01-dl04,dl06-dl09 pass with this patch on the SIS. Hesham, please test, review and push if you think it is OK.

Author: Chris Johns 2020-09-11T08:26:15.000Z

`dl05` has an issue in the unwind tables somewhere. An object's tables are added to the base tables so you can throw in a module and catch it elsewhere. `dl06` is a RAP thing which requires some work to sort out.

Author: Trac Migrate 2020-09-15T07:17:20.000Z

Thanks, Chris for your fixes! I applied the last patch and tried to test rv64imafdc_medany on QEMU, but dl01 fails in run-time triggering an exception while loading the object. I'll debug that issue.

Author: Chris Johns 2022-11-29T23:03:11.000Z

Summary

We have always had inconsistent directory and file naming. There is no consistency it would be nice if files sorted correctly and we had a policy going forward that all files must be lower case. With the exception of the file extension `.S` which does have some meaning and text files which again denotes that it's text, typically.

I'm proposing this in the spirit of wanting the source code reformatted for %6.1 we should take this opportunity to change the file names as well as cleaning up our in-source documentation with the MarkDown conversion. I consider this a purely documentation change.

We have no especial files in the source that are absolutely required to be upper case or Camel-Case that I can see. Below are a list of directories and files:

Directories

```

Author: Amar Takhar 2024-07-30T04:32:21.436Z

This change isn't going to happen anytime soon if at all because the includes also rely on the file case. It's not worth making a sweeping change like this with too much uncertainty.

At the very least I hope we can get a policy that does not introduce files that does not introduce more files or at least has a justification such as they come from upstream.

3.9.1.259 5076 - objectgetinfo.c: Potential access past end of array

Id	5076

Merges	1

Summary

If presented with a specific badly formed that includes an API class field of 4-7, this method will currently access beyond the end of the _Objects_Information_table array. This was spotted by Coverity – CID 1592935

```
44Objects_Information *_Objects_Get_information_id(
45  Objects_Id  id
46)
47{

CID 1592935: (#1 of 1): Out-of-bounds access (OVERRUN)
1. overrun-call: Overrunning callee's array of size 4 by passing argument _
↪Objects_Get_API(id) (which evaluates to 7) in call to _Objects_Get_information.
↪[show details]
48  return _Objects_Get_information(
49    _Objects_Get_API( id ),
50    _Objects_Get_class( id )
51  );
```

The fix is to ensure that the api field is validated in _Objects_Get_information().

Cloned from #4676:

The inactive_per_block for block 1 is not handled correctly. For the first object in the second block, the inactive_per_block value is not decremented. As a consequence, the block might be deleted when the second to last object from block 1 is deleted. This is only valid when the application is configured with `CONFIGURE_UNLIMITED_OBJECTS`.

The reason is the following:

in function `_Objects_Activate_unlimited` from “objectimpl.h”

```
block = _Objects_Get_index( the_object->id ) - OBJECTS_INDEX_MINIMUM;
if ( block > objects_per_block ) {
block /= objects_per_block;
information->inactive_per_block[ block ]--;
information->inactive--;
}
```

in a block with 8 objects per block, when creating the 9th object, _Objects_Get_index(the_object->id) returns 9. Therefore, “block” will be 8 (9 - 1). The next “if” will not be taken (8 > 8 ? No) and the inactive_per_block will not be decremented to 7 and remains at 8. This means that block 1 is a candidate for “_Objects_Shrink_information” function although object id 9 is still valid.

Steps to reproduce: -assuming 8 objects per allocation block -using semaphores as objects

1. create 17 `RTEMS_SIMPLE_BINARY_SEMAPHORE` semaphore objects id’s 1 -> 17.
2. delete semaphores 11, 12, 13, 14, 15, 16, 17 (order is important)
3. lock semaphore 9
4. delete semaphore 10 -> at this point, block 1 is freed although semaphore 9 is still active
5. unlock semaphore 9 -> this can lead to errors. In my case due to the free the semaphore object was altered and changed from a `SEMAPHORE_VARIANT_SIMPLE_BINARY`

to `SEMAPHORE_VARIANT_MUTEX_INHERIT_PRIORITY` resulting in a return value of `RTEMS_NOT_OWNER_OF_RESOURCE`.

Simple fix: the condition for the `if` should be >= instead of >.

Return the task and idle execution time via `getrusage()` call. User can use these times to determine the percentage load of the system and if they record the delta they current load.

Return the total amount of time executed by tasks (not `IDLE`) in the `utime` field and IDLE time in `stime` of `struct ruse`.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5049
Merges	1

Summary

Newlib has an old and out dated copy of `sys/tree.h` which RTEMS uses in the `score` via `rbtree.h`. Move the file from newlib to RTEMS and change the name to `bsd-tree.h`. Update the include guards.

Newlib does not use or depend on `sys/tree.h` and having it in newlib offers no advantage however it being there complicates it's use because newlib, RTEMS and LibBSD all depend on it and different versions:

1. RTEMS's internal data structures depends on a critical file external to RTEMS. RTEMS should contain important kernel structures and not be effect by outside files.
2. LibBSD is confused by this file and assuming LibBSD and newlib share a common version creates compatibility issues. The `6-freebsd-12` and `main` branches support the version in newlib however any current version of LibBSD does not and updating newlib's copy would break `6-freebsd-12`.

>
> The <sys/tree.h> in Newlib is not out-dated. I continuously synchronized it with FreeBSD. The last update was in 2021. FreeBSD decided to change the implementation from red-black trees to rank-based trees based on a XFS use case. I made a performance evaluation and kept the red-black tree implementation (see Newlib mailing list archive).

I would remove the <sys/tree.h> from libbsd and update the Newlib version if necessary. The red-black tree support provides a critical data structure and there should be only one version of it.

Author: Chris Johns 2024-06-21T05:43:19.485Z

Where is this data structure critical?

Author: Sebastian Huber 2024-06-21T05:43:19.485Z

It is used for the RTEMS thread queues and the watchdogs for example. A red-black tree implementation is not completely trivial and there is always an opportunity for performance tweaks. This is why it is good to use an implementation which is exposed to a large user group.

Author: Chris Johns 2024-06-21T05:43:19.485Z

Thanks, this confirms to me the change is a good idea. We should have data structures we deem critical held in the `score` sources and not dependent on an outside project where anyone could submit a change that effects us.

Author: Sebastian Huber 2024-06-21T05:43:19.485Z

I have the contrary point of view that things important for us should be shared with as many projects as possible.

Author: Chris Johns 2024-06-21T05:43:19.485Z

The change brings the code into RTEMS and insulates from any external changes. I asked on dsscord what the use case for it in newlib and you said none so this seems to be a style or preference thing. I see the newlib path as a liability on the project.

Being useful, and it is, is not a strong case for being in newlib. Newlib is about standards and `libc` and not a hold pen for useful code. Why do you need it there as RTEMS will install it?

Author: Sebastian Huber 2024-06-21T05:43:19.485Z

This is not the strategy I used in the past. I am in favour of sharing code with other projects as much as possible.

Author: Chris Johns 2024-06-21T05:43:19.485Z

We should avoid being a clearing house for fragments of code from other projects not directly used. User should be encouraged to use the upstream project and manage

fixes, updates and versioning. We should also not clutter other projects such newlib with things not related to that project's core purpose. Code brought into newlib to fulfill it purpose is acceptable however `tree.h` is not referenced.

Author: Sebastian Huber 2024-06-21T05:43:19.485Z

You neglect a bit how all this evolved. Newlib already had a <sys/queue.h> so adding a <sys/tree.h> was straight forward. During this period I worked a lot on making Newlib and FreeBSD compatible enough so that we are able to use the network stack from FreeBSD. I maintain the <sys/tree.h> file in Newlib since 2015 and will continue to do so. This resulted also in contributions to FreeBSD.

Author: Chris Johns 2024-06-21T05:43:19.485Z

I have not neglected how it evolved. Newlib has FreeBSD code in it and rightly so but that does then imply any FreeBSD can be added. There is no compelling reason for this file to be in newlib and I feel it is problematic being there. @joel has posted the remove patch as he said he would on discord so I think his view is clear. I support that patch.

I have found only a few references to `sys/tree.h` in the entire issue database and only one issue from you related to an optimization (#4522). I have only just learnt from you in this issue about a choice you made related to benchmark testing of the XFS version. There is no mention of XFS in the issue database. In reading #4522 the location of the code for coverage analysis is not clear so I can only assume our testsuite. This means we are coverage testing a key data structure and algorithm located in a different project or a key part of our kernel's performance can change with no record in our project. We should have this header in our code base where we can control and this is what !77 does.

I appreciate your offer of continued maintenance and that can continue with the file in our repo. Anyone can post a change to `tree.h` in newlib that breaks our build or more problematically changes its performance. Having to have someone from this project always monitoring and checking newlib and being a gatekeeper of that file is something I find not feasible long term.

Author: Sebastian Huber 2024-06-21T05:43:19.485Z

A performance change can go in two directions. You may also see a performance increase. If you remove this file, you may miss this chance. The rate of change in Newlib is pretty low. If the RTEMS Project is not able to monitor the Newlib changes, then it has a bigger issue. Right now you address an artificial problem.

The more serious issue is, that the RTEMS Project would probably not notice performance changes, because we do not systematically monitor the RTEMS performance at a project level.

Author: Chris Johns 2024-06-21T05:43:19.485Z

@joel has reminded us in his newlib post the score should never depends on libc and this change respects that principle. The principle has exist long before I joined the project. His statement in the post is:

> This actually violated a core development principle for RTEMS and we should have spotted this long ago. Everything in the score and "bottom" of RTEMS should not depend on libc.

Author: Sebastian Huber 2024-06-21T05:43:19.485Z

I am sorry for violating the core development principles of RTEMS, then please go ahead and fix this issue after nine years in service.

Author: Chris Johns 2024-06-21T05:43:19.485Z

Thanks. The header has not been an issue and it is now an issue so we are sorting out.

Milestone	6.1
Labels	cpukit, cpukit::cpuuse
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5060
Merges	0

Summary

Add two calls to CPU usage in `cpukit/libmisc` to return the time in nano-seconds or the time as ticks to the caller.

The EPICS iocStats module has code that directly iterates over the object information. This change provides a simple interface to remove the dependence of the IOC module on the internals of RTEMS. The CPU usage code i `libmisc` has all the pieces in place to make this a simple addition.

Author: Chris Johns 2024-07-04T05:40:04.950Z

assigned to @chris

Author: Sebastian Huber 2024-07-04T06:59:15.940Z

The <rtems/cpuuse.h> header file is generated from specification items. If you want to add new API elements to this header, then please do this in rtems-central, so that the Classic API Guide gets updated as well.

Author: Joel Sherrill 2024-07-04T16:10:27.742Z

Be sure to consider the behavior if the statistics are reset.

But grabbing a single thread's CPU usage should be ok.

If clock_gettime doesn't already support CLOCK_THREAD_CPUTIME_ID, please add it. That use case should match youra.

Author: Sebastian Huber 2024-07-04T18:08:00.590Z

Is this about getting timings for a single thread or all threads of the system?

Author: Sebastian Huber 2024-07-05T00:56:39.741Z

There is also a `times()` system call.

Author: Chris Johns 2024-07-05T00:56:39.692Z

Thanks, I did not know about the `times()` call. It may work nicely and solve the problem for EPICS iocStats.

Author: Chris Johns 2024-07-05T05:47:16.367Z

The man page on FreeBSD says:

> This interface is obsoleted by getrusage(2) and gettimeofday(2).
>
> The issue with `getrusage()` is:

```
/*
*  RTEMS only has a single process so there are no children.
*  The single process has been running since the system
*  was booted and since there is no distinction between system
*  and user time, we will just report the uptime.
*/
```

And EPICS wants the amount of time tasks have used which is this time less `IDLE`. I am now wondering is `IDLE` time should be account for as system time and that would leave user time as the time spent running tasks?

Author: Chris Johns	2024-07-05T06:10:51.083Z

In an SMP system would the `IDLE` time reported as system time be the total of active periods for all the `iDLE` threads? I think it is.

For example if you have 4 CPUs and 2 are running at 100% and 2 are idle the over all load is 50%, ie `user / (user + system)` if user is the total time tasks have run for and system is the total idle time.

Author: Chris Johns	2024-07-08T05:25:51.262Z

marked this issue as related to #5062

Summary

We need to generate release notes from GitLab. The old script relied on trac.

GitLab has internal support for ChangeLog generation:

- https://docs.gitlab.com/ee/user/project/changelogs.html

The `glab` command supports generating ChangeLogs so we may not even need a script:

- https://gitlab.com/gitlab-org/cli/-/issues/1337

It also supports templates here is someone bringing up a caveat:

- https://stackoverflow.com/questions/77355492/glab-changelog-generate-does-not-use-my-template

Author: Amar Takhar 2024-05-17T03:54:50.295Z

assigned to @chris and @amar

Author: Amar Takhar 2024-05-17T04:05:33.579Z

After further investigation the ChangeLog api uses git trailers. So while in the future we should start doing this to automatically generate changelogs it does not help us right now.

- https://docs.gitlab.com/ee/api/repositories.html#migrating-from-a-manually-managed-changelog-file-to-git-trailers
- https://docs.gitlab.com/ee/user/project/changelogs.html

Author: Chris Johns 2024-06-13T01:33:50.583Z

mentioned in merge request rtems-release!1

Author: Amar Takhar 2024-07-08T04:20:14.634Z

We've decided that we won't be supporting the internal `ChangeLog:` trailer tracking method that GitLab uses to generate changelogs internally.

@chris has written a script to do this and for releases we'll be generating and including it as a tarball we can do this as part of CI in the future.

3.9.1.266 5058 - dhrystone: Prevent procedure merging

Merges	1

Summary

From the Dhrystone RATIONAL file:

```
o No procedure merging

Although Dhrystone contains some very short procedures where execution would
benefit from procedure merging (inlining, macro expansion of procedures),
procedure merging is not to be used. The reason is that the percentage of
procedure and function calls is part of the "Dhrystone distribution" of
statements contained in [1]. This restriction does not hold for the string
functions of the C version since ANSI C allows an implementation to use
inline code for these functions.
```

We have to add `-fno-inline` to the CFLAGS.

Merges	1

Summary

An user noticed that for example on the Xilinx Zynq 7000 BSP, the rtems_cache_disable_data() doesn't work.

I had a look at this and managed to disable the L1 and L2 caches, however, afterwards I got not that far. On the Cortex-A cores it seems at least the L1 data cache is required to provide support for atomic operations:

https://stackoverflow.com/questions/76207164/disabled-dcache-will-prevent-atomic-flag-from-being-set

I guess we have this situation on most modern chips with caches since the reservation granule is usually a cache line. How do we want to deal with rtems_cache_disable_data() in this case? From my point of view, this function as no real use case and adding it in the first place was a mistake.

We have a couple of options:

- Make the rtems_cache_disable_data() directive a no-operation. Afterwards the cache is still enabled, and an user may get confused.
- Issue a fatal error if someone calls rtems_cache_disable_data().
- Really disable the cache and let the user figure out that the atomic operations no longer work. Disabling the data cache can be a quite complex thing to do.
- Add a return status code to rtems_cache_disable_data() and let it return RTEMS_UNSATISFIED for example.

After discussions, the solution to optionally issue a fatal error was selected. If rtems_cache_disable_data() issues a fatal error is BSP-specific.

Milestone	6.1
Labels	arch:powerpc, tool::gdb
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5043
Merges	1

Summary

The PowerPC BSP `libcpu` header `powerpc-utilities.h` has functions that force the machine type to be `e500`. GDB sees this machine state and selects the architecture to be `powerpc:e500` and that causes problems when debugging BSPs that are not `e500` based. For example the Beatnik BSP has `-mcpu=7400` and GDB should report `powerpc:7400` however it reports `powerpc:e500`.

The functions are https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/bsps/powerpc/include/libcpu/powerpc-utility.h?ref_type=heads#L887

Steps to reproduce

- Build `powerpc/mvme2700`
- Start GDB with `powerpc-rtems6-gdb build/powerpc/mvme2700/testsuites/samples/hello.exe`
- Enter `show architecture`

GDB reports the incorrect architecture:

```
(gdb) show architecture
The target architecture is set to "auto" (currently "powerpc:e500").
```

Solution

Find a solution. I cannot easily see how to conditionally build for E500 type processors. It would be good if someone with more PowerPC experience could help provide a solution.

Would removing the `.machine e500` statements be OK for all PowerPC BSPs?

Author: Chris Johns 2024-06-15T07:31:42.433Z

Checking the architecture and compiler options using the scripts and GDB init commands:

```
$ ../get-archs

Author: Amar Takhar 2024-06-17T03:37:13.547Z

Just as a note this was added by @sebhub not too long ago:

- https://gitlab.rtems.org/rtems/rtos/rtems/-/commit/9b3b33d91a4615175852aee5d2f44df0a9fd1e87

Author: Chris Johns 2024-06-17T03:37:13.506Z

It looks like GDB is detecting E500 through sections like `.gnu.attribute` and other sections. An example is https://github.com/RTEMS/sourceware-mirror-binutils-gdb/blob/master/gdb/rs6000-tdep.c#L7655.

Author: Sebastian Huber 2024-06-17T05:55:49.764Z

There should be no code for the inline assembly functions if they are not used. I guess that the e500 stuff slips in through the shared exception support.

Author: Chris Johns 2024-06-17T05:55:49.734Z

Yeah I suspect it does and I agree there is a lot of sharing in a common exe of code that should never run. My guess is `ld` collects up the `.gnu.atrribute` sections and so this machine type bubbles to the surface?

Is the `.machine e500` needed for some BSPs? Do you if those calls can be made conditional somehow?

Author: Sebastian Huber 2024-06-17T06:00:13.404Z

The idea of the shared exception support was to have the support for all targets in one binary and use a run-time detection to select the right one. This code existed before I started working with RTEMS.

Author: Chris Johns 2024-06-17T06:02:17.303Z

Yes and I have only recently started to use the older PowerPCs boards. I see no value in touching the code to change this so your help in finding a solution would be welcome. If the `.machine e500` lines can be removed that would work for me but I have no idea why they are there?

Author: Sebastian Huber 2024-06-17T06:10:21.145Z

This was a change for GCC 10, which no longer passes -many to the assembler. You can try to remove it and see if all powerpc BSPs still build.

Author: Chris Johns 2024-06-17T06:12:27.466Z

I have and they do. I used `rtems-bsps` to list the BSPs and created the attached INI file. Is this all that is needed?

powerpc-all.ini

Author: Sebastian Huber 2024-06-17T06:30:12.807Z

As far as I remember at that time this resulted in assembly-time errors. So, if everything builds now without the `.machine` push and pop, it should be all right.

Original author: JSchweikhardt

- **Milestone** set to %”6.1”
- **Owner** set to @chrisj
- **Status** changed from *new* to *assigned*

Author: Kinsey Moore 2024-06-14T15:46:05.784Z

This appears to be resolved. Both the user manual and classic API guide loaded as expected given the instructions in the issue. It did take a little bit to load as it’s a single HTML document that contains the entirety of the document.

Author: Kinsey Moore 2024-06-14T15:46:06.203Z

changed the description

Author: Amar Takhar 2024-06-14T17:12:10.717Z

The other reason it takes a while to load is all the assets/images are inlined so it really is just a single page.

Email from Joel to `devel`:

rtems 6.1rc2 has a lot of tool build failures because I didn't have gmp-devel installed.

```
Checking for gmp.h... no
configure: error: gmp.h header not found
```

This is reported as part of building `gcc-newlib`. Should the RSB account for this by building gmp at the same time?

For now, I installed a host `gmp-devel` and restarted the build sweep.

Author: Chris Johns 2024-02-28T05:24:16.000Z

Joel,

Can you please detail the operating system?

Can you please remove the installed `gmp-devel` package and then check if the GMP is built? Please add `--trace` to the RSB command line.

Thanks Chris

Author: Joel Sherrill 2024-02-28T23:47:38.000Z

The build of gdb now depends on gmp-devel. I don't know if we want to include gmp in the rsb bset or not. But once I loaded that package, it built.

This is on CentOS 7 with the software collection to have gcc 8 and Python 3. CentOS 7 default is a gcc 4.8 and Python 2 which is insufficient. Should we update the CentOS 7 recommendations in the Users Guide?

Author: Chris Johns 2024-03-01T05:14:38.000Z

Replying to Joel Sherrill:

> The build of gdb now depends on gmp-devel.
>
> Yes, it has for a while and we have building gmp for a while as a result.
>
> > I don't know if we want to include gmp in the rsb bset or not. But once I loaded that package, it built.
> >
> > Please remove the package and retest. It is included in the build setsfor the RTEMS tools. Please have a look in the defaults build sets for the 6 release.
> >
> > > This is on CentOS 7 with the software collection to have gcc 8 and Python 3.
> > >
> > > Python 3 is now required because GDB requires it. The RTEMS tools commands are still python 2 compatible however pushing to a more recent GDB means we all need python 3.
> > >

> > > >
> > > > > Should we update the CentOS 7 recommendations in the Users Guide?
> > > > >
> > > > > To say what? The issue is not needing the package but why it was not built when it should be. Can you please debug this?

Author: Chris Johns 2024-06-13T15:36:01.749Z

@joel is this fixed?

Author: Joel Sherrill 2024-06-13T15:36:01.718Z

This is fixed but the hash changed for rtems-tools without the sha512 checksum getting updated. I will have a MR for that shortly.

3.9.1.273 550 - fcntl() fails to put a non-blocking socket into blocking mode

Id	550
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Joel Sherrill
Created	2004-01-16T11:47:00.000Z
Updated	2024-06-13T01:26:19.534Z

Original author: trauscher

A socket cannot be put into blocking mode using `fcntl()` once it has been put into non-blocking mode.

`ioctl()` is working fine, so the problem is not in the IP stack.

The problem occurs in real life with the GoAhead webserver on high-latency connections as its non-blocking write socket remains non-blocking and a web page can be truncated when `websDone()` is called.

In newlib (1.10, 1.11) there are several non-blocking flags. The following is defined in `sys/fcntl.h`

```
#define _FNBIO          0x1000  /* non blocking I/O (sys5 style) */
#define _FNONBLOCK      0x4000  /* non blocking I/O (POSIX style) */
...
#define _FNDELAY        _FNONBLOCK      /* non blocking I/O (4.2 style) */
/*      O_NDELAY        _FNDELAY        set in include/fcntl.h */
/*      O_NDELAY        _FNBIO          set in 5include/fcntl.h */
#define O_NONBLOCK      _FNONBLOCK
```

So `O_NDELAY` is never defined. `sys/fcntl.h` is not patched by the `rtems-newlib` patch.

In RTEMS, `libio.c` and `libio_.h` both contain the following code

```
#if ! defined(O_NDELAY)
# if defined(solaris2)
#  define O_NDELAY O_NONBLOCK
# elif defined(RTEMS_NEWLIB)
#  define O_NDELAY _FNBIO
# endif
#endif
```

As `O_NDELAY` is undefined and `RTEMS_NEWLIB` is defined, `O_NDELAY` is defined to `0x1000`.

Thus, using `O_NONBLOCK` in `fcntl()` (this was suggested in the mailing list some time ago) doesn't seem to work.

Release: RTEMS-4.5

Environment: rtems-4.5.0, newlib-1.10 or newlib-1.11

- socketblock.c

Author: Joel Sherrill 2014-11-23T18:52:45.000Z

Original author: trauscher

I am hacking together a test but I believe this does happen in the current source. It looks like so_ioctl(fd, FIONBIO, [O_NONBLOCK|~O_NONBLOCK]) needs to be called. We have the ioctl_h handler but should we make the call if networking is enabled?

Author: Joel Sherrill 2014-11-23T18:56:06.000Z

Original author: trauscher

NOTE that FIONBIO is not defined in newlib – only in the network stack so that makes for some trouble. I suppose we could modify rtems_syscalls.c to handle F_SETFD.

Author: Joel Sherrill 2015-02-12T17:46:49.000Z

Original author: trauscher

- **Description** changed

```
A socket cannot be put into blocking mode using fcntl()
once it has been put into non-blocking mode.

ioctl() is working fine, so the problem is not in the IP stack.

The problem occurs in real life with the GoAhead webserver on high-
↪latency connections as its non-blocking write socket remains non-
↪blocking and a web page can be truncated when websDone() is called.

In newlib (1.10, 1.11) there are several non-blocking flags.
The following is defined in sys/fcntl.h

#define _FNBIO          0x1000  /* non blocking I/O (sys5 style) */
#define _FNONBLOCK      0x4000  /* non blocking I/O (POSIX style) */
...
#define _FNDELAY        _FNONBLOCK      /* non blocking I/O (4.2 style)␣
↪*/
/*      O_NDELAY        _FNDELAY        set in include/fcntl.h */
/*      O_NDELAY        _FNBIO          set in 5include/fcntl.h */
#define O_NONBLOCK      _FNONBLOCK

So O_NDELAY is never defined. sys/fcntl.h is not patched by
the rtems-newlib patch.

In RTEMS, libio.c and libio_.h both contain the following
code

#if ! defined(O_NDELAY)
# if defined(solaris2)
```

(continues on next page)

(continued from previous page)

```
#  define O_NDELAY O_NONBLOCK
# elif defined(RTEMS_NEWLIB)
#  define O_NDELAY _FNBIO
# endif
#endif

As O_NDELAY is undefined and RTEMS_NEWLIB is defined,
O_NDELAY is defined to 0x1000.

Thus, using O_NONBLOCK in fcntl() (this was suggested
in the mailing list some time ago) doesn't seem to work.

Release:
RTEMS-4.5

Environment:
rtems-4.5.0, newlib-1.10 or newlib-1.11
```

- **Milestone** changed from %”4.9.5” to %”5.0”

This is a known issue with many RTOS’. The FACE (http://www.opengroup.org/face) standard has specifically had to add requirements so this behavior is required of RTOSes conforming to the FACE POSIX Profiles. The ioctl() interface is not in POSIX and fcntl() is the only way to set non-blocking in a pure POSIX environment.

I pushed this milestone to 5.0 because:

- this is a long-standing issue.
- it is technically beyond the POSIX standard itself.
- it will need to be addressed with the current IPV4 stack, the new IPV4/IPV6 stack and LWIP if we are to support that.
- this needs test code.
- this needs a design that can work with multiple network stacks.

Author: Trac Migrate 2017-11-09T06:26:42.000Z

Original author: trauscher

- **Milestone** changed from %”5.0” to %”6.1”

Milestone renamed

Original author: Alex

The interrupt handler for the MicroBlaze BSPs defined in `bsps/microblaze/microblaze_fpga/start/_interrupt_handler.S` saves one register to the stack, R5, before jumping to the architecture `_ISR_Handler`. This is because R5 is used to pass the interrupt source if it is known. To indicate an unknown interrupt source, it uses the following instruction:

```
addi r5, r0, 0xFF
```

The `addi` instruction modifies the carry flag in MSR. This is a problem because MSR has not been saved to the stack yet. It is saved in `_ISR_Handler`.

This went unnoticed because it manifests itself in subtle ways. It requires that an interrupt happen somewhere between an instruction that modifies the carry flag and an instruction that uses the modified carry flag.

To resolve this issue, the entire interrupt frame should be saved as the first step of `_interrupt_handler` rather than in `_ISR_Handler`. It should also be made very clear that saving the stack frame is handled by the BSP rather than the architecture-specific `_ISR_Handler`.

Original author: kgardas

While working on stm32h7 I've noted strange results from fpu calculations when several tasks are involved. I've minimized that to attach testcase. The testcase runs well on Xilinx/A9/Qemu and BeagleBone White platforms (ARMv7-A), but fails by providing wrong output on ARMv7-M (STM32H757i-eval).

The core of the testcase is a comparison of power of two done on integer by shifting and by calling C pow function with using double. When there is discrepancy in comparison of those,

error is signaled and counted. The output then prints number of test run/number of failures and this all for Init and 4 other tasks created. The first error in comparison is also signaled for every task where it happen by clear 'ERROR' message. The output from H7 looks like:

```
initializing...
main task infinite loop.
ERROR, computation failed in fpu_task_pow2
ERROR, computation failed in fpu_task_pow3

INIT: 13000/2000, T1: 507506/0, T2: 518006/518006, T3: 517009/517009, T4: 517961/
↪517961
...
```

as you can see computation is always good (0 error) on T1 task while it is always bad on T2, T3, T4 tasks. Sometimes it is even bad on Init task.

Expected output from BeagleBone looks:

```
initializing...
main task infinite loop.
INIT: 1000/0, T1: 8028/0, T2: 8042/0, T3: 8043/0, T4: 8043/0
INIT: 2000/0, T1: 16053/0, T2: 16084/0, T3: 16084/0, T4: 16085/0
INIT: 3000/0, T1: 24076/0, T2: 24125/0, T3: 24125/0, T4: 24126/0
INIT: 4000/0, T1: 32097/0, T2: 32163/0, T3: 32165/0, T4: 32167/0
INIT: 5000/0, T1: 40120/0, T2: 40204/0, T3: 40207/0, T4: 40208/0
...
```

The idea here is that task context initialization or switch is not working well on v7-M platform.

```

Let me know if there is anything I should test here. I have some spare time at my disposal, but I'd need to be kicked into the right direction. Currently studding Cortex-M lazy stacking and context switching and RTEMS book is ordered as a backup and will be here probably next week. I'll also provide few registers dumps for your information...

Author: Trac Migrate 2023-07-07T14:05:26.000Z

Original author: kgardas

Maybe we don't save a status register related to the FPU.

Author: Joel Sherrill 2023-07-07T14:19:47.000Z

Original author: kgardas

Maybe the FPU context isn't properly initialized for this CPU variant. The first context switch restore is handled special in _Thread_Handler. Easy enough to break there and see what is actually being restored. If it's wrong, then that's the culprit.

Author: Trac Migrate 2023-07-07T14:48:04.000Z

Original author: kgardas

Ad _Thread_Handler breakpoint:

```
(gdb) b _Thread_Handler
Breakpoint 1 at 0x8003748: file ../../../cpukit/include/rtems/score/
↪percpu.h, line 719.
```

(continues on next page)

(continued from previous page)

```
Note: automatically using hardware breakpoints for read-only addresses.
(gdb) c
Continuing.

at ../../../cpukit/include/rtems/score/percpu.h:719
719       return cpu->executing;
```

this looks like some macro executing:

```
static inline struct _Thread_Control *_Per_CPU_Get_executing(
const Per_CPU_Control *cpu
)
{
return cpu->executing;
}
```

Author: Trac Migrate 2023-07-13T12:32:33.000Z

Original author: kgardas

We were able to reproduce the issue. It is a problem in the FPU context save/restore during interrupt processing. Under certain conditions, the FPU context is restored from an uninitialized frame which could enable the flush-to-zero configuration. I

am currently quite busy. I will add it to my TODO list, but it could be September/October.

Author: Trac Migrate 2023-07-13T12:43:11.000Z

Original author: kgardas

Sebastian, thanks a lot for the information. Could you give me as much information as possible with regarding to the issue as there is a high chance I find some time to deal it again before your available timeframe. For example I'm curious is it related to FPU lazy stack saving which is used and enforced by the RTEMS code? Knowing all information about it from you, will certainly help with possible fixing of the issue on our side. Thanks a lot!

Author: Trac Migrate 2023-07-13T13:23:33.000Z

Original author: kgardas

The FPU context corruption happens in _ARMV7M_Pendable_service_call(). Somehow the FPU context is not restored from the right frame position in certain cases. It is not clear, why this error doesn't show up in the spcontext01 test.

Author: Trac Migrate 2023-07-27T18:45:22.000Z

Original author: kgardas

I consider this issue to be release critical as it affects one of major platforms (ARMv7-M) and makes FPU computation unreliable/unpredictable there. Hence switching milestone to 6.1. Please discuss if you do not think so.

Original author: rlong

Currently, DTC is failing to build due to this check in checks.c. For some reason the argument into isxdigit is coming in as a char. I've brought it up to the maintainer, but he sees no reason to change it. Therefore, a patch is needed to get it to build.

1183 if (unitname[0] == '0' && isxdigit(unitname[1])) 1184 FAIL(c, dti, node, "unit name should not have leading 0s"); 1185 }

- 0001-checks.c-Ensure-argument-is-an-integer-v2.patch

I can't find the associated thread on the DTC mailing list. Could you please provide a link?

Author: Joel Sherrill	2023-01-20T15:02:48.000Z

Original author: rlong

See https://github.com/dgibson/dtc/issues/71 and I just posted. If you want to pile on, it would be appreciated. I don't think he sees the underlying issue.

Per https://en.cppreference.com/w/c/string/byte/isxdigit, the argument is an integer. GCC and LLVM warn for using a character as an array index and this is from the GCC manual.

```
-Wchar-subscripts
Warn if an array subscript has type char. This is a common cause of error, as programmers often forget that this type is signed on some machines. This warning is enabled by -Wall.
```

Original author: dppinto

Consider checking for overflow situations and taking necessary actions in the three files designated below.

Memory copy function accesses out-of-bound array element in file cpukitincludertemssco-recoremsgimpl.h (line 469)

Additional Information: The pointer to the structure that contains the buffer and the size is tested against NULL, but this finding refers to the fact that the argument size of is not validated against the maximum size of the destination and/or source buffer.

This function can be traced up to `rtems_message_queue_send` and `rtems_message_queue_receive` functions where the buffer, its size and maximum size for queue messages are provided by the user. In the RTEMS library at the moment of sending a message in the _CORE_message_queue_Submit function it is validated if the given size of the buffer is not above the user previously provided/configured maximum size, and returns an error if so. But it is up to the user to supply correct values. If the user tries to pass a buffer with 16 bytes, but indicates 32 bytes in the size there is no possible library validation that will detect an overflow situation. These cases must be detected by user code inspection/review.

```
Out of bound memory access (access exceeds upper limit of memory block) in file␣
↪cpukit\\include\\rtems\\score\\mrspimpl.h (lines 120, 312, 315)
```

Additional Information: There is a Global variable `const size_t _Scheduler_Count = _CONFIGURE_SCHEDULER_COUNT;` corresponding to the value configured statically depending of `RTEMS_ARRAY_SIZE( _Scheduler_Table )`, which is the number of scheduler. Relevant source code for lines 312 and 315, which are OK:

```
scheduler_count = _Scheduler_Count;
for ( i = 0 ; i < scheduler_count ; ++i ) {
(...)
scheduler_of_index = &_Scheduler_Table[ i ];
```

(continues on next page)

(continued from previous page)

```
(...)
mrsp->ceiling_priorities[ i ] =
```

Relevant source code for lines 120 and others, do not seem OK, because is not clear that the scheduler is always valid:

```
scheduler_index = _Scheduler_Get_index( scheduler ); // Note: translates to
↪"return (uint32_t) (scheduler - &_Scheduler_Table[ 0 ]);"
return mrsp->ceiling_priorities[ scheduler_index ];
```

Returned pointer value points outside the original object (potential buffer overflow) for file cpukitscoresrcthreadqops.c (line 294)

Consider checking for overflow situations and acting accordingly.

Additional Information: The line 294 (the referred line is for version 3 of the QDP), from function `_Thread_queue_Priority_queue_by_index`:

```
return &heads->Priority[ scheduler_index ];
```

The priority field is declared as `Thread_queue_Priority_queue Priority[ RTEMS_ZERO_LENGTH_ARRAY ];` which is a zero-length array...

Then in threads.h file a Struct is defined as

```
struct Thread_queue_Configured_heads {
Thread_queue_Heads Heads;
Thread_queue_Priority_queue Priority[ _CONFIGURE_SCHEDULER_COUNT ];
};
```

Which permits to access the zero-length array beyond the initial configuration of zero length (C99 permits it): C99 6.7.2.1, §16: As a special case, the last element of a structure with more than one named member may have an incomplete array type; this is called a flexible array member.

But still, scheduler_index value is obtained by calling several other functions which extract information from a thread object in order to obtain and use the scheduler_index value in the _Thread_queue_Priority_queue_by_index function. It is not clear that that value is below _CONFIGURE_SCHEDULER_COUNT value.

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-036.

Original author: dppinto

These should have been three tickets and not just one.

1. The message send directives use the size as an output only parameter. If you change this to an input and output parameter, then you may break existing applications which do not set the size parameter to a proper value.

2. The Semaphore Control Block size is defined by the application configuration:

```
#if CONFIGURE_MAXIMUM_SEMAPHORES > 0
SEMAPHORE_INFORMATION_DEFINE(
CONFIGURE_MAXIMUM_SEMAPHORES,
_CONFIGURE_SCHEDULER_COUNT
);
#endif
```

3. There are lots of other values in the Thread Control Block which have to be correct. Why should we add a check here specifically? We could add an _Assert().

1 >>> We agree that changing the function prototype for rtems_message_queue_send, rtems_message_queue_receive, _CORE_message_queue_Insert_message and other functions in-between could break existing applications and may not be acceptable to do so. So, one suggests dismissing this point of the ticket.

2 >>> This point can be dismissed as it is now confirmed that necessary protections are already in place on the API entry point for _MRSP_Get_priority and _MRSP_Get_priority, which is the rtems_semaphore_set_priority (one can refer to the protections implemented by this function within code and/or ICD).

3 >>> Yes, appending the _Assert(scheduler_index < _Scheduler_Count); just before the concerned line will solve it. Thanks

Original author: jameszxj

I use the latest rtems-tools to generate RAP file, I found the object file become too small(elf,2184bytes==>rap,736bytes) and the file loaded failed, error message like this:

```
load app.out error:offset past end of file: offset=736 size=736 error.
```

I reverted the rtl-rap.cpp commit (rtems/tools/rtems-tools@0ad4aaafc20afcb5aacb7a82b0b3a8150b638975).

At Chris's suggestion, I founded `get_relocations(s)` return all the count of relocation and write to rap file, but actual count is less, because ignore the reloc with `section=0`.

I tried to make the length fit the relocs write to rap file, the file can not be loaded, it crashed. So the `relocs(reloc.symsect == 0)` can not be ignored, at least on arm.

The command line I used to create RAP file is like this:

```
rtems-ld -n -e appmain -s -O rap --base rtems.elf app.elf -o app.out
```

A recent change to the version of GDB means we need `python3` development libraries installed as GDB will only build with Python3.

To aid compatibility for older operating systems provide options to aid the selection of a suitable python. Add support for:

`--with-python2` : command for Python2

`--with-python3` : command for Python3

`--with-python-version` : command for a version of Python

For example:

```
--with-python-version=python3.6
```

Author: Chris Johns 2023-06-30T00:14:15.000Z

Joel, what do you think?

Author: Chris Johns 2024-05-02T22:59:33.572Z

We have to python3 because GDB needs it to build. There is no point in supporting python2.

Merges	0

The default for `FD_SETSIZE` in newlib is 64. This is proving to be too small for EPICS applications. EPICS limits the number of descriptors here for RTEMS 6 builds. The comment in EPICS base is:

```
/* Note: The select() system call can only be used with the first FD_SETSIZE
*       File Descriptors (newlib default is 64).  Beginning RTEMS 5.1, FDs are
*       allocated sequentially.  So changing this CONFIGURE parameter such
*       that CONFIGURE_MAXIMUM_FILE_DESCRIPTORS >= FD_SETSIZE will likely
*       cause applications making select() calls to fault at some point.
*
*       IOC core components (libca and RSRV) do not make select() calls.
*
*       Applications and driver code using poll() or other socket
```

(continues on next page)

(continued from previous page)

```
10 *       multiplexers do not share this limitation.
11 *
12 *       cf. https://github.com/epics-base/epics-base/issues/300
13 */
```

Increasing FD_SETSIZE to 256 will increase the set but 64 is too small for RTEMS and we do not need 1024 that systems like FreeBSD have.

Summary

The group name for @approvers/arch/aarch64 is missing the 64 at the `[Arch AArch64]` section definition.

Steps to reproduce

Author: Gedare Bloom 2024-05-02T04:17:47.369Z

assigned to @amar

Author: Amar Takhar 2024-05-02T04:19:40.513Z

Please open this issue in @administration/gitlab All these tickets must go there if you want to create one here and link it to one there that's fine but open the @administration/gitlab issue first thanks.

Author: Amar Takhar 2024-05-02T05:21:25.771Z

That's cool when you mentioned the group it made all of the people in that group participants. . . .that's scary if you choose the approvers/general group

Author: Gedare Bloom 2024-05-02T05:21:25.705Z

oof, good to remember that.

Author: Amar Takhar 2024-05-02T05:22:42.993Z

I feel like half the things I learn while using it are this way.. and yes, on the GitLab project you can see 150+ participants on some issues or epics so it doesn't care.

3.9.1.291 4955 - sparc: Potential stack corruption in uniprocessor configurations during start multitasking

Id	4955
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2023-09-20T06:54:57.000Z
Updated	2024-04-29T15:49:30.640Z

Original author: sebastian.huber

The system initialization uses the interrupt stack. A first level interrupt shall never interrupt a context which uses the interrupt stack. Such a use would lead to stack corruption and undefined system behaviour. Unfortunately, in uniprocessor configurations this is the case right now. Multiprocessing is started using _CPU_Context_restore(). The caller of this function (_Thread_Start_multitasking()) uses the interrupt stack. Later we have in cpukit/score/cpu/sparc/cpu_asm.S:

```
mov     %g1, %psr                   ! restore status register and
! **** ENABLE TRAPS ****

ld      [%o1 + G5_OFFSET], %g5      ! restore the global registers
ld      [%o1 + G7_OFFSET], %g7

! Load thread specific ISR dispatch prevention flag
ld      [%o1 + ISR_DISPATCH_DISABLE_STACK_OFFSET], %o2
! Store it to memory later to use the cycles

ldd     [%o1 + L0_OFFSET], %l0      ! restore the local registers
ldd     [%o1 + L2_OFFSET], %l2
ldd     [%o1 + L4_OFFSET], %l4
ldd     [%o1 + L6_OFFSET], %l6

! Now restore thread specific ISR dispatch prevention flag
st      %o2, [%g6 + PER_CPU_ISR_DISPATCH_DISABLE]

ldd     [%o1 + I0_OFFSET], %i0      ! restore the input registers
ldd     [%o1 + I2_OFFSET], %i2
ldd     [%o1 + I4_OFFSET], %i4
ldd     [%o1 + I6_FP_OFFSET], %i6

ldd     [%o1 + O6_SP_OFFSET], %o6   ! restore the output registers
```

Between the ENABLE TRAPS and the restore of the output registers, we still use the stack of the

caller and interrupts may be enabled. If an interrupt happens in this code block, the interrupt stack is concurrently used which may lead to a crash.

```
sparc: Fix stack corruption

Fix a potential stack corruption in uniprocessor configurations during
start multitasking.

The system initialization uses the interrupt stack.  A first level
interrupt shall never interrupt a context which uses the interrupt
stack.  Such a use would lead to stack corruption and undefined system
behaviour.  Unfortunately, in uniprocessor configurations this was the
case.  Multiprocessing is started using _CPU_Context_restore().  The
caller of this function (_Thread_Start_multitasking()) uses the
interrupt stack.  Later we have in cpukit/score/cpu/sparc/cpu_asm.S:

mov     %g1, %psr                   ! restore status register and
! **** ENABLE TRAPS ****

ld      [%o1 + G5_OFFSET], %g5      ! restore the global registers
ld      [%o1 + G7_OFFSET], %g7

! Load thread specific ISR dispatch prevention flag
ld      [%o1 + ISR_DISPATCH_DISABLE_STACK_OFFSET], %o2
! Store it to memory later to use the cycles

```

(continues on next page)

(continued from previous page)

```
ldd     [%o1 + L0_OFFSET], %l0        ! restore the local registers
ldd     [%o1 + L2_OFFSET], %l2
ldd     [%o1 + L4_OFFSET], %l4
ldd     [%o1 + L6_OFFSET], %l6

! Now restore thread specific ISR dispatch prevention flag
st      %o2, [%g6 + PER_CPU_ISR_DISPATCH_DISABLE]

ldd     [%o1 + I0_OFFSET], %i0        ! restore the input registers
ldd     [%o1 + I2_OFFSET], %i2
ldd     [%o1 + I4_OFFSET], %i4
ldd     [%o1 + I6_FP_OFFSET], %i6

ldd     [%o1 + O6_SP_OFFSET], %o6     ! restore the output registers

Between the ENABLE TRAPS and the restore of the output registers, we
still use the stack of the caller and interrupts may be enabled.  If an
interrupt happens in this code block, the interrupt stack is
concurrently used which may lead to a crash.

Fix this by adding a new function _SPARC_Start_multiprocessing() for
uniprocessor configurations.  This function first sets the stack pointer
to use the stack of the heir thread.

Close #4955.

Original author: sebastian.huber

Some validation test cases use parameterized nested test cases. For example, the rtems_semaphore_obtain() test uses a parameterized test case to seize a mutex. The nested mutex seize test case uses a parameterized thread queue enqueue test case. Currently, there is no indication that these nested test cases did actually run. Some of these nested test cases run in a tight loop, so printing a hint on every run could lead to a massive amount of test output.

Add test case remarks to the RTEMS Test Framework which may be used to give such an indication.

Original author: sebastian.huber

Unfortunately, most SPARC SoCs supported by RTEMS lack a proper free-running counter. The only exception are the GR712RC and the GR740. For the pre-qualified GR712RC BSP, the current implementation is too complicated. Make the fall back to a free-running GPTIMER mandatory for the leon3 BSP family to simplify things. For the GR712RC use the DSU time tag counter.

Original author: sebastian.huber

The _ISR_Stack_size is defined by the application configuration like this:

```
1 /**
2 * @ingroup RTEMSAPIBaseDefs
3 *
4 * @brief Defines a global symbol with the name and value.
5 *
6 * @param _name is the user defined name of the symbol.  The name shall be a
7 *   valid designator.  On the name a macro expansion is performed and
8 *   afterwards it is stringified.
9 *
10 * @param _value is the value of the symbol.  On the value a macro expansion is
11 *   performed and afterwards it is stringified.  It shall expand to an integer
12 *   expression understood by the assembler.
13 *
14 * This macro shall be placed at file scope.
15 */
16 #if defined(__USER_LABEL_PREFIX__)
17 #define RTEMS_DEFINE_GLOBAL_SYMBOL( _name, _value ) \\
18 __asm__( \\
19 "\\t.globl " RTEMS_XSTRING( RTEMS_SYMBOL_NAME( _name ) ) \\
20 "\\n\\t.set " RTEMS_XSTRING( RTEMS_SYMBOL_NAME( _name ) ) \\
21 ", " RTEMS_STRING( _value ) "\\n" \\
```

(continues on next page)

(continued from previous page)

```
)
#else
#define RTEMS_DEFINE_GLOBAL_SYMBOL( _name, _value )
#endif

RTEMS_DEFINE_GLOBAL_SYMBOL(
_ISR_Stack_size,
CONFIGURE_INTERRUPT_STACK_SIZE
);
```

Firstly, the RTEMS_DEFINE_GLOBAL_SYMBOL() is broken. It should depend on __GNUC__ and not __USER_LABEL_PREFIX__.

Secondly, setting a symbol to an arbitrary absolute address may not work with all code models, see:

https://sourceware.org/pipermail/binutils/2023-September/129448.html

The _ISR_Stack_size should be changed to point to the end of the ISR stack of processor 0:

```
RTEMS_DEFINE_GLOBAL_SYMBOL(
_ISR_Stack_0_end,
RTEMS_SYMBOL_NAME( _ISR_Stack_area_begin )
+ CONFIGURE_INTERRUPT_STACK_SIZE
);
```

The tests for RTEMS_DEFINE_GLOBAL_SYMBOL() should be changed to use values relative to another symbol.

Author: Trac Migrate 2023-09-13T05:28:52.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

Since the start files are written in assembly, they can use the right instructions to load an arbitrary absolute address. A review of the uses of _ISR_Stack_size showed that there is actually no issue right now. Adjusting the tests for RTEMS_DEFINE_GLOBAL_SYMBOL() should be enough.

Author: Trac Migrate 2023-09-13T08:52:29.000Z

Original author: sebastian.huber

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

The spconfig01 test fails on aarch64 with:

```
testsuites/sptests/spconfig01/init.c: 89 rtems_configuration_get_
↪interrupt_stack_size() == CPU_STACK_MINIMUM_SIZE
```

The rtems_configuration_get_interrupt_stack_size() needs to be fixed.

Author: Trac Migrate 2023-09-13T08:57:43.000Z

Original author: sebastian.huber

- **Summary** changed from *Definition of _ISR_Stack_size may not work for some code models* to *Use of symbol addresses for arbitrary values may not work for some code models*

The use of _TLS_BSS_size and _TLS_Data_begin may also not work on some code models. I really wonder why the TLS related tests pass on aarch64.

Author: Trac Migrate 2023-09-13T09:02:33.000Z

Original author: sebastian.huber

There are also issues with _TLS_Size and _TLS_Alignment.

Original author: abutterfield

I am trying to install sphinx on an Apple Silicon OSX machine. I've already done this successfully in the past on a similar machine.

This time, after following steps in the rtems-docs README.txt, I do ./waf , it does some stuff and then:

```
[ 7/10] Compiling common/_static/favicon.ico
[ 8/10] Compiling common/_static/my-styles.css
[ 9/10] Compiling common/_static/logo.png
[10/10] Compiling common/_static/style.css

Theme error:
An error happened in rendering the page bld/index.
Reason: UndefinedError("'style' is undefined")
```

I'm using pip 22.2.1, Python 3.10.6 and pip3 installs sphinx 7.0.1

```
(sphinx) ab-rtems-docs% pip3 install sphinx
Requirement already satisfied: sphinx in ./sphinx/lib/python3.10/site-packages (7.
↪0.1)
```

361 |   RTEMS_UNREACHABLE();
|   ^~~~~~~~~~~~~~~~
```

The score headers basedefs.h header depends on assert.h and assert.h includes basedefs.h at it's top.

I think this ticket should be set to blocker for the 6.1 release. We should resolve this and the warnings before we make a release.

Author: Trac Migrate 2023-04-24T08:15:52.000Z

Yes, there is a cyclic dependency. For RTEMS_STATIC_ANALYSIS we need basedefs.h. For RTEMS_UNREACHABLE() we need _Assert().

I am not sure if the RTEMS_STATIC_ANALYSIS was really a good idea. It is currently just used in assert.h. Maybe we should remove it.

Author: Chris Johns 2023-04-24T08:27:17.000Z

You are the best judge of this. Breaking the dependency would be good to see done.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4874
Merges	0

Original author: dppinto

If one searches within SRSs or ICDs for 'undefined behaviour' one will find specifications/functions on which descriptions mention conditions that will lead to 'undefined behaviour', e.g.:

. . .

spec:/rtems/clock/if/get-boot-time

. . .

boot_time is the pointer to a struct timespec object. The time elapsed since the Unix epoch at some time point during system initialization call will be stored in this object. Calling the directive with a pointer equal to NULL is undefined behaviour.".

One created specific tests to further access the eventual impacts, for instance in the clock-related functions below:

spec:/rtems/clock/if/get-boot-time

spec:/rtems/clock/if/get-boot-time-bintime

spec:/rtems/clock/if/get-boot-time-timeval

spec:/rtems/clock/if/get-monotonic

spec:/rtems/clock/if/get-monotonic-bintime

spec:/rtems/clock/if/get-monotonic-coarse

spec:/rtems/clock/if/get-monotonic-coarse-bintime

spec:/rtems/clock/if/get-monotonic-coarse-timeval

spec:/rtems/clock/if/get-monotonic-timeval

spec:/rtems/clock/if/get-realtime

spec:/rtems/clock/if/get-realtime-bintime

spec:/rtems/clock/if/get-realtime-coarse

spec:/rtems/clock/if/get-realtime-coarse-bintime

spec:/rtems/clock/if/get-realtime-coarse-timeval

spec:/rtems/clock/if/get-realtime-timeval

The outcome was:

There is no internal check for a NULL pointer in these functions, so when called with a null pointer argument there is unwanted behaviour for both the GR712rc and GR740; an attempt to access memory location 0.

For the GR712rc board this memory position is not mapped and causes a trap to be raised (this trap handler leads to unpredictable results, the workflow of the program is not recoverable). For the GR740 board the actual memory position is either read or written (the previous value being overridden with unpredictable results).

So, even if somehow this shall also be a user responsibility, shouldn't one adopt a safe approach to this and add input checking for these functions?

Additional Notes:

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-REQ-VER-008 and RTEMS-SMP-VAL-005.

Author: Trac Migrate 2023-03-09T12:54:46.000Z

Original author: dppinto

- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

This was discussed on the RTEMS mailing list some time ago:

https://lists.rtems.org/pipermail/devel/2021-November/069991.html

Quite frankly, someone passing a NULL pointer to functions like `void rtems_clock_get_monotonic_bintime(struct bintime *time_point)` will also use the NULL pointer later. The next release of the pre-qualified RTEMS will probably contain the `clock_get()` function which performs these NULL pointer checks.

Original author: dppinto

Within cpukitincludertemsscoreobjectimpl.h line 545 one has: if (!the_api || the_api > OBJECTS_APIS_LAST)

This shall be equivalent to “if ((!the_api) || (the_api > OBJECTS_APIS_LAST))”, but at first glance, this is not always obvious to everyone and one might need to read further documentation to be fully sure of it.

We would suggest the parenthesis be added so that the code logic is straightforward. In this case, one would not call it an ‘excess’ as stated within the RTEMS SW Eng. Manual (“Avoid excess parentheses. Learn the operator precedence. rules.”).

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-076.

Author: Trac Migrate 2023-02-23T14:30:55.000Z

Original author: dppinto

The operators were interpreted as new lines. This is the correct description (with a white space between the operators):

Within cpukitincludertemsscoreobjectimpl.h line 545 one has:

if (!the_api | | the_api > OBJECTS_APIS_LAST) This shall be equivalent to “if ((!the_api) | | (the_api > OBJECTS_APIS_LAST))”, but at first glance, this is not always obvious to everyone and one might need to read further documentation to be fully sure of it.

Author: Joel Sherrill 2023-02-23T15:17:54.000Z

Original author: dppinto

The code would be better written avoiding the use of compound expressions which will ease the testing when moving to higher design assurance levels which require MCDC style analysis. I would recommend trying to rewrite code to avoid compound

expressions. This effectively can reduce testing to simpler decision/branch coverage. Here's my recommendation which also adds the braces which I am surprised didn't get flagged:

```
if ( !the_api ) {
return false;
}

if ( the_api > OBJECTS_APIS_LAST )
return false;
}

return true;
}
```

FWIW I don't think the code as written was hard to read or confusing. I wouldn't have changed based solely on that report. The rules of evaluation in C are clear enough that anyone confused by this shouldn't be touching this code anyway.

3.9.1.300 4862 - score/ & bsps/: Unused input parameters

Id	4862
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2023-02-23T12:36:23.000Z
Updated	2024-04-25T20:50:37.831Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::fixed, tickettype::defect, tickettype::enhancement, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4862
Merges	0

Original author: dppinto

The following functions list input parameters on their signature that seem not to be used:

File	Function	Line	Resolution
bsps\shared\cache\cacheimp	smp_cache_inst_inv_all	293	Unused due to API constraints
bsps\shared\dev\clock\clock	void Clock_isr	130	Fixed: parameter can be used
bsps\shared\dev\clock\clock	rtems_isr Clock_isr	134	Fixed: parameter can be used
bsps\shared\irq\irq-generic.c	bsp_interrupt_allocate_handler_index	62	Fixed: parameter removed
bsps\sparc\leon3\start\bspcl	bsp_fatal_extension	70	API backward compatibility
cpukit\score\src\threadchan	static void _Thread_Priority_action_change( );	92	Unused due to API constraints
cpukit\score\src\threadq.c	_Thread_queue_MP_callout_do_nothing	157	Unused due to API constraints
cpukit\score\src\threadqenq	_Thread_queue_Deadlock_fatal	382	Unused due to API constraints
cpukit\score\src\threadqops.	_Thread_queue_FIFO_do_initialize	137	Unused due to API constraints
cpukit\score\src\threadqtime	_Thread_queue_Add_timeout_ticks	28	Unused due to API constraints
cpukit\score\src\threadresta	_Thread_Join_flush_filter	84	Unused due to API constraints
cpukit\score\src\userextitera	_User_extensions_Thread_begin_visitor	102	Unused due to API constraints

Could one please double-check if in each case the unused parameters can be safely removed from the function's signature? PS: The first functions are also implemented within .h files and perhaps could be moved to .c files.

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and

Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-028.

Author: Joel Sherrill 2023-06-22T21:29:22.000Z

Original author: dppinto

- **Summary** changed from *Unused input parameters* to *score/ & bsps/: Unused input parameters*

Author: Trac Migrate 2023-06-23T14:14:00.000Z

Original author: dppinto

Most of the functions listed on the initial ticket description only have a single parameter.

Regarding the others, the information is included hereafter:

Author: Trac Migrate 2023-07-18T19:55:24.000Z

Original author: dppinto

There are two obvious reasons, why some of these functions have unused parameters:

1. When functions are used through function pointers, then they may have unused parameters since other functions may need the parameter. Only if the parameter is unused in all functions associated with a function pointer, the parameter is really superfluous.
2. API backwards compatibility.

Could you please remove these false positives from the list.

3.9.1.302 4855 - Input validity unchecked

Id	4855
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2023-02-13T14:21:44.000Z
Updated	2024-04-25T20:50:36.737Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::wontfix, tickettype::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4855
Merges	0

Original author: dppinto

In a generic way, function inputs shall be checked for validity before being used.

When successive calls are done to different functions, one might argue that inputs are to be checked only once and then considered valid in other calls. Yet this has some pitfalls like: * function inputs are not checked in a consistent way throughout all functions: * Each one has to constantly double-check in comments and/or callers if inputs are instead checked elsewhere in the call tree. * Even if for the moment no call tree leads to invalid input issues, future maintenance operations may add new calls without validity checks.

One can assume some exceptions can occur (e.g., when there is a considerable performance impact), but as long such cases are justified within the function's comments one can easily sort out those exceptions.

Bellow, there is a list of cases where input validity could be added:

- bspsincludebspirq-generic.h: bsp_interrupt_entry_load_first function is called by bsp_interrupt_handler_dispatch_unchecked where the argument was already checked.
- bspsincludebspirq-generic.h: bsp_interrupt_handler_index function is called by bsp_interrupt_entry_load_first, bsp_interrupt_entry_remove, bsp_interrupt_spurious, bsp_interrupt_entry_find, bsp_interrupt_entry_install, rtems_interrupt_handler_iterate functions. It was possible to trace in all of them a validation of the argument used in bsp_interrupt_handler_index before being called.
- bspssharedirqirq-default-handler.c: bsp_interrupt_handler_default is only called by bsp_interrupt_spurious and bsp_interrupt_handler_dispatch_unchecked functions and It was possible to trace in all ot them a validation of the argument used in bsp_interrupt_handler_index before being called.

- bspssharedirqirq-entry-remove.c: the *entry argument of bsp_interrupt_entry_do_remove is actually tested and validated inside of that function. That function is also the only place where bsp_interrupt_entry_remove is called. The arguments vector, *entry and **previous_next are all validated by a call to the bsp_interrupt_entry_find and subsequent code that is run prior to call bsp_interrupt_entry_remove function.
- bspssharedirqirq-generic.c: the bsp_interrupt_spurious function argument vector is tested before being called in bsp_interrupt_handler_dispatch_unchecked function.
- bspssharedirqirq-generic.c: bsp_interrupt_entry_install_first function is called once by bsp_interrupt_entry_install function. The validation of the argument vector can be traceback to rtems_interrupt_entry_install function. The argument *entry is also passed by bsp_interrupt_entry_install function and explained in the previous paragraph.
- bspssharedevclockclockimpl.h: in both functions (void Clock_isr and rtems_isr Clock_isr) declaration/definition (they are the same function, just declared differently depending of #if def's), both arguments are not used. Due to the evaluation of the internal #if, this functions are reduced to Clock_driver_ticks += 1; _Timecounter_Tick();
- bspssparcleon3startbspsmp.c: the bsp_start_on_secondary_processor function calls _SMP_Start_multitasking_on_secondary_processor with the same argument as it was called. This argument in that sub-function is used to get a value cpu_index_self, which itself is validated and checked if it is a proper value or not. Indirect validation.
- bspssparcleon3startbspsmp.c: the _CPU_SMP_Send_interrupt function is called in 3 different places: in one place (_SMP_Request_shutdown function in smp.c file) it is inside a for loop that is limited by _SMP_Processor_configured_maximum. This is OK. For the other 2 places (from _SMP_Send_message function in smp.c file and _Thread_Dispatch_request function in threaddispatch.h file it is not clear that the argument of _CPU_SMP_Send_interrupt cannot be limited (when it should be limited at least to _SMP_Processor_configured_maximum).
- bspssparcleon3starteirq.c: bsp_interrupt_get_attributes function actually tests vector argument. But also there is only one call to this function which is from rtems_interrupt_get_attributes function in irq-enable-disable.c file where both arguments are tested prior call to bsp_interrupt_get_attributes function.
- bspssparcsharedstartbspgetworkarea.c: _SPARC_Memory_initialize function receives its *end_of_usable_ram argument from the main function in start.S file. No validation is performed there. The argument is used to initialize a struct, which later on may be used for dynamically allocated memory. The referred pointer argument is never dereferenced, it is used as the end limit of the allocated memory position. It may make sense to test in this initialisation function if it is value is above &_Memory_Areas[0].
- cpukitlibcstringmemset.c: memset function is part of space qualification profile context, and the void *<[dst]> pointer is not tested against NULL.
- cpukitlibcstringmemcpy.c: memcpy function is part of space qualification profile context, and the void *dst and void *src pointers is not tested against NULL.
- cpukitposixsrcclocknanosleep.c: in function clock_nanosleep the *rmtp argument can be NULL if the user does not want to get the remain time, so there is no need to validated it. For the *rqtp (request) argument this should be validated if different than NULL and the tv_nsec field must be validated if between 0 and 999999999.
- cpukitrtemssrcclocktodtoseconds.c: the _TOD_To_seconds function is called by _Timer_Fire_when function from timercreate.c file, by rtems_task_wake_when function

from taskwakewhen.c file and by rtems_clock_set function from clockset.c file. In all three cases the argument with which the _TOD_To_seconds function is called is validated with a call to _TOD_Validate function prior to the call.

- cpukitrtemssrceventsend.c: the _Event_Seize function is called by two similar functions the rtems_event_receive from eventreceive.c file and rtems_event_system_receive from systemeventreceive.c file. The *event_out argument is validated prior the call; all other arguments are declared and defined in the caller functions prior to call the Event_Seize function.

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-VAL-029.

Original author: dppinto

Correction: The original ISVV reference for this issue is **RTEMS-SMP-VER-029**.

Author: Trac Migrate 2023-03-23T16:21:24.000Z

Original author: dppinto

- **Milestone** set to %"6.1"
- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

For internal functions it is responsibility of the caller to ensure that arguments are valid.

The C library functions memset() and memcpy() are not required to check for NULL.

clocknanosleep() checks the mentioned error conditions. There are also test cases for them.

The end_of_usable_ram is provided by the boot loader. How can the BSP validate this?

Original author: dppinto

The use of “goto” statements is strongly discouraged as it results in convoluted program logic, making it challenging to analyse and verify program correctness, particularly in loops. Instead, the “break” and “continue” statements provide alternatives to “goto” and should be utilized to simplify the code.

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). Original ISVV reference for this issue is RTEMS-SMP-CODE-VER-074.

File list: cpukit/score/src/threaddispatch.c (line 290)

Author: Joel Sherrill 2023-02-09T15:05:11.000Z

Original author: dppinto

Although cpukit/score/src/threaddispatch.c (line 290) is not right per the current source, on first examination, I think this goto can be a break. Leaving the label post_switch is probably good for understanding purposes. And adding a comment at that point would probably be a good idea also.

FWIW this goto was not present in versions <= 4.10 but shows up in 4.11 and I think that it could have been a break back then also. The code looks similar.

Author: Trac Migrate 2023-02-09T18:44:59.000Z

Original author: dppinto

Yes, it can be a break. I am not sure if the break improves the code clarity.

Author: Joel Sherrill 2023-02-09T18:59:30.000Z

Original author: dppinto

Looking at the older versions, there was not a loop around the dispatching activities. This was added because with SMP, the other cores could request a dispatch on a core while one was in process.

I'm fine with changing it to a break. I just think anytime you look at code, you should consider if more comments are necessary. I think the post_switch label is acting as a minimal comment and the scenarios for looping more than once or exercising the break could be documented in the comments.

Original author: dppinto

This source file contains both declaration and definition of the variable. It is recommended to declare global variables in a header file and define them in separate source files. Please consider this best practice and move the declarations to a header file and corresponding definitions to respective source files.

Additional Notes: LEON3_Boot_Cpu is a global variable and only used by start.S file. And as such cannot be declared as static. Because is used in an assembly file there was no need to declare it as external. But the global variable is in fact declared and defined in same file.

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). Original ISVV reference for this issue is RTEMS-SMP-CODE-VER-043.

The Software Document Design (starting on page 181) specifies that there should be two outputs, but the RTEMS_UNSATISFIED is not returned by the function. The only failure detected may be due to the assert function, but the rtems_status_code isn't the returned value. Ensure all output values specified in the SDD are returned.

Additional Notes: From code analysis and from objdumping the librtemsbsp.a library it can be observed that the asserts() currently do nothing: they are translated to #define _Assert(_e) ((void) 0) unless RTEMS_DEBUG or RTEMS_STATIC_ANALYSIS are defined, which in a release environment target are not defined. Since in the documentation it says that it can return RTEMS_UNSATISFIED or RTEMS_SUCCESSFUL either the documentation is wrong, or the code is not correctly implemented.

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-032.

Original author: dppinto

With respect to RTEMS 6 (ESA-promoted RTEMS SMP Qualification Data Pack release 3), the following issues are observed:

File	Lines	Discrepancy
bsps\inclu regs.h	84; 86; 88; 91; 96;98; 101; 106; 109; 115; 120; 123	According to table 365 of page 294 of the GR740 User Manual (v.2.50), the register addresses are incorrectly defined.
bsps\inclu regs.h	225	According to table 406 of page 319 of the GR740 User Manual (v.2,50), the register address is incorrect;
bsps\inclu regs.h	435	According to table 538 of page 403 of the GR740 User Manual (v.2.5), the register address is incorrect according to the table but it is correct according to the table description.
bsps\inclu regs.h	609	According to table 327 of page 259 of the GR740 User Manual (v.2.50), the register address is incorrect according to the table but it is correct according to the table description.
bsps\inclu regs.h	151	According to table 213 of page 200 of the GR740 User Manual (v.2.5), the register address is incorrect according to the table but it is correct according to the table description.
bsps\inclu regs.h	575; 591; 715; 787; 809	According to tables 191, 192, 199, 201, 202, respectively (to each identified line) starting on page 192 of the GR740 User Manual (v.2.5), the register addresses are incorrect according to the table but are correct according to the table description.

It seems that the generation of these registers definitions leads to incorrect bit definitions whenever there are reserved bits specified in the Gaisler User Manual. Can you please double-check these cases?

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-014.

Original author: dppinto

Description: SPAMR/CLANG point out to a possible deference to a null pointer. However, this issue has already been checked by the RTEMS team and flagged as false positive (see rtems-6-sparc-gr740-smp-3/doc/paf/spamr/spamr.pdf page 29).

Yet, the justification sentence ends with “Why CLANG complains about a possible null pointer at this place in code and not everywhere or nowhere remains a mystery” which sounds awkward and lead us to think that a complete analysis as not been done on the error.

Looking at it now, “_Chain_Initialize_one” is declared as static inline in a .h. That makes it public and so not all calls are controlled. Within the function, there is already an assert operation for one of the inputs. Now, one needs to add it also to the other one. Note that this assert is only active when compiler options RTEMS_DEBUG or RTEMS_STATIC_ANALYSIS are used which shall remove the CLANG error and not influence the flight executable.

(Missions might do an early compilation with RTEMS_DEGUG to spot any problem on this).

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). Original ISVV reference for this issue is RTEMS-SMP-CODE-VER-062.

- **Milestone** set to %”6.1”
- **Resolution** set to ~”wontfix”
- **Status** changed from *new* to *closed*
- **Version** set to ~”6”

Functions starting with an underscore are reserved for the RTEMS implementation and not a part of the API.

Adding an _Assert(x != NULL) to pointer parameters of internal functions in general makes no sense.

I reviewed the related clang analysis. The problem is that clang doesn’t know that _Scheduler_Count is greater than zero.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4828
Merges	0

Original author: dppinto

Description: Each register has a dedicated SHIFT macro, however, it is not utilized in subsequent macro definitions where the shift operation is performed. To improve consistency and maintainability, consider incorporating the defined shift macro in the subsequent macro definitions instead of using hardcoded shift values.

Additional Notes: These findings are related to the fact that a bunch of macros like AHBSTAT_AHBS_HMASTER_SHIFT are defined and then are not used right in the next few lines.

define AHBSTAT_AHBS_HMASTER_SHIFT 3

define AHBSTAT_AHBS_HMASTER_MASK 0x78U

define AHBSTAT_AHBS_HMASTER_GET(_reg) \

(((_reg) >> 3) & 0xfU)

define AHBSTAT_AHBS_HMASTER(_val) ((_val) << 3)

As stated, in every one of these files, “This file is part of the RTEMS quality process and was automatically generated”. There are YAML files where these registers are defined and the Waf build system generates the header files automatically with the current configuration.

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). Original ISVV reference for this issue is RTEMS-SMP-CODE-VER-013.

The files are generated, so changing the format would be easy. Is this the desired format?

```
#define AHBSTAT_AHBS_HMASTER_SHIFT 3
#define AHBSTAT_AHBS_HMASTER_MASK 0x78U
#define AHBSTAT_AHBS_HMASTER_GET( _reg ) \\
( ( ( _reg ) & AHBSTAT_AHBS_HMASTER_MASK ) >> AHBSTAT_AHBS_HMASTER_
↪SHIFT )
#define AHBSTAT_AHBS_HMASTER( _val ) ( ( _val ) << AHBSTAT_AHBS_HMASTER_
↪SHIFT )
```

It makes the lines longer and the files larger.

Author: Trac Migrate 2023-02-08T10:33:48.000Z

Original author: dppinto

Hello! Yes, we think this format is better, despite being longer and more extensive; this way, the logic is clearer and unambiguous.

Some headers generate C++ errors and so cannot be included.

Author: Chris Johns 2022-08-19T04:54:06.000Z

To test create a C++ source file with all the installed headers and compile. The exact source to build needs some defines and some include ti show the real issues:

```
#define _DEFAULT_SOURCE 1
#define CONFIGURE_SCHEDULER_CBS 1
#define BSP_GPIO_PIN_COUNT 128
#define BSP_GPIO_PINS_PER_BANK 8
#include <sys/time.h>
#include <bsp.h>
#include <libfdt_env.h>
```

Only the beagle defines the GPIO pins.

Author: Chris Johns 2022-08-19T06:31:52.000Z

Adding `RTEMS_SMP` generates the following:

```
In file included from ../cxx-headers.cc:28:
/opt/work/rtems/6-bsps/aarch64-rtems6/xilinx_versal_lp64_vck190/lib/
↪include/bsp/irq-generic.h: In function 'void bsp_interrupt_entry_

3.9.1.316 4691 - Add support for FACE Technical Standard Restriction on POSIX Absolute Timers

Id	4691
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill

Merges	0

Overview

Most of the time, the FACE Technical Standard (https://opengroup.org/face) defines a subset (e.g. profile) of a standard. It currently includes four profiles of the POSIX 1003.1-2008 standard with a few optional features like multiple processes and IPV6. However, in one case, it defines an error case for something POSIX defines as required behavior. This ticket is intended to track adding support for an application being able to configure whether it wants the POSIX behavior or that defined by the FACE Technical Standard.

3.9.1.316.1.1 FACE Technical Standard Requirements

POSIX allows for setting a timer on CLOCK_REALTIME[1] while the FACE Technical Standard defines this as an error. This behavior and deviation from POSIX has been in the FACE Technical Standard since the beginning and was present in Edition 1.0[2]. This is the language from Edition 1.0 of the FACE Technical Standard which was written in the tone of a white paper rather than as a set of requirements:

3.9.4 Time Management

Partial support for the POSIX CLOCK_REALTIME, which permits a calendar-based clock time to be set that becomes available to all partitions. Due to safety and security-related considerations in the POSIX definitions of this clock's behavior, the configuration data will specify which partitions (preferably one partition) have permissions to set (using the clock_settime API) this clock. All partitions may have access to read this clock, but an error will be returned for any partition that attempts to set an alarm based on this clock that is based on absolute time (setting of an alarm based on a relative time is supported). Partitions authorized to set the calendar time will also be authorized to set the time zone value that is visible to all other partitions.

Subsequent editions of the FACE Technical Standard have fine-tuned the language and made requirements clearer with simpler direct "shall" statements.

Also, although the term OSS UoC was defined in Edition 1.0, the requirements now use this acronym for Operating System Segment Unit of Conformance to refer to the operating system and foundational services. Other types of segments are defined for applications, communications, and device management. In Edition 3.1[3], the language has the same intent as Edition 1.0 but the requirements are stated in a more direct and clearer manner.

> 4.1.1.3 OSS POSIX Clock Requirements An OSS UoC provides support for POSIX clocks. 1. An OSS UoC shall support the POSIX Monotonic Clock option (CLOCK_MONOTONIC), including setting absolute and relative timers on this clock. 2. An OSS UoC shall support clock read-access based POSIX CLOCK_REALTIME clock (calendar-based clock time). 3. An OSS UoC shall support setting a relative timer-based POSIX CLOCK_REALTIME clock (calendar-based clock time). 4. An OSS UoC shall support clock time write access for POSIX CLOCK_REALTIME clock value under the constraint that configuration data specifies the partition is authorized to set the clock time (using the clock_settime() API). Note: The time value set by one partition becomes visible to all other partitions. The timezone value set by one POSIX process using the tzset() or setenv() APIs is local to that POSIX process. 5. An OSS UoC shall return an error when a software component attempts to set an absolute timer on the POSIX CLOCK_REALTIME clock. Note: The behavior is necessary (e.g., to prevent backwards and forwards shifts in sequential timers) due to the setting of POSIX_CLOCK_REALTIME clock impacting all partitions.
>
> The use of the word "partition" is intentional because the FACE Technical Standard includes ARINC 653 and POSIX standards. ARINC 653 defines a time and space partitioned real-time environment. POSIX or ARINC 653 applications can be hosted in a partition. In three of the four profiles, ARINC 653 is required while in the fourth it is optional. RTEMS can be hosted in an ARINC 653 partition using a paravirtualized configuration with a BSP that adapts it to the environment.
>
> The requirement being addressed by this ticket is (5) since RTEMS currently meets the other requirements. (5) contradicts the POSIX standard and modifying RTEMS to not support absolute POSIX timers is not an acceptable option.
>
> The proposed solution is to add a confdefs.h configure option that en-

ables this behavior when the OSS UoC (e.g. operating system) must provide FACE conformant behavior. When not defined, the POSIX behavior will be in effect.

This will require additions to the confdefs.h family of headers, adding a test, and updating documentation.

Author: Chris Johns 2022-08-02T01:24:38.000Z

What structure and naming convention do you propose for `confdefs.h`?

Could I configure the following to get all FACE related configures enabled:

```
#define CONFIGURE_FACE
```

?

Author: Trac Migrate 2022-08-10T19:07:27.000Z

In [changeset:"4b04589b097896795648de38b1e9bbc7570d9696/rtems" 4b04589b/rtems]:

```
Add support for CONFIGURE_POSIX_TIMERS_FACE_BEHAVIOR

This adds the configure option CONFIGURE_POSIX_TIMERS_FACE_BEHAVIOR
which allows the application to choose whether to have the POSIX
timer_create() function follow the behavior defined by POSIX or
the FACE Technical Standard.

Updates #4691.

Merges	0

Setting the `CLOCK_REALTIME` clock using `clock_settime(CLOCK_REALTIME, , )` clock does not update thread relative period entries on the watchdog timer queue.

A system's stability is effected if a user calls `clock_settime` on the `CLOCK_REALTIME` clock. The watchdog's REALTIME clock queue is references against the realtime clock and movement of the time means

The effected parts are:

1. User C code that calls `nanosleep`, `usleep`, `sleep` or `clock_nanosleep(CLOCK_REALTIME, , )`.
2. User C++ code that uses `std::this_thread::sleep_for()` as GCC uses the `nanosleep()` call.
3. LibBSD uses `CLOCK_REALTIME`.

The nanosleep call is explained in more detail in the [clock_nanosleep](https://pubs.opengroup.org/onlinepubs/9699919799/functions/clock_nanosleep.html) rational. The `nanosleep` clock must be `CLOCK_REALTIME`. The clock_settime standard says:

Setting the value of the CLOCK_REALTIME clock via clock_settime() shall have no effect on threads that are blocked waiting for a relative time service based upon this clock, including the

nanosleep() function; nor on the expiration of relative timers based upon this clock. Consequently, these time services shall expire when the requested relative interval elapses, independently of the new or old value of the clock.

- init-4.c

Author: Chris Johns 2022-08-01T04:23:04.000Z

- **Summary** changed from *CLOCK_REALTIME thread queue no updated as part of clock_settime call* to *CLOCK_REALTIME thread queue not updated as part of clock_settime call*

Author: Chris Johns 2022-08-01T06:56:47.000Z

The attached test checks the times. It will show the failure however it does not pass the initial check because the expected ticks is not the actual ticks. The failure is:

```
Clock settime while sleeping: step=0
clock: nanosleep: sec=0 nsec=500000000 ticks=51 expected-ticks=50
../../../testsuites/psxtests/psxclock/init.c: 120 ctx->ticks == ticks
```

Should the ticks the sleeper sees be `51` or `50`?

Author: Chris Johns 2022-08-01T08:07:48.000Z

- **Attachment** init-4.c added

testsuites/psxtests/psxclock/init.c

Author: Chris Johns 2022-08-02T00:53:45.000Z

Replying to Chris Johns:

> The attached test checks the times. It will show the failure however it does not pass the initial check because the expected ticks is not the actual ticks. The failure is: {{{ Clock settime while sleeping: step=0 clock: nanosleep: sec=0 nsec=500000000 ticks=51 expected-ticks=50 ../../../testsuites/psxtests/psxclock/init.c: 120 ctx->ticks == ticks }}} Should the ticks the sleeper sees be `51` or `50`?

Original author: sebastian.huber

The `rtems_task_delete()` directive is basically just a combined `pthread_cancel()` and `pthread_join()`. In addition, it removes the `PTHREAD_DETACHED` state. The exit value returned by `pthread_join()` of threads cancelled by `rtems_task_delete()` should reflect this by getting a PTHREAD_CANCELED value and not NULL.

Original author: sebastian.huber

Threads may join the thread termination of another thread using the `pthread_join()` or `rtems_task_delete()` directives. Currently, the thread cancel operation uses a special case priority boosting mechanism:

```
static void _Thread_Raise_real_priority(
Thread_Control   *the_thread,
Priority_Control  priority
)
{
Thread_queue_Context queue_context;

_Thread_queue_Context_initialize( &queue_context );
_Thread_queue_Context_clear_priority_updates( &queue_context );
_Thread_Wait_acquire( the_thread, &queue_context );

if ( priority < the_thread->Real_priority.priority ) {
_Thread_Priority_change(
```

(continues on next page)

(continued from previous page)

```
the_thread,
&the_thread->Real_priority,
priority,
PRIORITY_GROUP_LAST,
&queue_context
);
}

_Thread_Wait_release( the_thread, &queue_context );
_Thread_Priority_update( &queue_context );
}
```

The problem is that this approach is not transitive, it does not account for priority adjustments of the calling task while waiting for the join, clustered scheduling is not supported, and deadlocks are not detected. All these problems are fixed by using a priority inheritance thread queue for the join operation.

Author: Trac Migrate 2022-07-19T06:44:07.000Z

At some point during system initialization the idle threads are created. Afterwards the boot processor basically executes within the context of an idle thread with thread dispatching disabled. On some architectures, the thread-local storage state must be applied to processor registers. Add a new CPU port function to do this: `_CPU_Use_thread_local_storage( Context_Control *executing )`.

Original author: aoliva

sys/_bitset.h gets indirectly (*) included by sys/types.h, and should thus define only names that C and C++ standards reserve for the implementation. However, the line:

BITSET_DEFINE(bitset, 1);

expands to a definition of struct bitset in the global namespace.

Some of GCC's libstdc++ tests were failing on aarch64-rtems6.0 because of the naming ambiguity that arises. https://gcc.gnu.org/pipermail/gcc-patches/2022-June/596918.html

It would be best if user programs didn't have to resort to such trickery. In C++, it's not so hard; in C, it can be trickier.

I have not checked whether this struct bitset is actually used for any purpose on aarch64-rtems, or whether it's present on other ports. Maybe it could just be removed or renamed? Maybe upstream (FreeBSD?) would consider dropping it?

(*) sys/types.h includes sys/_pthreadtypes.h includes sys/cpuset.h includes sys/_cpuset.h includes sys/_bitset.h

changed the description

3.9.1.323 4662 - Fix GCC 12 warnings

Id	4662
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate
Created	2022-06-08T04:12:05.000Z
Updated	2024-04-25T20:49:54.396Z
Milestone	6.1
Labels	priority::highest, priority::normal, qualification, resolution::fixed, ticket-type::defect, tool::gcc, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4662
Merges	0

The move to GCC 12 has resulted in an increase in the number of warning. This ticket covers fixing these warning.

Author: Chris Johns 2022-06-13T22:22:46.000Z

In [changeset:"66dc06efcefcd4ea5b5981f81c371ae30633c6ad/rtems" 66dc06e/rtems]:

```
bsp/aarch64: Fix array warning

Updates #4664
```

Author: Trac Migrate 2022-06-15T02:56:27.000Z

In [changeset:"5262b9c2ab43373ff03d31543c9c2ea72ae9ad51/rtems" 5262b9c/rtems]:

```
score/cpu: Silence ARM and AARCH64 GCC 12 false trigger array warning

The false trigger is covered in:

https://gcc.gnu.org/bugzilla/show_bug.cgi?id=99578

GCC 11 and 12 has been patched for constant pointer casts above
4K. This code casts a constant pointer within the first 4K
page. As a result the patch disables the warning.

Updates #4662
```

In [changeset:"0cf0914efef17832ac963cc144f7288845d9b883/rtems" 0cf0914/rtems]:

```
cpukit: Change _COMPILING_NEWLIB to _LIBC for helper functions decls

Updates #4662
```

Author: Chris Johns 2022-06-20T00:39:36.000Z

The `rtems/test.h` code has a few warnings that are confusing:

```
In file included from ../../../testsuites/libtests/ttest01/test-leak.
↪c:1:
../../../cpukit/include/rtems/test.h: In function 'T_case_body_missing_
↪free':
../../../cpukit/include/rtems/test.h:225:9: warning: 'p' may be used␣
↪uninitialized [-Wmaybe-uninitialized]
225 |         T_check_not_null(&T_check_instance, a);                ␣
↪      \\
|           ^~~~~~~~~~~~~~~~
../../../cpukit/include/rtems/test.h:219:6: note: by argument 2 of type
↪'const void *' to 'T_check_not_null' declared here
219 | void T_check_not_null(const T_check_context_msg *, const void *);
|      ^~~~~~~~~~~~~~~~
```

There are some more. Why does the code have tabs? It makes it difficult to update.

Author: Chris Johns 2022-06-20T01:19:56.000Z

The warning in comment:4 looks similar to:

```
[3173/4451] Compiling testsuites/psxtests/psxkey07/init.c
../../../testsuites/psxtests/psxkey07/init.c: In function 'Test_Thread':
../../../testsuites/psxtests/psxkey07/init.c:59:8: warning: 'value_p'␣
↪may be used uninitialized [-Wmaybe-uninitialized]
59 |   sc = pthread_setspecific( Key, value_p );
|        ^~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
In file included from ../../../testsuites/psxtests/psxkey07/init.c:34:
/opt/work/rtems/6/arm-rtems6/include/pthread.h:309:9: note: by argument␣
↪2 of type 'const void *' to 'pthread_setspecific' declared here
309 | int     pthread_setspecific (pthread_key_t __key, const void *__
↪value);
|         ^~~~~~~~~~~~~~~~~~~
```

The code is also similar to the comment:4 test case:

```
int *value_p, *value_p2;

value_p = malloc( sizeof( int ) );
rtems_test_assert(value_p != NULL);
```

Note, I added the `NULL` assert. Is this a false trigger for gcc 12 or something related to the `malloc` decl?

Author: Chris Johns 2022-06-20T01:30:06.000Z

There are a number of validation warnings. This is the bug notice of these warning as per the header.

Author: Chris Johns 2022-08-03T07:18:28.000Z

I would prefer not to have to touch this trail:

```
../../../cpukit/score/src/percpudata.c: In function '_Per_CPU_Data_
↪initialize':
../../../cpukit/score/src/percpudata.c:88:7: warning: 'memcpy' offset 0␣

↪assert( s != NULL );
↪                                                                      ␣
↪                                                                      ␣
↪                                                |extern rtems_filesystem_
↪global_location_t rtems_filesystem_global_location_null;
|   ^~~~~~~~~
↪                                                                      ␣
↪                                                                      ␣
↪                                                    |                 ␣
↪                                                                      ␣
↪                                                                      ␣
↪                                          |
```

The pointer `q` has been free so I am wondering if the `realloc` works because the

same block in the heap is allocated?

Author: Chris Johns 2022-08-03T10:18:25.000Z

I think this warning is due to the pointer being captured in a `static const` variable:

```
In file included from ../../../testsuites/libtests/ttest01/test-leak.c:1:
../../../cpukit/include/rtems/test.h: In function 'T_case_body_missing_free':
../../../cpukit/include/rtems/test.h:225:9: warning: 'p' may be used uninitialized [-Wmaybe-uninitialized]
225 |         T_check_not_null(&T_check_instance, a);                 \
    |         ^~~~~~~~~~~~~~~~
../../../cpukit/include/rtems/test.h:219:6: note: by argument 2 of type 'const void *' to 'T_check_not_null' declared here
219 | void T_check_not_null(const T_check_context_msg *, const void *);
    |      ^~~~~~~~~~~~~~~~
```

It should be OK so I am wondering if this is a false warning?

Author: Chris Johns 2022-08-03T10:24:17.000Z

Replying to Chris Johns:

> I think this warning is due to the pointer being captured in a `static const` variable: The pointer is not part of the `static const` data.

Looking through the Clock Manager at the new APIs, I noticed that there is nothing about what bintime and sbintime are in the "Time and Date Data Structures" section. Explaining what these time representations are is needed.

struct timeval and timespec are also not described in "Time and Data Data Structures" but this may be OK since they are from C and/or POSIX.

There is no discussion of what coarse is versus the non-coarse and what this means in practice.

There is no background on what the various clock sources are.

There may be other similar typos but rtems_clock_get_monotonic() describes its sole argument as being of the wrong type.

Without some background on the various time formats, sources, and terminology, the distinction between these APIs and their intended uses is impossible to figure out.

3.9.1.328 4528 - rate monotonic: reset of CPU usage time not always detected

Id	4528
State	closed

Original author: frank_k

`rtems_rate_monotonic_get_statistics()` and `rtems_rate_monotonic_get_status()` must detect whether the used CPU time was resetted during a period (`rtems_cpu_usage_reset()`). This

is achieved by storing the CPU usage time counter value when the period is started. To detect whether there was a reset, the CPU usage time value from the period start and the current value are compared. If the current value is lower than the one from the start there was a reset.

The bug is that when the current CPU usage time value is greater than the value at the start, a reset may still have occurred.

For example, when the period starts the used CPU time is at 1000 and 1000 is stored. Then the CPU time counter is resetted - so it is 0. Assume the period thread does some work and the CPU usage time is at 100 when `rtems_rate_monotonic_get_status()` is called. In this case the current code detects the reset and returns correctly `RTEMS_NOT_DEFINED`. Yet, when more CPU usage time passes without `rtems_rate_monotonic_period()` being called - lets say the used CPU time is at 1200 - and `rtems_rate_monotonic_get_status()` is called, the stored value (1000) is smaller than the current one (1200) so the reset is not detected.

This bug has been found with a test which manipulates the time directly. I doubt this bug is very relevant in practice. It requires that there are periods with long intervals and much CPU load and that either the system is shortly started or `rtems_cpu_usage_reset()` is used frequently.

The background:

The Classic API guide https://docs.rtems.org/branches/master/c-user/rate-monotonic/directives.html#rtems-rate-monotonic-get-status says for `rtems_rate_monotonic_get_status()`:

`RTEMS_NOT_DEFINED`: There was no status available due to a reset of the processor time usage of the owner task of the period.

The directive `rtems_cpu_usage_reset()` sets `the_thread->cpu_time_used` 0 in line 43 of `cpukit/libmisc/cpuuse/cpuusagereset.c`.

The detection whether there was an reset or not is done in file `cpukit/rtems/src/ratemonperiod.c` line 56 in function `_Rate_monotonic_Get_status()`:

```
[...]
/*
*  Determine cpu usage since period initiated.
*/
_Thread_Get_CPU_time_used( owning_thread, &used );

/*
*  The cpu usage info was reset while executing.  Can't
*  determine a status.
*/
if ( _Timestamp_Less_than( &used, &the_period->cpu_usage_period_initiated ) )
return false;
[...]
```

The directive `rtems_rate_monotonic_get_statistics()` is affected indirectly because collecting its data is skipped when there was a reset. `cpukit/rtems/src/ratemonperiod.c` line 149 in function `_Rate_monotonic_Update_statistics()` (which in turn calls the above code).

```
rtems: Fix rate monotonic statistics

The rate monotonic period statistics were affected by
rtems_cpu_usage_reset().  The logic to detect and work around a CPU
usage reset was broken.

The Thread_Contol::cpu_time_used is changed to contain the processor
time used throughout the entire lifetime of the thread.  The new member
Thread_Contol::cpu_time_used_at_last_reset is added to contain the
processor time used at the time of the last reset through
rtems_cpu_usage_reset().  This decouples the resets of the CPU usage and
the rate monotonic period statistics.

Update #4528.

Merges	0

The move to statically allocate the stacks for the IDLE threads resulted in the loss of the capability for a custom stack allocator to be able to allocate the idle threads' stacks. This occurred close to the 5 branching point and is addressed for the 5 branch by #4520. This ticket is for the master (6).

Original author: sebastian.huber

The message queue handler uses the thread queue extract operation to dequeue a receiver thread. This is wrong in SMP configurations since the extract thread queue operation does not ensure FIFO fairness across schedulers. The thread queue surrender operation should be used instead.

```
score: Fix blocking message queue receive

In order to ensure FIFO fairness across schedulers, the thread queue
surrender operation must be used to dequeue a thread from the thread
queue.  The thread queue extract operation is intended for timeouts.

Add _Thread_queue_Resume() which may be used to make extracted or
surrendered threads ready again.

Remove the now unused _Thread_queue_Extract_critical() function.

Close #4509.

The _RTEMS Classic API **Guide**_ https://docs.rtems.org/branches/master/c-user/index.html in _Message **Manager**_ → _Directives_ → section 14.4.8 _rtems_message_queue_receive()_ says:

> `RTEMS_UNSATISFIED`: The queue was flushed while the calling task was waiting to receive a message.
>
> Yet, when I tested it, this does not happen. A waiting task is not released from the message queue when calling `rtems_message_queue_flush()`. Moreover, I did not find any sign in the source code of `rtems_message_queue_flush()` which look liked it would dequeue waiting threads. (In contrast `rtems_message_queue_delete()` does!) Furthermore, there is no other hint in the documentation of either function that `flush()` would kick out waiting receivers.
>
> I may misinterpret the documentation above or oversee something in the code. Yet, I believe the text I cited above is a mistake in the documentation and should simply be removed.
>
> How to reproduce/How I tested:
>
> The debug output of my test looks like (the worker task is not released by `rtems_message_queue_flush()` but afterwards by a timeout of 3 ticks):

Original author: sebastian.huber

Currently, the trap table is statically initialized (see start.S). Unexpected traps end up in system error mode. Later during startup most traps are changed to jump to _ISR_Handler(). This is a side-effect of bsp_spurious_initialize(). The used functions for this dynamic initialization are a bit complex and need cache manager directives which involve all online processors. This should be simplified to cover only basic requirements.

1. The _ISR_Vector_table should be initialized by _CPU_Initialize_vectors() to an new default handler _SPARC_ISR_handler_default() which just invokes _Terminate().

2. The traps associated with external interrupts (0x11 up to including 0x1f) should be statically initialized in start.S to jump to _ISR_Handler().

3. Standard synchronous exceptions such as * 0x01 instruction access exception * 0x02 illegal instruction * 0x03 privileged instruction * 0x04 fp disabled * 0x07 memory address not aligned * 0x08 fp exception * 0x09 data access exception * 0x0A tag overflow * 0x24 cp_disabled * 0x28 cp_exception

should also be statically initialize to jump to _ISR_Handler() to invoke the fatal error handler.

If software needs to change the default initialization, then it can use set_vector() or alternatives on demand.

```
sparc: Simplify trap table initialization

Move _ISR_Handler() to a separate file since it is now only used if a handler
is installed by _CPU_ISR_install_raw_handler().

Statically initialize the traps for external interrupts to use the new
_SPARC_Interrupt_trap() which directly dispatches the interrupt handlers
installed by rtems_interrupt_handler_install() via the BSP-provided
_SPARC_Interrupt_dispatch().

Since the trap table is now fully statically initialized, there is no longer a
dependency on the Cache Manager in the default configuration.

Update #4458.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4455
Merges	0

Original author: soja

The current implementation of the TSC calibration during startup yields inaccurate results.

There are 2 issues:

1. Rounding error:

The `calibrate_tsc` function calibrates for 1s by waiting for `rtems_clock_get_ticks_per_second()` ticks via the PIT.

The PIT has a frequency of 1193182 Hz. For a rtems tick of 1ms this yields 1193. Waiting for 1s means then waiting for 1193000 PIT ticks (instead of the full 1193182). For a 1 GHz TSC clock this would yield already ~150 kHz less then the correct TSC frequency.

2. Waiting for the first loop at begin of timer period

```
for (i = rtems_clock_get_ticks_per_second() * pc386_isrs_per_tick;
i != 0; --i ) {
/* We know we've just completed a tick when timer goes from low to high */
then_lsb = then_msb = 0xff;
do {                            <== First loop does not start at begin of clock␣
↪period
READ_8254(now_lsb, now_msb);
if ((then_msb < now_msb) ||
((then_msb == now_msb) && (then_lsb < now_lsb)))
break;
then_lsb = now_lsb;
then_msb = now_msb;
} while (1);
}
```

This can yield deviations of several MHz for the TSC frequency. For example, for a tested CPU with a TSC frequency of 19167.1 MHz yields a calibration result of 1912.3 MHz.

Proposed solution

- Just wait 1193182 PIT ticks for 1 s instead of a number of rtems ticks
- Use the raw timer value instead of waiting for clock ticks.

3.9.1.339 4435 - Thread cancellation may produce ready threads with an active thread timer

Id	4435
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2021-05-20T15:15:13.000Z
Updated	2024-04-25T20:49:04.199Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::fixed, rtems::score, ticket-type::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4435
Merges	0

Original author: sebastian.huber

The _Thread_Cancel() (in contrast to _Thread_Restart() which uses a similar code block) may produce ready threads with an active timer in case the thread to cancel has its thread life protection enabled. The problem is this code block:

```
Priority_Control priority;

_Thread_Add_life_change_request( the_thread );

if ( _Thread_Is_life_change_allowed( previous ) ) {
_Thread_State_release( the_thread, &lock_context );

_Thread_queue_Extract_with_proxy( the_thread );
_Thread_Timer_remove( the_thread );
} else {
_Thread_Clear_state_locked( the_thread, STATES_SUSPENDED );
_Thread_State_release( the_thread, &lock_context );
}

priority = _Thread_Get_priority( executing );
_Thread_Raise_real_priority( the_thread, priority );
_Thread_Remove_life_change_request( the_thread );
```

The life change request should only be added/removed if a life change is allowed (see _Thread_Restart()).

Author: Trac Migrate 2021-05-26T12:41:24.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"ce6319ade410d304c187de6d107b52da4a32e255/rtems" ce6319a/rtems]:

```
score: Fix _Thread_Cancel()

The _Thread_Cancel() (in contrast to _Thread_Restart() which used a
similar code block) may have produced ready threads with an active timer
in case the thread to cancel had its thread life protection enabled. The
problem was this code block:

Priority_Control priority;

_Thread_Add_life_change_request( the_thread );

if ( _Thread_Is_life_change_allowed( previous ) ) {
_Thread_State_release( the_thread, &lock_context );

_Thread_queue_Extract_with_proxy( the_thread );
_Thread_Timer_remove( the_thread );
} else {
_Thread_Clear_state_locked( the_thread, STATES_SUSPENDED );
_Thread_State_release( the_thread, &lock_context );
}

priority = _Thread_Get_priority( executing );
_Thread_Raise_real_priority( the_thread, priority );
_Thread_Remove_life_change_request( the_thread );

The life change request should only be added/removed if a life change is
allowed (see _Thread_Restart()).  Add _Thread_Try_life_change_request()
and use it in _Thread_Cancel() and _Thread_Restart().

Close #4435.
```

Original author: sebastian.huber

In rtems_task_restart() there is a check if the executing thread is restarted. However, in interrupt context, this simple check results in an internal error INTERNAL_ERROR_BAD_THREAD_DISPATCH_DISABLE_LEVEL if the executing thread is restarted.

Check also if an ISR is in progress to make sure the thread restart works within interrupt context.

Author: Joel Sherrill 2021-05-14T13:01:36.000Z

Original author: sebastian.huber

This service is not documented as being allowed from an ISR. Only task suspend and resume are documented as allowed. I assume by “works” you mean that it returns an error without an internal error.

Author: Trac Migrate 2021-05-14T13:08:57.000Z

Original author: sebastian.huber

The rtems_task_restart() works well if called from within interrupt context if you use _ISR_Is_in_progress() to determine a self restart. This directive doesn't use a mutex internally only ISR locks.

Author: Trac Migrate 2021-05-14T15:05:31.000Z

Original author: sebastian.huber

- **Resolution** set to ~”fixed”
- **Status** changed from *assigned* to *closed*

In [changeset:”73ebf9a27ed5cd0fd3e0dc0da98345d7faa610a2/rtems” 73ebf9a/rtems]:

```
rtems: Fix task restart within interrupt context

rtems_task_restart() may be called from within interrupt context.  So
checking only that the thread to restart is equal to the executing
thread is insufficient to determine a self restart.  We have to also
check that no ISR is in progress.  Merge _Thread_Restart_other() and
_Thread_Restart_self() into one _Thread_Restart() since they share a lot
of common code.

Close #4412.
```

Author: Trac Migrate 2021-05-26T12:41:27.000Z

Original author: sebastian.huber

In [changeset:”de694b753ca11136adce7600d55642695c8ef39d/rtems” de694b75/rtems]:

```
score: Direct thread dispatch in a self restart

Commit 73ebf9a27ed5cd0fd3e0dc0da98345d7faa610a2 accidentally removed the
direct thread dispatch in a self thread restart.  In case of a self
restart (always in task context) the directive shall not return.  If
this is not possible due to a bad thread dispatch disable level, then a
fatal error shall occur.

Update #4412.
```

In [changeset:"523867de9d274d2bdc29ce649d764b42a9167c0e/rtems" 523867d/rtems]:

```
rtems: Constify rtems_task_wake_when()

Add a parameter to _TOD_Validate() to disable the validation of the
ticks member.

There are two reasons for this change.  Firstly, in
rtems_task_wake_when() was a double check for time_buffer == NULL (one
in rtems_task_wake_when() and one in _TOD_Validate()).  Secondly, the
ticks member is ignored by rtems_task_wake_when().  This was done with a
write of zero to the ticks member and thus a modification of the
user-provided structure.  Now the structure is no longer modified.
Using a mask parameter is quite efficient. You just have to load an
immediate value and there are no additional branches in _TOD_Validate().

Original author: sebastian.huber

In case the processor set is not large enough to contain the processor set of the scheduler return RTEMS_INVALID_SIZE instead of RTEMS_INVALID_NUMBER. This is more in line with other directives since the issue is related to the size of an object.

A similar change was done in #4393.

Original author: sebastian.huber

There is a special case in malloc() which results in a malloc(0) == NULL invariant. This special case should move to rtems_heap_allocate_aligned_with_boundary() to have a consistent behaviour across the API level memory allocation directives.

Author: Trac Migrate 2021-04-20T18:37:24.000Z

Original author: sebastian.huber

- **Summary** changed from *Make zero size allocation result consistent accross directives* to *Make zero size allocation result consistent across directives*

Author: Joel Sherrill 2021-04-20T22:41:58.000Z

Original author: sebastian.huber

This is an area of undefined behavior per POSIX. It might be worth considering having this be a debug failure.

https://pubs.opengroup.org/onlinepubs/009695399/functions/malloc.html

Author: Trac Migrate 2021-04-21T04:43:41.000Z

Original author: sebastian.huber

It is not undefined behaviour in the latest POSIX edition:

https://pubs.opengroup.org/onlinepubs/9699919799/functions/malloc.html

It is implementation-defined behaviour. The implementation has two options. The RTEMS malloc(0) returns NULL. Linux seems to return a unique pointer.

The rtems_memalign(&p, 8, 0) returns a unique pointer. I think this size == 0 behaviour should be consistent in RTEMS.

Author: Trac Migrate 2021-05-04T11:08:10.000Z

Original author: Alex

The AArch64 annotated assembly produced by covoar reveals that branches that are never taken are marked “ALWAYS TAKEN” and branches that are always taken are marked “NEVER TAKEN”.

It appears that this is caused by incorrect return values in `TargetBase::qemuTakenBit()` and `TargetBase::qemuNotTakenBit()`. These methods should be overridden in `Target_aarch64` so that the return values are switched.

Original author: Alex

To get covoar working again, the ELF and DWARF info cleanup was moved from the `ExecutableInfo` constructor to the `ExecutableInfo` destructor. Without this change, covoar would report the locations of symbols as `unknown:-1`. This is because the DWARF info is used later in the `ExecutableInfo::getSourceAndLine()` method with a call to `debug.get_source()`.

This caused a new issue: the ELF and DWARF info is now held in memory for the life of the program. This causes very high memory usage when running covoar, more than 10 GB for some BSPs.

A quick and dirty solution is to find what is being referenced in `debug.get_source()` and preserve it after `debug.end()` is called. It appears that refraining from calling `cus.clear()` in `rld::dwarf::file::end()` would be a good place to start. Additionally, the `rld::dwarf::sources` class will likely need to be changed to copy out the DWARF source file info.

Original author: Alex

The `Coverage::GenerateReports()` function uses a variable of type `std::list<ReportsBase *>` to store the `ReportsBase`-derived classes used to generate the reports. The function should use an `std::vector<std::unique_ptr<ReportsBase>>` instead.

An `std::vector` is the preferred container type in this case because the constant-time insertion and removal properties of `std::list` are not needed. The smart pointer type `std::unique_ptr<ReportsBase>` is preferred over `ReportsBase *` because it eliminates the need for manual pointer deletion at the end of the function.

Original author: Alex

The covoar tool should be changed to handle all symbol sets for a coverage run rather than being called by coverage.py for each symbol set.

Currently, coverage.py calls covoar once for each symbol set found in the symbol-sets.ini configuration file. This leads to a lot of redundancy. For each symbol set, covoar has to process the objdumps and the coverage information of all the executables even though they do not change.

Changing covoar to process all symbol sets and generate reports in one invocation will result in a large speedup.

This will also require a minor modification to coverage.py to generate the correct .ini file and only call covoar once.

In [changeset:"b02600a6bbc4d0524b731e504c91bc293d70a354/rtems-tools" b02600a/rtems-tools]:

```
covoar: Split symbols by symbol set

This changes the way covoar organizes the symbols. Instead of treating
all symbols as one set, covoar is now aware of multiple symbol sets and
tracks statistics for each set. It now also generates reports for each
symbol set.
```

(continues on next page)

(continued from previous page)

```
7
8  This change relieves the caller of covoar of the reponsibility of
9  managing the symbol sets. As a result, covoar can minimize the work
10 done for each symbol set, yielding a significant speedup.
11
12 Updates #4374
```

Original author: sebastian.huber

The priority queues in clustered scheduling configurations use a per scheduler priority queue rotation to ensure FIFO fairness across schedulers. This mechanism is implemented in the thread queue surrender operation. Unfortunately some semaphore and message queue directives use wrongly the thread queue extract operation.

Author: Trac Migrate 2021-09-02T05:48:04.000Z

Original author: sebastian.huber

In [changeset:"9c0591f12d450401746bc0bf7cd7a0e0b14a5f3b/rtems" 9c0591f1/rtems]:

```
score: Fix priority discipline handling

The priority queues in clustered scheduling configurations use a per
scheduler priority queue rotation to ensure FIFO fairness across
schedulers.  This mechanism is implemented in the thread queue surrender
operation.  Unfortunately some semaphore and message queue directives
used wrongly the thread queue extract operation.  Fix this through the
use of _Thread_queue_Surrender().

Update #4358.

Original author: sebastian.huber

In _Thread_Initialize() we have this code:

```
_Objects_Open_u32( &information->Objects, &the_thread->Object, config->name );

/*
*  We assume the Allocator Mutex is locked and dispatching is
*  enabled when we get here.  We want to be able to run the
*  user extensions with dispatching enabled.  The Allocator
*  Mutex provides sufficient protection to let the user extensions
*  run safely.
*/
extension_status = _User_extensions_Thread_create( the_thread );
if ( extension_status )
return true;
```

If an extension fails, then the thread object is not closed. Also the delete extensions are not called. If a later create extension fails, the earlier create extensions may have allocated resources

which could be freed by a corresponding delete extension.

Author: Trac Migrate 2021-02-26T07:51:50.000Z

This captures a user's environment variables?

Author: Trac Migrate 2021-02-25T07:22:20.000Z

Original author: sebastian.huber

There are always means to sabotage something. We don't recommend the use of environment variables and a waf configure warns about them. I will add a note that environment variables are not recommended and not used for the build hash.

Author: Trac Migrate 2021-02-25T15:13:58.000Z

Original author: sebastian.huber

As discussed on the mailing list I tried the following approach. Iterate over all start files and libraries generated by the build and then create a hash of all executable sections. Then we recompile one object with a command line define with the build hash and replace this object in librtemscpu.a. Unfortunately, this exceeds my waf skills at the moment. I think it is feasible, but you really have to know how to adjust the waf tasks through meta programming.

Author: Trac Migrate 2021-11-23T13:52:54.000Z

Original author: sebastian.huber

3.9.1.379 4245 - Add PCI regions support to RTEMS nexus bus support

Id	4245
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2021-02-15T21:28:56.000Z
Updated	2024-04-25T20:48:36.160Z
Milestone	6.1
Labels	arch:powerpc, bsp, library::libbsd, priority::normal, resolution::fixed, tickettype::enhancement, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4245
Merges	0

The RTEMS Nexus bus support in LibBSD assumes a linear address map with a `!:1` address mapping between the PCI bus master and CPU. Some target hardware has a different PCI bus master address space to the CPU memory address space.

- Provide a BSP means to enable PCI support in `machine/bus.h` in LibBSD
- Update `powerpc/motorola_powerpc` to support cache coherent memory
- Change any PowerPC internal calls that clash with the Linux IO interface used in LibBSD. The PowerPC shared BSP calls have a different call signature

Author: Trac Migrate 2021-02-16T20:31:57.000Z

In [changeset:"6e3c6e044e17286b500bcbba42abe2d0777327a7/rtems" 6e3c6e04/rtems]:

```
powerpc/io: Make [out/in] le and be calls conditional

- These calls clash with the Linux IO header in LibBSD. Making these
conditional here means BSPs build and the imported Linux header is
untouched.

Updates #4245

3.9.1.380 4244 - Possible infinite recursion in Classic API Signal handling

Id	4244
State	closed

Original author: sebastian.huber

Due to implementation flaws, there may be an infinite recursion in the signal processing even if ASR mode is disabled during signal processing. The problem is that rtems_task_mode() is used to set up and tear down the ASR-specific task mode. This needs to be changed to set the modes under protection of the right locks and using a loop instead of recursion to schedule the next ASR processing step if needed.

Original author: sebastian.huber

The rtems_build_name() is implemented by: {{{!c

define _Objects_Build_name(_C1, _C2, _C3, _C4) \

((uint32_t)(_C1) << 24 | (uint32_t)(_C2) << 16 | (uint32_t)(_C3) << 8 | (uint32_t)(_C4)) }}} If the name is build from four “char” components, then the result depends on the signedness of the char type. The macro should first cast the chars to uint8_t.

Original author: sebastian.huber

If we want to use gcov in RTEMS to get code coverage in all system states, then we need some tweaks in GCC:

https://gcc.gnu.org/pipermail/gcc/2020-November/234164.html

The linker set based gcov information registration is already included in GCC:

https://gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html#index-fprofile-info-section

There is a discussion about how the gcov information can be transferred from the embedded system to the host:

https://gcc.gnu.org/pipermail/gcc-patches/2020-November/559342.html

The following patch set was integrated in GCC 13:

https://gcc.gnu.org/pipermail/gcc-patches/2022-April/593536.html

https://gcc.gnu.org/onlinedocs/gcc/Freestanding-Environments.html#Freestanding-Environments

- 0001-Back-port-__gcov_info_to_gcda-to-GCC-10.patch
- 0001-Back-port-v1-of-gcov-tool-merge-stream-to-GCC-12.patch

Original author: sebastian.huber

Currently, the Classic API initialization task is created with rtems_task_create(). In order to better support applications which use the new rtems_task_construct() directive add a configuration options which constructs the Classic API initialization task with rtems_task_construct():

```
/* Generated from spec:/acfg/if/init-task-storage-size */

/**
* @brief This configuration option is an integer define.
*
* The value of this configuration option defines the task storage size of the
* Classic API initialization task.  If this configuration option is specified,
* then the Classic API initialization task is constructed by
* rtems_task_construct() instead of using rtems_task_create().
*
* @par Default Value
* The default value is 0.
*
* @par Value Constraints
* @parblock
* The value of this configuration option shall satisfy all of the following
* constraints:
*
* * It shall be greater than or equal to #CONFIGURE_MINIMUM_TASK_STACK_SIZE.
```

(continues on next page)

(continued from previous page)

```
*
* * It shall be defined using RTEMS_TASK_STORAGE_SIZE().
* @endparblock
*
* @par Notes
* @parblock
* A task storage area of the specified size is defined by the configuration
* for the Classic API initialization task.  The
*
* * #CONFIGURE_INIT_TASK_STACK_SIZE and
*
* * ``CONFIGURE_INIT_TASK_STORAGE_SIZE``
*
* configuration options are mutually exclusive.
* @endparblock
*/
#define CONFIGURE_INIT_TASK_STORAGE_SIZE
```

Author: Trac Migrate 2020-12-12T12:53:44.000Z

Original author: sebastian.huber

In [changeset:"fcd9618ac84e04d363741419e67b5d618ebe6a81/rtems" fcd9618a/rtems]:

```
config: Fix invalid static assertions in C

Expressions in static assertions must be integral constant expressions. In
integral constant expressions the use of address constant expressions is not
allowed.

In static initializers the address constant expressions are allowed. Introduce
a new macro _CONFIGURE_ASSERT_NOT_NULL() which leads to a compile time error if
the second parameter is NULL.  It generates error messages like this if for
example

#define CONFIGURE_INIT_TASK_ENTRY_POINT NULL

is provided by the application:

cpukit/include/rtems/confdefs/inittask.h:51:26: error: size of unnamed array is negative
51 |     ( _type ) sizeof( int[ ( _value ) != NULL ? 1 : -1 ] ) )
|                          ^
cpukit/include/rtems/confdefs/inittask.h:170:3: note: in expansion of macro '_CONFIGURE_ASSERT_NOT_NULL'
170 |   _CONFIGURE_ASSERT_NOT_NULL(
|   ^~~~~~~~~~~~~~~~~~~~~~~~~~

This fix relates to CID 1470570 (PARSE_ERROR).

Update #4181.
```

```
leon,tn-0018: work around GRLIB-TN-0018 errata

Overview
========

The errata is worked around in the kernel without requiring toolchain
modifications. It is triggered the JMPL/RETT return from trap␣
↪instruction
sequence never generated by the compiler and. There are also other
conditions that must must be true to trigger the errata, for example the
instruction that the trap returns to has to be a JMPL instruction. The
errata can only be triggered if certain data is corrected by ECC
(inflicted by radiation), thus it can not be triggered under normal
operation. For more information see:
www.gaisler.com/notes

Affected RTEMS target BSPs:
* GR712RC
* UT699
* UT700/699E

The work around is enabled by defining __FIX_LEON3_TN0018 at build time.
After applying the following GCC patch, GCC will set the define when
compiling for an affected multilib:
* GR712RC (-mcpu=leon3 -mfix-gr712rc)
* UT700/UT699E (-mpcu=leon3 -mfix-ut700)
* UT699 (-mcpu=leon -mfix-ut699)
When building for another multilib and TN0018 is still required, it
is possible to enable it on the RTEMS kernel configure line using the
TARGET_CFLAGS (-D__FIX_LEON3FT_TN0018) or other by other means.

The following GCC patch sets __FIX_LEON3FT_TN0018 for the affected RTEMS
multilibs:

(continued from previous page)

```
Workaround Implementation
=========================

In general there are two approaches that the workaround uses:
A) avoid ECC restarting the RETT instruction
B) avoid returning from trap to a JMPL instruction

Where A) comes at a higher performance cost than B), so B) is used
where posssible. B) can be achived for certain returns from trap
handlers if trap entry is controlled by assembly, such as system calls.

A)
A special JMPL/RETT sequence where instruction cache is disabled
temporarily to avoid RETT containing ECC errors, and reading of RETT
source registers to "clean" them from incorrect ECC just before RETT
is executed.

B)
The work around prevents JMPL after system calls (TA instruction) and
modifies assembly code on return from traps jumping back to application
code. Note that for some traps the trapped instruction is always
re-executed and can therefore not trigger the errata, for example the
SAVE instruction causing window overflow or an float instruction causing
FPU disabled trap.

RTEMS SPARC traps workaround implementation:
NAME                  NOTE   TRAP   COMMENT
* window overflow         1 - 0x05   always returns to a SAVE
* window underflow        1 - 0x06   always returns to a RESTORE
* interrupt traps         2 - 0x10..1f special rett sequence workaround
* syscall                 3 - 0x80   shutdown system - never returns
* ABI flush windows       2 - 0x83   special rett sequence workaround
* syscall_irqdis          4 - 0x89
* syscall_irqen           4 - 0x8A
* syscall_irqdis_fp       1 - 0x8B   always jumps back to FP instruction
* syscall_lazy_fp_switch  5 - 0x04   A) jumps back to FP instruction,␣
↪or to
B) _Internal_error() starting with SAVE

Notes:
1) no workaround needed because trap always returns to non-JMPL␣
↪instruction
2) workaround implemented by special rett sequence
3) no workaround needed because system call never returns
4) workaround implemented by inserting NOP in system call generation.␣
↪Thus
fall into 1) when workaround is enabled and no trap handler fix needed.
5) trap handler branches into both 1) and returning to _Internal_error()
which starts with a SAVE and besides since it shuts down the system that
```

(continues on next page)

(continued from previous page)

```
RETT should never be in cache (only executed once) so fix not necessary
in this case.

Any custom trap handlers may also have to be updated. To simplify that,
helper work around assembly code in macros are available in a separate
include file <libcpu/grlib-tn-0018.h>.

Close #4155.
```

Merges	0

Original author: sebastian.huber

RTEMS is a real-time operating system and the applications using RTEMS end up in a single executable which contains also the full system initialization. The linker uses a start file to determine what should be linked into the executable. The start file is also built by the build system, however, it is only indirectly referenced via a linker script, for example:

https://git.rtems.org/rtems/tree/bsps/arm/shared/start/linkcmds.base#n28

So, every executable depends on the start file (start.o usually). If start.o changes, then the executable needs to be re-linked. Also the start file needs the name expected by the linker script, for example not start.S.17.o.

The start files are build with this commands:

https://git.rtems.org/rtems/tree/wscript#n535

https://git.rtems.org/rtems/tree/wscript#n244

Somehow we have to add a dependency on start.o to every executable.

To experiment with the build system use the following commands to set it up:

```
cd $HOME
mkdir rtems-sdk
mkdir rtems-sdk/src
cd rtems-sdk/src
git clone git://git.rtems.org/rtems.git
git clone git://git.rtems.org/rtems-source-builder.git rsb
```

(continues on next page)

(continued from previous page)

```
cd rsb/rtems
../source-builder/sb-set-builder --prefix=$HOME/rtems-sdk/6 6/rtems-sparc
cd ../../rtems
echo "[sparc/leon3]" > config.ini
./waf configure --prefix=$HOME/rtems-sdk/6
./waf
```

The host must be capable to build GCC and needs the Python development support (header files) installed.

Author: Trac Migrate 2020-09-16T07:04:51.000Z

In [changeset:"4eea8d4bc44116b3465d7fdeb053d66bf95428f4/rtems" 4eea8d4/rtems]:

```
build: Fix dependencies for start and asm files

Add a feature to enforce an explicit target file for assembler sources.
Add a build start file node list and use it as a test program
dependency.

The fix for #3846 and #4080 needs to be combined, because the fix
for #3846 requires the removal of 'before=["cstlib"]'. This patch fixes
two issues:

1. The tracking of start file dependencies.

2. Reflect that executables depend on the start files.

We need a start.o file in the right path so that the linker can find is
as specified by the linker script, and not for example a start.S.17.o
file in some path. This part is addressed by the "explicit_asm_target"
feature.

This build process extension

@after("apply_link")
@feature("cprogram", "cxxprogram")
def process_start_files(self):
if getattr(self, "start_files", False):
self.link_task.dep_nodes.extend(self.bld.start_files)

addresses 2.

```

Original author: sebastian.huber

The free() implementation in RTEMS supports that allocated memory is freed in interrupt context. Since the heap is protected by a mutex, the frees issued in interrupt context cannot immediately be freed to the heap, instead they are placed on a deferred free list. This list is emptied by the core allocation function rtems_heap_allocate_aligned_with_boundary(). This adds a dependency to free() in rtems_heap_allocate_aligned_with_boundary(). In order to better support applications which only allocate memory an never free it, this dependency should be avoided.

This can be done with a weak default implementation of _Malloc_Process_deferred_frees(). In the free() module a strong implementation can be provided.

Original author: sebastian.huber

In RTEMS 5 a lot of development was done to allow a static allocation of resources provided by RTEMS and avoid the use of a heap. Similar to #3959 a new directive to build Classic API message queues without using the workspace is proposed:

```
/**
* @brief The message queue configuration to construct a message queue.
*/
typedef struct {
/**
* @brief The name of the message queue.
*/
rtems_name name;

/**
* @brief The count of the provided buffers.
*
* This value defines the maximum number of pending messages.
*/
size_t buffer_count;

/**
* @brief The size of the provided buffers in bytes.
*/
```

(continues on next page)

(continued from previous page)

```
size_t buffer_size;

/**
* @brief The array of count message buffers.
*
* Each buffer shall have the size of the buffer_size member.  The maximum
* message size is buffer_size minus sizeof( rtems_message_queue_buffer ).
*/
rtems_message_queue_buffer *buffers;

/**
* @brief The attribute set of the message queue.
*/
rtems_attribute attributes;
} rtems_message_queue_config;

/**
* @brief Constructs a message queue according to the specified configuration.
*
* @param config The message queue configuration.
* @param[out] id The message queue identifier of the new message queue.
*
* @retval RTEMS_SUCCESSFUL Successful operation.
* @retval RTEMS_INVALID_ADDRESS The id parameter is @c NULL.
* @retval RTEMS_INVALID_NAME The message queue name is invalid.
* @retval RTEMS_TOO_MANY No message queue is available.
*/
rtems_status_code rtems_message_queue_construct(
const rtems_message_queue_config *config,
rtems_id                         *id
);
```

Original author: sebastian.huber

For the RTEMS Qualification project we need a specification of the RTEMS Classic API. This specification can be used to generate an Interface Control Document (ICD), header files with Doxygen markup and content for the RTEMS Classic API Guide. The RTEMS Classic API is mainly defined in the following header files:

- <rtems.h>
- <rtems/config.h>
- <rtems/extension.h>
- <rtems/fatal.h>
- <rtems/init.h>
- <rtems/io.h>
- <rtems/rtems/barrier.h>
- <rtems/rtems/cache.h>
- <rtems/rtems/clock.h>
- <rtems/rtems/config.h>
- <rtems/rtems/dpmem.h>
- <rtems/rtems/event.h>
- <rtems/rtems/intr.h>
- <rtems/rtems/message.h>
- <rtems/rtems/modes.h>
- <rtems/rtems/mp.h>
- <rtems/rtems/object.h>
- <rtems/rtems/options.h>
- <rtems/rtems/part.h>
- <rtems/rtems/ratemon.h>
- <rtems/rtems/region.h>
- <rtems/rtems/sem.h>
- <rtems/rtems/signal.h>
- <rtems/rtems/status.h>
- <rtems/rtems/support.h>
- <rtems/rtems/tasks.h>
- <rtems/rtems/timer.h>
- <rtems/rtems/types.h>
- <rtems/score/stack.h>

Examples for interface specification items are available here:

https://git.rtems.org/sebh/rtems-qual.git/tree/spec/if/rtems/status

You find an example for a generated header file here:

https://git.rtems.org/sebh/rtems.git/tree/cpukit/include/rtems/rtems/status.h?h=qual

The header files are generated by this script:

https://git.rtems.org/sebh/rtems-qual.git/tree/spec2rtems.py

As preliminary work, remove all RTEMS APIs deprecated in RTEMS 5.1.

Use and improve the Interface Specification How-To during the work on this ticket.

Carry out the following tasks for each header file:

1. Add a interface specification item for each variable, typedef, enum, enumerator, define, macro, function, struct, and union.
2. For each item analyse the change history using `git log -p --follow` to determine the copyright holders of the Doxygen markup. Use only Doxygen markup for the specification items from contributors which agreed on a dual-licensing (CC-BY-SA-4.0 OR BSD-2-Clause) in #3899. Use this information to provide copyright statements for the items. The API parts alone (e.g. function names, parameter names, type names, etc.) are not considered to be copyrightable information.
3. Use the RTEMS documentation sources to document the API. Use only content from contributors which agreed on a dual-licensing (CC-BY-SA-4.0 OR BSD-2-Clause) in #3899.
4. Add unspecified interface items for interfaces to the implementation, C language, compiler, user provided defines, build system provided defines, etc.
5. Run the RTEMS test suite with all tests enabled and check for regressions (in particular new warnings).
6. Create a commit for each header file and send it to the RTEMS mailing list for review.

The global variable _RTEMS_version was declared via <rtems.h> and may be used directly by application code. Applications should use rtems_get_version_string() instead. Move it to an implementation header file in RTEMS 6.

Original author: sebastian.huber

In RTEMS 5 a lot of development was done to allow a static allocation of resources provided by RTEMS and avoid the use of a heap. One missing piece is the support for statically allocated RTEMS tasks. The rtems_task_create() function allocates the task stack from a heap. We need an alternative function which allocates an RTEMS tasks with a user provided stack (similar to the POSIX threads).

There does need to be documentation on the allocation strategies, when to use, limitations, and particularly the use of rtems-exeinfo to get the TLS size. This is one case for sure where an RTEMS Tool needs explicit mention in both the API and configure option sections.

Proposed API:

```
/**
* @brief This structure defines the configuration of a task constructed by
*   rtems_task_construct().
*/
typedef struct {
/**
* @brief This member defines the name of the task.
*/
rtems_name name;

/**
* @brief This member defines the initial priority of the task.
*/
rtems_task_priority initial_priority;

/**
* @brief This member shall point to the task storage area begin.
*
* The task storage area will contain the task stack, the thread-local storage,
* and the floating-point context on architectures with a separate
* floating-point context.
*
```

(continues on next page)

(continued from previous page)

```
* The task storage area begin address and size should be aligned by
* #RTEMS_TASK_STORAGE_ALIGNMENT.  To avoid memory waste, use RTEMS_ALIGNED()
* and #RTEMS_TASK_STORAGE_ALIGNMENT to enforce the recommended alignment of a
* statically allocated task storage area.
*/
void *storage_area;

/**
* @brief This member defines size of the task storage area in bytes.
*
* Use the RTEMS_TASK_STORAGE_SIZE() macro to determine the recommended task
* storage area size.
*/
size_t storage_size;

/**
* @brief This member defines the maximum thread-local storage size supported
*   by the task storage area.
*
* Use RTEMS_ALIGN_UP() and #RTEMS_TASK_STORAGE_ALIGNMENT to adjust the size to
* meet the minimum alignment requirement of a thread-local storage area used
* to construct a task.
*
* If the value is less than the actual thread-local storage size, then the
* task construction by rtems_task_construct() fails.
*
* If the is less than the task storage area size, then the task construction
* by rtems_task_construct() fails.
*
* The actual thread-local storage size is determined when the application
* executable is linked.  The ``rtems-exeinfo`` command line tool included in
* the RTEMS Tools can be used to obtain the thread-local storage size and
* alignment of an application executable.
*
* The application may configure the maximum thread-local storage size for all
* threads explicitly through the #CONFIGURE_MAXIMUM_THREAD_LOCAL_STORAGE_SIZE
* configuration option.
*/
size_t maximum_thread_local_storage_size;

/**
* @brief This member defines the optional handler to free the task storage
*   area.
*
* It is called on exactly two mutually exclusive occasions.  Firstly, when the
* task construction aborts due to a failed task create extension, or secondly,
* when the task is deleted.  It is called from task context under protection
* of the object allocator lock.  It is allowed to call free() in this handler.
* If handler is NULL, then no action will be performed.
```

(continues on next page)

(continued from previous page)

```
*/
void ( *storage_free )( void * );

/**
* @brief This member defines the initial modes of the task.
*/
rtems_mode initial_modes;

/**
* @brief This member defines the attributes of the task.
*/
rtems_attribute attributes;
} rtems_task_config;

/**
* @brief Constructs a task from the specified the task configuration.
*
* In contrast to tasks created by rtems_task_create(), the tasks constructed
* by this directive use a user-provided task storage area.  The task storage
* area contains the task stack, the thread-local storage, and the
* floating-point context on architectures with a separate floating-point
* context.
*
* This directive is intended for applications which do not want to use the
* RTEMS Workspace and instead statically allocate all operating system
* resources.  It is not recommended to use rtems_task_create() and
* rtems_task_construct() together in an application.  It is also not
* recommended to use rtems_task_construct() for drivers or general purpose
* libraries.  The reason for these recommendations is that the task
* configuration needs settings which can be only given with a through
* knowledge of the application resources.
*
* An application based solely on static allocation can avoid any runtime
* memory allocators.  This can simplfiy the application architecture as well
* as any analysis that may be required.
*
* The stack space estimate done by <rtems/confdefs.h> assumes that all tasks
* are created by rtems_task_create().  The estimate can be adjusted to take
* user-provided task storage areas into account through the
* #CONFIGURE_MINIMUM_TASKS_WITH_USER_PROVIDED_STORAGE application
* configuration option.
*
* The #CONFIGURE_MAXIMUM_TASKS should include tasks constructed by
* rtems_task_construct().
*
* @param config is the task configuration.
*
* @param[out] id is the pointer to an object identifier variable.  The
*   identifier of the constructed task object will be stored in this variable,
```

(continues on next page)

(continued from previous page)

```
*   in case of a successful operation.
*
* @retval ::RTEMS_SUCCESSFUL The requested operation was successful.
*
* @retval ::RTEMS_INVALID_ADDRESS The id parameter was NULL.
*
* @retval ::RTEMS_INVALID_NAME The task name was invalid.
*
* @retval ::RTEMS_INVALID_PRIORITY The initial task priority was invalid.
*
* @retval ::RTEMS_INVALID_SIZE The thread-local storage size is greater than
*   the maximum thread-local storage size specified in the task configuration.
*   The thread-local storage size is determined by the thread-local variables
*   used by the application and #CONFIGURE_MAXIMUM_THREAD_LOCAL_STORAGE_SIZE.
*
* @retval ::RTEMS_INVALID_SIZE The task storage area was too small to provide
*   a task stack of the configured minimum size, see
*   #CONFIGURE_MINIMUM_TASK_STACK_SIZE. The task storage area contains the
*   task stack, the thread-local storage, and the floating-point context on
*   architectures with a separate floating-point context.
*
* @retval ::RTEMS_TOO_MANY There was no inactive task object available to
*   construct a task.
*
* @retval ::RTEMS_TOO_MANY In multiprocessing configurations, there was no
*   inactive global object available to construct a global task.
*
* @retval ::RTEMS_UNSATISFIED One of the task create extensions failed during
*   the task construction.
*
* @retval ::RTEMS_UNSATISFIED In SMP configurations, the non-preemption mode
*   was not supported.
*
* @retval ::RTEMS_UNSATISFIED In SMP configurations, the interrupt level mode
*   was not supported.
*/
rtems_status_code rtems_task_construct(
const rtems_task_config *config,
rtems_id                *id
);
```

The following are some suggested updates. It is hard to comment on stuff in the ticket header in a way that does not change it so I hope doing this is OK?

Updated ....

```
1 /**
```

(continues on next page)

(continued from previous page)

```
 * @brief This structure defines a task configuration used to create
 *        a task with user provided storage.
 *   This structure defines the configuration of a task created by
 *   rtems_task_create_from_config().
 */
```

With this ...

```
 * There are no alignment requirements for the task storage area.  To␣
↪avoid
 * memory waste, use the #RTEMS_TASK_STORAGE_ALIGNMENT variable␣
↪attribute to
 * enforce the recommended alignment of the task storage area.
```

... I understand the alignment for a user is anything but internally the memory may be aligned and that will potentially create some waste. For example I could provide `0x1` as an address but the stack base or the start of the TLS may need to be aligned depending on the arch, `_TLS_Alignment`, or something. Does this need to be explained?

Updated ...

```
 * It is called when the task creation aborts due to a failed task create
 * extension or the task is deleted.  It is called from task context␣
↪under
 * protection of the object allocator lock.  It is allowed to call␣
↪free() in
 * this handler.  The handler may be NULL to disable.
```

Updated ...

```
 * @brief Creates a task from the specified the task configuration.
 *
 * In contrast to tasks created by rtems_task_create(), the tasks␣
↪created by
 * this directive use a user-provided task storage area.  The task␣
↪storage area
 * contains the task stack, the thread-local storage, and the floating-
↪point
 * context on architectures with a separate floating-point context.
 *
 * It is recommended rtems_task_create() and rtems_task_create_from_
↪config()
 * are not used together in an application. This means
 * rtems_task_create_from_config() is not recommended for drivers or␣
↪libraries
 * an application may use. This directive is intended for applications␣
↪which
 * do not want to use the RTEMS Workspace and instead statically␣
↪allocate all
 * operating system resources.
```

(continues on next page)

(continued from previous page)

```
 *
 * An application based solely on static allocation can avoid any runtime
 * memory allocators. This can simplfiy the application architecture as well
 * as any analysis that may be required.
 *
 * The stack space estimate done by <rtems/confdefs.h> assumes that all tasks
 * are created by rtems_task_create().  The estimate can be adjusted to take
 * user-provided task storage areas into account through the
 * #CONFIGURE_TASKS_CREATED_FROM_CONFIG application configuration option or a
 * custom task stack allocator, see #CONFIGURE_TASK_STACK_ALLOCATOR.
 *
 * The #CONFIGURE_MAXIMUM_TASKS should includes tasks created with
 * rtems_task_create_from_config().
```

Original author: sebastian.huber

Yes, the storage internal alignment is something which needs to be better explained.

I think we should change RTEMS_TASK_STORAGE_ALIGNMENT to be just the alignment value and say that the maximum thread-local storage size shall have at least this alignment.

CONTEXT_FP_SIZE should be aligned by RTEMS_TASK_STORAGE_ALIGNMENT. For RTEMS_TASK_STORAGE_ALIGNMENT we should use CPU_HEAP_ALIGNMENT.

Author: Chris Johns 2020-09-15T02:50:02.000Z

Original author: sebastian.huber

Sure. What about adding "`RTEMS_TASK_STORAGE_ALIGNMENT` will optimally use the provided storage"? We do not need to hand hold into the detail but we should hint at the best approach.

```
rtems: Add rtems_task_construct()

In contrast to rtems_task_create() this function constructs a task with
a user-provided task storage area.  The new directive uses a
configuration structure instead of individual parameters.

Add RTEMS_TASK_STORAGE_SIZE() to calculate the recommended size of a
task storage area based on the task attributes and the size dedicated to
the task stack and thread-local storage.  This macro may allow future
extensions without breaking the API.

Add application configuration option
CONFIGURE_MINIMUM_TASKS_WITH_USER_PROVIDED_STORAGE to adjust RTEMS
Workspace size estimate.

Update #3959.

- **Description** changed

```
In RTEMS 5 a lot of development was done to allow a static allocation of resources provided by RTEMS and avoid the use of a heap. One missing piece is the support for statically allocated RTEMS tasks. The rtems_task_create() function allocates the task stack from a heap. We need an alternative function which allocates an RTEMS tasks with a user provided stack (similar to the POSIX threads).

There does need to be documentation on the allocation
strategies, when to use, limitations, and particularly the
use of rtems-exeinfo to get the TLS size. This is one case
for sure where an RTEMS Tool needs explicit mention in
both the API and configure option sections.

Proposed API:
- {{{#!c
+ {{{
+ #!c
/**
-  * @brief This variable attribute defines the recommended alignment of a task
-  *   storage area.
-  */
- #define RTEMS_TASK_STORAGE_ALIGNMENT RTEMS_ALIGNED( CPU_STACK_ALIGNMENT )
-
- /**
-  * @brief Returns the recommended task storage area size for the specified size
-  *   and task attributes.
-  *
-  * @param _size is the size dedicated to the task stack and thread-local
-  *   storage in bytes.
-  *
-  * @param _attributes is the attribute set of the task using the storage area.
-  *
-  * @return The recommended task storage area size calculated from the input
-  *   parameters is returned.
-  */
- #if CPU_ALL_TASKS_ARE_FP == TRUE
-   #define RTEMS_TASK_STORAGE_SIZE( _size, _attributes ) \\
-     ( ( _size ) + CONTEXT_FP_SIZE )
- #else
-   #define RTEMS_TASK_STORAGE_SIZE( _size, _attributes ) \\
```

(continues on next page)

Original author: sebastian.huber

Move content of the bsp_specs to GCC 10. Once this is done, update the tools and delete the bsp_specs.

On powerpc this means we have to move the content of rtems_crti.S to GCC. It may not be possible to back port this to GCC 10 and we may have to maintain this as a patch until GCC 11 is released.

Add support for nostartfiles and [nodefaultlibs](https://gcc.gnu.org/onlinedocs/gcc/Link-Options.html#index-nodefaultlibs).

Dupe of #3250

Author: Trac Migrate 2020-04-06T14:03:35.000Z

Original author: sebastian.huber

Replying to Joel Sherrill:

> Dupe of #3250 I think this is a subtask.

Author: Trac Migrate 2020-04-06T14:49:54.000Z

Original author: sebastian.huber

Since -qrtems is not used to build GCC/Newlib. The rtems_crti.S could probably stay in RTEMS.

Author: Joel Sherrill 2020-04-06T14:56:00.000Z

Original author: sebastian.huber

The only crti/crtn not provided by GCC are these for the PowerPC. They really should move. Whatever is being done is a hack left over from the days when we were unwilling to modify GCC.

```
$ find . -name rtems_crt*
./bsps/powerpc/shared/start/rtems_crti.S
./bsps/powerpc/shared/start/rtems_crtn.S
```

“Remove hacks left over from when we were unwilling to modify GCC” should be the name of this ticket. :)

Author: Trac Migrate 2020-04-06T14:58:38.000Z

Original author: sebastian.huber

I will try to get the RTEMS-only changes in GCC 10.2. This already requires release manager approval.

I am not sure if they are happy if I try to change standard powerpc files for RTEMS on a release branch.

3.9.1.411 3935 - Remove use of RTEMS_INLINE_ROUTINE in the RTEMS sources

Id	3935
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2020-04-06T07:08:19.000Z
Updated	2024-04-25T20:48:00.759Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::fixed, tickettype::task, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3935
Merges	0

Original author: sebastian.huber

Replace all uses of RTEMS_INLINE_ROUTINE with “static inline”. This makes it a bit easier for third-party tools to parse the RTEMS sources.

Author: Joel Sherrill 2020-04-06T13:20:41.000Z

Original author: sebastian.huber

Please cite where “static inline” became part of the C and C++ standards. Eons ago static inline meaning do not include method bodies in the generated object was a GNU extension. Other compilers had their own way of specifying this.

Author: Trac Migrate 2020-04-06T13:25:42.000Z

Original author: sebastian.huber

This is C99. The default language version is C11 since a while.

Author: Joel Sherrill 2020-04-06T13:33:01.000Z

Original author: sebastian.huber

Citation please. Section and paragraph.

Author: Trac Migrate 2020-04-06T13:40:56.000Z

Original author: sebastian.huber

I don't understand the problem, we use this for a long time:

```
/**
*  The following (in conjunction with compiler arguments) are used
*  to choose between the use of static inline functions and macro
*  functions.   The static inline implementation allows better
*  type checking with no cost in code size or execution speed.
*/
#ifdef __GNUC__
#define RTEMS_INLINE_ROUTINE static __inline__
#else
#define RTEMS_INLINE_ROUTINE static inline
#endif
```

Wikipedia has some background information: https://en.wikipedia.org/wiki/Inline_function

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3866
Merges	0

Original author: sebastian.huber

In GCC 10 there is a new common variable attribute `noinit`:

https://gcc.gnu.org/onlinedocs/gcc/Common-Variable-Attributes.html#index-noinit-variable-attribute

https://gcc.gnu.org/git/gitweb.cgi?p=gcc.git;a=commit;h=f0033821c1c9ba386a1983499a666d5759cdd943

To support this, a change in the linker command files is necessary.

Author: Chris Johns 2020-02-05T21:47:47.000Z

Original author: sebastian.huber

Does clang have this support?

Author: Trac Migrate 2020-02-09T16:40:17.000Z

Original author: sebastian.huber

clang doesn't support this attribute. I added an enhancement request for this:

https://bugs.llvm.org/show_bug.cgi?id=44811

As a workaround for clang and GCC < 10 you can use the section attribute. The key issue is to have support for .noinit section in the linker command files.

Original author: sebastian.huber

See discussion:

https://lists.rtems.org/pipermail/devel/2020-January/056728.html

Approach A

Use c-user/glossary.rst as the project-wide glossary. Generate document-specific glossaries from this file and the use of :term: in the specific document. Add new waf target "./waf regenerate" to carry out the glossary generation.

Approach B

Move the glossary terms to the RTEMS specification (e.g. in the RTEMS sources "spec/glossary/*.yml") and generate the glossary.rst for the documents with a script. This gives us more flexibility and removes the need for the special parser code, see:

https://lists.rtems.org/pipermail/devel/2020-January/056811.html

The AV-2 mentioned of the DoD Architecture Framework (DoDAF) wants the glossary terms in categories. We could add categories to the glossary specification items. This would be difficult with a master glossary in reST.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3846
Merges	0

Original author: sebastian.huber

This defect relates to the new waf based build system.

Most start.o are generated from start.S files which use the C preprocessor. The start.o files are not re-generated if header files (e.g. cpuopts.h, bspopts.h) change. The problem is that the automatic dependency generation via the GCC -MMD flags doesn't work with the current asm rule:

```
def asm(self, bld, bic, source, target=None, deps=[], cppflags=[]):
if target is None:
target = os.path.splitext(source)[0] + ".o"
bld(
asflags=self.data["asflags"],
before=["cstlib"],
cppflags=cppflags + self.data["cppflags"],
features="asm c",
includes=bic.includes + self.data["includes"],
rule="${CC} ${ASFLAGS} ${CPPFLAGS} ${DEFINES_ST:DEFINES} ${CPPPATH_ST:INCPATHS} -
↪c ${SRC[0]} -o ${TGT}",
source=[source] + deps,
target=target,
)
return target
```

Author: Trac Migrate 2020-09-17T06:58:03.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"

- **Status** changed from *assigned* to *closed*

In [changeset:"4eea8d4bc44116b3465d7fdeb053d66bf95428f4/rtems" 4eea8d4/rtems]:

```
build: Fix dependencies for start and asm files

Add a feature to enforce an explicit target file for assembler sources.
Add a build start file node list and use it as a test program
dependency.

The fix for #3846 and #4080 needs to be combined, because the fix
for #3846 requires the removal of 'before=["cstlib"]'. This patch fixes
two issues:

1. The tracking of start file dependencies.

2. Reflect that executables depend on the start files.

We need a start.o file in the right path so that the linker can find is
as specified by the linker script, and not for example a start.S.17.o
file in some path. This part is addressed by the "explicit_asm_target"
feature.

This build process extension

@after("apply_link")
@feature("cprogram", "cxxprogram")
def process_start_files(self):
if getattr(self, "start_files", False):
self.link_task.dep_nodes.extend(self.bld.start_files)

addresses 2.

Close #3846.
Close #4080.
```

Original author: sebastian.huber

The new work area initialization introduced by #3838 introduces a dependency on _Heap_Extend() for all BSPs. The BSP knows how many memory areas it delivers to the system. It should provide also the RTEMS Workspace and C Program Heap initialization functions to the system so that an unnecessary pull in of _Heap_Extend() can be avoided.

Original author: sebastian.huber

Replace the existing Autoconf and Automake based build system with something new. Goals:

- Easier configuration of BSPs (BSP options)
- Easier to maintain (nobody understands the details of the existing build system)
- Faster builds (especially on Windows)
- Reusable build specifications (e.g. generate documentation for BSP options for the user manual)
- Validation of built artefacts (e.g. ensure that the objects are built as specified using the DWARF debug information)
- Support building of BSPs external to the project
- Customization of the build (e.g. build only a subset of the RTEMS functions)
- Support alternative compilers such as clang instead of GCC

Proposed solution:

- Use waf for the build system
- Specify the build through build specification items maintained by Doorstop

Author: Trac Migrate 2019-11-07T08:30:03.000Z

build: Alternative build system based on waf

Update #3818.
```

Author: Trac Migrate 2020-09-14T21:14:39.000Z

Original author: sebastian.huber

with new build system smp enabled build of pc686 fails. Linkage of samples fails with

```
/export/home/karel/sfw/rtems/6-tools-core2/lib/gcc/i386-rtems6/10.2.1/../../../../i386-rtems6/bin/ld: ./librtemsbsp.a(smp-imps.c.10.o): in function `boot_cpu':
/export/home/karel/git/rtems/rtems-head/build/i386/pc686/../../../bsps/i386/pc386/start/smp-imps.c:274: undefined reference to `_binary_appstart_bin_start'
/export/home/karel/sfw/rtems/6-tools-core2/lib/gcc/i386-rtems6/10.2.1/../../../../i386-rtems6/bin/ld: /export/home/karel/git/rtems/rtems-head/build/i386/pc686/../../../bsps/i386/pc386/start/smp-imps.c:274: undefined reference to `_binary_appstart_bin_size'
collect2: error: ld returned 1 exit status
```

that's due to fact this part of Makefile based build was not translated to the new build system:

```
appcpustart.$(OBJEXT): ../../../../../../bsps/i386/pc386/start/startAP.S
$(CPPASCOMPILE) $(AM_CPPFLAGS) -o $@ -c $<

appstart.$(OBJEXT): appcpustart.$(OBJEXT)
$(LD) -N  \\
-Ttext 0x70000 -e app_processor_start -nostdlib \\
-o appstart_tmp.exe $<
$(OBJCOPY) -O binary appstart_tmp.exe appstart.bin
$(OBJCOPY) -I binary -O elf32-i386 -B i386 appstart.bin $@
```

besides this there is also error in files (getcpuid.c seems to be gone, bspsmp.c needs to be there:

```
diff --git a/spec/build/bsps/i386/pc386/objsmp.yml b/spec/build/bsps/i386/pc386/objsmp.yml
index af882cb425..9e83bd7a01 100644
--- a/spec/build/bsps/i386/pc386/objsmp.yml

In order to ease the requirements engineering process (such a process doesn't exist currently, see #3715) select a supporting tool (or tools). Define tool selection criteria. Do a market survey. Use the following wiki page for this work:

Developer/RequirementsEngineering

3.9.1.419 3718 - Add support for test plans

Id	3718
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-03-04T13:02:17.000Z
Updated	2024-04-25T20:47:17.495Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::fixed, tickettype::task, tool::test, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3718

Original author: sebastian.huber

Test plans are required by ECSS-Q-ST-40C:

- 5.5.3.2, Software unit testing, a.
- 5.5.4.1, Software integration test plan development
- 5.6.3.1, Development and documentation of a software validation specification with respect to the technical specification, a.

The test plans are a content of several documentation sets. Test plans are subject to verification activities:

- 5.8.3.6, Verification of software unit testing (plan and results)
- 5.8.3.7, Verification of software integration
- 5.8.3.8, Verification of software validation with respect to the technical specifications and the requirements baseline

It should be possible to create documents from individual test plan fragments for a particular test case. There are two approaches possible:

1. Add the test plan directly to the test code in form of a specially formatted comment.
2. Use separate files with a specific format for test plans.

The test plans should include a

- test identifier,
- test classification (unit, integration, validation),
- test steps,
- links to requirements, design, architecture, unit, component, etc.

It should be possible to verify that a test is executed according to the plan from the test output. For example the test plan could specify test steps. The test output could print the test steps. A tool could check that the test steps in the output and the plan are consistent.

Author: Trac Migrate 2021-09-29T13:31:41.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

Test cases are specified by specification items:

Original author: sebastian.huber

The test guidelines chapter should cover the following topics:

- tools involved in testing
- test classification
- test organization
- how to plan tests
- how to write tests
- how to run tests

- how to report tests

Author: Trac Migrate 2022-11-30T08:53:19.000Z

Original author: sebastian.huber

- **Milestone** changed from %”6.1” to %”7.1”

Original author: sebastian.huber

The chapter should cover the following topics:

- Overview and introduction
- Evaluation of tools for requirements management
- Selected tool for requirements management
- Evaluation of data models and formats for the requirements
- Definition of data model and format actually used for the project (may overlap with tool)
- Requirements management workflow used in the project
- Requirements on requirements, e.g. derived from standards such as ECSS-E-ST-10-06C
- Requirement identifiers used to ensure traceability

Author: Trac Migrate 2019-03-04T13:10:43.000Z

Original author: sebastian.huber

- **Status** changed from *assigned* to *accepted*
- **Summary** changed from *Add Requirements Engineering chaper to RTEMS Software Engineering Handbook* to *Add Requirements Engineering chapter to RTEMS Software Engineering Handbook*

Author: Chris Johns 2019-03-04T23:02:03.000Z

Original author: sebastian.huber

How does the quality of RTEMS and it's requirements depend on the evaluation and selection of the tools for requirement management? I can understand the quality of the requirements effecting the quality of RTEMS but not the tools used to capture them? Why have the process, ie a sort of log book, in the engineering handbook? I

would have expected this document to contain the out come of the discovery process and not the process itself.

I am concerned adding these things just creates a liability for the project. Can an email archive can perform this task?

Author: Joel Sherrill 2019-03-04T23:06:15.000Z

Original author: sebastian.huber

I agree with Chris. A trade study of requirements tools shouldn't end up in the handbook. Perhaps our requirements for a tool.

- open source
- supports format XXX for interchange
- supports links for requirement derivation
- ...

Author: Trac Migrate 2019-03-07T07:34:38.000Z

Original author: sebastian.huber

Yes, maybe this is not the best place for the tool overview. I though it would be helpful in case someone asks in two years, why did you use this, have you considered that, etc.? Should I add a ticket for the tool selection instead?

Author: Chris Johns 2019-03-07T21:00:27.000Z

Original author: sebastian.huber

Replying to Sebastian Huber:

> Yes, maybe this is not the best place for the tool overview. I though it would be helpful in case someone asks in two years, why did you use this, have you considered that, etc.?
>
> A brief rational can be helpful, but the details can be distracting. I feel the simpler and more direct this document is the more effective it will be.
>
> > Should I add a ticket for the tool selection instead?
> >
> > Yes, it can links to mailing lists discussions and attachments and it is easy to link too.

eng: Add register block specification types

A register block may be used to specify the interface of devices which
contain registers associated with an integer address.  Register blocks
consist of register block members specified by the ``definition``
attribute.  Register block members are either instances of registers
specified by the ``registers`` attribute or instances of other register
blocks specified by links with the "register-block-include" link role.
Registers consists of bit fields.  The register block members are placed
into the address space of the device relative to the base address of the
register block.  Register member offests and the register block size are
specified in units of the address space granule.

Update #3715.
```

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *accepted* to *closed*

The initial work for this chapter is now done. The specification of the specification items in rtems-central is in line with the rtems-docs repository. Further work in this area should be done under a new ticket.

Original author: sebastian.huber

Create a hierarchy of RTEMS software components using Doxygen groups. Review the existing Doxygen groups (software components) first.

https://docs.rtems.org/doxygen/branches/master/modules.html

Grouping should be done by at BSP level architecture and then by BSP.

There should be a device driver group with subgroups for each device class and specific device drivers, e.g. a BSP-specific device driver belongs to a device class and BSP.

There should be groups for APIs, file systems, support libraries, super core, etc.

Original author: sebastian.huber

A Software Design Document (SDD) is required by ECSS-E-ST-40C specified by Annex F. The plan is to use Doxygen for the software * architecture, and * detailed design.

How should links to from a software component (Doxygen group) to requirements be handled?

Author: Trac Migrate 2019-02-26T13:30:45.000Z

Original author: sebastian.huber

In [changeset:"a6e39d4a5928ddcb63f95e9108eefb8b8d79ce56/rtems" a6e39d4a/rtems]:

```
Update Doxyfile to Doxygen 1.8.15

Generate Doxygen output in doc and ignore this directory in Git.  Add
RTEMS logo.  The Doxygen documentation is now built using the source
tree.  Just invoke "doxygen" in the top-level source directory.

The Doxyfile works also with at least Doxygen 1.8.13 and Doxygen 1.8.14.

Update #3705.
```

Original author: sebastian.huber

Review and update the Doxygen recommendations.

Due to the removal of the pre-install build step we can now use Doxygen directly with header files in the source tree. It should be possible to generate documentation for all architectures and BSPs.

All code files (headers, C source, assembler) should have an @file entry belong to at least one Doxygen group (@ingroup).

There are a lot of source file in RTEMS (excluding test code and legacy network stack):

```
find bsps cpukit -name '*.[chsS]' | grep -v libnetworking | wc
4898    4898  187167
```

Creating the groups and categorizing all code file is a labour intensive work package. Therefore it should be discussed if the @brief and descriptions for files should be removed. The file content will be covered by groups and individual documentation.

The use of @param should be clarified. It is not clear if the [in], [out] or [in,out] should be used. If they should be used, what they mean exactly.

3.9.1.425 3702 - Space profile for RTEMS SMP

Id	3702
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-02-26T10:33:00.000Z
Updated	2024-04-25T20:47:08.535Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::fixed, tickettype::task, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3702
Merges	0

Original author: sebastian.huber

Define a subset of RTEMS SMP functionality which is

- useful for space applications, and
- can be pre-qualified by project #3701.

To figure out the feature set carry out an online survey. In addition, do a workshop at ESA / ESTEC premises (also accessible on-line via Skype for Business).

The space profile needs to be documented.

Author: Trac Migrate 2019-02-26T13:30:45.000Z

Original author: sebastian.huber

- **Status** changed from *assigned* to *accepted*

Author: Trac Migrate 2021-11-19T14:44:03.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *accepted* to *closed*

The Technical Note: Space Profile is finalized:

https://ftp.rtems.org/pub/rtems/people/sebh/tn-space-profile-r6-23062019.pdf

Please note that the pre-qualified feature set of RTEMS is a proper superset of the space profile.

Author: Joel Sherrill 2021-11-19T14:56:54.000Z

Original author: sebastian.huber

Would it be possible to generate a document similar to the one you linked to which documents that superset? Asked another way, how could someone approaching RTEMS.org know the subset of RTEMS which has the supporting artifacts for pre-qualification?

Author: Trac Migrate 2021-11-19T15:00:19.000Z

Original author: sebastian.huber

Yes, this is possible, but I think this belongs to another ticket. I am currently busy with integrating all my work in progress.

Author: Trac Migrate 2021-12-02T11:10:16.000Z

Original author: sebastian.huber

Just for reference, a list of pre-qualified interfaces can be obtained via the `./specview.py --filter=api`.

Author: Joel Sherrill 2021-12-02T22:15:47.000Z

Original author: sebastian.huber

I'm sure that list is right but wasn't there a small set of POSIX APIs which were candidates? I looked for pthread_once() which I expected but isn't there. Was thinking of the pthread APIs which were always on before the POSIX configuration was reworked – once and keys.

Author: Trac Migrate 2021-12-03T05:54:40.000Z

Original author: sebastian.huber

We considered to add POSIX keys and once, but we had no time left over to do this.

Author: Amar Takhar 2024-04-25T20:47:07.807Z

3.9.1.426 3199 - New test framework

Id	3199
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2017-10-19T10:12:46.000Z
Updated	2024-04-25T20:47:08.171Z
Milestone	6.1
Labels	library, priority::normal, qualification, resolution::fixed, ticket-type::enhancement, version::5

Merges	0

Original author: sebastian.huber

Requirements:

- Support for RTEMS and general POSIX systems such as Linux or FreeBSD
- Test output functions
- printf() like
- No floating point support by default

- Optional floating point support
- Non-blocking
- Arbitrary context, e.g. during system start, before device drivers, in interrupt context
- Automatic test case registrations (constructors, linker set)
- Standard test case output, e.g. begin/end of test case message
- Ability to sort test cases at run-time
- Safe assert functions, e.g. assert(a == b) vs. assert(a = b) vs. assert_eq(a, b)
- Easy to write, e.g. avoid long namespace prefix rtems_test_*
- Support multiple threads
- No dependency on C++
- Context validation, context invariant validation (e.g. thread dispatch disable level, interrupt state, heap state)
- Test pattern support (e.g. spintercritical*, parallel tests on SMP)

No ready to use framework exists which fulfils these requirements. We have to write something for RTEMS.

API proposal (header file <T.h>):

```
T_eq(a, b)
T_gt(a, b)
T_printf(fmt, ...)
T_output_printf(putchar, fmt, ...)
T_output_string(putchar, s, n)
T_output_add_format_handler(handler, arg)
```

Example for T_output_add_format():

```
#include <stdio.h>
#include <string.h>

typedef void (*T_putchar)(char c);

typedef size_t (*T_format_handler)(void *arg, T_putchar putchar, const char *fmt,␣
↪const char *s, int *out);

int T_printf(const char *fmt, ...);

void T_output_printf(T_putchar putchar, const char *fmt, ...);

void T_output_string(T_putchar putchar, const char *s, size_t n);

void T_output_add_format_handler(T_format_handler handler, void *arg);

size_t T_output_float_handler(void *arg, T_putchar putchar, const char *fmt,␣
↪const char *s, int *out)
```

(continues on next page)

(continued from previous page)

```
{
char buf[32];

if (strncmp(fmt, "%f", 2) != 0) {
return 0;
}

*out = snprintf(buf, sizeof(buf), "%f", s);

if (*out > 0) {
T_output_string(putchar, s, (size_t) *out);
}

return 2;
}

void f(void)
{
T_output_add_format_handler(T_output_float_handler, NULL);
}
```

tests: Use printf() instead of fprintf()

Update #3170.
Update #3199.
```

Author: Trac Migrate 2017-11-06T06:29:13.000Z

Original author: sebastian.huber

In [changeset:"10827984c2cf54188a9af71b94a7e83197812bb5/rtems" 1082798/rtems]:

```
score: Add _IO_Printf() and _IO_Vprintf()

The previous vprintk() implementation had a questionable licence header,
lacks support for the 'z' and 'j' format specifiers, is not robust
against invalid format specifiers, uses a global variable for output.
Replace it with a stripped down version of the FreeBSD kernel kvprintf()
function.

The new implementation allows a low overhead rtems_snprintf() if
necessary.

Update #3199.
Close #3216.

Original author: sebastian.huber

In [changeset:"cbfc3415607a6943823e8fc47c38408dcc7dbd90/rtems" cbfc3415/rtems]:

```
ttest01: New test

This is an example test using the RTEMS Test Framework.  It tests also
the framework itself.

Add T_FILE_NAME command line define to get rid of the full file path.
This is important to reduce the read-only data of test files and make
them build system independent.

Update #3199.
```

3.9.1.427 3659 - LEON3 kernel entry point is overwritten - secondary processors may enter into spurious handler

Id	3659
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate

Original author: martinaberg

When linking a LEON3 RTEMS SMP application, the entry point in the ELF output file is set to the symbol “start”.

“start” is the first entry in the trap table and directly jumps to “hard_reset”.

The boot CPU does the following in the boot_card(): 1. Release other CPUs from power-down (but does not wait here) 2. Some other initializations 3. Overwrite trap entry 0 with spurious interrupt handler 4. The rest

It means that the entry point is guaranteed to be valid for the first CPU entering the RTEMS kernel. But 1. and 3. above gives a race. non-first CPU:s will either enter the kernel properly or end up in the spurious interrupt handler depending on how quick it reaches the “start” label.

One example where this has been an issue is when secondary processors run for some time (self-tests) in a ROM boot loader before entering the RTEMS (ELF) entry point. It is convenient to use the ELF file entry point for all processors.

Possible solutions:

a. Do not install spurious handler on trap table entry 0. For example by changing bsps/sparc/leon3/start/spurious.c:

```
-  for ( trap=1 ; trap<256 ; trap++ ) {
+  for ( trap=0 ; trap<256 ; trap++ ) {
```

(This changes address 0 on GR740. So following a null function pointer may not end up in spurious trap anymore.)

b. Change the SPARC ELF entry point. For example to the symbol hard_reset.

c. Document that the entry point for boot processor is “start” and entry point for other processors is “hard_reset”.

Author: Trac Migrate 2021-09-02T05:57:51.000Z

Original author: martinaberg

- **Milestone** set to %”6.1”

This was fixed by #4459. The trap table is now read-only.

According to the RTEMS POSIX 1003.1 Compliance Guide, `poll()` from `poll.h` is not supported (https://docs.rtems.org/branches/master/posix-compliance/posix-compliance.html#poll-h)

PS: I wrote the test for POSIX API Signature Compliance Test and it compiled correctly but I suppose that some things are still not fully supported.

Original author: sebastian.huber

The original use case for the CPU counter was low level profiling of SMP synchronization primitives and busy wait loops for device drivers.

For low overhead timestamps the CPU counter may be also used, e.g. for tracing. To support timestamps, the CPU counter must increment monotonically within the whole range of the CPU counter data type, e.g. 32-bit unsigned integer. In addition, it should not be affected by power saving states of the processor.

```
Simplify _CPU_Counter_difference()

In order to simplify the use of CPU counter values it is beneficial to
have monotonic increasing values within the range of the CPU counter
ticks data type, e.g. 32-bit unsigned integer.  This eases the use of
CPU counter timestamps in external tools which do not know the details
of the CPU counter hardware.  The CPU counter is the fastest way to get
a time on an RTEMS system.

Such a CPU counter may be also used as the timecounter.  Use it on SPARC
for this purpose to simplify the clock drivers.

Update #3456.

Original author: sebastian.huber

The IRQ extensions API defined by <rtems/irq-extensions.h> is currently only implemented by some BSPs and not covered by test cases. It is not documented in the RTEMS Classic API Guide. Change the BSPs so that every BSP implements this API at least as a stub so that we can write tests for this API. Specify and document the API.

Extend the API to enable/disable specific interrupt vectors. The proposed functions for this are rtems_interrupt_mask() and rtems_interrupt_unmask().

Extend the API to raise/clear specific interrupt vectors. This allows to test specific interrupts. The proposed functions are rtems_interrupt_raise() and rtems_interrupt_clear().

Extend the API to set/get the interrupt vector priority.

Extend the API to get some information about a particular interrupt vector, e.g. if the raise/clear functions work, if it is possible to change the priority, etc.

Extend the API to set/get the interrupt vector priority.

Extend the API to get some information about a particular interrupt vector, e.g. if the raise/clear functions work, if it is possible to change the priority, etc. </pre> </details> * **Milestone** changed from %"Indefinite" to %"5.1" * **Summary** changed from *Add functions to enable, disable, and clear interrupts to the IRQ extensions API* to *Make the IRQ extensions API a standard API* * **Version** set to ~"5"

```
smpcapture02: Fix use of BSP_INTERRUPT_VECTOR_MAX

This define represents the last valid interrupt vector number.

Update #3269.
```

Author: Trac Migrate 2021-06-24T10:29:56.000Z

Original author: sebastian.huber

In [changeset:"cd5573c09def76d3d202349639da6ba05617b31b/rtems" cd5573c/rtems]:

```
bsps/irq: Add BSP_INTERRUPT_VECTOR_COUNT

Assert BSP_INTERRUPT_VECTOR_MAX + 1 == BSP_INTERRUPT_VECTOR_COUNT.

After building all BSPs with this patch, BSP_INTERRUPT_VECTOR_MAX can be
removed and replaced by BSP_INTERRUPT_VECTOR_COUNT.  The
BSP_INTERRUPT_VECTOR_COUNT allows a default implementation which␣
↪supports no
interrupt vector at all.  Using COUNT instead of MAX may avoid some
interpretation issues, for example is the maximum value a valid vector␣
↪number
or not.

Update #3269.

```
1  bsps/irq: Add rtems_interrupt_entry_install()
2
3  Add rtems_interrupt_entry_remove().  Split up irq-generic.c into␣
   ↪several files.
4  In particular, place all functions which use dynamic memory into their␣
   ↪own
5  file.
6
7  Add optional macros to let the BSP customize the vector installation␣
   ↪after
8  installing the first entry and the vector removal before removing the␣
   ↪last
9  entry:
10
11 * bsp_interrupt_vector_install()
12
13 * bsp_interrupt_vector_remove()
14
15 Use these new customization options in the m68k/genmcf548x BSP so re-
   ↪use the
16 generic interrupt controller support.
17
18 Update #3269.

3.9.1.438 3250 - Remove Use of bsp_specs

Id	3250
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2017-11-21T19:27:53.000Z
Updated	2024-04-25T20:45:58.819Z
Milestone	6.1

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3250
Merges	0

The bsp_specs file in each BSP directory is GCC specific and a barrier to supporting other compilers including clang/llvm. The bsp_specs file is used in a variety of ways including some odd build system dependencies and this ticket is to track eliminating those uses and the direct use of bsp_specs themselves for extending GCC options.

The primary use of the bsp_specs file is to extend GCC's notion of what to link with. The bsp_specs itself commonly specifies:

- start.o file
- program entry point

- crt[in].o or crtbegin.o/crtend.o
- linker script
- Frequently, arguments which are implicitly passed to ld.

This is typical and from a recently added BSP:

```
%rename endfile old_endfile
%rename startfile old_startfile
%rename link old_link

*startfile:
%{!qrtems: %(old_startfile)} \\
%{!nostdlib: %{qrtems: start.o%s crti.o%s crtbegin.o%s -e _start}}

*link:
%{!qrtems: %(old_link)} %{qrtems: -dc -dp -N}

*endfile:
%{!qrtems: %(old_endfiles)} %{qrtems: crtend.o%s crtn.o%s }
```

Note that it has the implicit "-dc -dp -N" arguments which are passed to ld. The -dc and -dp options are equivalent and assign space to common symbols even with linking with -r. Why these two options are included is a mystery lost to time. Similarly the -N sets the .text and .data sections to be readable and writable and do NOT page align the data segment. This option is also a blast from the ancient past and likely should not be used.

The "-qrtems" option is used with this pattern when compiling and linking RTEMS programs:

```
-B${PREFIX}/${BSP}/lib/ -specs bsp_specs -qrtems
```

The -B says that the following directory is a system directory. It is treated as a "lib" directory and is also assumed to have an include/ subdirectory. They are added to the linker and include search paths, respectfully. The -specs option references the bsp_specs and adds the -qrtems options which are then tripped by specifying -qrtems. Every part of this must be eliminated and performed in a manner that is more amenable to using a compiler other than GCC.

In order to eliminate the bsp_specs, the arguments used in each BSP's version will have to be reviewed, made common, and then eliminated. A similar effort was performed when the BSP specific make-exe rules were eliminated from the "make/custom" files and a common pattern was put in place.

In addition to using the bsp_specs to specify details about linking and include files, the build system has quite a few odd dependencies on the presence of bsp_specs:

- all BSP configure.ac use bsp_specs like this:

```
AC_CONFIG_SRCDIR([bsp_specs])
```

The idea was that this was a unique file to ensure the script was in the right directory. This can be changed to use a specfic make/custom/*.cfg file and not lose any integrity checking.

- all BSP Makefile.am have this:

```
dist_project_lib_DATA = bsp_specs
```

That can just be removed when we don't use the file.

- ./aclocal/check-bsps.m4 uses it to see if it is BSP directory
- bootstrap uses it generate the list of BSP directories for the libbsp/*/acinclude.m4 files
- Other references are either comments or obvious uses of it in

some invocation of GCC.

Author: Trac Migrate 2020-06-06T20:36:54.000Z

In [changeset:"e84587355a64152b8cd6ae748ac88d8c75447b51/rtems" e845873/rtems]:

```
tests for fenv.h functions

added tests for fesetexeptflag(), fegetexeptflag(),
fegetround(), fesetround().

In the test fegetround() does not return any flag
other then FE_TONEAREST in tests.
This is probably due to soft float.

The test complies successfully and returns assert
at fegetround()

Other tests run without any errors
tested on RISCV/rv32imac

The test prints nothing if runs successfully.

updates #2971

changed the description

3.9.1.441 2365 - Task pre-emption disable is broken due to pseudo ISR tasks

Id	2365
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2015-06-11T13:18:57.000Z
Updated	2024-04-25T20:44:48.010Z
Milestone	6.1
Labels	priority::lowest, qualification, resolution::fixed, rtems::score, ticket-type::defect, version::4.10
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/2365
Merges	0

Original author: sebastian.huber

We have for example:

```
Scheduler_Void_or_thread _Scheduler_priority_Unblock (
const Scheduler_Control *scheduler,
Thread_Control          *the_thread
)
{
Scheduler_priority_Context *context =
_Scheduler_priority_Get_context( scheduler );
Scheduler_priority_Node *node = _Scheduler_priority_Thread_get_node( the_thread );

_Scheduler_priority_Ready_queue_enqueue(
&the_thread->Object.Node,
&node->Ready_queue,
&context->Bit_map
);

/* TODO: flash critical section? */

/*
*  If the thread that was unblocked is more important than the heir,
*  then we have a new heir.  This may or may not result in a
*  context switch.
```

(continues on next page)

(continued from previous page)

```
*
*  Normal case:
*    If the current thread is preemptible, then we need to do
*    a context switch.
*  Pseudo-ISR case:
*    Even if the thread isn't preemptible, if the new heir is
*    a pseudo-ISR system task, we need to do a context switch.
*/
if ( the_thread->current_priority < _Thread_Heir->current_priority ) {
_Scheduler_Update_heir(
the_thread,
the_thread->current_priority == PRIORITY_PSEUDO_ISR
);
}

SCHEDULER_RETURN_VOID_OR_NULL;
}
```

So the unblock event of a pseudo ISR task (MPCI or timer server) may pre-empt a task with disabled pre-emption. Suppose a higher priority task than the non-preemptible task is ready. Then this task gets scheduled once the pseudo ISR task blocks again.

Author: Trac Migrate 2015-06-12T12:00:01.000Z

Original author: sebastian.huber

It is not clear which date and time is returned by rtems_clock_get_tod(). For example which time zone is used. Is there a relation to UTC?

Author: Chris Johns 2014-09-16T07:29:53.000Z

Original author: sebastian.huber

- **Cc** added @@chrisj

The timezone is the one you used when you set the time with the set call. If the time is not set this function returns RTEMS_NOT_DEFINED. It is assumed you set a suitable time in the first place and know the specific context of use.

Author: Gedare Bloom 2014-12-19T05:06:18.000Z

Original author: sebastian.huber

- **Priority** changed from ~"normal" to ~"highest"

Bump priority to highest for tickets with a fix attached or seemingly simple fix proposed in the description or comments.

Author: Gedare Bloom 2015-03-02T20:42:45.000Z

- **Milestone** changed from %”4.11” to %”4.11.1”

bump milestone

Author: Joel Sherrill 2015-10-20T23:05:06.000Z

Original author: sebastian.huber

This ticket does not have a patch attached or an obvious (to me) fix. What is the fix proposed?

Author: Trac Migrate 2015-10-21T05:42:48.000Z

Original author: sebastian.huber

We need a more precise documentation of the time services. How are leap seconds handled for example? UNIX time vs. UTC.

Author: Trac Migrate 2015-11-24T09:34:59.000Z

Original author: sebastian.huber

The wall clock time services lack documentation in general. What is the relation between rtems_time_of_day and the UNIX time as specified by IEEE Std 1003.1, 2013 Edition, 4.15 Seconds Since the Epoch (http://pubs.opengroup.org/onlinepubs/9699919799/). For example _TOD_To_seconds() does not use the expression in this standard document. This affects rtems_timer_fire_when().

Author: Joel Sherrill 2015-11-24T16:22:54.000Z

Original author: sebastian.huber

Can you provide a specific link? That is to the top of the standard.

Original author: junkes@fhi-berlin.mpg.de

Only a few bsps are available as configurations (bsets). Not all that are listed in the documentation. E.g. ‘beatnik’ is missing.

this is the output of ../source-builder/sb-set-builder –list-bsets ... bsps/atsamv.bset bsps/beagleboneblack.bset bsps/erc32.bset bsps/gr712rc.bset bsps/gr740.bset bsps/imx7.bset bsps/pc.bset bsps/qoriq_e500.bset bsps/qoriq_e6500_32.bset bsps/qoriq_e6500_64.bset

bsps/raspberrypi2.bset bsps/xilinx_zynq_zc702.bset bsps/xilinx_zynq_zc706.bset bsps/xilinx_zynq_zedboard.bset . . .

Author: Trac Migrate 2024-03-14T08:41:12.000Z

Original author: junkes@fhi-berlin.mpg.de

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

but this works? ../source-builder/sb-set-builder –prefix=$HOME/development/rtems/6.1-rc2 –target=powerpc-rtems6 –with-rtems-bsp=powerpc/beatnik –with-rtems-tests=yes 6/rtems-kernel

Author: Joel Sherrill 2024-03-14T14:26:09.000Z

Original author: junkes@fhi-berlin.mpg.de

Is that kernel building command line equivalent? The BSP stack bsets include more than RTEMS – they usually build the tools, rtems, network stack, and likely some support libraries. This is from BBB:

```
6/rtems-arm
6/rtems-kernel
6/rtems-libbsd
6/rtems-packages
```

If you want that set easily buildable and not just RTEMS, some more BSPs need to get added.

It would be a question for Chris, but I wonder if the RSB supports a way to have a template bset that the arch and bsp come from the command line. This could reduce it to 3 bsets (libbsd, lwip, and no networking). Just a thought.

And FWIW every BSP bset gets built as part of the OAR build sweeper. Just as needed when there are changes requiring it.

Author: Chris Johns 2024-03-15T01:44:17.000Z

Original author: junkes@fhi-berlin.mpg.de

The RTEMS deployment repo has more examples and possible ways to build BSP packages:

The libc call `strtof` leaks memory when a thread exits if `strtof` has been made within the context of the thread. The code uses `Balloc` and `Bfree` to obtain pieces of memory it uses. The memory is recycled using newlib reent TLS variables. The `_reclaim_reent()` does not clean up `_REENT_MP_P5S`.

- 0001-Reclaim-_REENT_MP_P5S-in-_reclaim_reent.patch

Getting sources for `7/rtems-mips` fails with:

```
error: 7/rtems-mips.bset:6: cannot find file: tools/rtems-mipstx39-gdb-head
```

Release candidates for 6 get the 7 sources because the `6-rc?` are made from `master`.

Author: Chris Johns 2023-07-30T22:58:41.000Z

To test run this command (https://git.rtems.org/rtems-release/tree/rtems-release-sources#n139):

```
../source-builder/sb-get-sources --stop-on-error
```

Author: Chris Johns 2023-09-03T05:39:22.000Z

I will point the 7 MIPS gdb to the 6 version. I have no idea about this architecture and tools and no one has picked the issue up.

Also this is present:

```
warning: 0001-gcc-config-aarch64-rtems.h-Define--USE-INIT-FINI-.patch: no hash found
warning: 0001-microblaze-Define--ELF--for-RTEMS-target.patch: no hash found
```

I need to see why an error was not generated. No hash should be a hard error.

Author: Chris Johns 2023-11-17T03:18:22.000Z

- **Owner** set to joel
- **Status** changed from *new* to *assigned*

This is still present and making a release candidate breaks:

```

Author: Chris Johns 2023-08-24T23:48:52.000Z

The tests use the `TEST_OPTIMIZATION_FLAGS` which is defined in the BSP and based on `OPTIMIZATION_FLAGS`. This does not seem to be working.

Author: Chris Johns 2023-08-25T23:28:06.000Z

The issue is the tests are not being linked with the right or complete set of flags.

The optimization flags contain `-g` and given `-g` does not change the generated code it is questionable if this option should be here or a debug flags settings or even forced on as an invariant default.

The simplest solution at this point in time is to add `${TEST_OPTIMIZATION_FLAGS}` to the `ldflags` in the `grp.yml` for the testsuite.

Adding `TEST_OPTIMIZATION_FLAGS` to the linker flags has the benefit of linking with `-fdata-sections` and `-ffunction-sections` and given we are building all the code with those options the tests are not truly testing the build a user sees.

There is a fragility around having the separate sections flags in optimization flag set. If someone adjusts the `-O` level they need to carry the other flags over. Is the

separate sections important enough now that it needs its own setting to avoid simple mistakes?

Author: Chris Johns 2023-08-25T23:49:15.000Z

The test `dl09` does not build `dl-load.o` with the `TEST_OPTIMIZATION_FLAGS` flags. Updating the `dl09.yml` spec's `cflags` to have `TEST_OPTIMIZATION_FLAGS` works but adding that same to the `ldflags` breaks the build because the substitution does not happen.

It seems `cflags` does not pick up the top level `grp.yml` setting while `ldflags` does. I have no idea why it is like this.

executing thread ID: 0x0a010001
executing thread name: UI1
```

The issue is the `.bss` section size is too small for the sections present. The bug has been triggered by the separate section support now being used in the testsuite.

Author: Chris Johns 2023-08-28T06:31:02.000Z

The change to use separate data and text sections exposed a bug in how symbols and section alignment are handled when locating the symbols. The issues are: 1. The base address of a section may not be aligned to the required alignment 2. The location support on PowerPC included SDATA symbols in respective data section processing while not being included in the size calculation. This pushed the symbols out past the end of the allocated memory.

Author: Trac Migrate 2023-08-29T01:21:58.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"ac6de5a3e91e05f068f8ed2e548056357024b944/rtems" ac6de5a3/rtems]:

```
cpukit/libdl: Correctly account for section alignments

- Add the section alignment to the size as the allocator may not
provide correctly aligned memory

- Only include symbols in the section when locating symbols. The
powerpc was incorrectly adding SDATA BSS symbols to the BSS offset
overrunning the section

Closes #4950
```

```

Author: Chris Johns 2023-08-15T02:51:10.000Z

It also fails on `powerpc`.

Author: Chris Johns 2023-08-18T23:54:04.000Z

The `dl091` test allocates large blocks of memory between loading object files to move the object's text base address out of the range of any relative addressing instructions to symbols in the base image forcing the use of trampolines.

On `aarch64` the failure is the trampoline memory is out of range to the text memory so the relocations to the trampoline memory cannot be fixed up. The allocated trampoline memory is not colocated to the allocated text memory when it should be. The overflow is:

```
rtl: JUMP26/PC26/CALL: insn=0x4e123208 where=0x4e123208␣
↪target=0xfffffffff1f24898 raddr=0x40047aa0 parsing=0
```

The `target` value is the relative offset and is `-201367832`. The instruction to fix up is located at `0x4e123208`. The trampoline allocation is:

```
rtl: tramp:elf: tramps: 14 count:14 total:14
rtl: tramp:elf: slots: 14 (224)
rtl: alloc: new: OBJECT addr=0x421190f0 size=224
```

If trace is enabled for the test a set of commands are run at the end of each pass to report the state of some things such as the heap. The heap state is returned by the `malloc_info()` call and that call causes the test to pass (see #4946). Something happens in the heap to bring the allocated memory closer together.

The intent of the original design was to have a trampoline table appended to one end of the text area of the object file's memory. This means the maximum size of code that can be loaded is half the relative instruction offset size. A review of the code shows the trampoline memory is being heap allocated as a separate block. I cannot remember why it is implement this way. Effort was spent determining how to handle the allocation because the relocation records need to be parsed to determine the amount of memory to append to the text area and this means the relocation records are processed twice slowing loading down. The double processing of the relocation records was considered a suitable compromise to solve the problem. Parsing was added however the number of relocations is not being used when allocating the text area of memory.

I think the text area needs to be extended to hold the trampoline memory. I am not sure if the text size reported should be the object file's text size or the size with the

trampoline memory. I suppose it is text type memory so it should be included. It will make the change simpler.

Author: Chris Johns 2023-08-19T00:04:35.000Z

I now see the complicating factor and the reason the memory is a separate allocation.

The trampoline memory is sized to allocate space for each unresolved symbol an object file has. When loading an object file you do not know if an unresolved symbol will need a trampoline to reach the symbol.

Author: Chris Johns 2023-08-24T06:16:08.000Z

I have added allocator `resize` support to `libdl`. The object file memory is resized if there are any trampolines found when the relocation records are parsed. The sizing determines the amount of trampoline memory needed and the `tramp_size` is added to the `text_size` resizing the `text` section.

The order of allocations has been changed so `text` is last and so lower the probability resizing moves the `text_base` address. In the output from `dl09` you can see 120 bytes of trampoline memory is being added onto the `text` section:

```
rtl: alloc: resize: READ_WRITE prev-addr=0x4e132610 addr=0x4e132610␣
↪size=8
rtl: alloc: resize: READ_WRITE prev-addr=0x4e132670 addr=0x4e132670␣
↪size=32
rtl: alloc: resize: READ prev-addr=0x4e1326e0 addr=0x4e1326e0 size=328
rtl: alloc: resize: READ_EXEC prev-addr=0x4e132870 addr=0x4e132870␣
↪size=472
rtl: resize sect: text  - b:0x4e132870 s:472 a:4
rtl: resize sect: tramp - b:0x4e1329d0 s:120 a:8
rtl: resize sect: const - b:0x4e1326e0 s:328 a:8
rtl: resize sect: eh    - b:0 s:0 a:0
rtl: resize sect: data  - b:0x4e132610 s:8 a:0
rtl: resize sect: bss   - b:0x4e132670 s:32 a:8
```

The changes will handle a section moving when resizing.

The `dl09` test now passes for `aarch64` with and without trace being turned on.

Author: Chris Johns 2023-08-26T23:05:18.000Z

Test results with the changes to fix `dl09` for `arm/ilinx_zynq_a9_qemu`:

```
Passed:         9
Failed:         1
User Input:     1
Expected Fail:  0
Indeterminate:  0
Benchmark:      0
```

The `sis` BSP is using gdb and I am not sure gdb supports the SIS simulator any more?

And `sis-run` is broken with the stand alone `sis` tool we now use. The `-a` option is not supported.

Merges	0

This is to add the Regulator Helper. This will include the regulator itself, a test with full coverage, an example for rtems-examples, and a chapter in the Classic API Guide.

The regulator is designed to sit logically between two entities – a source and a destination, where it limits the traffic sent to the destination to prevent it from being flooded with messages from the source. This can be used to accommodate bursty input from a source and meter it out to a destination.

Author: Joel Sherrill 2023-07-07T20:31:10.000Z

- **Owner** set to @joel
- **Status** changed from *new* to *assigned*

Author: Trac Migrate 2023-07-09T01:12:13.000Z

Hello joel intrested in working on this ticket would like some more info.

Author: Joel Sherrill 2023-07-09T14:57:23.000Z

The code was posted to devel@ for review Friday. Documentation will follow soon. The most helpful thing would be to review this code. Beyond this help is needed to address tickets with a 6.1 target.

Author: Trac Migrate 2023-08-11T18:21:24.000Z

In [changeset:"fd693085ea1fcfe41fedb877eac35875cad4aa08/rtems" fd69308/rtems]:

```
Add the Regulator Interface and test

Updates #4924.

The Regulator is an application support class which is used to
deal with the scenario where there is a bursty input source
which needs to be metered out to a destination sink. The maximum
size of bursts needs to be known and the delivery method must
be configured to deliver messages at a rate that allows the
traffic to not overflow.
```

Author: Joel Sherrill 2023-08-16T15:10:43.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

Chapter added to the Classic API Guide and an example added to rtems-examples without having the ticket tagged:

- https://git.rtems.org/rtems-docs/commit/?id=7bd117cb00b68e5cb89aa8c237a813730876817e
- https://git.rtems.org/rtems-examples/commit/?id=d11f57cff6621fefac1d1bca5d013b8c79171cc7

This can now be closed.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4943
Merges	0

The ARM unwind support is not working and `dl05` is failing on `aarch64`.

The support uses `__gnu_Unwind_Find_exidx` and it is not being called.

I have not tested `arm` but the support is shared between `arm` and `aarch64`.

Author: Chris Johns 2023-08-12T05:59:41.000Z

The `aarch64` architecture can use the DWARF 2 exception support. This is an improvement over the specific ARM support. Switching the unwind support to `rtems_rtl_elf_unwind_dw2_.*` functions results in `dl05` passing.

Hello,

patch series for updating STM32 H7 HAL/LL drivers code is ready for review already here: https://github.com/karelfv/rtems/tree/stm32h7-hal-update-2023-07.

The code was tested on both M7 and M4 cores on stm32h747i-disco board and shows that update does not cause any new failures/regressions.

The patch series was already submitted for review on devel@ here: https://lists.rtems.org/pipermail/devel/2023-July/075880.html

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4867
Merges	0

The uLan directory in rtems-lwip was originally sourced from another project as documented in its ORIGIN.uLan file. This directory contains both some BSP-specific drivers as well as some of the core RTEMS/lwIP integration code in the form of sys_arch.c/h.

Permission has been given by the authors of this upstream repository to relicense the code under the terms of the rtemslwip directory so as to remove references to “uLan” since this term is relatively unrelated to either project and just so happened to be the location of the source. https://lists.rtems.org/pipermail/devel/2023-March/074525.html

Core integration components should be rehomed under rtemslwip/common and BSP-specific code should be rehomed under rtemslwip in a BSP-specific directory or in a new root directory with appropriate LICENSE and ORIGIN files depending on its provenance.

Original author: Eagleirony

Can we please have an `ioctl` command that lets a user can set a region in the flash device access is limited to? It may be nice to make the `read` and `write` calls relative to a region's base address. By default a device open maps to the entire flash.

The use case is allowed shared access to the flash device. For example JFFS on a region and the ability to modified a boot area.

Author: Trac Migrate 2023-03-09T00:31:19.000Z

Original author: Eagleirony

Renamed the API to spiflash to reflect it's use for more then QSPI flash. I have also added region set and unset to define a base and length for limited access. Offsets are relative to the base set.

The `waf` support does not handle staged builds or the options `--rtems-tools` and `--rtems` at the same time. The build fails when reading the `rtemsbsp` static library because it will not be in the `PREFIX`.

Also the build script scans for `.c` and `.h` files. This is fragile. If someone copies in a C file for some reason it is picked up. The sources and headers need to be explicit in build script.

- r

Author: Chris Johns 2023-03-23T21:20:31.000Z

I do not understand what the `bsp_drivers.py` use of `os.path.expanduser` is for? A build should not reference files outside the source tree unless there are options a user uses.

I am not following the `bsp_driver` code. Testing it I am seeing for `atsamv`:

```
arm/atsamv:
({'arm/atsamv': ['bsps/arm/atsamv/arm/atsamv/net', 'bsps/arm/atsamv/arm/
↪atsamv/include']}, {'arm/atsamv': []})
```

There is `` bsps/arm/atsam`` but no `bsps/arm/atsamv` and `bsps/arm/atsamv/arm/atsamv/net` looks to be repeated. I am confused.

Author: Chris Johns 2023-03-24T02:13:23.000Z

The BSP list does not handle aliases, for example the `powerpc/beatnik` has a number of aliased BSPs such as `powerpc/mvme2703`.

Author: Chris Johns 2023-03-27T03:40:31.000Z

- **Attachment** r added

List of headers in rtems-net-legacy against those install by an RTEMS 5.3 networking build

Author: Chris Johns 2023-03-27T03:42:36.000Z

The attached file `r` is a list of headers that matched headers found in an installed `powerpc/mvme2307` build of RTEMS 5.3 with networking enabled.

The list is what needs to be installed. The existing build scans for files and installs them.

Author: Chris Johns 2023-03-21T05:57:40.000Z

There are a couple of issues. The headers installed with the tools requires `-DIN_HISTORICAL_NETS=1` on the command line and the `score` API for the CPU usage has changed.

libbsd not working on nucleo-h743ZI.

I run the libbsd testsuit selectpollkqueue01,get a fatal.

The same fatal happened in my project.

* **FATAL** * fatal source: 0 (INTERNAL_ERROR_CORE) fatal code: 2 (INTERNAL_ERROR_TOO_LITTLE_WORKSPACE) RTEMS version: 6.0.0.020163e5b7bb0b4363b57f37729b99becae9c629 RTEMS tools: 12.2.1 20230224 (RTEMS 6, RSB f0e34eab8bf33b833a7d9d0b2bddd3b89f6d83cb, Newlib 17ac400) executing

i used a sh to build libbsd

```
cd /home/yangn0/devel/rtems-arm/rtems-libbsd
./waf distclean
./waf configure --prefix=$HOME/devel/rtems-arm/tools/rtems/6 \\
--rtems-bsps=arm/nucleo-h743zi \\
--buildset=buildset/default.ini
./waf
./waf install
```

Author: Joel Sherrill 2023-06-22T20:47:17.000Z

Original author: yangn0

The nucleo-h743ZI only has 1MB RAM. Although we don't have a hard line for the minimum RAM required for libbsd, this is well below the normal for use. We would recommend using lwip instead in such a low RAM environment. Please feel free to ask on devel@ or Discord for help with that.

Currently zlib is in cpukit/ while xz is in cpukit/libmisc. The purpose of this ticket is to create cpukit/compression and move both to it.

This ticket does not add, remove, or upgrade the existing source. It is intended to just document improving the organization.

3.9.1.476 4901 - rtems_task_construct Documentation Missing Some Details

Id	4901
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2023-04-26T14:31:48.000Z
Updated	2023-05-19T05:21:42.000Z
Milestone	6.1

The rtems_task_construct directive description has a couple of deficiencies:

- does not mention or link to RTEMS_TASK_STORAGE_SIZE
- does not provide rtems_task_config and discuss the fields

It would be nice to discuss how each of the parameters to rtems_task_create is set/computed when using rtems_task_config.

I did not look but rtems_message_queue_construct may have similar issues.

Author: Trac Migrate 2023-04-27T05:57:24.000Z

Yes, this is definitely missing. One issue is that we have no documentation of the data structures in the Classic API Guide. They are only present in the Doxygen documentation. My plan is to improve the documentation generator in rtems-central to produce documentation for the data structures.

Author: Joel Sherrill 2023-04-27T11:43:15.000Z

It isn't just the data structure. That could be largely accounted for with a quick mention that rtems_task_config maps to the arguments to rtems_task_create. The problem is specifically stack_size in create becomes storage_size in construct and you have to use a macro on your desired stack_size to fill in the structure. The dtor field is also missing info. You could get by with a bullet list on the structure parameters showing how they map or are used.

There is also nothing in rtems-examples which uses this.

Author: Trac Migrate 2023-04-27T13:38:13.000Z

Most of the stuff is already covered in the Doxygen output:

https://github.com/RTEMS/rtems/blob/master/cpukit/include/rtems/rtems/tasks.h#L107

The Versal polled mode it broken when building. The disable all interrupt call is not built in polled mode.

The UART interrupt mode behaves differently with a small stand alone app than a full app with libbsd. A full application with libbsd seems to behave while the small app exhibit the "not tx interrupt on FIFO load" issue.

- 0001-aarch64-versal-Fix-uart-interrupt-issues.patch

Author: Trac Migrate 2022-12-05T22:28:42.000Z

- **Attachment** 0001-aarch64-versal-Fix-uart-interrupt-issues.patch added

Author: Chris Johns 2023-02-09T02:27:13.000Z

The UART IP is based on the standard ARM IP however Xilinx have finally reported to me the interrupts are not the same as the ARM IP. There is weird issue around needing to prime the FIFO to half plus one to generate the first TX interrupt.

Xilinx has confirmed this will not change across the range of ACAP devices.

The main issue this raises is using the UART for a specialized protocol and not a terminal where sending a number of carriage returns is harmless.

3.9.1.480 4896 - Makefile.inc exported BSP include path not a system include path

Id	4896
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2023-04-12T21:55:08.000Z

The BSP include path exported in the `Makefile.inc` set of files uses `-I` and that is not a system include. The RTEMS 5 and earlier `autoconf` build system provided a spec file using the `-B` option and that either added a system path or the spec file included a system path. Either way the BSP include path was added as a system include path and so the compiler placed it at the end of the include list.

The `CPU_DEFINES` macro is part of `CPPFLAGS` exported by `Makefile.inc` and we cannot control how applications uses that variable so we need to make sure the BSP include path is exported as a system include path.

The issue was found with EPICS. EPICS installs a header file called `link.h` under its include path. RTEMS now provides a header file called `link.h`. The `CPPFLAGS` are before the EPICS include path so our `link.h` was seen before the EPICS one and that broken the build.

Building the tools with a recent MacOS such as Ventura failed because Apple has removed support for embedded python in programs. This means GDB does not build. The solution is to teach the RSB GDB support to use a build of Python from https://www.python.org/.

The RSB failed to build gcc on the M series processors on Ventura using Xcode 14.2. The build gcc crosscompiler (`xgcc`) crashes with sig faults. GCC does not bootstrap on ARM systems:

```
*** Configuration aarch64-apple-darwin22.3.0 not supported
```

Look at supporting Homebrew built `gcc`.

Patch 4 of 4

Author: Chris Johns 2023-03-27T04:20:26.000Z

I have attached the 4 patches I have for building on a recent MacOS.

You need:

1. Recent Xcode installed with the command line tools package. To install the package start Xcode and then click on the Xcode menu item followed by "Open Developer Tools", "More Developer Tools...". Find the command line tools package for the version of Xcode you are running and install.
2. Install a recent Python 3 from https://www.python.org/downloads/macos/ and install. From a terminal shell run:

```
% /Applications/Python\\ 3.11/Update\\ Shell\\ Profile.command
```

To install the paths in your environment

3. Create a virtual environment and activate it:

```
% python3 -m venv rpy
% . ./rpy/bin/activate
```

4. Optionally install Homebrew and set up the environment. Make sure one of gcc-12 through to gcc-9 packages is installed.
5. Run a normal RSB build

Note: Currently M2 Pro builds are failing with a segment fault. I have only one machine to test this on.

Author: Trac Migrate 2023-03-28T10:26:27.000Z

Somethings's fishy here. If we'are talking about tools build by RSB as presented in HEAD, then I'm able to build those on Ventura. The point is to:

- use hand build python3
- use either more RAM or limit jobs

The common issue of segfaulting GCC seems to be caused by Ventura reworked memory management which seems to be very sensitive to available amount of RAM.

Using Ventura 13.2 here.

Author: Trac Migrate 2023-03-28T10:52:36.000Z

OK, so sorry for noise here. What I wrote was applicable in the past. Now, while looking into the internal documentation for MacOS-based customer (which may become part of rtems doc, just don't know where to put it nor had a time to submit/merge) I see these asciidoc paragraphs:

```
#### Install RTEMS build requirements
Please note that this paragraph is written for macOS 13.2.1 (Ventura) and is
not directly applicable to Linux distributions and/or various BSDs.

We are using homebrew to install basic packages required to compile
RTEMS tools and packages. Let's start with the Homebrew installation first.
Open the shell window and run following command inside it.
----
% /bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
----
The command will ask for root access and will then also download not
only brew package manager, but also Apple's Xcode command line tools.

When this is done, you may choose to configure brew to be available on
your PATH by following 'Next steps' printed to the terminal by the
installation process.

When this is done, you may continue with using brew package manager to
install required packages for us. Please use following command in
order to do it.
----
% brew install xz python3 texinfo
----
In order to use python3 installed above with just a 'python' command
which is required by the RTEMS source builder (due to required support
for python2 on tools side) you will also need to create a symbolic
link python3 -> python like below:
----
% cd /opt/homebrew/bin
% ln -s python3 python
----
```

Author: Trac Migrate 2023-03-28T12:59:14.000Z

I can confirm that I've built tools using RSB with last patch being:

```
commit f0e34eab8bf33b833a7d9d0b2bddd3b89f6d83cb (origin/master, origin/
↪HEAD)
Author: Chris Johns <chrisj@rtems.org>
Date:   Tue Mar 21 22:05:41 2023 +1100

binutils: Disable stack exec and RWX section warnings

Binutils 2.39 and later enable by default warnings for executables
with executable stack and RWX sections. Disable them.

Closes #4881
```

hour ago on my Ventura Mac Mini M1 software versions:

```
karel@mini rtems % sw_vers
ProductName:            macOS
ProductVersion:         13.2.1
BuildVersion:           22D68
```

just *FINE* and without any of your proposed patches!

So please do not destabilize stuff. macOS is enough PITA :-)

Author: Trac Migrate 2023-03-28T21:28:04.000Z

Hold on! You added patches. I described two ways how is it possible to build tool and yet you claim patches are needed when half of the patches try to deal with crashing of gcc on your Ventura.

Also you claim homebrew is optional yet you like to use it's gcc/g++ to build tools.

A bit contradicting.

Anyway, please make sure you are on the *LATEST* Ventura and not on the .0 release. If you update, you will see your gcc crashes may be gone for good. I reported that on devel@ few times already.

Yes, makeinfo is still required by RSB otherwise I would not install it.

Yes, if RSB build its own xz and python and whatever, it would be good.

Author: Chris Johns 2023-03-29T05:57:47.000Z

> >
> > The patches are not attempting to address the crashing. I have no idea what causes those. The patches address other issues. They are:
> >
> > 1. Using Python virtual env and cleaning up python support for MacOS. This lets a user install python from python.org.
> > 2. DTC did not build because of warnings treated as errors. No idea how you missed this is you are at the same level of updates as me.
> > 3. Libgcc uses `sh` and not `$(SHELL)` in it's `Makefile.in`. I have not looked into why I got it but something is different in the set up or environment to trigger it.

4. Add homebrew as a I wanted to try building xgcc with gcc rather than Xcode. It did not help so I am currently considering dropping that patch.

   Also you claim homebrew is optional yet you like to use it's gcc/g++ to build tools.

   I have not yet added Homebrew support. It is sitting in a patch. I would prefer not to have it part of the build. I have explained this on the devel list in the past.

   > A bit contradicting.
   >
   > I did not and have not and I cannot understand why you need to talk to me like this. Can you please not?

   > > > > Yes, makeinfo is still required by RSB otherwise I would not install it.
   > > > >
   > > > > The RSB checks but is it needed in any packages these days? It was added long ago when all projects built the docs by default using it. We do not build doc. If needed support should be added like gsed.
   > > > >
   > > > > > Yes, if RSB build its own xz and python and whatever, it would be good.
   > > > > >
   > > > > > The RSB is written in python so building python would be difficult without

it already being installed. Ah yes xz is another. I built that by hand and had forgotten.

Author: Chris Johns 2023-04-02T23:29:15.000Z

Building on M2 Pro with Ventura 13.3 and Xcode Version 14.3 (14E222b) results in segmentation faults in `cc1` and `cc1plus`. Inspecting the MacOS crash reports showed invalid accesses to the stack guard area of memory. A typical crash report is:

```

The FAR is in the stack guard area. The crashes are always in the MPFR library and relate to calls to GMP. The GMP tests pass. The MPFR built by gcc tests fail and a hand built MPFR tests pass.

The crash leaves the build so changing to the MPFR build directory lets you run the tests:

```
cd build/arm-rtems6-gcc-cf59d86-newlib-17ac400-arm64-apple-darwin22.4.0-1/build/mpfr
make check
```

The results are:

```
============================================================================
Testsuite summary for MPFR 4.2.0
============================================================================
# TOTAL: 197
# PASS:  97
# SKIP:  3
# XFAIL: 0
# FAIL:  97
# XPASS: 0
# ERROR: 0
```

The failures are all seg faults.

I upgraded to MPFR 4.2.0 as it does not need the `fix-mac-arm64-mpfr-config.patch` patch. Building by hand and referencing the gcc build GMP has the following results:

```
============================================================================
Testsuite summary for MPFR 4.2.0
============================================================================
# TOTAL: 197
# PASS:  194
```

(continues on next page)

(continued from previous page)

```
# SKIP:  3
# XFAIL: 0
# FAIL:  0
# XPASS: 0
# ERROR: 0
```

I provided the same `configure` command line used by gcc when it builds the library internally. There are no sig faults.

I ran the tests for GMP and there were no errors.

Close inspection of the build and the `config.log` reveals a difference. The gcc build has:

```
-DHAVE___GMPN_INVERT_LIMB=1 -DHAVE___GMPN_RSBLSH1_N=1
```

and they are not present when building by hand. The `config.log` shows:

```
configure:19315: checking for __gmpn_invert_limb
[..]
configure:19315: result: yes
```

The hand built MPFR has:

```
configure:19315: checking for __gmpn_invert_limb
[..]
configure:19315: result: no
```

This is the only difference I could see.

- **Attachment** gcc-no-sig.diff added

Disable GCC catch sign fauls and cleaning up with a error message.

Author: Chris Johns 2023-04-04T23:16:43.000Z

I have found a suitable work around for MacOS `arm64` that stops the crashes. I tracked issue to GMP and the assembler accelerators it has for `aarch64`. That code seems to access memory outside the area allocated and MacOS 13.2/13.3 detects this on `arm64`. The crash depends on where the `alloc` call allocates memory in relation to the stack guard.

I ised the simple patch attached to `toplev.cc` to stop GCC catching the seg fault signal. This lets MacOS capture the fault and generate a useful crash report.

After a crash I changed directory to the GCC build of MPFR and ran `make check`. The results failed as shown in comment:10.

Testing of builds of MPFR showed the issue in GMP and inspecting GMP `configure --help` showed `--disable-assemble`. Using this option results in the MPFR tests passing. I updated the GMP build to add this option on MacOS `arm64`.

This exposed a second issue. GCC was building GMP internally as the source was linked into the top level of GCC's sources. GMP is now built as a package because GDB also requires GMP. There is no point building it twice. Removing the GMP sources from the GCC build let GCC pick up the GMP package built and staged earlier in the build set with the work around configure option.

No bug report has been raised with the GMP or MPFR projects. If someone feels like doing that please do.

rtems-lwip currently scans a subset of directories for files. Since it already supports includes in its definition format, it should instead explicitly list all files to be compiled and support for directory scanning should be removed.

The base struct for an I2C driver can set `set_clock` handler so a user can change the I2C clock speed. The default `ioctl` handler does not check for the `I2C_BUS_SET_CLOCK` command and if the `set_clock` handler is set calling it.

Author: Chris Johns		2023-03-22T05:26:40.000Z

- **Resolution** set to ~"invalid"
- **Status** changed from *assigned* to *closed*

Ah sorry I was looking at a device and not the bus.

3.9.1.484 4881 - powerpc gas and ld warnings

Id	4881
State	closed
Type	ISSUE
Author	Chris Johns

The upgraded `binutils` generates new warnings when linking executables:

```
/opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/../../../../powerpc-rtems6/bin/ld: warning: /opt/work/rtems/6-bsp/powerpc-rtems6/mvme2307/lib/vectors_entry.o: missing .note.GNU-stack section implies executable stack
/opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/../../../../powerpc-rtems6/bin/ld: NOTE: This behaviour is deprecated and will be removed in a future version of the linker
/opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/../../../../powerpc-rtems6/bin/ld: warning: /opt/work/chris/rtems/libbsd/rtems-libbsd.git/build/powerpc-rtems6-mvme2307-default/termios05.exe has a LOAD segment with RWX permissions
/opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/../../../../powerpc-rtems6/bin/ld: warning: /opt/work/chris/rtems/libbsd/rtems-libbsd.git/build/powerpc-rtems6-mvme2307-default/termios05.exe has a LOAD segment with RWX permissions
```

Author: Chris Johns 2023-03-21T06:23:45.000Z

This article by Nick Clifton explains the changes in `binutils-2.39`:

https://www.redhat.com/en/blog/linkers-warnings-about-executable-stacks-and-segments

Author: Chris Johns 2023-03-21T06:57:19.000Z

This diff removes the warning:

```
diff --git a/bsps/powerpc/shared/start/vectors_entry.S b/bsps/powerpc/shared/start/vectors_entry.S
index 07b17a48af..9140c55121 100644
--- a/bsps/powerpc/shared/start/vectors_entry.S
+++ b/bsps/powerpc/shared/start/vectors_entry.S
@@ -10,6 +10,7 @@
#include <rtems/score/cpu.h>

PUBLIC_VAR (__rtems_start)
+       .section .note.GNU-stack,"",@progbits
.section .entry_point_section,"awx",@progbits
/*
* Entry point information used by bootloader code
```

however it moves to another object file:

```
/opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/../../../../powerpc-rtems6/bin/ld: warning: /opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/m604/ecrtn.o: missing .note.GNU-stack section implies executable stack
/opt/work/6/lib/gcc/powerpc-rtems6/12.2.1/../../../../powerpc-rtems6/bin/ld: NOTE: This behaviour is deprecated and will be removed in a future version of the linker
```

This time it is in the gcc build object files.

Author: Chris Johns 2023-03-21T09:26:15.000Z

The following removes the warnings:

```
[powerpc/mvme2307]
LINKFLAGS = -Wl,--no-warn-execstack -Wl,--no-warn-rwx-segments
```

I do not know how to add these options to the `LINKFLAGS` in the spec files.

Author: Chris Johns 2023-03-21T09:51:24.000Z

I will get the RSB to disable these warnings for RTEMS. This will mean we will not have to change anything and users will not see these warnings and be confused.

Original author: lsilistr

Cloned from #4877:

When calling sem_open with the O_CREAT flag the sem_open function requires 4 parameters. It will: value = va_arg(args, unsigned int); so the “value” argument will be randomly chosen.

sem_open can fail if the random value is not a valid semaphore value, failing the test.

Currently generic RISC-V BSPs (riscv/riscv) that start with rv64 and not rv64_medany will start at 0x70000000. This adds high maintenance overhead and deviates from almost all other RISC-V-based OSes and baremetal program that start at 0x80000000. Further, testing now has to account for an extra parameter (medany or not) that doubles the number of BSPs need to be tested.

It would be ideal to reduce maintenance efforts by defaulting all RV64 BSPs to medany and make them start at 0x80000000 to run on both QEMU and Spike. Those that need other cmodels or start addresses could be customised (e.g., rv64imac would default to medany but rv64imac_medlow won't).

```
- Currently generic RISC-V BSPs (riscv/riscv) that start with rv* and not rv*_medany will start at 0x70000000. This adds high maintenace overhead and deviates from almost all other RISC-V-based OSes and baremetal program that start at 0x80000000. Further, testing now has to account for an extra parameter (medany or not) that doubles the number of BSPs need to be tested. RV32* currently don't have medany support as gcc/newlib doesn't build this. Thus, rv32 only currently runs on Spike as QEMU starts at 0x80000000.
+ Currently generic RISC-V BSPs (riscv/riscv) that start with rv64 and not rv64_medany will start at 0x70000000. This adds high maintenance overhead and deviates from almost all other RISC-V-based OSes and baremetal program that start at 0x80000000. Further, testing now has to account for an extra parameter (medany or not) that doubles the number of BSPs need to be tested.

- It would be ideal to reduce maintenance efforts by defaulting all BSPs to medany and make them start at 0x80000000 to run on both QEMU and Spike. Those that need other cmodels or start addresses could be customised (e.g., rv64imac would default to medany but rv64imac_medlow won't).
+ It would be ideal to reduce maintenance efforts by defaulting all RV64 BSPs to medany and make them start at 0x80000000 to run on both QEMU and Spike. Those that need other cmodels or start addresses could be customised (e.g., rv64imac would default to medany but rv64imac_medlow won't).
?                                                
```

(continued from previous page)

```
↪overhead
and deviates from almost all other RISC-V-based OSes and baremetal␣
↪programs
that start at 0x80000000. Further, testing now has to account for an␣
↪extra
parameter (medany or not) that doubles the number of BSPs need to be
tested.

This commit defaults all RV64 BSPs to use medany code model to allow␣
↪starting
all BSPs at 0x80000000. BSPs that require different code models and/or
start addresses are custom and need to add their own entries.

Updates #4775

While investigating the build issue tracked as #4858, I tried bumping the gdb to 12.1 hoping it included the fix. But it did not. This bumps the default gdb to 12.1 with the same patch.

The hash needs updated in order for glib to be built. This is currently preventing

- 0001-devel-glib-2.48-Update-hash.patch
- 566e1d61a500267c7849ad0b2552feec9c9a29a6.patch

Author: Trac Migrate	2022-03-24T15:16:13.000Z

Original author: rlong

- **Attachment** 0001-devel-glib-2.48-Update-hash.patch added

Author: Trac Migrate	2022-03-24T20:49:58.000Z

Original author: rlong

This is currently preventing QEMU from being built. The hash of the patch changed for some unknown reason. Therefore, we are going to store a copy of that patch here so that it doesn't change. This patch will then be pulled down and applied in place of where it was originally done. The hash of the patch will still have to be updated, but hopefully this will prevent it from happening again.

3.9.1.500 4453 - Global vs Local Attribute Unclear for SMP/Distributed MP

Id	4453
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2021-06-09T18:31:46.000Z

Milestone	6.1
Labels	priority::normal, resolution::fixed, tickettype::enhancement, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4453
Merges	0

The description for global vs local attributes on objects do not make it clear whether they apply to SMP or distributed multiprocessing configuration. This applies to at least the rtems_task_create description but likely needs to be addressed in the description in every create with global/local and in the SMP section.

Author: Trac Migrate 2021-06-10T13:28:04.000Z

In the rtems_task_create() description we have:

The task has a local or global scope in a multiprocessing network (this attribute does not refer to SMP systems). The scope is selected by the mutually exclusive RTEMS_LOCAL and RTEMS_GLOBAL attributes.

Maybe we should add `local scope` and `global scope` glossary terms. Maybe we should replace `scope` with something more specific.

3.9.1.507 4489 - waf configure's –rtems-config and build create an error

Id	4489
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate
Created	2021-08-05T07:30:27.000Z
Updated	2022-11-29T23:47:23.000Z
Milestone	6.1
Labels	priority::normal, resolution::wontfix, rtems::build, tickettype::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4489
Merges	0

Waf allows `distclean`, `configure`, `build` and `install` on a single command line however adding `--rtems-config` to the configure stage generates this error:

```
The --rtems-config command line option is not allowed in the build command
```

This is error is incorrect.

Author: Chris Johns 2022-11-29T23:47:23.000Z

- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

I am closing this as it will not be fixed for now. It is not right in the normal context of `waf` command lines but it is a corner case to fix.

Please reopen if this is important.

```

The same `config.ini` in the source tree finds all configured bsps.

Being able to cleanly sandbox builds is a feature of the `autotools` build system.

Author: Trac Migrate 2020-12-09T05:55:53.000Z

I guess the issue is that it finds a “config.ini” in the source tree since this is the current working directory of the wscript process.

For a discussion of out of tree builds see:

https://lists.rtems.org/pipermail/devel/2020-November/063066.html

When testing the RTEMS master, one can use the rtems6 or rtems7 tools. The rtems-bsp-builder is hard-coded to rtems6.

As part of doing this, the version should be in the email subject and report so that similar reports can be distinguished.

3.9.1.513 3977 - Add unexplained-failure as option for Test Configuration Files

Id	3977
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2020-05-10T16:34:31.000Z
Updated	2022-11-29T23:16:56.000Z
Milestone	6.1
Labels	priority::normal, resolution::invalid, tickettype::enhancement, tool::test
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3977
Merges	0

RTEMS has many BSPs and it is a large amount of work to investigate each test execution that has an unexpected result. The tcfg files were initially created to just avoid trying build tests where the executable did not fit into target memory. That has grown to incorporate knowledge about which tests require human input and are not automated. This ticket is to add a new test state for "unexplained failure".

If a test has been investigated and has an explanation, it is a known failure. This could be associated with a ticket (e.g. dynamic loading or fenv not supported on an architecture) or just a comment explaining it (e.g. mips jmr3904 simulator trapping invalid memory accesses before the trap handler is tripped).

But many tests are currently just marked as failures because they do fail but no one has investigated and explained it. The addition of "unexplained failure" is to capture those. This will make it possible for someone looking to know they need investigating but are known to fail. Marking these are "known failure" permanently puts them in a category where they will not get looked at again.

This has two side-effects. The first is that we can have test results with no "unexpected failures." They are either known and explained or known and need investigation. This helps anyone looking at test results since there should be no unexpected failures. The second side-effect is

that it hopefully captures the set of repeatedly failing tests and encourages us to investigate and file tickets or explain.

The milestone for this is **NOT** 5.x because this is moving the goalpost for test results. Release 5.x is the first with the body of test results data we have. The build@ mailing list has them and can be compared by any user interested. We also do not have a way to machine check results yet which would ease checking the test results for deviations.

Note: As an odd case, there are multiple BSPs where the executables can run on hardware or 1+ simulators. Sometimes the results vary across the target environment even for the same executable. This is at least something to consider as we want to have a trustworthy and checkable set of test results available.

Author: Chris Johns 2020-05-13T01:32:55.000Z

For the record the TCFG files were created to manage the states for the tester. The change included excluding a test. The tester command had the state checks and handling added in April 2017. The test states were also added to `rtems.git` at this time so all states have been present and documented in README.testdata together. I also raised #2962 at the time to indicate we need to manage this before we release.

From my point of view and `rtems-test` nothing has changed. What was added did not set a policy for managing failures or the relationship to releasing and any failure, known, expected or otherwise is just a failure. The tester either expects to see a failure or it does not for accounting purposes only.

I have gone away and spent time looking at adding this state and the change feels wrong because this state and any like it are basically a logical `OR` of `expected-fail` and the tester does not care about a policy that manages this or arrives at the expected fail state. The end goal is to have `./waf test` that runs all the tests on a configured test harness and `waf` returns a non-zero exit code for any regressions from the build's baseline. I doubt we have single BSP that does this on any test harness.

We should actively discourage specific test analysis from test results as they are simply a tool to account for a build's baseline. The result's stats should be bounded and consistent and provide a simple way to have a machine determine the state of a build.

I have posted a detailed alternative. For these to work we will need a workable set of policies for the management of test failures.

I think it is unrealistic to expect RTEMS to have 100% pass on all tests on all BSPs on all test platforms a BSP supports. There will be failures. There has been little or no analysis of existing tests that fail captured and accounted for so I dispute the assertion moving them to expected failures will stop any analysis. I believe the solution to this issue lies else where.

I am fine with tests that have no analysis being left as unexpected failures but we need a way for buildbot or any other CI tool to run the test suite on selected profiles to know if a change has caused a regression. Any test failure in a clean clone from `rtems.git` breaks the ability to do this. This is the first thing we need to fix.

Transitioning from the current state to one where the tester can detect regressions requires some effort. It is unfair to instantly say _"all commits to rtems.git must

have no unexpected results for BSP XXX on YYY"_ if this is the policy. I do think we need to select a few key BSPs and test harnesses that are required to have no unexpected results befor a release can be made.

I would like to close this ticket and open a new one for the tester state changes. I suggest a ticket to document the unexpected results policy be created.

Author: Chris Johns 2020-09-25T01:20:22.000Z

This ticket should be closed. Please close.

The RSB and Tools wrap python scripts in a shell script based wrapper that detects the installed version and uses it. Other python scripts in RTEMS do not. I would like to have a consistent model for all scripts.

[| PEP0394] discusses the issues and says a distro can decide not to provide a `python` command by default. It also says a `virtualenv` can be used to provide a consistent default environment.

Do we assume `#! /usr/bin/env python` will always work in our script and we make sure we are `python2` and `python3` clean for user installed commands?

If a user does not have a `python` command installed by default do we document how to install one or do we document using a `virtualenv`?

A simple shebang is cleaner for us to maintain however it added an extra dependency we need to document.

Note, development script and tools should follow the same model we decide on however they only need to support `python3`.

Author: Chris Johns 2020-08-01T00:17:16.000Z

- **Summary** changed from *Python script distrubution standardisation* to *Python script distribution standardisation*

Author: Trac Migrate 2020-08-02T09:00:11.000Z

I'm currently a bit undecided. Both methods have advantages and disadvantages.

Points that could be a reason _not_ to use a wrapper: * **One important point**: We start to use `waf` everywhere. `waf` starts with a `#!/usr/bin/env python`. So it assumes that `python` exists. That means as soon as a user wants to build something with `waf` he needs a `python`. I don't think that we want to provide a wrapper for `waf`? * Although you did a great job making it as simple as possible: A wrapper adds complexity. How many edge cases are missed in the wrappers? For example: If you try to call one of the source builder commands using a soft link in another directory, the `$(dirname $0)` of the wrapper will fail. * Every supported system has to provide a `/bin/sh` and a `dirname` command. Can we be sure that's the case? What about Windows? If we enforce the wrapper we will always need a mingw or msys for Windows. If we remove it it might be possible to build RTEMS with only a python installation somewhen in the future (although you still need a cross-compiled gcc or llvm). * Do we really want to support multiple python versions on the long term? It might start to get really complicated to test all relevant configurations. By the way: Does buildbot use `python2`, `python3` or both?

Points that could be a good reason for using a wrapper: * Do all our scripts work with `python3` already? The wrapper of the source builder currently defaults to `python2`. So most likely it is nearly untested with `python3`. * I think I had trouble building rtems-docs with python3 in the past (and I always have been too lazy to fix them - sorry). That means that currently _not_ everything is ready to work with all python versions. A wrapper could select the best one. But that also means we basically depend on `python2` _and_ `python3` to be installed. * We will have a really simple possibility to switch to `python4` when it comes out. * On systems without a `python` it will definitively make it simpler.

Background questions: * Do we know of distributions that don't provide a `python` (without version number) command?

Author: Trac Migrate 2020-08-03T07:16:27.000Z

openSUSE 15.2 installs Python 3 by default and Python 2 is **not** available by default. There is no "python" command by default, only "python3".

I think we should ask the waf community how they want to deal with this.

About a year ago I started a discussion about "Which Python version for new tool code?". It seems RHEL 7 was the only relevant distribution not providing a Python 3, but this changed during the discussion:

https://lists.rtems.org/pipermail/devel/2019-August/055010.html

CentOS 7.7 ships it also. Is there anything left which doesn't ship Python 3? If not, then why don't we change the shebang to `#!/usr/bin/env python3`?

Author: Chris Johns 2020-08-04T07:37:25.000Z

We need to support long life versions of host systems and I have understood this to mean `python2`. As a result we need to make sure our user facing tools run on Python 2 and 3 for a while yet. This ticket is about how we handle this and not that choice.

The `python` command may not install by default but is there a package that does provide it?

The `waf` point is a valid one. We need a `python` command while it requires it. If that changes then we can consider what happens then. If you wish to ask please do so.

Author: Trac Migrate 2020-08-04T09:11:31.000Z

Seems that I misinterpreted the intention of the ticket. You asked:

> Do we assume `#! /usr/bin/env python` will always work in our script and we make sure we are python2 and python3 clean for user installed commands? If a user does not have a python command installed by default do we document how to install one or do we document using a virtualenv? A simple shebang is cleaner for us to maintain however it added an extra dependency we need to document.
>
> From my point of view: As long as waf needs `python`, we can assume it for our scripts too. So we have to document that anyway as soon as we switch to `waf` for all core repos.
>
> From what you wrote we have to make sure that our scripts work with `python2` and `python3` anyway. I would reject a `python2` only version with it beeing no maintained anymore and slowly removed from distributions and you don't like a `python3` only version.
>
> The alternative would be to add a shell wrapper around `waf` too. But do we really want to maintain that with all edge cases? And again: That adds a fixed dependency to a shell. Without a wrapper we might be able to have packages for Windows that only contain a binary toolchain and a python installation. That could be useful for big teams that want to build the toolchain only on one host and distribute it in binary form to all developers.

Author: Chris Johns 2020-08-05T00:32:58.000Z

I tend to agree. I would like to first know if CentOS7 and openSUSE 15.2 to have a package to install `python`?

Author: Trac Migrate 2020-08-05T04:49:05.000Z

On the waf issue tracker I found this:

https://gitlab.com/ita1024/waf/-/issues/2259

The suggested solution is to modify the shebang by hand for waf 2.*.

On openSUSE 15.2 you have to install Python 2 to get a `python` command or add the symlink yourself as root.

My preferred solution would be to change all shebangs to `#!/usr/bin/env python3` and require all users of RTEMS to install Python 3.

Author: Chris Johns 2020-08-05T08:23:09.000Z

I have re-read PEP 394 and I am starting to think we should document and provide support for our users to run virtual environments. This is a recommendation in the PEP and I think it makes sense. As stated previously we need to support Python2 and Python3 for a period of time. Users restricted to Python2 should have a `python` command or they should have a `virtualenv` package for Python2. Python3 users should be on `python3.6` or later and that has the `venv` module which gives them a `python` command.

I feel hard coding the version of python into the shebang restricts us and only creates further issues. Getting our users educated to use a virtual environment will pay off in the long term.

Author: Trac Migrate 2020-08-05T08:30:03.000Z

I am not against using virtual environments, however, we should really evaluate if we want to support Python 2 in RTEMS 6. Maybe we should ask on the users mailing list if there are still host computer systems in use without a Python 3 support.

Author: Chris Johns 2020-08-06T00:20:26.000Z

A primary goal of RTEMS is to provide long life support for hardware and hosts.

I see the major issue with Python2 and Python3 as the shebang and `python` support rather than the coding. There are some basic things we need to do to support both but it is not a big deal. At this point in time I do not support just Python3.

As a result I prefer we focus on how we manage this situation. I believe virtual environments provide this. I see forcing the shebang to `python3` as problematic long term.

Author: Trac Migrate 2020-08-06T04:52:12.000Z

I still think we should try to learn a bit more about which hosts are in use by the RTEMS users. If there are still users around which are stuck with Python 2, then fine, otherwise we have one problem less.

How do you want to use the virtual environments? How is it set up? I have no experience in packaging and deploying Python projects. For me it would be a bit inconvenient if I have to activate a virtual environment just to run ./waf to build RTEMS for example.

Author: Joel Sherrill 2020-08-06T14:06:17.000Z

Can we write a simple program as an alternative to env which answers the question of "which Python" in a way we want? rtems-which-python python[23] and let it answer the question?

I am opposed to forcing use of virtualenv but only encouraging it. It is a nice feature and I am using it but I only use it because the host doesn't have everything in a complete (Tex packaging) or current way. If the host is sufficient, it shouldn't be needed.

CentOS 7 does have a Python 3 but you have to install a "software collection" (https://developers.redhat.com/products/softwarecollections/overview for a description and list). This is the RedHat way of adding newer technologies as an option. This is what I have been doing on CentOS 7 combined with a virtualenv.

```
scl enable rh-python36 bash
```

I have been doing the Python 3 Software Collection plus a virtualenv for Sphinx to build the RTEMS documentation.

Author: Trac Migrate 2020-08-06T14:12:46.000Z

Author: Chris Johns 2020-08-06T23:44:44.000Z

Using a virtual env, selecting an OS or a specific distribution of an OS, using `python3 waf` or adding a symlink yourself are all user choices. No one is forcing anyone to select any specific option and in fact I am concern we limit the choices in what we do. We also need to consider users may have other Python tools and commands and we need to make sure users can still run those tools.

The proposal I am putting forward is for user facing tools and scripts only and it is to shebang python only and we document a few of the approaches so it becomes a user choice. If you want to use CentOS with Python2 and `python` that is fine. If you want to install Python3 on CentOS that is no problem. If you use a bleeding edge Linux distro with a progressive set of packages and it only comes with Python3 that is also fine.

What I would like to avoid is us selecting a specific case and mandating it. This means we cannot force the shebang to `python3` and we cannot explicitly exploit something in a virtual env.

Creating a specific env for us does not help other tools like `waf`.

Author: Trac Migrate 2020-08-07T06:31:13.000Z

Maybe let me summarize a bit:

- No one really fought for keeping the wrappers. Instead we should start documenting how to set up a good environment (either via `virtualenv` or installing directly on host systems).
- For our tools we should select a shebang that is used in all user facing tools.

- We have at least `waf` which uses just `python` in the shebang. So regardless what we chose: Our environment needs a `python` command as long as `waf` uses it.
- There is no consensus about which python version we should use for user facing tools. Maybe we should move that discussion to the mailing list like suggested multiple times?

I think the first three points answer the original question of the ticket? Did I miss something from the discussion?

The last point is definitively a controversial one. There are good reasons for both directions. But again: Maybe that should be discussed with a broader audience?

Author: Chris Johns 2020-08-10T06:06:10.000Z

Replying to Christian Mauderer:

Replying to Christian Mauderer:

> > The last point is definitively a controversial one. There are good reasons for both directions. But again: Maybe that should be discussed with a broader audience?
> >
> > I think there will be some push back to dropping Python2 right now and this will fade as time goes on.
>
> There would be some advantages too. Maybe we should discuss an indicator that it is time to drop the python2 support (for example: as soon as waf does; or as soon as CentOS doesn't installs it by default; or in 1 year; or . . .) so that there is a clear plan and it isn't discussed again and again every few months. But like you said: That's not the topic of this ticket and I think it would be better to discuss this on the mailing list.
>
> I think the new build system and the qual project need to be done and we have releases with them. I think at the core of this issue is releases with python 2 and 3 and once we know how they are traveling it will become apparent what we can do.

I will remove the script support in the RSB and close this ticket when it is merged.

Original author: rmueller

I think here is still some issue with the HUART3 console support, at least for the STM32H743ZI-Nucleo board.

I solves the issue by calling some hardware initializaton functions and override void HAL_UART_MspInit(UART_HandleTypeDef* huart) like this:

```
#include "hardware_init.h"
#include <stm32h7xx_hal_rcc.h>
#include <stdio.h>

void hardware_init() {
MX_USART3_UART_Init(115200);
}
```

(continues on next page)

(continued from previous page)

```
8
9
10 /**
11 * ST-LINK UART3
12 * CN5 pins on board
13 */
14 UART_HandleTypeDef huart3;
15 GPIO_InitTypeDef gpio_uart_init_struct;
16
17 void MX_USART3_UART_Init(uint32_t baudRate)
18 {
19 __HAL_RCC_USART3_CONFIG(RCC_USART3CLKSOURCE_HSI);
20 __HAL_RCC_GPIOD_CLK_ENABLE();
21 __HAL_RCC_USART3_CLK_ENABLE();
22
23 int result;
24 huart3.Instance = USART3;
25 huart3.Init.BaudRate = baudRate;
26 huart3.Init.WordLength = UART_WORDLENGTH_8B;
27 huart3.Init.StopBits = UART_STOPBITS_1;
28 huart3.Init.Parity = UART_PARITY_NONE;
29 huart3.Init.Mode = UART_MODE_TX_RX;
30 huart3.Init.HwFlowCtl = UART_HWCONTROL_NONE;
31 huart3.Init.OverSampling = UART_OVERSAMPLING_16;
32 huart3.Init.OneBitSampling = UART_ONE_BIT_SAMPLE_DISABLE;
33 huart3.Init.ClockPrescaler = UART_PRESCALER_DIV1;
34 //huart3.Init.FIFOMode = UART_FIFOMODE_DISABLE;
35 //huart3.Init.TXFIFOThreshold = UART_TXFIFO_THRESHOLD_1_8;
36 //huart3.Init.RXFIFOThreshold = UART_RXFIFO_THRESHOLD_1_8;
37 huart3.AdvancedInit.AdvFeatureInit = UART_ADVFEATURE_NO_INIT;
38 // we can't do error handling (simple print out first) here because UART3 is our␣
   ↪print interface
39 result = HAL_UART_Init(&huart3);
40 if(result == HAL_OK) {
41 printf("\\rUART3 configured successfully!\\r\\n");
42 }
43 }
44
45 // Will be called by HAL_UART_Init
46 void HAL_UART_MspInit(UART_HandleTypeDef* huart) {
47 /*Configure GPIO pins : PD8 PD9 */
48 gpio_uart_init_struct.Pin = GPIO_PIN_8|GPIO_PIN_9;
49 gpio_uart_init_struct.Mode = GPIO_MODE_AF_PP;
50 gpio_uart_init_struct.Pull = GPIO_NOPULL;
51 gpio_uart_init_struct.Speed = GPIO_SPEED_FREQ_LOW;
52 gpio_uart_init_struct.Alternate = GPIO_AF7_USART3;
53 HAL_GPIO_Init(GPIOD, &gpio_uart_init_struct);
54 }
```

I then call hardware_init() from my main application and after that, printf is working properly.

Maybe the problem is also related to using the Nucleo board?

Kind Regards Robin

Hardware init header file

Author: Trac Migrate 2021-01-02T18:33:13.000Z

Original author: rmueller

I found the UART config in console-uart3.c

```
static const stm32h7_uart_config stm32h7_usart3_config = {
.gpio = {
.regs = GPIOB,
.config = {
.Pin = GPIO_PIN_9 | GPIO_PIN_10,
.Mode = GPIO_MODE_AF_PP,
.Pull = GPIO_NOPULL,
.Speed = GPIO_SPEED_FREQ_LOW,
.Alternate = GPIO_AF7_USART3
}
},
.irq = USART3_IRQn,
.device_index = 2
};
```

and tried to replace it with this:

```
static const stm32h7_uart_config stm32h7_usart3_config = {
.gpio = {
.regs = GPIOD,
.config = {
.Pin = GPIO_PIN_8 | GPIO_PIN_9,
.Mode = GPIO_MODE_AF_PP,
.Pull = GPIO_NOPULL,
.Speed = GPIO_SPEED_FREQ_LOW,
.Alternate = GPIO_AF7_USART3
}
},
.irq = USART3_IRQn,
.device_index = 2
};
```

Recompiled the BSP but it still is not working without the workaround from above. If I call printf, the function also never exits and something appears to be broken.. I don't really know why..

Original author: rmueller

The clocks are not initialized by the current console driver.

For a custom board initialization, you can provide the data structures defined in bsps/arm/stm32h7/start/stm32h7-config.c in your application configuration.

STM32H732ZINucleo patch

Author: Trac Migrate 2021-01-04T15:19:13.000Z

Original author: rmueller

Thanks, it works now. I am not sure, maybe I did not rebuild the BSP properly. I supplied a patch for this particular STM32H7 board configuration so users just have to set an option in config.ini to true for the STM32H743ZI-Nucleo board.

Kind Regards Robin

`rtems_filesystem_location_copy` overwrites a location that may have been cloned via the ops handler leaking the destination node. If a file system has allocated resources in a location node when cloned it will leak. I assume there is a free for every clone?

An example of a leak is to mount of file system under IMFS and then open a file under the mounted file system. The path eval restart in the IMFS will clone a node and then open will:

```
rtems_filesystem_eval_path_extract_currentloc( &ctx, &iop->pathinfo );
rtems_filesystem_eval_path_cleanup( &ctx );
```

The `ctx` contains a cloned location.

Allocating resources to a location may be required because of the limited available file system fields and the opaque nature of the fields or a file system may have data it locks or reference counts and that needs to be managed.

I do not fully understand the semantics around the location object and while I could guess at a fix there are a number functions related to locations and a large number of use cases that I would not know if my fix is OK. For example should the copy function free the destination location and then clone the source location or should it just free the destination location or should all the places a copy is done be updated to manage the free and cloning based on the context? Or is the issue in the `open` call and the lines pasted here be swapped?

Author: Trac Migrate 2021-01-07T08:16:42.000Z

Do we have this resource leak with one of the current file systems? If yes, could you please add test case for this resource leak.

Author: Chris Johns 2021-01-07T22:20:27.000Z

Replying to Sebastian Huber:

> Do we have this resource leak with one of the current file systems?
>
> Yes I believe there is a leak with `open` as stated above.
>
> > If yes, could you please add test case for this resource leak.
> >
> > A test is a good idea however as stated I do not understand the _locations_ struct and the eval code in `libio`. I could create a test and provide a fix and break an existing file system.
> >
> > Maybe the following will help explain why I am confused:
> >
> > 1. Is this simply a bug in `open`? Does ...
>
> ```
> rtems_filesystem_eval_path_cleanup( &ctx );
> rtems_filesystem_eval_path_extract_currentloc( &ctx,
> ↪ &iop->pathinfo );
> ```
>
> > ... resolve the leak? Does that create another leak and so should the code be ...

```
rtems_filesystem_eval_path_cleanup( &ctx );
rtems_filesystem_eval_path_extract_currentloc( &ctx,
↪ &iop->pathinfo );
rtems_filesystem_eval_path_cleanup( &ctx );
```

... ? Would fixing the copy also resolve this leak? I have no idea which of these is right solution because I do not understand how this is suppose to work.

2. The call `rtems_filesystem_location_copy()` does not _free_ the resource. The only doco with this function says it is a bitwise copy yet the resource will be added to the corresponding mount. This is confusing because the resource is accounted for yet it does not perform a deep copy of the contents when the file system is required to provide an interface to do this.

Author: Trac Migrate 2021-01-08T05:28:40.000Z

I am not sure if we have an unintentional resource leak in open() with the current file systems. I would be good to have a test case. The purpose of open() is to create a location for a file which is released to the system through a call to close(). If errors happen during the path evaluation, the rtems_filesystem_eval_path_error() should be called which uses rtems_filesystem_location_detach() if necessary.

Author: Chris Johns 2021-01-09T01:24:43.000Z

I agree we need a test, there is no objection here. I will look at this when I have time.

The bug is in the eval restart call in the IMFS. When a mount point is found the eval restart call clones the root loc. The open code ends up calling copy which wipes the clone out. A test is needed to expose the leak.

Putting the test case side, I would like to know if the copy should be deep? The test could then check for it being shallow or deep.

Author: Trac Migrate 2021-01-11T05:25:37.000Z

From looking at the code, I don't see an issue in the restart code:

```
void rtems_filesystem_eval_path_restart(
rtems_filesystem_eval_path_context_t *ctx,
rtems_filesystem_global_location_t **newstartloc_ptr
)
{
free_location(&ctx->currentloc);
rtems_filesystem_instance_unlock(&ctx->startloc->location);
rtems_filesystem_global_location_assign(
```

(continues on next page)

(continued from previous page)

```
&ctx->startloc,
rtems_filesystem_global_location_obtain(newstartloc_ptr)
);
rtems_filesystem_instance_lock(&ctx->startloc->location);
rtems_filesystem_location_clone(&ctx->currentloc, &ctx->startloc->
↪location);
}
```

It first frees the current location and then continues with a clone of the new start location. A test case would definitely help.

The locations are just pointers which are registered in the system. I think the documentation of rtems_filesystem_location_copy() is in line with its implementation.

Author: Chris Johns 2021-01-12T01:36:02.000Z

It might have been the optimiser had not shown the path in the debugger and I was seeing something else. A review of this and then the path clean up in open does seem OK. The `struct vnode` counts will highlight an issue once I have that integrated. When I saw the problem and noted it I did not see the free but I saw the copy.

Author: Joel Sherrill 2021-12-17T17:05:49.000Z

The use of python virtualenv to build docs or use RSB has been suggested a few times. We should provide a brief sketch in our documentation about that utility.

For example, in modern versions of Arch Linux, `python` is now a shortcut to `python3` from the `python` package. For tools that do not yet function in Python 3, users can set up a virtual environment with Python 2 as follows:

At a root terminal, install `python2-virtualenv` with `pacman`.

```
# pacman -S python2-virtualenv
```

Examples of other architectures and uses for virtualenv would round out a reasonable section in the user manual for Preparation.

Original author: Sambeet

I wrote the three essential files for cross build of libxml for RTEMS, i.e. the .bset file (libxml.bset), the version specific configuration file (libxml2-2.7.8.cfg) and the build configuration file (libxml2-2.7.8.cfg).As per the FreeBSD ports I have placed it under textproc.However when the build configuration script is run, an error “config file is not found” occurs. I tried to cd into the directory by providing a bash script but that is also not working,an error “can’t cd to ..<config directory>” appears.

Original author: Shashvat Jain

Originally, this ticket requested that ToolStatus and Tools_Used wiki pages be addressed. ToolsStatus was horribly out of date and removed. This leaves Tools_Used as a list of the tools used at a point in time. This list needs to be updated and grown into a Support Tools section of the Software Engineering Guide. Beyond a list of the tools and their use with RTEMS, it should discuss the attribute(s) that led to the tools selection.

Original ticket description below:

https://devel.rtems.org/wiki/TBR/Review/ToolStatus This page's data is very old and needs to be updated so that it can be added to the wiki with a link to the home page name "Development Tools".

All the data about the tools on the page must be updated to the latest used by RTEMS 5 , this new page can either be added to the page https://devel.rtems.org/wiki/Tools_Used or be made into a separate page altogether . Advice on the placement of the new page is needed.

Given the age of this information, I would say delete the page and fix references. Is there anything of value left in it?

Author: Chris Johns 2018-11-23T00:27:54.000Z

Original author: Shashvat Jain

I can see no value in either page. Please delete the pages and close this ticket.

Original author: Shashvat Jain

Does this wiki already has a "development tools" page , the information is quite old , is it worth deleting these and adding a new one which are updated?

Author: Chris Johns 2018-11-23T03:51:02.000Z

Original author: Shashvat Jain

Replying to shashvat jain:

>
> No it does have one. A wiki page for this type of thing for RTEMS is difficult to get right. The issues are: 1. Each version of RTEMS has a specific set of tools so a single page would not work. 2. The tool

matrix is complex with different versions of the various tools for different architectures and then differences for these for different hosts. You can see this my looking at the build output from the RSB on the `build` list, for example a recent ARM build (https://lists.rtems.org/pipermail/build/2018-November/001318.html) The last section is the build report that lists the files and patches. 3. The term “Tools” covers the compiler and its tools plus it now it includes the various eco-system tools. The size of the page would be large and getting all the detail right would be an busy long term task.

The term “Tools” covers the compiler and its tools plus it now it includes the various eco-system tools. The size of the page would be large and getting all the detail right would be an busy long term task.

1)We may add the page for the current version under development 5 2)Instead of a tool matrix , we can mention all the tools shared by architecures like gdb , gcc newlib , g++ , binutils , etc . 3)If the term tools covers so much then can we make a document covering everything about the compiler ? , if we spend some time and make it , the next step left would be just to update it timely when the version changes.

Do you think it is worth the time and effort of updating?

Author: Chris Johns 2018-11-25T00:08:37.000Z

Original author: Shashvat Jain

I just removed https://devel.rtems.org/wiki/TBR/Review/ToolStatus since it had very out of date information.

https://devel.rtems.org/wiki/Tools_Used is a modest version of what we want in the Software Engineering Guide for documenting supporting tools.

RTEMS's FDT wrapper does not handle the `reg` property correctly. Update to handle 64bit register addresses.

Author: Chris Johns 2022-10-06T04:33:38.000Z

The calls `rtems_fdt_prop_map` and `rtems_fdt_get_value` change to return a table `uintptr_t` values.

Author: Kinsey Moore 2022-11-22T00:58:45.000Z

Original author: Eagleirony

The patch looks good to me.

Author: Kinsey Moore 2022-11-22T01:16:11.000Z

Original author: Eagleirony

My only comment beyond that is that I should have renamed the existing Arasan base define and reused it instead of making RTEMS_BSD_DRIVER_XILINX_ZYNQMP_SDHCI in rtems-bsd-nexus-bus.h when I added the driver to the ZynqMP platform.

Author: Kinsey Moore 2022-11-22T01:20:30.000Z

Original author: Eagleirony

If you feel like fixing that, you could combine the existing RTEMS_BSD_DRIVER_XILINX_ZYNQMP_SDHCI and RTEMS_BSD_DRIVER_XILINX_ZYNQ_SDHCI along with RTEMS_BSD_DRIVER_XILINX_VERSAL_SDHCI added in this patch into a single reused RTEMS_BSD_DRIVER_ARASAN_SDHCI.

Author: Trac Migrate 2022-11-22T01:35:29.000Z

Original author: Eagleirony

- **Attachment** 0001-rtemsbsd-versal-Add-SDHCI-Driver-support-v2.patch added

Author: Trac Migrate 2022-11-22T01:40:02.000Z

Merges	0

I have noted in the RTEMS Class that this method is only kept for legacy purposes for many years now. There is no real use in the tree now. Only the following:

```
$ grep -rl rtems_io_lookup_name .
./cpukit/include/adainclude/rtems-io.adb
./cpukit/include/rtems/io.h
./cpukit/libfs/src/imfs/ioman.c
./testsuites/sptests/sp21/sp21.scn
./testsuites/sptests/sp21/init.c
```

Deprecate in 5.1 and remove in 6.x or obsolete and just remove now?

Author: Trac Migrate 2018-09-17T11:49:12.000Z

I would not touch this function. It adds no overhead to applications which don't use it.

Original author: dsa93

Hi

I am developing device driver in custom BSP in RTEMS. I applied my BSP on top of master branch.

My driver code looks like this:

```
/* driver logic in "static" functions (omitted) */

void custom_driver_init(void);

RTEMS_SYSINIT_ITEM(
custom_driver_init,
RTEMS_SYSINIT_DEVICE_DRIVERS,
RTEMS_SYSINIT_ORDER_SEVENTH
);
```

It is discarded by linker. custom_driver_init is never called. I discovered hack how to make linker not discard this: if I put at least one extern linkage function and call it in other file then linker dont discard “custom_driver_init”

```
/* driver logic in "static" functions (omitted) */

/* Call this function for example from main function */
int workaraound(void) {
return 5;
}

void custom_driver_init(void);

RTEMS_SYSINIT_ITEM(
custom_driver_init,
RTEMS_SYSINIT_DEVICE_DRIVERS,
RTEMS_SYSINIT_ORDER_SEVENTH
);
```

Driver file compilation arguments:

```
-MMD,
-Wall,
-Wmissing-prototypes,
-Wimplicit-function-declaration,
-Wstrict-prototypes,
-Wnested-externs,
-O2,
-g,
-fdata-sections,
-ffunction-sections,
-mthumb,
-mcpu=cortex-m7,
-mfpu=fpv5-d16,
```

(continues on next page)

(continued from previous page)

```
-mfloat-abi=hard,
-save-temps,
-Icpukit/include,
-I../../../cpukit/include,
-Icpukit/score/cpu/arm/include,
-I../../../cpukit/score/cpu/arm/include,
-Ibsps/include,
-I../../../bsps/include,
-Ibsps/arm/include,
-I../../../bsps/arm/include,
../../../bsps/arm/someplatform/console/console.c,
-c,
-DHAVE_CONFIG_H=1,
-DBOARD_MAINCK_FREQ_HZ=10000000
```

Application linkage files

```
/home/dsa/rtems/rsb-6/bin/arm-rtems6-gcc
-g
-mthumb
-mcpu=cortex-m7
-mfpu=fpv5-d16
-mfloat-abi=hard
-DBOARD_MAINCK_FREQ_HZ=10000000
-I/home/dsa/arm-rtems6/someplatform/lib/include
-B/home/dsa/arm-rtems6/someplatform/lib
-qrtems
-Wl,--gc-sections
-Wl,-Map=ecu-app.map,--print-memory-usage,--cref
CMakeFiles/ecu-app.dir/src/main.c.obj
-o ecu-app.elf
-lrtemsbsp
-lrtemscpu
```

I tried to research this topic and I am not sure if there is a way to prevent this optimisation, so I decided to post it here. I can provide you some more details or perform some tests

If it is discarded through the linker garbage collection, then you probably use a custom linker command file which doesn't have the KEEP() directive.

If it is not linked in at all, then your application has no reference to the driver or you didn't add the driver to the objects list of the executable link.

Questions like this should be discussed on the mailing list.

Merges	0

jmr3904 last had a good test run in January 2022 (now July). Since then, there has not been one in which more than 1 test pass and I suspect that's because the one doesn't expect output.

https://lists.rtems.org/pipermail/build/2022-January/030809.html

This has been tracked down to a gdb simulator bug which has been reported as:

https://sourceware.org/bugzilla/show_bug.cgi?id=29439

Many details follow in the comments.

- hello.exe.xz

Author: Joel Sherrill 2022-07-30T18:21:29.000Z

- **Summary** changed from *mps/jmr3904 Massive Number of Test Failures* to *mips/jmr3904 Massive Number of Test Failures*

Author: Joel Sherrill 2022-07-30T21:13:04.000Z

I checked with the gdb 8 used with RTEMS 5 and the hello.exe runs. The same executable fails to run with the gdb 11.2 used with RTEMS 6 or the gdb 13 used with RTEMS 7.

I will try to narrow it down some more before reporting to the gdb mailing list. At least it doesn't look like something broken in RTEMS itself.

Author: Trac Migrate 2022-08-01T07:57:50.000Z

This looks like a GDB or other tool issue. Maybe a sign extension bug:

```
1 objdump -h build/mips/jmr3904/testsuites/samples/ticker.exe
2
3 build/mips/jmr3904/testsuites/samples/ticker.exe:     file format elf32-
  ↪tradbigmips
4
```

Merges	0

Does minimum actually reflect what you think is the smallest possible configuration now? That as always the test's purpose – to have a single that was the smallest we thought we could produce. It seems all your changes that it needs a review for tweaks to the configuration.

Inspecting the size of this test should tell you the smallest executable possible on this BSP with the current configuration settings.

There is a version in rtems-examples/misc which will either need to be synchronized or deleted.

This needs to be checked on 5 and 6.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3897
Merges	0

Original author: ionut.vilsan

Background: the DCHP client is started using the rc.conf script. In the background a new task dedicated to the dhcp client is created and then the dhcp client takes over this task. This works fine, we can get IP form the dhcp server and then take part in network communication based on IPv4.

Problem: The dhcp client cannot be stopped any time. Any shell commands will never reach the dhcpcd task, but rather it will instantiate a new dhcpd task which will take over the current task. E.g: in rtems console if you enter dhcpd -x, instead of killing the dhcpcd task a new dhcpcd task will be created which will run from the console. This means that the console cannot be used anymore.

There seems to be noway to communicate with the already created dhcpcd task.

I took a look over the dhcpcd in libbsd code and some of the features are turned off. Can someone give more details regarding this ?

Author: Trac Migrate 2020-04-03T15:01:19.000Z

Original author: ionut.vilsan

- **Priority** changed from ~"high" to ~"normal"
- **Resolution** set to ~"wontfix"
- **Status** changed from *assigned* to *closed*

The dhcpcd is not intended to be started via a shell command. Maybe we should remove the shell command.

Author: Chris Johns 2020-04-14T22:47:44.000Z

Original author: ionut.vilsan

- **Milestone** set to %"6.1"
- **Resolution** ~"wontfix" deleted
- **Status** changed from *closed* to *reopened*
- **Version** set to ~"6"

Replying to Sebastian Huber:

> The dhcpcd is not intended to be started via a shell command. Maybe we should remove the shell command.
>
> Reopening this bug. This is either a bug in dhcpcd (my view) or the rc.conf support needs to be enhanced to correctly support it. The rc.conf model uses working commands that are wrapped. On FreeBSD the wrapping is using shell scripts and on RTEMS it is a C framework. Another solution is to enhance the shell to push a command into the back ground.
>
> I have stated before now and I will repeat what I have said, `rc.conf` is the documented method to use libbsd. I know of no other documented method and I am reluctant to expose and support other methods built on RTEMS internal specifics. If other methods exist and are in use then it is those users who are at risk of things changing and breaking on them. We fell into this hole in the legacy stack and I do not wish to repeat doing that here.

Author: Joel Sherrill 2020-04-14T23:51:19.000Z

Original author: ionut.vilsan

Can you file a new ticket for a general solution to spawning a daemon that this ticket will use? Reference this ticket in that one.

Author: Trac Migrate 2020-04-15T04:45:06.000Z

Original author: ionut.vilsan

The RTEMS shell and the RTEMS rc.conf parser are two different things. This bug here is about controlling (e.g. stopping) the dhcpcd from the RTEMS shell. The dhcpcd is intended to be started at most once and then run forever.

Author: Chris Johns 2020-04-16T03:32:27.000Z

Original author: ionut.vilsan

Replying to Sebastian Huber:

> The RTEMS shell and the RTEMS rc.conf parser are two different things.
>
> Is the rc.conf support for dhcpcd using the shell? I am not sure and I have not looked.
>
> > This bug here is about controlling (e.g. stopping) the dhcpcd from the RTEMS shell. The dhcpcd is intended to be started at most once and then run forever.
> >
> > Is this related to our implementation or the upstream sources?

Author: Trac Migrate 2022-09-08T08:15:06.000Z

Original author: ionut.vilsan

- **Resolution** set to ~"wontfix"
- **Status** changed from *reopened* to *closed*

The dhcpcd is intended to be started at most once and then run forever. This is a limitation of the libbsd port and related to the fact that RTEMS is a single process operating system.

There exists a specification of the application configuration options (work in progress) here:

https://git.rtems.org/sebh/rtems-qual.git/tree/spec/acfg/opt/

For the RTEMS Qualification project we have to test the implementation according to the specification (validation and unit tests).

A test plan needs to be developed. The tests should use the RTEMS Test Framework. Add C preprocessor error tests to the new build system, e.g. test #error and #warning directives.

Author: Joel Sherrill 2020-09-14T12:53:32.000Z

Original author: sebastian.huber

I agree that this isn't right. We shouldn't be implicitly defining anything that enables extended APIs.

How did you spot this?

Author: Trac Migrate 2020-09-14T15:19:38.000Z

Original author: sebastian.huber

I noticed this during the tests of the new build system. The powerpc is the only RTEMS target which defines _GNU_SOURCE.

Author: Chris Johns 2020-09-15T03:19:01.000Z

Original author: sebastian.huber

Replying to Joel Sherrill:

3.9.1.545 4713 - Make pthread_atfork follow FACE Technical Standard Behavior for Single Process Environments

Id	4713
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2022-09-02T16:38:18.000Z
Updated	2022-09-06T22:22:09.000Z
Milestone	6.1
Labels	api::posix, priority::normal, resolution::fixed, tickettype::defect
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4713
Merges	0

The POSIX specification for pthread_atfork() does not address the behavior when in a single process environment. The RTEMS implementation was an arbitrary decision on our part with no basis from the wider POSIX community. The FACE Technical Standard includes profiles without multiple process support and has defined the behavior for this method as follows:

When multiple POSIX processes are supported, pthread_atfork(), the functionality is per the POSIX standard. When multiple POSIX processes are not supported, pthread_atfork() should return 0. The provision to support only a single process is not addressed in the POSIX standard.

The RTEMS implementation currently returns ENOSYS instead of 0.

This ticket is to track the change to RTEMS and the documentation.

3.9.1.546 4225 - Cobham Gaisler NOEL-V RISC-V 32- and 64-bit processor BSP

Id	4225
State	closed

Original author: daniel

To add a BSP configurations for Cobham Gaisler's NOEL-V processor IP. The NOEL-V processor is compliant with the open RISC-V 32/64-bit ISA. Depending on the soft-core IP configuration different RISC-V extensions may or may not be available, a matching RTEMS BSP build configuration must be selected accordingly. Similar to Cobham Gaisler's LEON3/4/5 processor designs, the NOEL-V is also a part of GRLIB providing building blocks such as I/O peripherals and L2-cache etc. that is typically used with the processor in SoC solutions. For more information about GRLIB and the current state and road-map of NOEL-V: * https://www.gaisler.com/grlib * https://www.gaisler.com/noel-v

The NOEL-V and GRLIB are available either under open-source GPL or commercial license. Demonstration designs with pre-built bit-streams, DTS/DTB, user's manuals, quick-start guides, etc. are freely available for the FPGA development boards listed under the NOEL-V page above. For example: * Arty A7: Artix-7 FPGA Development Board (https://www.gaisler.com/NOEL-ARTYA7) * PolarFire FPGA Splash Kit (https://www.gaisler.com/NOEL-PF) * Xilinx Kintex UltraScale FPGA KCU105 Evaluation Kit (https://www.gaisler.com/NOEL-XCKU)

All the above demonstration designs have the same base memory layout and peripherals based on GRLIB. A DTS/DTB is needed to describe the system for RTEMS. The first BSP implementation targets only a minimal system with Memory Controller, Processor, IRQ Controller and Timer (RISC-V plic, clint, mtime). Thus the GRLIB drivers based on the driver manager is not needed to run RTEMS on NOEL-V.

The free GRMON eval hardware debugger can be used with the above demonstration designs to initialize, upload RTEMS images, execute RTEMS and debug the new NOEL-V BSPs.

In [changeset:"9ec9be834d94c5a90890eddb9a1eed8269d67300/rtems" 9ec9be83/rtems]:

```
bsp/riscv: Add NOEL-V BSP

Added support for Cobham Gaisler NOEL-V systems. The NOEL-V support
is implemented as a riscv BSP. Both 32-bit and 64-bit processor
systems are supported. Cobham Gaisler's NOEL-V RISC-V processor IP
is described here:
https://www.gaisler.com/NOELV

Compatible with the following NOEL-V FPGA example design ranges
available from Cobham Gaisler. Follow the links for free
bit-streams, DTS/DTB, user's manuals and quick-start guides:
- NOEL-ARTYA7-EX    (https://www.gaisler.com/NOEL-ARTYA7)
- NOEL-PF-EX        (https://www.gaisler.com/NOEL-PF)
- NOEL-XCKU-EX      (https://www.gaisler.com/NOEL-XCKU)

Uses the shared GRLIB APBUART console driver "apbuart_termios.c".
APBUART devices are probed using device tree.

Closes #4225.
```

3.9.1.547 4693 - Remove ILP32 aarch64/xilinx_versal_* BSPs

Id	4693
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2022-08-02T02:45:54.000Z
Updated	2022-08-22T21:51:43.000Z
Milestone	6.1
Labels	arch:aarch64, priority::normal, resolution::fixed, tickettype::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4693
Merges	0

The BSPs:

1. `aarch64/xilinx_versal_ilp32_qemu`
2. `aarch64/xilinx_versal_ilp32_vck190`

support ILP32 addressing and the Versal has default memory regions above the 4G address boundary. There is value in supporting ILP32 if there is not practical use for it.

If a use case is identified they can be added back.

Author: Chris Johns 2022-08-21T23:40:09.000Z

I will rename the `aarch64/xilinx_versal_ilp64_qemu` to `aarch64/xilinx_versal_qemu` and `aarch64/xilinx_versal_ilp64_vck190` to `aarch64/xilinx_versal_vck190`

Author: Chris Johns 2022-08-21T23:43:02.000Z

I will add `aarch64/xilinx_versal_aiedge` as a generic BSP. The AI Edge series product range Xilinx Versal has the same scalar processors on all variants.

Author: Trac Migrate 2022-08-22T21:51:43.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"dee5ea81479eed172b634506fd5ab91bb53e9982/rtems" dee5ea81/rtems]:

```
bsps/xilinx/versal: Remove IPL32 BSPs, add aiedge and change defaults

- Versal has IO mapped to the upper 64bit address space and
needs full 64bit addresses.

- Add xilinx_versal_aiedge for custom hardware

- Make the hardware settings the defaults and qemu as variants

Closes #4693
```

Author: Joel Sherrill 2022-08-02T17:51:36.000Z

Original author: lsilistr

This report appears to be against an architecture and BSP (myriad2/ma2x8x) that are not in the RTEMS.org source base. I have built two other non-SMP BSPs this week (mips and powerpc) and the weekly BSP build sweeps would also catch a general or BSP specific build issue.

The ISR method definitions are part of the architecture port. My guess is that you are dropping the architecture and BSP code into a git clone from rtems.org and that the myriad2/ma2x8x code is not up to date.

Original author: lsilistr

Thanks for confirmation that it should work.

Figured it was cherrypick from an older version that broke it for us. Once removed we don't see the issue anymore.

Original author: rlong

In rtl-sym.c, where the exported symbols table is read in `rtems_rtl_symbol_global_add`, the addresses are expected to be of size `sizeof(unsigned long)`. This works fine for most architectures because most of them evaluate to 4. For Aarch64 however, this evaluates to 8.

Original author: sebastian.huber

The test programs are not re-linked if a start.o or linker command file changes. The dependency tracking doesn't know anything about the linker command files or GCC specification files. The start files are normally included through the linker command file START() directive. Somehow these dependencies must be manually added to the test programs.

Author: Trac Migrate 2022-07-28T07:17:35.000Z

Original author: sebastian.huber

- **Resolution** set to ~"duplicate"
- **Status** changed from *assigned* to *closed*

The start.o dependency tracking works, see #4080. For linkcmds issue see #4681.

The Versal's DDRMC0 supports region 0 and 1. Region 0's base address defaults to `0x00000000000` and can be up to 2G in length. If the hardware has more than 2G of DDR memory it is placed in region 1 and it's default base address is `0x00800000000` placing it in the A64 address space.

Add support so the user defined memory length `BSP_XILINX_VERSAL_RAM_LENGTH` spans region 0 and 1.

Extend the heap with the region 1 memory.

Calling `exit()` in a C++ application results in `std::terminate()` being called.

The `std::ios_base::Init::~Init()` destructor flushes `std::cout`, `std::cerr` and `std::clog`. The flush of `std::cerr` results in terminate being called.

The `ios_base` class uses a sentry to check the state. The code in it's destructor is:

```
1 if (bool(_M_os.flags() & ios_base::unitbuf) && !uncaught_exception())
```

The `std::cerr` object has `ios_base::unitbuf` set so `uncaught_exception()` is called. This call gets the cxa globals:

```
1 __cxa_eh_globals *globals = __cxa_get_globals ();
```

The `__cxa_get_globals()` checks if the `ec_globals init` object:

```
1 static __eh_globals_init init;
```

to see if it is still valid and the state is:

```
1 (gdb) p /x init
2 $2 = {
3 _M_key = 0x13010001,
4 _M_init = 0x1
5 }
```

However the static destructor has run and the POSIX key has been deleted. This results in `std::terminate()` being called.

The code for the destructor on ARM is:

```
1 006562e0 <__eh_globals_init::~__eh_globals_init()>:
2 6562e0:       7903            ldrb    r3, [r0, #4]
```

(continues on next page)

(continued from previous page)

```
6562e2:       b510            push    {r4, lr}
6562e4:       4604            mov     r4, r0
6562e6:       b90b            cbnz    r3, 6562ec <__eh_globals_init::~__eh_

3.9.1.561 4475 - Add NFSv4 client support to libbsd

Id	4475
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2021-07-19T08:57:15.000Z
Updated	2022-06-08T13:11:44.000Z
Milestone	6.1
Labels	libbsd, priority::normal, resolution::fixed, tickettype::task, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4475
Merges	0

Add NFSv4 client support to libbsd. The client support is part of kernel and provides support for a range of the NFS protocol version including version 4.

The task is made of the following:

1. Update the locks and locking to support the lock manager. VFS requires this be supported 1. Add support for the FreeBSD Virtual File System (VFS) 1. Add the kernel RPC implementation 1. Add NFS client support

VFS

VFS is built around the FB's file structure and file descriptor structure. These need to be supported. The file struct and file descriptor form the basis for all `fd` based interactions with the FB kernel code such as files, devices and sockets.

3.9.1.561.1.1 LibIO and FB *fd*

The FB `fd` and `file` support clashes with the existing `libio` implementations used for things like `socket`, `kqueue` and `select`. The work to port the VFS requires:

1. `socket`, `kqueue`, `select` support FB `fd` support. This is closer to the kernel. No direct `libio` access
2. Provide an interface to `libio` mapping the `iop` descriptors to FB descriptors.

This approach nests the FB file descriptors inside the `libio` support. This is not optimal in terms of some activities but the hot paths in the code should not see a significant change in performance. Some paths like `open` are not optimal because the RTEMS file system op handlers imply a specific implementation that does not match up well with the FB `namei` interface. The long term approach is to look at `libio` and the handlers and consider allowing closer integration of FB's `fd` support.

3.9.1.561.1.2 BIO and Paging

The `bio` layer is required for VFS. No paging support other than the calls needed to have VFS link are provided. No VM paging is need and none of that code need be ported.

3.9.1.561.1.3 System Calls

Collect all the `syscall` functionality exported to RTEMS into a single place. Currently the calls are spread around the code and this:

1. Does not centralize the code
2. Add a lot of code to FB being ported

Proc0

FreeBSD's initialization creates the initial process called `proc0`. Add support to create `proc0` and let all thread' reference it. This allow the creds to be managed, kernel trace to work and it removes a number of changes that do not need to be made.

File Descripter Reuse

The `libio` functionality of cycling across the `fd` range rather than reusing lower `fd` numbers is not compatible with the `select` call. Not reusing `fd` numbers once closed until the range as been used provides some protection against bugs where a user does not cleanly handle the `fd` they own however this is not compatible with FB and makes supporting `select` harder.

The `select` interface should not be used on RTEMS and users should be encourages to use threads for concurrent IO or `kqueue`. The means `select` may exist for legacy code porting reasons however the cycling `fd` count reduces how well the code ported will actually work. For example port a piece of `select` code, open a socket and use, it may work. Then `open` and `close` a file 64 times then run the same code. It will fail.

FB `fd`'s are reused.

RPC

The legacy NFSv2 client the the NFSv4 cannot be built at the same time.

The kernel RPC and the user land RPC cannot exist in the same build. I have not looked extensively into this but I was seeing clashes with headers for the same types but different contents. The legacy NFSv2 client uses the user land RPC code while the kernel NFSv4 uses the kernel's RPC.

Module support is already in `libbsd` to handle the separate building of each piece.

Security

NFSv4 provides a number of extra security features. The code will be ported is possible but little or no security tested is planned at this point in time.

Testing

The NFSv4 stack will be tested against Linux and FreeBSD servers.

Author: Chris Johns 2021-07-20T07:36:52.000Z

- **Description** changed

```
Add NFSv4 client support to libbsd. The client support is part of␣
↪kernel and provides support for a range of the NFS protocol version␣
↪including version 4.

The task is made of the following:

1. Update the locks and locking to support the lock manager. VFS␣
↪requires this be supported
1. Add support for the FreeBSD Virtual File System (VFS)
1. Add the kernel RPC implementation
1. Add NFS client support

== VFS

```

(continues on next page)

(continued from previous page)

```
VFS is built around the FB's file structure and file descriptor structure. These need to be supported. The file struct and file descriptor form the basis for all `fd` based interactions with the FB kernel code such as files, devices and sockets.

=== LibIO and FB `fd`

The FB `fd` and `file` support clashes with the existing `libio` implementations used for things like `socket`, `kqueue` and `select`. The work to port the VFS requires:

1. `socket`, `kqueue`, `select` support FB `fd` support. This is closer to the kernel. No direct `libio` access
2. Provide an interface to `libio` mapping the `iop` descriptors to FB descriptors.

This approach nests the FB file descriptors inside the `libio` support. This is not optimal in terms of some activities but the hot paths in the code should not see a significant change in performance. Some paths like `open` are not optimal because the RTEMS file system op handlers imply a specific implementation that does not match up well with the FB `namei` interface. The long term approach is to look at `libio` and the handlers and consider allowing closer integration of FB's `fd` support.

=== BIO and Paging

The `bio` layer is required for VFS. No paging support other than the calls needed to have VFS link are provided. No VM paging is need and none of that code need be ported.

=== System Calls

Collect all the `syscall` functionality exported to RTEMS into a single place. Currently the calls are spread around the code and this:

1. Does not centralize the code
2. Add a lot of code to FB being ported

+ == Proc0
+
+ FreeBSD's initialization creates the initial process called `proc0`. Add support to create `proc0` and let all thread' reference it. This allow the creds to be managed, kernel trace to work and it removes a number of changes that do not need to be made.
+
== File Descripter Reuse

The `libio` functionality of cycling across the `fd` range rather than
```

(continues on next page)

(continued from previous page)

```
↪reusing lower `fd` numbers is not compatible with the `select` call.␣
↪Not reusing `fd` numbers once closed until the range as been used␣
↪provides some protection against bugs where a user does not cleanly␣
↪handle the `fd` they own however this is not compatible with FB and␣
↪makes supporting `select` harder.

The `select` interface should not be used on RTEMS and users should be␣
↪encourages to use threads for concurrent IO or `kqueue`. The means␣
↪`select` may exist for legacy code porting reasons however the␣
↪cycling `fd` count reduces how well the code ported will actually␣
↪work. For example port a piece of `select` code, open a socket and␣
↪use, it may work. Then `open` and `close` a file 64 times then run␣
↪the same code. It will fail.

FB `fd`'s are reused.

== RPC

The legacy NFSv2 client the the NFSv4 cannot be built at the same time.

The kernel RPC and the user land RPC cannot exist in the same build. I␣
↪have not looked extensively into this but I was seeing clashes with␣
↪headers for the same types but different contents. The legacy NFSv2␣
↪client uses the user land RPC code while the kernel NFSv4 uses the␣
↪kernel's RPC.

Module support is already in `libbsd` to handle the separate building␣
↪of each piece.

== Security

NFSv4 provides a number of extra security features. The code will be␣
↪ported is possible but little or no security tested is planned at␣
↪this point in time.

== Testing

The NFSv4 stack will be tested against Linux and FreeBSD servers.

Original author: sebastian.huber

Cloned from #4655:

According to POSIX

https://pubs.opengroup.org/onlinepubs/9699919799/functions/sync.html

we have

```
The sync() function shall cause all information in memory that updates file␣
↪systems to be scheduled for writing out to all file systems.
```

Currently, the RTEMS sync() implementation synchronizes only the file descriptors associated with a FILE object. This should be changed to call fsync() and fdatasync() for all file descriptors.

3.9.1.563 4646 - Control buildsets using the –with-* command line option

Id	4646
State	closed
Type	ISSUE

The following thread has raise an important issue on how we can test newer versions of tools. This ticket is about providing a solution:

https://lists.rtems.org/pipermail/devel/2022-May/071458.html

The solution is allow users to specific a tool set on the command line for a build of tools. The standard option is `--with-.*`. For example a command line could be:

```
../source-builder/sb-set-builder \\
--prefix=/opt/rtems/6 \\
--log=arm.txt \\
--with-rtems-gcc=tools/rtems-gcc-head-newlib-head \\
6/rtems-arm
```

The buildset logic is to be changed to expand macros for buildset file names and to add a new buildset specific keyword `%defineifnot`. The tools default file becomes:

```
#
# Default tools configuration.
#
%include 6/rtems-base.bset

#
# Default RTEMS build. Override on the command line to the
# the RSB. For example to test the latest versino of gcc use:
#
#  --with-rtems-gcc=tools/rtems-gcc-head-newlib-head
#
%defineifnot with_rtems_dtc      devel/dtc-1.6.1-1
%defineifnot with_rtems_expat    devel/expat-2.4.8-1
%defineifnot with_rtems_gmp      devel/gmp-6.2.1
%defineifnot with_rtems_gdb      tools/rtems-gdb-11.2
%defineifnot with_rtems_binutils tools/rtems-binutils-2.38
%defineifnot with_rtems_gcc      tools/rtems-gcc-10-newlib-head
%defineifnot with_rtems_tools    tools/rtems-tools-6

```

(continues on next page)

(continued from previous page)

```
#
# Build gdb first to raise the Python install error as early as
# possible.  GDB needs expat so it needs to be built before.
#
%{with_rtems_dtc}
%{with_rtems_expat}
%{with_rtems_gmp}
%{with_rtems_gdb}
%{with_rtems_binutils}
%{with_rtems_gcc}
%{with_rtems_tools}
```

This approach lets `cron` based CI flows configure a build with the latest gcc, binutils etc so they can always be tested as a workflow.

The new keyword lets a define in a nested buildset file override a command line value. That may be needed.

Original author: frank_k

The rtems-source-builder fails to build the tools in a Fedora 35 container. I am building ARM for RTEMS 6 and get this error message:

```
config: tools/rtems-gdb-11.2.cfg
error: shell macro failed: /home/minna/src/rtems-source-builder/source-builder/sb/
↪rtems-build-dep -c gcc  -l : 2: error: no library (-l) provided
Build Set: Time 0:00:33.396165
```

The same error appears for other architectures like AARCH64, POWERPC, RISCV on Fedora 35. The source for this error is in file `source-builder/config/gdb-common-1.cfg` in line 118:

```
104 %ifnos darwin
105   %if %{host_ldflags} == %{nil}
106     %define gdb-host-libs %{nil}
107   %else
108     %define gdb-host-libs -L '%{host_ldflags}'
109   %endif
110   %if %{gdb-python-config} != %{nil}
111     %define gdb-python-lib-filter awk 'BEGIN{FS=" "}/python/{for(i=1;i<NF;
↪++i)if(match($i,".*lpython.*")) print "lib"substr($i,3)"*";}'
112     %if %{gdb-python-ver-mm} < 3.8
113         %define gdb-python-config-lib-check-flags --ldflags
114     %else
115         %define gdb-python-config-lib-check-flags --ldflags --embed
116     %endif
117     %define gdb-python-config-libs %(%{gdb-python-config} %{gdb-python-config-
↪lib-check-flags} | %{gdb-python-lib-filter})
118     %define gdb-python-lib-check %(%{_sbdir}/sb/rtems-build-dep -c %{__cc} %
↪{gdb-host-libs} -l %{gdb-python-config-libs})
119   %else
120     %define gdb-python-lib-check %(%{_sbdir}/sb/rtems-build-dep -c %{__cc} %
↪{gdb-host-libs} -l %{gdb-python-ver-lib})
121   %endif
122   %if %{gdb-python-lib-check} == not-found && !%{_rsb_getting_source}
```

(continues on next page)

(continued from previous page)

```
123     %error "gdb: python: library file not found: %{gdb-python-ver-lib},␣
↪please install"
124   %endif
125 %endif
```

Some values of involved variables:

```
gdb-python-ver-mm = 3.10
gdb-python-config = /usr/bin/python3-config
gdb-python-config-lib-check-flags = --ldflags
gdb-python-lib-filter = awk 'BEGIN{FS=" "}/python/{for(i=1;i<NF;++i)if(match($i,".
↪*lpython.*")) print "lib"substr($i,3)"*";}'
gdb-python-config-libs = ''
```

The trouble is that `gdb-python-config-libs` is empty when line 118 gets called. It is empty because there is no python-library in the output of this call on Fedora 35:

```
$ /usr/bin/python3-config --ldflags
-L/usr/lib64  -lcrypt -ldl  -lm -lm
```

Just to compare, on OpenSUSE 15.3 the same call returns (note the ``-lpython3.6m ``):

```
$ /usr/bin/python3-config --ldflags
-L/usr/lib64 -lpython3.6m -lpthread -ldl  -lutil -lm  -Xlinker -export-dynamic
```

Commenting out line 118 makes the build go through smoothly but I would prefer a permanent fix.

- Would be skipping line 118 when `gdb-python-config-libs` is empty be an appropriate solution?
- Is the “real” error in line 112? (`%if 3.10 < 3.8` evaluates unexpectedly to `true`)
- Would the “error” in line 123 print out the correct library name?
- Does the whole check make sense when `python3-config` is obviously installed (both the command and the library are “usually” in the same `pythonX-devel` package)?

Notes:

- On Fedora 35 `/usr/lib64/libpython3.10.so` exists.
- On Fedora 35 adding `--embed` provides the library:

```
$ /usr/bin/python3-config --ldflags --embed
-L/usr/lib64 -lpython3.10 -lcrypt -ldl  -lm -lm
```

For the records:

Command:

```
../source-builder/sb-set-builder --rtems-version 6 --prefix /opt/rtems/6 --with_
↪cxx --with_fortran --with_objc --jobs=12 --log ~/sb-set-builder.log 6/rtems-arm
```

Original author: rlong

The elf_machdep header file is missing the body under cpukit/score/cpu/x86_64/include/machine.

Joel found the code that needed to be put in at http://cvsweb.netbsd.org/bsdweb.cgi/src/sys/arch/amd64/include/elf_machdep.h.

Cloned from #4638:

The problem from #2353 still exists in 5 and 6:

Original description:

From the reporter (<skruglov@nm.ru>):

- First bug I detect with attempt write file to full device (zero empty blocks).
- And after I send too many files, disk overflow and system not responding (receive and write to disk have high priority). A test, and found block=0, after – = too big value.
- In imfs_memfile.c

function IMFS_memfile_extend block declared: unsigned int block, and after block— work incorrect (if block = 0). for (; block>=old_blocks ; block–) { IMFS_memfile_remove_block(memfile, block); }

Must be declare int block;

Author: Trac Migrate 2022-04-07T08:27:37.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"43119193ef0f3fef6bc01a391ccda8a97cfc149c/rtems" 43119193/rtems]:

```
imfs: Fix index underrun when extending empty file

Currently the following sequence causes a endless loop when extending an
IMFS file:

- Create a file with zero length and close it.
```

(continues on next page)

(continued from previous page)

```
- Make sure nearly no allocatable memory is left.
- Open the file and write enough data into it that more than the
remaining memory will be used.

In that case when extending the IMFS file, the file currently need zero
blocks. If allocating enough new blocks fails, the already allocated new
blocks will be freed again.

The comparison of block>=old_blocks that has been used prior to this
patch compared two unsigned numbers. If old_blocks was zero, the
comparison of these two numbers always evaluated to true.

This patch frees the last block in a separate step to avoid this
problem.

Fixes #4639
```

3.9.1.567 4635 - untar on JFFS slow down

Using `untar` on JFFS is slower on rtems 6 compared to 4.11. The application writes files to the flash disk from an in memory tarfile and the difference is easy to see for 10M or so of files.

I reviewed the changes to JFFS in rtems 6 and they look OK so it is not a regression the `libfs`. I also timed the flash driver and it is the same on 6 as 4.11.

I noticed on 6 there is a lot more blocks being written at the flash driver level compared to 4.11. Looking at `untar` I see the block size written is `512` bytes and with compression this results in a lot of small blocks. Changing the `untar` block write size to 8K speeds returns the performance.

I am not sure why there are more blocks on 6. A guess is the compression is better, which is is nice. I will not look into this any more than changing `untar` to use 8K blocks.

We need a way to override the default release for testing. This is a developer option and is not for production. A `waf` option is considered the best way to manage this.

Author: Trac Migrate 2021-11-13T13:53:19.000Z

This enhancement should be solved in a more general setting. What we need is the ability for maintainers to alter build system variables which a user should not be able to change.

What we could do is using an _ prefix for internal build system variables which may be changed by the `config.ini` file if an `--rtems-maintainer-mode` option is given at the configure command line.

An alternative would be a `get-option` option action (similar to `set-value`) which uses a command line specified value if it is available. We could also add this feature to `set-value`.

Author: Chris Johns 2021-11-14T02:56:59.000Z

I think maintainer experiments should be done with `spec` file changes on feature branches. My concern about a generic method from the command line, INI file or any other method is the testable dependencies it exposes. I feel what we have and where we are at is a good compromise between the web of options we had with //autoconf's// `configure` and the ever present complexity of build and BSP options we have to have.

I agree the implementation of how to manage this should follow reasonable design paths but I think the type of action needed has to be explicit with `wscript` or `spec`

file changes.

I have added a call named `item_set_action_value()` that takes a `path` and `value`. The `value` needs to be of a type and nature that matches the `action`. The code to set the major version from the command line is:

```
if conf.options.rtems_version is not None:
item_set_action_value(conf, '/cpukit/optvermaj/set-value', conf.options.
↪rtems_version)
```

I think a path to address an item is a suitable abstraction. This version value update happens before the items are processed by `configure` which is important.

Original author: till.straumann@psi.ch

This pull request implements a nexus driver (on top of the 5-freebsd-12 branch) for the Marvell 643xx ethernet adapter which is used on the MVME6100 board (powerpc/beatnik BSP).

Note that this driver builds on top of the low-level driver which is part of the beatnik BSP and requires a patch to the rtems bsp which was submitted in a related ticket.

3.9.1.571 4167 - Coverity Scan Does Not Run on rtems6

Id	4167
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Created	2020-10-28T16:14:14.000Z

This is a ticket to note that Coverity does not appear to like the gcc version going from one to two digits. Since the Coverity Scan support for free users is minimal, I asked on the GCC mailing list if anyone had insight (https://gcc.gnu.org/pipermail/gcc/2020-October/234073.html).

This is completely outside our control and this is just a tracking ticket to note that Coverity Scan reports will be run against the 5 branch until this is fixed. This will likely be of limited use since rtems 5 is stable and changes are minimal compared to the rtems master.

If it really is a two digit major issue (unconfirmed if this works for gcc 9), I could do Coverity builds using a special toolchain based on gcc 9.

Author: Joel Sherrill 2020-10-29T15:19:10.000Z

I have done some more analysis which I reported in the GCC mailing list thread. I build sparc-rtems6 tools using gcc 7, 8, 9, and 10. Coverity worked using GCC 7, 8, and 9 but not 10 using the autoconf build since that made it more similar to gcc 7 on rtems5. It required uninstalling Coverity and reinstalling each time I switched GCC versions. There must be some residual configuration left between runs which this addresses.

I did try the waf build with gcc 7, 9, and 10. Same behavior as with the autoconf build.

The questions going forward are:

- Is there a way to make Coverity aware of a bug like this? Support for the open source projects using Coverity Scan is minimal.
- Do we want to switch to the master for Coverity runs? This would require me using a special gcc9 build. The code on rtems5 is stable and any fixes/changes are much more likely to be on the master so I tend to lean to switching.

This is going to be an issue until Coverity updates the binary for Scan to support GCC 10.

Author: Joel Sherrill 2021-12-16T20:02:55.000Z

Coverity Scan has been running on RTEMS for a while now. Closing.

Merges	0

The RTEMS stack checker reporting function can be called without the stack checker infrastructure being enabled. This causes a bad access to 0x0 because the static interrupt stack checker data remains null instead of being initialized by rtems_stack_checker_begin_extension. The actual failure occurs in Stack_check_Find_high_water_mark while searching for U32_PATTERN.

This was found when the trailing D was left off of the CONFIGURE_STACK_CHECKER_ENABLED define in a test program.

Author: Trac Migrate 2022-01-27T18:59:40.000Z

- **Owner** set to Kinsey Moore <kinsey.moore@oarcorp.com>

This BSP was merged in 1995 and there has been no mention of it recently. There do not appear to be any recent modifications to this BSP that are not part of a generic sweep of BSPs.

Removing this will reduce the number of BSPs which need modification to account for changes being introduced to support libbsd bus interface properly on PowerPC.

Original author: sebastian.huber

During a four month period every RTEMS user is encouraged to test its BSPs of interest with the new build system. The user should use the following check list. Issues should be reported on devel@rtems.org or this ticket.

1. Review the build system specification in the user manual. If something is unclear, please complain.

2. Use "./waf bsp_defaults" to get a list of options with default values for the BSPs of interest. Check that all options are present. Check the type of the options in the build specification (e.g. actions get-integer, get-boolean, get-string). Review the description of the options. Review the default values. Add sanity checks to options (e.g. actions assert-*).
3. Build the BSPs of interest with all tests enabled (BUILD_TESTS = True). Review the ABI and linker options. Review the linker command files. Run the test on the boards.
4. Build the BSPs of interest with different permutations of build options. Make sure a sample set of tests runs for each permutation.
5. Check that all artefacts (libraries, header files, start files, linker command files, etc.) are properly installed.
6. Check that you can build your applications and third-party libraries with the installed BSPs of interest.

Author: Chris Johns 2019-02-21T21:35:03.000Z

Why do we have `linkcmds.base` and `linkcmds.share` in this arch and what are there differences? Why are the names similar?

I cannot find a any local readme type files explaining the reason there are two files. The git log entry for the addition of this file offers no insight.

At a guess the addition of `mpc55xx` as a new BSP required a new linkcmd file, which is fine, however an explanation on difference and rational would be helpful to me at this point.

Author: Trac Migrate 2019-02-22T10:04:59.000Z

The reason for this is excessive use of copy and paste in the past combined with the long history of the PowerPC port.

The bsps/powerpc/shared/start/linkcmds.base is similar to the bsps/arm/shared/start/linkcmds.base or bsps/riscv/shared/start/linkcmds.base. It uses memory regions and should be used for new BSPs.

The 64-bit PowerPC ELFv2 ABI has no small data area.

Author: Chris Johns 2019-02-23T23:32:17.000Z

I now see there are a couple of other BSP specific linkcmds files all of which need to be modified.

I am now seeing:

```
1 gmake[5]: Entering directory '/opt/work/chris/rtems/kernel/bsps/psim/
  ↪powerpc-rtems5/c/mpc5643l_dpu/testsuites/sptests'
2 powerpc-rtems5-gcc  -mcpu=8540 -meabi -msdata=sysv -fno-common -msoft-

  ↪Wimplicit-function-declaration -Wstrict-prototypes -Wnested-externs -
  ↪B./../../lib/libbsp/powerpc/mpc55xxevb -B/opt/work/chris/rtems/kernel/
  ↪rtems.git/bsps/powerpc/mpc55xxevb/start -specs bsp_specs -qrtems -L./.
  ↪./../cpukit -L/opt/work/chris/rtems/kernel/rtems.git/bsps/powerpc/
```

(continues on next page)

(continued from previous page)

```
↪shared/start -Wl,--wrap=printf -Wl,--wrap=puts -Wl,--wrap=putchar -Wl,
↪--gc-sections -o sp47.exe sp47/sp47-init.o ./../../lib/libbsp/powerpc/
↪mpc55xxevb/librtemsbsp.a ./../../cpukit/librtemscpu.a
/opt/work/rtems/5/lib/gcc/powerpc-rtems5/7.4.0/../../../../powerpc-
↪rtems5/bin/ld:linkcmds.mpc55xx:18 cannot move location counter␣
↪backwards (from 00000000400165c0 to 0000000040010000)
collect2: error: ld returned 1 exit status
gmake[5]: *** [Makefile:5229: sp47.exe] Error 1
```

and this does not look related to what I have been working on. Is this test too big for this target?

Author: Chris Johns 2019-02-23T23:59:32.000Z

Further investigation of the `mpc5643l_dpu` BSP I see a lot of tests are failing to link. I think this BSP should have all tests disabled, sorry I have no capacity to maintaining this stuff.

What has changed in RTEMS to cause the tests to overflow the memory area? Is a bisect needed?

I will now look at adding regx support to the `.tcfg` files so wildcards can be supported. To exclude all tests:

```
rexclude *
```

can be used as a simple way to disable all tests. I may consider `rexclude` and `rinclude` as an order set of filters so:

```
rexclude *
rinclude samples/*
```

This syntax introduces the `/` delimiter so specific groups can be filtered.

Author: Trac Migrate 2019-02-25T06:16:13.000Z

The reason for the recent link-time errors on some small memory BSPs is the change from workspace initialization to static allocation for the objects. I work on this already, but is a bit tedious. My approach is to add some general *.tcfg files like this:

testsuites/testdata/disable-256k-data-or-more-tests.tcfg testsuites/testdata/disable-128k-data-or-more-tests.tcfg testsuites/testdata/disable-64k-data-or-more-tests.tcfg testsuites/testdata/disable-32k-data-or-more-tests.tcfg

Using errno implicitly references the newlib reentrancy structure. Changing this eliminates one reason the reentrancy code may be pulled into minimum.exe.

Original author: soja

Enable the xilinx_zynq based BSPs to support the configuration of the MMU to use small 4 kiB pages.

By default 1 MB pages will be used. The 4 kiB pages have to be enabled with the ARM_MMU_USE_SMALL_PAGES configuration option.

RTEMS currently only supports utimes() which is marked as Legacy in the POSIX standard. Support needs to be added for futimens() and utimensat() per the following specification:

https://pubs.opengroup.org/onlinepubs/9699919799/functions/futimens.html

utimes() only has second granularity on its times. The newer methods greatly improve on that even if many of the RTEMS file systems do not support nanosecond times on the file access, create, etc timestamps.

The following changes have been identified:

- The utimes file handler entry will need to be replaced with a handler geared to the futimens() API.
- File systems will have to be updated to account for the new handler.

- Existing methods like utimes() will have to be adjusted to be implemented in terms of the futimens() style method.
- File system test cases will have to be added to the fstests.

Author: Joel Sherrill 2021-12-16T15:54:33.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *new* to *closed*

This was implemented and this ticket should have been closed.

3.9.1.596 1712 - Add LWIP Support to RTEMS

This port was done by Marcello Presulli <m.presulli@embed-it.com> and has been in my inbox for a while. I think I have merged most of their BSP specific work but the lwip has been pending. They managed to run LWIP+SNMP and an application in something like 128K RAM

Here are some email fragments about it.

For now we have just finished to port the latest lwip-1.3.2 based on the latest rtems 4.9.4 version successfully including a test_app for pings.

We have stressed the stack with ping floods (packetsize 1400 Bytes interval ~150ms) about 250.000 sequences or more without packet losses and an average latency of 2ms.

Additional we have adopted a new bsp target for the mcf5225x platform.

To lwip now:

we integrated it directly via the autoconfigure/automake process under the rtems cpukit/liblwip subtree and therefore it gets built with rtems when u configure it with –enable-networking=lwip appropriately. The driver on the other side we put it in libcpu/m68k/mcf5225x and it got built in the library context of the librtemsbsp.a. The driver has only 2 references on lwip headers . . .

To the bsp:

The bsp we have adopted from mcf52223 and have created it as a own bsp-target=mcf5225x also via the autoconfig/automake mechanism. In the bsp itself i have modified the

bsp_get_CPU_clock_speed() and some improvements in the console driver and PIT2 timer interrupt. The bsp_start() we have defined as weak symbol so we don't have to touch the "empty" bsp_start() of rtems coz it's platform-circuit specific you know.

- **Cc** added @thomas.doerfler
- **Cc** added @ralf.corsepius

Replying to comment:8:

> Sebastian, others, I have had second thoughts about putting this in RTEMS. I agree that it would be better to submit the port to LWIP and let it live there. IMO, this proposal is non-applicable, because a network stack's interactions are deeply woven with the OS.
>
> Considering this, using an external networking stack introduces bootstrapping problems (== problems building rtems).
>
> That said, to me, LWIP is a binary decision: Switch from BSD or LWIP rsp. to forget about it - I am very strongly leaning towards the latter and consider all proposal so far to be beyond reason.

Merges	0

I think there are a couple of places in an rtems6 build of RTEMS itself where rtems5 is being used from some hard-coded. Not sure what's up but here's the message to the build@ list.

https://lists.rtems.org/pipermail/build/2020-February/010431.html

From the post above, you only see that all failed. Looking at the build log from a single BSP, I see is early which doesn't cause a visible failure

gmake[4]: Entering directory `/home/joel/rtems-cron-6/b-jmr3904/mips-rtems6/c/jmr3904/make' sed -e "s|[@]prefix[@]|/home/joel/rtems-cron-6/tools/6/bsp-install|" -e "s|[@]exec_prefix[@]|/home/joel/rtems-cron-6/tools/6/bsp-install/mips-rtems6|" -e "s|[@]pkgdatadir[@]|/home/joel/rtems-cron-6/tools/6/bsp-install/share/rtems5|"

and this one which is error inducing.

: error trying to exec 'mips-rtems5-gcc': execvp: No such file or directory error: compiling wrapper: Compiler error gmake[5]: *** [dl08-sym.o] Error 10

The first looks like a typo that isn't breaking anything but needs to be fixed.

The latter is some issue during the dl tests using rtems5 or it is hard-coded in a tool somewhere.

Those symbols are part of the RTEMS test support and would not have been included in whatever test directory you copied. They may be in a test support library. I don't know if it is installed.

I hope you mean SMP and not multiprocessor. Those are different configurations in RTEMS terminology.

Which test did you copy?

Author: Trac Migrate 2021-11-04T10:43:20.000Z

Original author: mohamedosama94

Replying to Joel Sherrill:

> Those symbols are part of the RTEMS test support and would not have been included in whatever test directory you copied. They may be in a test support library. I don't know if it is installed. I hope you mean SMP and not multiprocessor. Those are different configurations in RTEMS terminology. Which test did you copy? Dear Joel Sherrill,
>
> thanks for your reply, yes I mean SMP, and this issue happens when I use any test suites samples that have test_begin() and test_end() functions like: "base_mp "test, "base_sp" test but test like "hello" that doesn't have these functions build normally on eclipse so how can I install the support library and make the eclipse can reach them

Author: Joel Sherrill 2021-11-04T13:29:30.000Z

Original author: mohamedosama94

Replace test_begin() and test_end() with a print to denote beginning and end of the test.

base_mp is for the distributed multiprocessing model in RTEMS. You want to build with SMP not multiprocessing (confusing I know). And I don't think there is an SMP sample. You may have to look at one of the tests smptest directory. These all use test support functions also but smpschedaffinity01 and smpschedaffinity01 are not large and show how to do affinity. smpthreadpin01 shows pinning but is a bit more complicated than just demonstrating that a collection of threads were properly assigned to the desired core.

Remove the legacy networking stack from `rtems.git` and place it in new top level repo `rtems-legacy-network.git`.

The initial tasks are:

1. Move the code to a new repo
2. Add `rtems_waf` support to build it
3. Clean out BSP references to network interfaces or drivers
4. Merge in the network demos repo

Author: Chris Johns 2020-10-07T00:08:03.000Z

- **Description** changed

```
Remove the legacy networking stack from `rtems.git` and place it in new top level repo `rtems-legacy-network.git`.

The initial tasks are:

1. Move the code to a new repo

2. Add `rtems_waf` support to build it

3. Clean out BSP references to network interfaces or drivers
+
+ 4. Merge in the network demos repo
```

Merges	0

Original author: sebastian.huber

The aarch64 cache support defines:

bsps/aarch64/shared/cache/cache.c:#define CPU_CACHE_SUPPORT_PROVIDES_DISABLE_DATA

However, it does not provide rtems_cache_disable_data().

Author: Kinsey Moore 2021-12-10T15:31:20.000Z

Original author: sebastian.huber

You are correct, while the AArch64 cache code provides _CPU_cache_disable_data(), it does not provide rtems_cache_disable_data(). I'll submit a patch to remove this define since the existing support via _CPU_cache_disable_data should be sufficient given that CPU_DATA_CACHE_ALIGNMENT is defined.

Author: Trac Migrate 2021-12-12T17:58:14.000Z

Original author: sebastian.huber

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"68b0db358c81a7f770a44ceb819197bdc320bc99/rtems" 68b0db35/rtems]:

```
bsps/aarch64: Remove erroneous cache feature

The AArch64 cache implementation does not define
rtems_cache_disable_data(), but declares that it does via
CPU_CACHE_SUPPORT_PROVIDES_DISABLE_DATA. The existing implementation of
_CPU_cache_disable_data() is sufficient to enable this functionality
without the erroneous cache feature flag.

Closes #4569
```

3.9.1.605 4081 - Remove Autoconf/Automake based build system

kernel configuration builds using autoconf-based build system. Needs to be switched to waf. Hopefully contained to rtems-kernel-common.cfg.

Author: Joel Sherrill 2020-10-14T17:17:25.000Z

- **Summary** changed from *rtems-source-builder: RTEMS Kernel Recipe* to *rtems-source-builder: Update RTEMS Kernel Recipe to Use waf for RTEMS*

Author: Chris Johns 2020-11-09T04:54:19.000Z

This is not as easy as I thought it might be. Let me explain . . .

The `config.ini` file hides some important detail the RSB needs. The RSB currently names the package as:

```
rtems-%{rtems_version}-%{_target}-%{rtems_bsp}-%{_host}-%{release}
```

The target and BSP are in the build config file and a config file could build a mix of architectures breaking this naming.

The simplest approach is to take the arguments provided to the RSB and create a `config.ini` file but this would be limiting where complex BSP options are needed.

I could check if the `--with-rtems-bspopts` option is a path and that could be a list of specific BSP options appended into the BSP specific area.

Should the following options print a depreciate warning: `--with-rtems-legacy-network` `--with-rtems-cxx` I am not sure about `--with-rtems-posix`. I think it should be removed and POSIX always be enabled.

Libdebugger has limited backend support however the generic parts are bring built for all architectures and `libdebugger.a` is being install however it will never link because of the missing backend support.

LibBSD has been fixed to correctly detect `libdebugger.a` and enable the test. This now fails to build.

RTEMS provides a `pipe()` call in `cpukit/libfs/src/pipe/pipe.c` and LibBSD also provides a call in `rtemsbsd/rtems/rtems-bsd-syscall-api.c`. We should not have competing interfaces.

The selection of the version you get depends on the link order and the linker version. The RTEMS 6 linker seems to have a different preference to RTEMS 5. Apart from this fragility LibBSD should not be providing this interface.

A LibBSD `pipe()` is problematic for a number of reasons and so I am going to remove the call from it.

If LibBSD support is needed it needs to be via a file system op handles like all other file system interfaces for descriptor based access. I will not be adding this support.

The removal of `pipe()` from LibBSD removes the `kqueue` support for pipes. See the test `selectpollkqueue01`. If this support is needed please contact the RTEMS developers.

- **Summary** changed from *RTEMS and LibBSD both provide pipe()* to *RTEMS and LibBSD both provide competing pipe() interfaces*

Author: Chris Johns 2021-09-24T00:06:48.000Z

The removal of `pipe()` from LibBSD does effect the `kqueue` support but it also lets the RTEMS version get linked in and do it's work. Pipe for `libio` descriptors and `libmisc/redirector` work nicely well before LibBSD is initialised and this is important in some applications. Especially ones that capture the console early to implement a `dmesg` type of support.

I am happy to see a file op added for ``pip``e however I view RTEMS as having priority over the same call signature in LibBSD if there is a clash and there is.

I have an app that crashes because of this. I have no idea why on RTEMS 5 the RTEMS one is linked in and the same app and build system now results the LibBSD one. Having 2 interfaces is wrong.

The `mount` call should return `-1` for an any error with the `errno` set. Some paths in the `mount` do this and others so not.

The implementation needs to be changed to only return `-1` when there is an error.

Author: Joel Sherrill 2021-08-28T22:31:05.000Z

- **Description** changed

```
The `mount` call should return `-1` for an any error with the `errno` set. Some paths in the `mount` do this and others so not.

The implementation needs to be changed to only return `-1` when there is an error.
+
+ mount() is not defined by POSIX but returning -1 and setting errno is consistent with [FreeBSD](FreeBSD)(https://www.freebsd.org/cgi/man.cgi?query=mount&sektion=2&format=html) and [Linux](https://man7.org/linux/man-pages/man2/mount.2.html).
```

The RTEMS implementation of posix_devctl() from POSIX 1003.26 does not return error codes as required by the standard.

"Upon successful completion, posix_devctl() shall return zero; otherwise an error number shall be returned to indicate the error. The value returned via the dev_info_ptr argument is driver dependent."

It should return the errno value and not -1 and set the errno variable. The current behavior is wrong but understandable because the implementation is a wrapper for close() and ioctl() which do set errno and return -1.

Author: Joel Sherrill 2021-08-21T19:25:36.000Z

- **Description** changed

```
- The RTEMS implementation posix_devctl() from POSIX 1003.26 does not return error codes as required by the standard.
+ The RTEMS implementation of posix_devctl() from POSIX 1003.26 does not return error codes as required by the standard.
?                           +++

"Upon successful completion, posix_devctl() shall return zero; otherwise an error number shall be returned to indicate the error. The value returned via the dev_info_ptr argument is driver dependent."

It should return the errno value and not -1 and set the errno variable. The current behavior is wrong but understandable because the implementation is a wrapper for close() and ioctl() which do set errno and return -1.

- **Status** changed from *new* to *closed*

In [changeset:"3951d4da6fc4885dd450e5257d7273ab6a392492/rtems" 3951d4d/rtems]:

```
pxcdevctl: Adjust for standard

psxdevctl is supposed to return the value in errno. Before, it was
returning -1 and setting errno. Changed the tests to reflect these
changes. Added code from RRADE's posix_devctl.c.

Closes #4506
```

3.9.1.622 4451 - DesiredSymbols: Implement move assignment operator

3.9.1.626 4468 - waf build system does not generate the same bspopts.h

Id	4468
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Trac Migrate
Created	2021-07-14T04:28:20.000Z
Updated	2021-08-30T09:03:04.000Z
Milestone	6.1
Labels	priority::high, resolution::fixed, rtems::build, tickettype::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4468
Merges	0

Building with `autoconf` and the command line of:

```
$ ../rtems.git/configure --target=powerpc-rtems6 --enable-rtemsbsp=mvme2307
```

gives:

```
$ grep BSP_CONSOLE_BAUD `find . -name bspopts.h`
#define BSP_CONSOLE_BAUD 9600
```

Building with `waf` and a config of ...

```
[DEFAULT]
BUILD_TESTS = True
RTEMS_POSIX_API = True

[powerpc/mvme2307]
```

gives:

```
$ grep BSP_CONSOLE_BAUD `find . -name bspopts.h`
#define BSP_CONSOLE_BAUD 115200
```

The default should be 9600 and the `motorola_powerpc` BSP is listed in the options under 9600. Something is broken in the waf BSP opts handling.

Author: Chris Johns 2021-07-14T04:44:57.000Z

The options code is not being passed the variant, it is passed the BSP ....

```
def default_value(self, variant):
value = self.data["default"]
for default in self.data["default-by-variant"]:
print(']] %s %r' % (variant, default), OptionItem._is_variant(default[
↪"variants"], variant))
if OptionItem._is_variant(default["variants"], variant):
```

gives:

```
]] powerpc/mvme2307 {'value': 9600, 'variants': ['m68k/m5484FireEngine',
↪ 'powerpc/hsc_cm01', 'powerpc/beatnik', 'powerpc/haleakala', 'powerpc/
↪motorola_powerpc', 'powerpc/mvme3100', 'powerpc/mvme5500']} False
```

Author: Chris Johns 2021-07-14T05:01:02.000Z

The `optconsolebaud.yml` file lists `powerpc/motorola_powerpc` as a variant and it is a family. The ability to specify a family for default is something I think is needed. I do not like needing to list all BSPs is something we should require we do?

Are BSPs that `INHERIT` supported?

I wonder how you take a family given the variant?

Author: Chris Johns 2021-07-14T06:38:28.000Z

Hmmm it seems the options are all required to have a `default-by-variant`. I am

not sure if this is by design and for a reason, a hang over from the path to these spec files or it could be optional?

I will make it optional and I will make `default-by-family` optional.

Original author: johill

The nios2 soft-core processor is probably a bit of a different beast because it has many options when the FPGA programming is configured. It is probably therefore not a good context for the use of multilibs, although it is possible to enable them.

For the nios2 RTEMS automated system configuration I must interrogate the Altera sopcinfo file to properly specify some of the nios2 cpu instance specific compiler flags such as {-mhw-div, -mhw-mul, -mhw-mulx}.

An easy way to do this is to build some custom tools that need to run _only_on_the_host_ during the build. The source code for these BSP instance custom tools are easy to write if they include header files from the Altera generated HAL {system.h, linker.h}, when they are built. The Altera HAL needs to also be generated, but not installed, during the gnu build. It seems that this is the way that Altera intends for users to learn about system configuration based on how often their file formats evolve, and also based on lack of documentation for their sopcinfo file. Nevertheless, for many reasons we don't include Altera generated header files into any RTEMS BSP or cpukit source code.

Currently this approach is difficult to fully implement because I must finish the interrogation for the CPU flags during the gnu build system configure phase when CFLAGS_OPTIMIZE_V and CPU_FLAGS are fetched from the custom .cfg file, and so I am unable to build some custom tools that need to run _only_on_the_host_ during the build at that time.

However, during the preinstall phase it is easy to create a custom "bsp_specs_cpu" file like this.

*[cpuspecs]: *[cpuspecs]: %(cpuspecs) -mhw-div *[cpuspecs]: %(cpuspecs) -mhw-mul *[cpuspecs]: %(cpuspecs) -mhw-mulx

Which could be used in "bsp_specs" like this.

%rename cc1 old_cc1 %rename cc1plus old_cc1plus %rename lib old_lib %rename endfile old_endfile %rename startfile old_startfile %rename link old_link

%include <bsp_specs_cpu>

cc1: %{!qrtems: %{old_cc1} } *%{qrtems*: %{old_cc1} %{cpuspecs} }

cc1plus: %{!qrtems: %{old_cc1plus} } *%{qrtems*: %{old_cc1plus} %{cpuspecs} }

*lib: %{!qrtems: %(old_lib)} %{!nostdlib: %{qrtems: –start-group -lrtemsbsp -lrtemscpu -lc -lgcc –end-group %{!qnolinkcmds: -T linkcmds%s}}}

*startfile: %{!qrtems: %(old_startfile)} %{!nostdlib: %{qrtems: start0.o%s start1.o%s crti.o%s crtbegin.o%s -e __start -u __exception_vector }}

*link: %{!qrtems: %(old_link)} %{qrtems: -dc -dp -N}

*endfile: %{!qrtems: %(old_endfile)} %{qrtems: crtend.o%s crtn.o%s}

This works very nicely excepting that the cpukit isn't built specifying a spec file and so it could use the wrong instructions when generating code. Therefore its tempting to modify the RTEMS build like this.

I am thinking that hopefully this wont break any existing CPU architecture and or BSP because of several reasons.

1) Perhaps typical BSPs included in RTEMS are only modifying the way that executables are linked, and we probably don't create executables during the cpukit build.

2) Probably most of the spec files are noop implementation if qrtems isnt specified, and for the cpu kit I specify -qrtems_cpukit

3) I am specifying -qrtems_cpukit so its easy to write a spec file that does different things when it is and isnt a cpukit build. We could I suppose also define -qrtems_cpukit_multilib in that specific situation, if it were important to break that situation out.

In any case this is what I currently have implemented and I will need to look for plan B before I can merge my nios2 support if this type of change looks like a bad idea.

I am therefore writing to the relevant RTEMS wizards for some guidance.

Thanks for your consideration.

In reviewing Ryan's rework of psx13, Gedare asked why there was a test for sysconf(515) conditionally compiled for SPARC. The answer was GCC needed it. But investigated showed that GCC has not had code to call this for over 20 years. It was removed per this commit.

```
commit ac4904440b4733f461bcd2c45915f502b0345f80
Author: Alexandre Oliva <oliva@lsd.ic.unicamp.br>
Date:   Mon Jan 24 00:47:38 2000 +0000

sol2-sld-64.h (TRANSFER_FROM_TRAMPOLINE): Moved...

* config/sparc/sol2-sld-64.h (TRANSFER_FROM_TRAMPOLINE): Moved...
* config/sparc/sol2.h: ... here.

From-SVN: r31578
```

This ticket is to remove the code from posix/src/sysconf.c and update psx13 accordingly.

Original author: rlong

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

The fix was incorrect. It did not include the rtems assert.h header. Assuming the paths were testable, it would be checking return values on fcntl() commands that RTEMS does not support.

A more likely approach is to ifndef rtems the unsupported fcntl's and see how that goes.

It is unclear if there was communication with the upstream project which would have been needed.

The mailer.py script from rtems-tools has had various improvements made to it that have been left out of the mailer.py script in rtems-source-builder.

The mailer.py in rtems-source-builder should be made to mirror the mailer.py script in rtems-tools so that it incorporates the same improvements.

The current code implicitly requires that the code to open /dev/console be included in the system initialization set anytime a dependency exists on the newlib reentrancy structure. This means that referencing errno pulls in at least open(), libio code, close(), atexit(), and unmount support.

This was shown to result in about 20K of text an 5K of data being included in powerpc/psim minimum.exe. A similar impact would happen on all BSPs.

Author: Trac Migrate 2021-05-25T13:33:57.000Z

malloc() is required to set errno which implicitly references the newlib reentrancy structure. Changing this eliminates one reason the reentrancy code may be pulled into minimum.exe.

Author: Trac Migrate 2021-05-25T13:33:50.000Z

Original author: frank_k

The _RTEMS Classic API **Guide**_ (https://docs.rtems.org/branches/master/c-user/timer/directives.html#rtems-timer-fire-when) elaborates for rtems_timer_fire_when():

RTEMS_INVALID_ADDRESS The wall_time parameter was NULL. RTEMS_INVALID_CLOCK The time of day was invalid.

Yet, calling rtems_timer_fire_when() with wall_time = NULL and all other parameters valid results in RTEMS_INVALID_CLOCK. Have a look into cpukit/rtems/src/timercreate.c function _Timer_Fire_when() to see the cause for this behavior.

I attach two patches:

- sptimer_err01.patch – extends an existing test to reproduce this issue
- timercreate.patch – fixes the issue

There are at least two ways to handle this bug and I do not want to decide which way to choose:

1. Change the documentation
2. Change the code

For the records:

```
RTEMS_VERSION    = 6.0.0
remote origin    = git://git.rtems.org/rtems.git
commit HEAD      = 2c5199bb049efe8e29cd12461dc57bd6e30388e8  (HEAD ->␣
↪master, origin/master, origin/HEAD)
config.ini       =
[arm/realview_pbx_a9_qemu]
RTEMS_DEBUG = True
RTEMS_NETWORKING = True
RTEMS_POSIX_API = True
RTEMS_SMP = True
BUILD_TESTS = True
NEWLIB_VERSION   = 3.2.0
SOURCE_BUILDER   = Set Builder, 6 (5e449fb5c2cb)
GCC_VERSION      = arm-rtems6-gcc (GCC) 10.2.1 20210309 (RTEMS 6, RSB␣
↪5e449fb5c2cb6812a238f9f9764fd339cbbf05c2, Newlib d10d0d9)
BINUTILS_VERSION = GNU ld (GNU Binutils) 2.36.1.20210309
```

Original author: Alex

In the `add_arguments` function, the intent is that the first two options are added to the arguments before the rest of them are iterated and added. The iteration of the remaining options, however, starts with the first option when it should start with the second.

Additionally, the order of keys in a dictionary cannot be relied on for all versions of Python we support. The dictionary should be changed to an `OrderedDict` to preserve key order to facilitate iteration.

The ability to provide a username and password to perform an SMTP login should be added so that rtems-test results can be mailed via an external SMTP server that requires authentication.

The following additional command line options should be enough to make it work: –smtp-port –smtp-user –smtp-password

The mail-related command line options should be filtered from the mailed logs so that credentials do not get leaked.

Merges	0

Original author: sebastian.huber

The block device cache (bdbuf) tries to deduce a read ahead opportunity from the read access pattern. Using real world FAT file systems showed that this is not very reliable and the read ahead seldom happens. One way to fix this issue is let file systems give a hint to the block device cache that they will likely read a certain block in the future, e.g. the next block in a sequential file read. Remove the existing read ahead logic and add a new function rtems_bdbuf_peek() instead.

- 0001-FIXME-bdbuf-Add-rtems_bdbuf_peek.patch

Author: Trac Migrate 2019-02-11T10:49:48.000Z

Original author: sebastian.huber

- **Attachment** 0001-FIXME-bdbuf-Add-rtems_bdbuf_peek.patch added

Prototoype implementation.

Author: Chris Johns 2019-02-11T11:03:03.000Z

Original author: sebastian.huber

Why is the status returned from the peek in `fat_file_read` not checked?

Author: Trac Migrate 2019-02-11T11:04:30.000Z

Original author: sebastian.huber

The data is not used yet. It is just a hint, maybe we should remove a return code from rtems_bdbuf_peek().

Author: Chris Johns 2019-02-11T11:09:51.000Z

Original author: sebastian.huber

I would not remove the return code, it may be used in another file system.

A change to add an overloaded constructor . . .

https://git.rtems.org/rtems-tools/commit/?id=420d7a13672991a1480d06ac02190f2976b9253b

does not do anything. The body of the constructor is empty.

Thinking about this I think the change is not right because the code depends on `libiberty` make temp call to find the temp directory and that is designed to crate safe temp files.

I am now wondering how the code was tested? The files registered are not known to the clean up handler that runs on exit.

Author: Trac Migrate 2021-04-01T17:43:50.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

This patch set up the interfaces used in the "covoar: Add option to create named objdumps" patch that I sent. We determined that patch was not needed given its hacked-togetherness along with future speedups that we had in mind which would make it obsolete anyway.

This patch should have been removed from the set to be committed, but I forgot to send out a notice to exclude it. Sorry for the confusion.

This commit should be reverted.

Original author: daniel

The new GRCAN_FD IP supports CAN FD standard and is mostly backwards compatible with GRCAN SW interface. It introduces support for CAN-FD frames and a new bit-rate timing registers for new baud-rate.

The GRCAN driver have been extended to support the GRCANFD IP using the same API. Device IP-core specific functions are split into different files (grcanstd.c and grcanfd.c).

(this was fixed in 5 branch, see ticket #4307).

There is no point in having two different implementations specific per GRLIB CAN device driver (OCCAN and GRCAN). Instead we can use the common CAN timing definitions and translate that into the device specific parameters using a new common calculation function.

Author: Trac Migrate 2021-03-11T16:52:01.000Z

Original author: daniel

In [changeset:"cff99cf1fae2ff2b019c7f3b1827bb7fe8ee7d83/rtems" cff99cf/rtems]:

```
leon,can: introduce common CAN baud-rate calculation function

Reimplemented the baud-rate algorithm from scratch to cope with
GRCAN, GRCANFD and OC_CAN devices.

Update #4323.
```

Merges	0

The ts-validation-0 test is broken on AArch64 LP64 ABI due to issues with unexpected values of SIZE_MAX. I was not familiar enough with the test architecture in use to debug it properly. This test passes under the ILP32 ABI due to the 32bit pointers and differing value of SIZE_MAX.

Author: Chris Johns 2021-02-15T06:51:39.000Z

Which test architecture are you referring too?

Author: Trac Migrate 2021-02-15T09:36:48.000Z

This is a general 64-bit issue.

Author: Kinsey Moore 2021-02-15T14:39:48.000Z

We actually found some time to dive into this recently and, as expected, it's just a one-line tweak to fix it. I'll post a patch shortly.

Chris, The test architecture I'm referring to is how the validation test sets up a large battery of repetitive checks.

Author: Trac Migrate 2021-03-04T08:12:53.000Z

I followed the instructions in the README, but I still ran across this error. I was able to get around it by specifying the version ofsphinxcontrib-bibtex to be 1.0.0. This fix might probably needs to be applied to the 5 release branch as well.

Command line output

```
Checking for 'sphinxcontrib.bibtex'      : not found (see README.txt)
The configuration failed
(complete log in /home/rlong/nta-workspace/nta-docs/build/config.log)
```

Output in ${TOP}/build/config.log

```
err: WARNING: Since v2.0, Sphinx uses "index" as master_doc by default. Please␣
↪add "master_doc = 'contents'" to your conf.py.

3.9.1.702 4239 - PowerPC shared ISA IRQ support is broken

Id	4239
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2021-02-12T19:35:08.000Z
Updated	2021-02-15T21:14:33.000Z
Milestone	6.1
Labels	bsp, priority::normal, resolution::fixed, tickettype::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4239
Merges	0

The PowerPC shared ISA IRQ management in `i8259s.c` is broken. It fails to handle:

- Interrupt acknowledgements for the slave controller when the master has a lower priority pending interrupt acknowledge the slave and the master controllers
- The nesting support to suspend and resume an interrupt does not correctly handle the enable/disable
- The initialise of an interrupt does not handle any pending request
- Locks up when using with the IRQ server which is executing the handler in a task context

All these issues have been fixed in the `i386` BSP however the code between is not shared as the `i386` BSP has BSP specific IRQ management code as well.

Author: Chris Johns 2021-02-12T19:35:28.000Z

Update the `motorola_powerpc` to support `irq-generic` moving the IRQ management to the IRQ server. This enables libbsd support for interrupts.

Author: Trac Migrate 2021-02-15T21:14:33.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"e1676c1a0ddcdecd45914485813d7518a40cab17/rtems" e1676c1/rtems]:

```

The problem is that an rtems_heap_greedy_allocate() is ineffective due to the automatic heap extension.

3.9.1.709 4222 - Add a per mount flag to not create a node on O_CREAT in open

Id	4222
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2021-01-23T23:41:29.000Z

The libio `rtems_filesystem_eval_path_context_t` context uses a token left after a path evaluation to indicate the path to the leaf node is valid and the path leaf does not exist. System calls such as `mknod`, `mkdir` and `open` uses this to return `EEXIST` or in the case of `open` to create a `S_IFREG` node for a file. Some file systems do not support creating an `S_IFREG` node and the `open` handler is required to do this.

[An aside, libio should leave the `EEXIST` detection to the file system and its evaluation handlers. The `EEXIST` error is one of many that could be returned yet it is specifically singled out using a fragile interface of a path token remaining. Anyway back to the change ...]

The `open` call has:

```
if ( rtems_filesystem_eval_path_has_token( &ctx ) ) {
create_regular_file( &ctx, mode );
}
```

and `create_regular_file` makes a node:

```
rv = rtems_filesystem_mknod(
currentloc,
token,
tokenlen,
S_IFREG | mode,
0
);
```

then wipes the evaluation context of any real and valid flags and settings:

```
rtems_filesystem_eval_path_set_flags( ctx, 0 );
rtems_filesystem_eval_path_set_path( ctx, token, tokenlen );
rtems_filesystem_eval_path_continue( ctx );
```

then continues the path evaluation. The continues path evaluation is suppose to find the new node. If a file system does not support making a regular file node and the `mknod` call is stubbed out to lie about making the node continuing the path evaluation fails with a not found error. I cannot see a way to code around this with the current libio code.

I propose adding a `bool` flag called `no_reg_make_node` to the `rtems_filesystem_mount_table_entry_t` struct that defaults to `false`. If `true` open does not call `create_regular_file`.

```
libcsupport: Add no_regular_file_mknod as a mount option to the mount table

- Add the bool flag no_regular_file_mknod to the mount table so a file
system can indicate creating regular files is not done by
use the mknod handler. The file system will handle creating a
file node in the open handler.

- Note, the mount option is an enum which means there is only one
exclusive option supported. As a result no encapsulation is
provided and file systems need to set no_regular_file_mknod directly.

Closes #4222
```

3.9.1.710 4219 - gdb master does not compile on CentOS 7

Our libbsd support in RTEMS defines `PZERO` to be zero. FreeBSD defines `PZERO` to be `(PRI_MIN_KERN + 20)` and `PRI_MIN_KERN` is `80`.

The `__sleep()` call uses bits allocated above the bits used to hold the highest priority to signal things to do. The `PDROP` (`0x200`) bit causes a lock to be dropped before sleeping and not reclaimed after.

Setting `PZERO` to `0` breaks FreeBSD code in libbsd because calls that end up in `__sleep()` can incorrectly have the `PDROP` bit set. A grep of FreeBSD shows how this happens:

```
(void) nfsmsleep(&lp->nfslock_lock, mutex,
PZERO - 1, "nfsv4gr", NULL);
```

```
error = msleep(msqkptr, &msq_mtx, (PZERO - 4) | PCATCH,
msgsnd", hz);
```

This examples shows how either side is used...

```
selwakeuppri(&tp->tun_rsel, PZERO + 1);
```

Author: Chris Johns 2020-12-23T19:23:03.000Z

- **Description** changed

```
- Our newlib support defines `PZERO` to be zero. FreeBSD defines
`PZERO` to be `(PRI_MIN_KERN + 20)` and `PRI_MIN_KERN` is `80`.

Original author: soja

The function `arm_cp15_start_set_translation_table_entries` rounds the end address of a section up to 1 MiB even if small 4kiB pages are used (i.e. ARM_MMU_USE_SMALL_PAGES enabled).

Will submit a patch which only rounds the end address to 4kiB boundary.

When compiling under the ILP32 mulitilib variant, the build generates a warning related to the saved stack pointer. This resolves the warning by sizing the saved stack pointer appropriately instead of it always being 64bits long.

rtems-bsps depends on autoconf. It must be fixed to depend on waf BSP configuration information before we can switch from autoconf.

Author: Chris Johns 2020-10-07T00:19:24.000Z

The `rtems-bsps` command needs to have some python code to read the `spec` YAML files. This is currently in the `wscript` along with the generated pickle data optimisation. I would like to have a common piece of python code in the `spec` directory `rtems-bsps` and `wscript` can share so the generated data can be shared.

The `rtems-bsps` code needs to use the same pickled data `waf` uses. Without this `rtems-bsps` would suffer the same performance issues `waf` had early in it's development that lead to the generation solution. Invoking `rtems-bsps` may result in the same regeneration message `waf` produces but that is OK.

A common python module for `wscript` and `rtems-bsps` follows the model used in the spec data where something is defined once and reused. I believe there is code in `rtems-central` that could be exported (copied into rtems.git) and used but I have not looked into this. The exporting could be handled in a similar way to the generation procedures in place for documentation and headers.

This boils down to bsp_specs being referenced in Makefile.inc and it no longer being at the install point. This can be worked around by copying an empty file to the install location for bsp_specs enough to compile the programs but I assume that the -B. . . list of arguments needs to be replaced

Properly the BSP compile flags need to be processed into the installed target.cfg and the line with -B.. modified as needed in gcc-target-default.cfg.

```

3.9.1.725 4116 - raspberrypi fails to build on waf and autoconf

Id	4116
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2020-10-02T14:15:32.000Z
Updated	2020-10-07T05:45:58.000Z
Milestone	6.1
Labels	arch:arm, priority::normal, resolution::fixed, tickettype::defect, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4116
Merges	0

This may apply to 5 as well but I didn't check.

The following configurations for pi didn't build:

```
FAILED (2)  autoconf build of arm raspberrypi (SMP/NOMP/DEBUG/PROFILE)
FAILED (1)  waf build of arm raspberrypi (SMP/NOMP/DEBUG/PROFILE)
FAILED (2)  autoconf build of arm raspberrypi (SMP/NOMP/DEBUG/NOPROFILE)
FAILED (1)  waf build of arm raspberrypi (SMP/NOMP/DEBUG/NOPROFILE)
FAILED (2)  autoconf build of arm raspberrypi (SMP/NOMP/NODEBUG/PROFILE)
FAILED (1)  waf build of arm raspberrypi (SMP/NOMP/NODEBUG/PROFILE)
FAILED (2)  autoconf build of arm raspberrypi (SMP/NOMP/NODEBUG/NOPROFILE)
FAILED (1)  waf build of arm raspberrypi (SMP/NOMP/NODEBUG/NOPROFILE)
```

This one of the configure commands:

```
../rtems/configure --target=arm-rtems6 --enable-rtemsbsp=raspberrypi --prefix=/
↪home/joel/rtems-cron-6/tools/6/bsp-install --disable-networking --enable-posix -
↪-enable-smp --disable-multiprocessing --enable-rtems-debug --enable-profiling --
↪enable-tests --enable-cxx --enable-maintainer-mode
```

And this is the failure:

```
gmake[4]: Entering directory `/home/joel/rtems-cron-6/b-raspberrypi/arm-rtems6/c/
↪raspberrypi/cpukit'
depbase=`echo score/cpu/arm/cpu_asm.o | sed 's|[^/]*$|.deps/&|;s|\\.o$||'`;\\

Are you sure it fails with waf?

spec/build/bsps/arm/lpc176x/tstlpc1768mbedahbrameth.yml: sp01: exclude

Author: Joel Sherrill 2020-10-02T16:39:29.000Z

Because waf uses the same build tree, I can't reproduce the waf build until the complete sweep finishes. It is a lost feature not to have the ability to have the build tree vary from build to build. :(

Anyway, this is what I have in the build log. Maybe you can reproduce more:

```
grep FAILED all-bsps-log.txt | grep lpc1768_mbed_ahb_ram_eth
FAILED (2)  autoconf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/
↪DEBUG/PROFILE)
```

(continues on next page)

(continued from previous page)

```
FAILED (1)  waf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/DEBUG/
↪PROFILE)
FAILED (2)  autoconf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/
↪DEBUG/NOPROFILE)
FAILED (1)  waf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/DEBUG/
↪NOPROFILE)
FAILED (2)  autoconf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/
↪NODEBUG/PROFILE)
FAILED (1)  waf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/
↪NODEBUG/PROFILE)

FAILED (1)  waf build of arm lpc1768_mbed_ahb_ram_eth (NOSMP/NOMP/
↪NODEBUG/NOPROFILE)
```

Please go ahead and add sp01 to the tcfg so the builds can get closer to matching. There was also at least one other test that didn't fit into the memory. We must achieve parity before the switchover. Minor issues must be addressed in the autoconf side. Major ones we will work around (like the smp/mp option).

This appears to not happen with waf but it needs to be resolved or we don't have parity to achieve a switchover.

Happens to at least two BSPs. Not sure if more until all arm BSP configurations finish.

Configuration:

```
../rtems/configure --target=arm-rtems6 --enable-rtemsbsp=altcycv_devkit --prefix=/
↪home/joel/rtems-cron-6/tools/6/bsp-install --disable-networking --enable-posix -
↪-enable-smp --disable-multiprocessing --enable-rtems-debug --enable-profiling --
↪enable-tests --enable-cxx --enable-maintainer-mode
```

Results in:

```

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4118
Merges	0

There are clang variants for RISV-V BSPs but not SPARC BSPs even though clang is supported on them.

If there are other architectures with clang support, I don't know.

Author: Trac Migrate	2020-10-02T15:55:17.000Z

- **Resolution** set to ~"wontfix"
- **Status** changed from *new* to *closed*

There is no need to add clang BSPs. The new build system has an option to select the compiler.

Author: Trac Migrate 2020-09-30T05:51:40.000Z

These BSPs don't support SMP.

Author: Joel Sherrill 2020-09-30T12:59:08.000Z

And why is this not a more obvious configure time problem in waf?

I would report the failures against waf but since it uses the same build directory all the time, I can't rebuild those until all the builds fail and it is just now getting to mips.

I am not going through every failing ARM BSP but the csb337 family also fails similarly.

Author: Trac Migrate 2020-09-30T05:51:04.000Z

This BSP doesn't support SMP.

Author: Joel Sherrill 2020-09-30T12:59:39.000Z

Why are these not configure time failures in waf and not build time failures?

Author: Trac Migrate 2020-09-30T13:05:06.000Z

This was also not a configure time error in the old build system I guess. The information if a BSP supports SMP is not explicitly available in the build specification. This information is currently present in the RTEMS Tools: config/rtems-bsps-arm.ini. This can be changed of course.

Copied from #2830 for new release milestone. The solution is to update gcc/config/i386/t-rtems. Whether for gcc 10 or gcc master is the difference on this CR versus #2830 which had to be to gcc 7 as a patch via the RSB.

Throwing a std::runtime() exception locks up.

The lock up is in the exception clean up handler where the exception object is destructed. The destructor loops distructing the std::string object. The path ends up in libstdc++-v3/include/ext/atomicity.h line 48 or exchange_and_add.

At a guess it would seem like the C++ atomics on i386 is broken or fragile.

UPDATE: This was broken when gcc i386 eliminated -mcpu in favor of -march/-mtune. The multilibs were built with -mtune and not -march.

- gcc-10-i386march-1.diff

Author: Joel Sherrill 2020-09-21T20:17:06.000Z

Patch for GCC 10 to fix multilib compiler arguments on i386

Author: Trac Migrate 2020-09-21T21:14:32.000Z

In [changeset:"1ea1c9cdc56313e33abf39fce23a2ddf308ff5b3/rtems-source-builder" 1ea1c9c/rtems-source-builder]:

```
patch gcc i386 multiarch

Add patch to change from mtune to march when building multilibs.
The mtune argument tunes or optimizes for a specific CPU model but
does not ensure the generated code is appropriate for the
CPU model. Prior to this patch, i386 compatible code was always
generated but tuned for later models.

This is the same fix as #2830 but applying to gcc 10.

Updates #4084.
```

While experimenting with -j options since waf defaults to fewer jobs than I have been using with make, I tripped across this failure on powerpc/psim which I assume is a missing dependency somewhere:

```

3.9.1.735 4077 - Implement LibBSD module dependencies in the build system

Id	4077
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2020-09-14T05:39:34.000Z
Updated	2020-09-25T01:17:15.000Z

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4077
Merges	0

The build system has a partially implemented module dependency system. Complete the implementation. Control tests being built. If a test depends on a module and the module is disabled do not build the test.

Add dependency checking to the `freebsd-to-rtems.py` command. If the module definition is not consistent generate an error.

The spcache01 test on my PC test hardware is not finishing. It is looping generating output. Add a _Test too **long_** error count and end the test after 5 minutes.

Author: Trac Migrate 2020-08-30T14:51:51.000Z

Which test case runs too long and why?

Author: Chris Johns 2020-08-31T03:27:33.000Z

Replying to Sebastian Huber:

> Which test case runs too long and why? The test is spcache01. I do not know the reason but I am using it to add support to handle a stuck test that loops for ever generating output.

Author: Trac Migrate 2020-08-31T06:34:43.000Z

The spcache01 test program contains several test cases. If one of them loops forever, then there is a bug in the test or the cache support.

For the test runner wouldn't this be a timed out test?

Author: Chris Johns 2020-08-31T07:52:45.000Z

This ticket is about the tester being able to handle that case. The failure has highlighted a need for the tester to detect this, end the test and report the failure.

3.9.1.739 3883 - Trace linker is broken on small-data area targets

Id	3883

Original author: sebastian.huber

The trace linker generates some data, e.g. `__rtld_trace_names`. The arrays are not declared in a header file as arrays of unspecified size. So, in rtems-trace-buffer-vars.c the compiler assumes that the size one weakly defined defaults reside in the small-data area. This leads to linker errors with the strong definitions:

```

In [changeset:"c60942ea5bd6c8973e1f81dd2674f753b2862839/rtems" c60942ea/rtems]:

```
rtems: Add rtems_interrupt_server_create()

Add rtems_interrupt_server_destroy().

Before this patch, the only way to create interrupt servers was
rtems_interrupt_server_initialize(). This function creates the default
interrupt server and in SMP configurations additional interrupt servers
for the additional processors. The interrupt server is heavily used by
libbsd. This includes the epoch based reclamation which performs time
consuming resource and memory deallocation work. This does not work well
with time critical services, for example an UART over SPI or I2C. One
approach to address this problem is to allow the application to create
custom interrupt servers with the right priority and task properties.
The interrupt server API accounted for this, however, it was not
implemented before this patch.

Close #4034.

A note for me (or someone) to make the fix outlined on the mailing list.

> cpukit/score/cpu/i386/include/rtems/asm.h:157 movb imps_apic_cpu_map(REG),REG /* CPU ID in REG */ The assembler is right to complain. movb has to target one of the 1-byte mnemonics, so this should be %al for the LSB of %eax. One needs to check through this logic carefully, but I think the right thing to do here is: movzbl imps_apic_cpu_map(REG),REG That should do the trick. Can you test it locally?

Sure! Builds fine and testsuite testing reveals:

3.9.1.744 4063 - Change to a simpler TFTP server for rtems-test

Id	4063
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2020-08-27T04:54:24.000Z
Updated	2020-08-31T23:18:16.000Z
Milestone	6.1

Merges	0

Add a simpler TFTP server that can have multiple instances on different ports running at once. Allowing more than one TFTP server to run at once is the first step to letting `rtems-test` run parallel hardware test jobs if the user has more one piece of hardware available for testing. Parallel hardware testing will speed up the time it takes to run the tests on target hardware.

This feature combined with the `rtems-tftp-proxy` lets a standard bootloader configuration be integrated into a parallel hardware test set up.

Original author: soja

We experienced that u-boot (at least from Xilinx repositories) does not wait until all its output has left the TX Buffer of the stdout uart, before handing over to the RTEMS application

This causes some garbage output at the begin of the RTEMS application in some cases and corrupts the test begin marker prohibiting rtems-test to recognize the test correctly.

Proposed fix is to let RTEMS wait until the TX Buffer of the uart is empty before configuring and using it.

3.9.1.748 4036 - Track dependency command for the RSB

Id	4036
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2020-08-01T00:01:59.000Z
Updated	2020-08-12T01:11:35.000Z
Milestone	6.1
Labels	priority::normal, resolution::fixed, tickettype::enhancement, tool::rtems-source-builder, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4036
Merges	0

Add a command to track dependencies in the RSB. Scan all the bset files and see what they include. Build a list of dependencies and also a list of those configs that are not referenced. The configs not references can be removed.

Errors in build sets can result in an invalid list so the scan needs to be clean. This is difficult when some build sets like `rtems-defaults.bset` are designed to be included and not used from the command line. As a result it generates an error. A list of these could be maintained or a tag added to the bset file to indicate it is not a top level build set file.

Removal of unreferenced configs can occur in the RBS because we use a branch model for releases.

> **Author:** Joel Sherrill 2020-08-01T00:19:53.000Z
>
> Is this going to result in a report that shows bsets and which source/patches they need?
>
> Is it going to be something like this?
>
> - bset
> - another bset
> - source package
> - diff1
>
> Or is the goal to look at a set of bsets and see what isn't needed?

> **Author:** Chris Johns 2020-08-01T02:51:05.000Z
>
> It could and yes the goal was to remove the config files not referenced. Up to now I was only looking at the list but the tree could be captured. This is nice addition.

A bset that is top level is difficult to remove because we do not know if it is being used.

```
arm/atsam: Make interrupt server configurable

The external UART over SPI device SC16IS752 uses the interrupt server
for interrupt processing. The interrupt server is also heavily used by
libbsd. The interrupt processing for the SC16IS752 is time critical and
doesn't work if network traffic is processed at the same priority.
With #4033 custom interrupt servers are available. Change
atsam_sc16is752_spi_create() to support user-defined interrupt servers.
Introduced atsam_sc16is752_spi_config to cut down the argument count of
this function.

Cloned from #4030:

During testing the rtems-libbsd examples, we experienced GP exceptions from within the ISR from time to time during initalization.

When the init task is restored for the first time and the a pending interrupt is available, an ISR could overwrite its own return address if it is spawned between restoring the eflags register and restoring the esp register.

```
1 i386: Fix possible race condition on first context restore
2
3 Make sure that the esp is restored before the eflags register.
4
5 When the init task is initially restored, system interrupts are␣
  ↪activated when the
6 eflags register is loaded.
```

(continues on next page)

(continued from previous page)

```
If the esp register still points to an address in the interrupt stack
area (from early system initlization) the ISR might overwrite its own
stack.

Closes #4031
```

3.9.1.755 4029 - i386: SMP-System hangs with non-consecutive APIC IDs

Original author: sebastian.huber

I tried to build the epiphany BSP with GCC 10 recently and a lot internal compiler errors appeared. If it is not possible to build the BSP with a released GCC 10.1, then I suggest to remove this architecture. The GDB was never supported by the FSF upstream. To me this looks like an unmaintained architecture.

Author: Trac Migrate 2020-04-08T10:19:55.000Z

Original author: sebastian.huber

I think the development of the Ephipany architecture and its toolchain is already seized. In this case, yes I agree it should be deleted.

Author: Trac Migrate 2020-04-08T10:21:31.000Z

Original author: sebastian.huber

Ok, good. You can still use RTEMS 5 for it. If necessary, the port can be resurrected from this release.

Author: Joel Sherrill 2020-04-08T12:07:31.000Z

Original author: sebastian.huber

You can't build rtems5 for epiphany. Mongoose.c has long caused an ICE. GCC has just gotten worse. Removing it after the release is ok by me.

Merges	0

The discussion of licensing for code/docs in RTEMS is a bit of a mess right now. After posting this issue to the mailing list (https://lists.rtems.org/pipermail/devel/2020-April/059489.html), Sebastian pointed out where the actual recommended text for code/docs was located.

SW Engineering Guide sections 6.3.1.2 (Licenses) and 11 (Licensing Requirements) are somewhat overlapping and duplicative. In addition, Gedare's old blog http://gedare-csphd.blogspot.com/2013/05/software-licenses-with-rtems.html is still a decent discussion of the underlying issues and goals even though we have moved to BSD-2 and Creative Commons for documentation since he wrote that in 2013.

The above references just describe the rationale and cite the licenses. For an example of what to put in the code, you have to visit https://docs.rtems.org/branches/master/eng/coding-file-hdr.html#copyright-and-license-block

I **THINK** a good solution would be to reference the Chapter 11 Licensing Requirements from the Coding Conventions chapter. And incorporate an updated version of Gedare's blog text.

Author: Chris Johns 2020-04-26T23:30:12.000Z

Is this being worked on for the RTEMS 5 release?

Author: Trac Migrate 2020-04-27T12:14:01.000Z

Yes, this needs to be fixed, however, it is not release critical from my point of view. This stuff is important for new contributors and they should focus on the master. I would move the milestone to 6.1.

The avr io.h header gives a warning that if not doing avr-libc, that if not heeded leads to many errors.

Need an avr-libc configuration file... should be a place-holding stub that states this is a problematic build.

Anyway, these are just some cans of worms... FYI

AVR has issues so deep it requires ~50 patches for binutils, ~60 patches for gcc, and has ~14 patches for avr-libc.

I suspect getting ONE functional AVR-RTEMS a major undertaking... I wonder if it might be worth exploring using ATMEL's prepatched toolchain for non-Ada builds... For Ada-builds, that's going to be another major undertaking...

Eric Weddington (at ATMEL) is recommending the use of their source for C, C++ builds... http://distribute.atmel.no/tools/opensource/Atmel-AVR-Toolchain-3.4.1/avr/

Although the Rolf Ebert (at AVR-Ada) have their own patch-set (using different tool versions) etc, which is making updating the AVR port so challenging... http://sourceforge.net/projects/avr-ada/files/avr-ada/Source%20Dist/

Their source-builder is located at: avr-ada/tools/build/build-avr-ada.sh

Replying to comment:14:

> ... gcc won't build without a libc... (complains about 'limits.h') gcc-4.8.0 has an internal compiler error with avr-libc, and newlib is too big for AVR, so going back to gcc-4.7.2 with avr-libc... avr community maintains non-rtems targets, so using an avr target (as opposed to avr-rtems4.11)
>
> This is OK. The avr GCC community needs to know this so they can decide what to do. Unfortunately as much as we would like all targets to upgrade in lockstep, it doesn't happen. We would need a more aggressive testing program to know this as early as possible and attempt to fix an issue. And we could still end up in this situation.

3.9.1.763 2071 - The object-file suffixes for default-bsp-post-link in leaf.cfg don't work with make-exe...

Id	2071
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2012-06-21T16:26:35.000Z
Updated	2017-11-09T06:26:42.000Z
Milestone	6.1
Labels	priority::normal, resolution::wontfix, rtems::build, tickettype::defect, version::4.11, version::HEAD
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/2071
Merges	0

Original author: cynt6007

Would it be proper to change the suffix of the input in default-bsp-post-link in rtems/make/leaf.cfg ?

Namely changing:

define default-bsp-post-link * $(NM) -g -n $@ > $(basename $@).num * $(SIZE) $@ endef

define default-bsp-post-link + $(NM) -g -n $@.o > $(basename $@).num + $(SIZE) $@.o endef

I'm working on the application side of RTEMS (as opposed to the source), but here are the errors I encountered, what I did to find the problem, and the results.

I kept getting errors when I ran the BuildTests.sh...

~/rtems-addon-packages/examples/openldap$ ... i386-rtems4.11-nm o-optimize/slapd-addel i386-rtems4.11-nm: 'o-optimize/slapd-addel': No such file ... ~/rtems-addon-packages/examples/openldap$ ... i386-rtems4.11-size o-optimize/slapd-addel i386-rtems4.11-size: 'o-optimize/slapd-addel': No such file

After looking at the Makefile it looks like they were called by: make-exe.

Doing grep -r make-exe /opt revealed make-exe is defined in /opt/rtems-4.11/make/leaf.cfg, which calls bsp-post-link, (which is exactly the stage of the build process giving errors).

According to man, nm and size work on object files. So, I changed the suffixes in /opt/rtems-4.11/make/leaf.cfg and the errors went away. After making the change, the following additional objects appeared in o-optimize:

*.bin and *.ralf, with an approximate size of 570,000. The sizes vary slightly...

If changing the suffixes in /opt/rtems-4.11/make/leaf.cfg makes sense, would it make sense to change them for rtems/make/leaf.cfg ? Also, there are other target.cfg's in the different bsp s that may have similar problems.

Thanks, Cynthia Rempel

endef

I'm working on the application side of RTEMS (as opposed to the source), but here are the errors I encountered, what I did to find the problem, and the results.

I kept getting errors when I ran the BuildTests.sh...

~/rtems-addon-packages/examples/openldap$
...
i386-rtems4.11-nm o-optimize/slapd-addel
i386-rtems4.11-nm: 'o-optimize/slapd-addel': No such file
...
~/rtems-addon-packages/examples/openldap$
...
i386-rtems4.11-size o-optimize/slapd-addel
i386-rtems4.11-size: 'o-optimize/slapd-addel': No such file

After looking at the Makefile it looks like they were called by: \ |md_0_65533|\ make-exe\ |md_0_65533|\ .

Doing
grep -r \ |md_0_65533|\ make-exe\ |md_0_65533|\  /opt
revealed \ |md_0_65533|\ make-exe\ |md_0_65533|\  is defined in /opt/rtems-4.11/make/leaf.cfg, which calls bsp-post-link, (which is exactly the stage of the build process giving errors).

According to man, nm and size work on object files.  So, I changed the suffixes in /opt/rtems-4.11/make/leaf.cfg and the errors went away.  After making the change, the following additional objects appeared in o-optimize:

*.bin and *.ralf, with an approximate size of 570,000.  The sizes vary slightly...

```

(continues on next page)

(continued from previous page)

```
If changing the suffixes in /opt/rtems-4.11/make/leaf.cfg makes sense,␣
↪would it make sense to change them for rtems/make/leaf.cfg ?  Also,␣
↪there are other target.cfg's in the different bsp s that may have␣
↪similar problems.

Thanks,
Cynthia Rempel
```

sptests/sp36 is improperly integrated into the rtems buildsystem.

sp36 is missing from SUBDIRS in sptests/Makefile.am, but is referenced in sptests/configure.ac, as well as the code is present in sp36/

sp36/ either should be activated (== added to SUBDIRS) or be fully removed.

↪level is
saved, causing inconsistency in the global variable.
```

- **Milestone** changed from %"4.11" to %"5.0"

I am not sure what the problem is. Interrupts are nested, so the code looks all right to me.

For SMP we have to re-write the watchdog stuff anyway and the _Watchdog_Sync_level and _Watchdog_Sync_count will go away.

Author: Trac Migrate 2016-01-05T10:41:38.000Z

Original author: silvah15

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

There is no problem in pre 4.11 versions, since interrupts are nested. Version 4.11 and later use a different watchdog handler implementation.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/1728
Merges	0

Original author: m.presulli

This patch is based on a “clean” RTEMS 4.9.4 and offers some modifications/enhancements for the BSP.

- Generic Exception Handler can be used instead of _uhoh
- Flash Driver for the onboard flash including flash security
- DMA initializations can be used to substitute the whole termios, so we saved

alot of code/memory size

- Bugfixes in fec for the lwip-port, the fec driver works now “optimized” with the lwip-port
- RTC driver routines which configures the RTC clock and time
- generic software trap handler capable of return values
- Bugfix in “old” bsp with MASKALL_BIT when use RTEMS without console
- bugfixes and extensions in bsp header file “mcf5225x.h”
- generic dbg_printk() which prints debug outputs directly via a dma channel

I hope someone have the time to merge it into the CVS head, it shouldn’t be a real task i think.

It is possible to include files within the SECTIONS scope in linker command files. We can use this to reduce the amount of copy & paste inside the linker command files. Example:

.rodata : { *(.rodata .rodata.* .gnu.linkonce.r.*) INCLUDE linkcmds_score_rodata }

We can use this also for the “Special FreeBSD sysctl sections”.

IMO, libcpu/shared is not helpful

Either something is * cpu-specific, then it should go into cpukit/score/cpu, * general, then in should go into cpukit/ * bsp-dependent, then it should go into libbsp.

I would strongly suggest to reconsider libcpu/shared.

This directory contains only support code for the cache manager. I don’t know a better place for these files. They cannot go into cpukit, since the cache manager is potentially BSP-dependent.

Commit	f61086a40492deabec039c4168d3c3cd87322e5f

Summary

Revert “bsps/stm32h7: Workaround STM32 H7 errata by enforcing aligned access only”

This reverts commit d81bf04501cb83de4586f431ae91123e4965d86a.

The commit is reverted as this is only partial solution and remaining part to fix properly is extremely hard and usually done in completely diffetrent way. Hence let’s not enforce compiler but rather enforce RTEMS/H7 users.

Closes #5110

Commit	b5767d2c60be32b6f21d457388d4ccfa8f18c2cc

Summary

jffs2: Add checks for long file name

Add filename length checks to prevent the creation of files and folders that cannot be listed, unlinked or renamed by subsequent calls. These changes are sufficient to make the jffs2fsrenamelongname and jffs2nandfsrenamelongname testcases pass.

Should also `pathconf` be fixed or is it fine like that? `pathconf` yields wrong information for all the filesystems

Updates #5073

Author: Joel Sherrill 2024-08-23T20:28:14.060Z

I don't think "appart" is a word. Rework the sentence please.

Author: Loris Nardo 2024-08-23T20:28:14.060Z

Ops.. should have been "apparent", but that line is being removed from the file because with the changes the test does not fail anymore

Author: Joel Sherrill 2024-08-23T17:35:10.988Z

Code changes look ok. Just need to fix the tst.yml file.

Commit	3b053f69191f10dbe75bfcab3096ec8d8d83b297

Summary

bsps/shared: Add Abracom EOZ9 RTC driver

The EOZ9 RTC has a similar register interface like the MCP7940M (and quite some other I2C RTCs). This commit:

- Extracts the generic parts from MCP7940M and moves it into a generic

i2c-rtc driver. * Uses the new i2c-rtc for the MCP7940M. * Uses the new i2c-rtc for the new Abracom EOZ9.

Commit	bcd4b83e1666f1160514546ebf4e474938f424b7

Summary

When the user name input interface is activated, if the user only presses the Enter key and the entered user name is empty, then this input will be ignored.

Author: Sebastian Huber 2024-10-15T05:57:38.893Z

What is the benefit of ignoring the input?

Author: shuhua hua 2024-10-15T05:57:38.893Z

Just as when we use other systems such as the Linux system, user account information is typically stored in the /etc/passwd file, with each account having a line of records that include the username, password (stored in an encrypted form), user ID, group ID, and other information. Records with a blank username are not permitted because this would cause the system to be unable to correctly identify and manage

the user. If a user does not wish to use a username, they can set the login_check parameter to NULL in rtems_shell_init when logging into the shell. Currently, during system startup, when prompting the user to enter a username, some additional printouts may be appended after the username prompt. Users usually press the Enter key, which then leads to a password prompt, and pressing Enter again will lead to a prompt to re-enter the username. By incorporating a check to see if the user's input for the username is empty, the system can directly prompt the user to enter a username, thus avoiding the aforementioned operations.

Author: Sebastian Huber 2024-10-15T05:57:38.893Z

Ok, makes sense. We have tests for this function in `testsuites/libtests/shell01/init.c`. Please add a test case to your patch and squash the commits. Please also fix the formatting to be in line with the surrounding code.

Author: shuhua hua 2024-10-15T05:57:38.893Z

Sure, I'll pay attention to my code style. I reviewed the testsuites/libtests/shell01/init.c test case you mentioned, and I think there might have been a misunderstanding. My submission concerns an issue I encountered while using the shell: when it prompts me for a username, other programs subsequently print some logs. At that point, I press Enter intending to clear these logs and expecting the username prompt to reappear. However, the system unexpectedly jumps to requesting a password, which prompted me to submit that pull request.

Regarding init.c that you just mentioned, I attempted to add two test cases within it:

1.When rtems_shell_login_check("", NULL) is tested, the return value of false is understandable.

2.However, when I test rtems_shell_login_check(NULL, NULL), the return value is true. Is this return value expected behavior?

Author: Sebastian Huber 2024-10-15T05:57:38.893Z

With respect to 2), this is a feature of getpw_r().

Author: Chris Johns 2024-10-15T05:57:38.893Z

@huangshuhua your experience is what I see on a FreeBSD console. If I hit enter on a screen full of log message the login prompt is quickly returned. I think having the same behavior is a good idea.

Author: shuhua hua 2024-10-15T05:57:38.893Z

Yes, I encountered this issue while working in the shell, which is why I submitted this modification request. I have just revised the code style to align it with the

surrounding conventions, ensuring consistency. Thank you for your feedback, and I appreciate your consideration of my contribution

Author: Sebastian Huber 2024-10-15T05:57:38.893Z

Could you please squash your commits so that we have a single consistent commit which ends up in the repository.

Author: Amar Takhar 2024-10-15T05:57:38.893Z

I have done this for the submitter.

Commit	29a0d99bfd8dcd896884a6cfe01cf8f82de5a8d5

Summary

cpukit/libmisc/shell:fix command df overflow

- change type unsigned to uint64_t, it might overflowed if

the size is greater the 4GB. * increase buffer size is to eliminate the compiler's warning that the buffer might be too small

Author: Christian Mauderer 2024-09-13T08:52:02.435Z

Why is it necessary to increase the buffer size? If you use the biggest number (2 ^ 64 = 18446744073709551616) The `rtems_shell_df_humanize_size` should make a `16777216T` out of that if I calculated that correctly. So it shouldn't be necessary to increase the size. Or did I miss something?

By the way: Would it be a good idea to add a 'P' and maybe a 'E' to the `suffixes`? With that, the number would get better readable for huge sizes in the peta or exabyte range.

Author: xiaojun zheng 2024-09-13T08:52:02.435Z

I think gcc considers `block_size` to be a 64-bit number, and be written to a buffer, the buffer size is less than the biggest length, so gcc throw out a warnning. Since the maximum number after the conversion is less than `16777216T`, I think `block_size` can be force to uint32_t when write to buffer, and increase buffer size is not necessary.

Author: Christian Mauderer 2024-09-13T08:52:02.435Z

OK. If it avoids a warning, that's fine. I don't think that the 3*4 additional bytes will be a problem in any application. I more or less just wondered why you selected 20 and therefore started to think about it. For the 2 ^ 64, 22 chars would have been necessary (20 for the number, one suffix and one `\0`. But I'm fine with your explanation.

Commit	1f52965f98047f4a6772e38a97512a041711aba2

Summary

dev/serial: Fix uninitialized variable warnings

Use the reset values to get rid of uninitialized variable warnings.

Author: Sebastian Huber 2024-09-19T02:18:15.890Z

assigned to @sebhub

Author: Chris Johns 2024-09-19T02:26:13.892Z

Just a note for the MR.

The reset values are set by the FSBL using the `ps7_init` settings from Vivado so resets values can be confusing with the Zynq platform.

Commit	48618b1060c75c9d81a2769ef61c59e3810a918e

Summary

ntptime: Use time_t for tv_sec related variables

The struct timespec tv_sec member is of type time_t. Make sure that all variables related to this member are of the type time_t. This is important for targets where long is a 32-bit type and time_t a 64-bit type.

Commit	e91c136f67f49f79e3b816708069f510b97b7434

Summary

libmisc/stackchk: fix Doxygen file comment

revert back to the original RTEMS Doxygen guidelines by adding @file and @ingroup

Author: Joel Sherrill 2024-09-13T00:06:04.922Z

First, if this stays, it should be an @note.

More importantly, the extension installed does not change based on the direction the stack grows. There are some macros and one function that have different definitions based on direction.

You can change this to say it uses conditional compilation to account for stack direction but does not use different extensions.

Commit	7cda579524d35e6566a1137164596f71ad44100d

Summary

minimum sample is not expected to run, or to produce testable output.

verified this works on erc32/sis.

Author: Sebastian Huber 2024-09-24T23:13:30.409Z

The test produces no output, however, it is still important to run. Even in this minimum configuration you should properly ends up in the system termination process and not for example end up in an infinite loop somewhere.

Author: Sebastian Huber 2024-10-15T22:11:19.010Z

Not running this test produces a gap in the test coverage. It was the only test with potentially no dependency to the test output device.

Author: Gedare Bloom 2024-10-15T22:12:01.985Z

I happened to come across this comment. It's pretty easy to miss activity on a closed MR. You can open an Issue if you think we need this capability, but, we have no effective way to test it automatically so such test case seems unhelpful in CI/automation. I submitted this because `minimum` has no way to be tested for pass/fail. If you want this as an Issue, I think it should be possible to "Create a new Issue" here and then convert this thread to an Issue. I just have no clue how to resolve such an Issue with the tools we have.

3.9.2.20 229 - bsp/aarch64:Fix _CPU_SMP_Get_current_processor()

Commit	5e5214b786e327fa0639b45c181638ac174f1f97

Summary

bsp/aarch64:Fix _CPU_SMP_Get_current_processor()

Fix _CPU_SMP_Get_current_processor(), since read from register MPIDR_EL1 (the least significant byte) is not always right,for example the least significant byte of MPIDR_EL1 is always zero for cortex-a55. aarch64 has a thread ID register TPIDR_EL1 available for for OS management purposes. RTEMS stores per-CPU control in TPIDR_EL1 when the core startup, so we can use _Per_CPU_Get_index() to get current processor index.

update #5064

Author: Sebastian Huber 2024-09-19T17:23:04.279Z

`_CPU_SMP_Get_current_processor( void )`

Commit	ce1fb41a6c33e5708b477e8b34c0aa49d6fc79ec

Summary

kvprintf(): Fix '+' conversion handling

For example, printf("%+i", 1) prints "+1". However, kvprintf() did print just "1" for this example. According to PRINTF(3):

A sign must always be placed before a number produced by a signed conversion.

For "%+r" radix conversions, keep the "+" handling as it is, since this is a non-standard conversion. For "%+p" pointer conversions, continue to ignore the sign modifier to be in line with libc.

This change allows to support the ' conversion modifier in the future.

This appears to have caused a constant failure on AArch64 hardware (ZynqMP) while still passing on the QEMU BSP:

```
P:2:0:UI1:test-time.c:152
FAILED:80:*ctx->c == c
```

The failing comparison generates a string representation `1.099999992` instead of the expected `1.100000000`.

Author: Sebastian Huber 2025-03-11T02:08:17.867Z

Thanks for the report. It looks like we still have rounding issues. I will have a look at it at some point in time.

Summary

Properly serialize explicit thread priority changes (for example rtems_task_set_priority()) and thread priority changes carried out by thread queues (locking protocols such as priority inheritance).

I think remove this `#define` and replace all further uses of it with `if defined(RTEMS_SMP)`. May be there will be other reasons to have these scheduler change inhibitor set.

Author: Gedare Bloom 2024-11-27T03:09:32.833Z

Nevermind, I'm OK with this how it is for now. If we need to change when it gets defined in the future we can.

Commit	106d00537e3d135f77ac8b3b8f0ada535a5b1f6a

Summary

posix/lio_listio: corrected addition of system event

Previously the system event used by lio_listio was manually added to event.h and not using rtems-central. This patch corrects that and renames the event to make it clearer.

Some related dead code has also been removed.

Author: Pavel Pisa 2024-11-22T00:17:01.265Z

I have applied your changes and tried to call `dlopen` on BeaglV-Fire from my test application

https://github.com/ppisa/rtems-devel/tree/master/rtems-omk-template/appdl

which calls `shell_dlopen` and tries to load simple ELF file

build from https://github.com/ppisa/rtems-devel/blob/master/rtems-omk-template/appdl/examples/appdl_print.c

And the result is exception

```
SHLL [/] # dlopen bin/appdl_print-riscv64.o

I do not have JTAG cable with special connector yet. So I have trued to decode problem from the reported mepc. GDB decodes location as

```
0x10000271a8 <rtems_rtl_elf_relocate_rela+270>:      lw      a4,0(s0)
```

If I try to decode to line `l * 0x10000271a8`

then it points to the function `rtems_rtl_elf_relocate_rela`

```
0x10000271a8 is in rtems_rtl_elf_relocate_rela (../../../../../git/
↪rtems/cpukit/libdl/rtl-mdreloc-riscv.c:128).
```

But if I try next location then it points to

```
0x10000271aa is in rtems_rtl_elf_relocate_rela (../../../../../git/
↪rtems/cpukit/libdl/rtl-mdreloc-riscv.c:364).
```

```
359       case R_TYPE(CALL): {
360         int64_t hi = SignExtend64(pcrel_val + 0x800, bits);
361         write32le(where, (read32le(where) & 0xFFF) | (hi &
↪0xFFFFF000));
362         int64_t hi20 = SignExtend64(pcrel_val + 0x800, bits);
363         int64_t lo = pcrel_val - (hi20 << 12);
364         write32le(((char *) where) + 4, (read32le(((char *) where)
↪+ 4) & 0xFFFFF) | ((lo & 0xFFF) << 20));
```

(continues on next page)

(continued from previous page)

```
365       }
366       break;
```

I have found way how to convert RTEMS generate ELF to HSS payload relatively easily by direct call of `hss-payload-generator`.

I use `rtems-config.yaml`:

```
set-name: 'PolarFire-SoC-HSS::RTEMSImage'
hart-entry-points: {u54_1: '0x1000000000', u54_2: '0x1000000000', u54_
↪3: '0x1000000000', u54_4: '0x1000000000'}
payloads:
rtems-app.elf: {exec-addr: '0x1000000000', owner-hart: u54_1, secondary-
↪hart: u54_2, secondary-hart: u54_3, secondary-hart: u54_4, priv-mode:␣
↪prv_m, skip-opensbi: true, payload-name: "rtems-app"}
```

and then run in terminal

```
hss-payload-generator -c rtems-config.yaml rtems-payload.bin
```

Author: Chris Johns 2024-11-22T00:17:01.265Z

Are you able to run the `libtest/dl??` and what passes?

Author: Pavel Pisa 2024-11-22T00:17:01.265Z

Hello Chris,

I have tested dl01 and it fails as well.

I have added some debug

```
diff --git a/cpukit/libdl/rtl-mdreloc-riscv.c b/cpukit/libdl/rtl-

}
```

The *where is disabled for now, because I have fear, that it causes problems.

It is suspicious that sect->base is zero. It should be zero for debugging sections etc. but I expect that such relocs should be skipped. May it be that they are. I can try to dig deeper tomorrow. I would expect that actual area allocated for the ELF image starts at 0x100004bde0 and that these relocs are form .text section.

Author: Pavel Pisa 2024-11-22T00:17:01.265Z

It is suspicious that the failure follows info ending to `0x....0013` so it seems that the relocation for case 0x13 .. 19 .. R_RISCV_CALL_PLT is broken.

Author: Pavel Pisa 2024-11-22T00:17:01.265Z

When I decode `mcause` it reports 4 Load address misaligned and when I analyze the initial case then it is `lw a4,0(s0)` where `s0` is `0x00000010001b97e6`. So this matches. It seems that misaligned accesses are disabled on CPU level. But GCC and ISA expects that they are enabled. So RTEMS startup code should enable them. I try to find how they are enabled and supported on PolarFire.

Author: Pavel Pisa 2024-11-22T00:17:01.265Z

From

PolarFire SoC MSS Technical Reference Manual

3.1.2.5 Data Cache (Ask a Question)

The U54 dCache has an 8-way set-associative 32 KB write-back, VIPT data cache memory with a line size of 64 bytes. Access latency is two clock cycles for words and double-words, and three clock cycles for smaller quantities. Misaligned accesses are not supported in hardware and result in a trap. dCache is kept coherent with a directory-based cache coherence manager, which resides in the L2 cache.

So it seems that misaligned accesses are not supported in hardware and has to be emulate by software.

So it seems that for RISC-V ABI compliance (misaligned accesses are allowed in software), there is mandatory to install emulation handler when RTEMS is running in M-mode and no SBI is present. The HSS integrates OpenSBI for this purpose and relevant code is available at

https://github.com/polarfire-soc/hart-software-services/blob/master/thirdparty/opensbi/lib/sbi/sbi_misaligned_ldst.c

https://github.com/polarfire-soc/hart-software-services/blob/master/thirdparty/opensbi/lib/sbi/sbi_trap.c#L294

Summary

bsps/aarch64/zynqmp: Factor out the CFC-400X management console

This moves the management console implementation into its own file so that BSPs which do not need it do not carry the code around with them.

Closes #5120

Summary

confdefs: do not CONFIGURE_FILESYSTEM_NFS in ALL

Fixes #5118.

I tested with a normal build, but I did not test with a build of any NFS applications. Requires a change in the release notes to warn users that they need to explicitly use `CONFIGURE_FILESYSTEM_NFS` if they want it.

What did you want this for?

Author: Gedare Bloom 2024-11-17T00:27:03.365Z

weird, I changed it to 6.1 in the dialog box. Guess it didn't take. Happened also with my related https://gitlab.rtems.org/rtems/rtos/rtems-release/-/merge_requests/17. I don't know why.

Commit	7d1a9348843b07169895d4c57b1f0f167bf2cb6c

Summary

bsps/shared/flash: Add a JFFS2 flashdev driver

This adds generic JFFS2 interworking code that allows JFFS2 to be used on top of any flashdev backend. It currently only supports NOR flashdev backends.

Closes #5157

Author: Kinsey Moore 2024-11-19T01:41:33.558Z

I tested this on a Microzed. Ok I have built and run the MR branch and it works. I was able to mount a JFFS2 FS open, edit and create files through power cycles. We should add some tests to the testsuite for this in future. I've opened a issue for that here 5158.

resolved all threads

Author: Chris Johns 2024-11-21T03:50:05.230Z

Please mark this as draft. It is not suitable for 6.

Author: Chris Johns 2024-11-21T03:50:05.230Z

Disregard my request, it is only Python 2 support which is no long enabled as `waf` is now only `python3`.

Author: Sebastian Huber 2024-11-21T03:45:36.165Z

On Windows I only used a standard Python from python.org and x86_64-w64-mingw32 tools. No MSYS2 or Cygwin.

Author: Chris Johns 2024-11-21T03:45:36.165Z

Where did YAML come from?

Author: Sebastian Huber 2024-11-21T03:45:36.165Z

I didn't remove the YAML module for Python 3.

Author: Gedare Bloom 2024-11-21T03:45:36.165Z

I tested on MSYS2 with sparc/erc32 build successful.

Author: Chris Johns 2024-11-21T03:45:36.165Z

Oh I see I am sorry. I assumed they are the same thing.

Does this mean these sources are not being used with `waf` on `python3`

Author: Sebastian Huber 2024-11-21T03:45:36.165Z

With this change set, RTEMS builds directly in a PowerShell.

Author: Sebastian Huber 2024-11-21T03:45:36.165Z

The included Python 3 yaml module is in `yaml/lib3/yaml`.

Author: Chris Johns 2024-11-21T03:45:44.607Z

Commit	ae7a21c5e9a34589457dd81c29259c8b5ba90568

Summary

build: Report normal Git hash

Commit 3d782180eae14d8d9666ff8f9584b6fba7772804 changed the reported Git hash to short. Change this back to the normal Git hash. Existing support code may rely on this. The short hash is generated based on the current repository state. The reported hash should be useful also for future states of the repository. If Git changes the hash algorithm in the future, then the hash length may be used as an indicator for the hash algorithm. With a variable hash length this is more difficult.

Update #5037.

Compare with previous version

Author: Chris Johns 2024-11-18T04:58:49.750Z

Yes the change was to short I prefer short. If there is an issue with short hashes I suggest you refer this to the git project for comment. I also see not point in guessing on possible changes to the hash used by git.

Author: Sebastian Huber 2024-11-18T04:58:49.750Z

We had the long version for quite a while. In the commit message, there are three issues with the short version:

1. Existing support code may rely on this.
2. The short hash is generated based on the current repository state. The reported hash should be useful also for future states of the repository
3. If Git changes the hash algorithm in the future, then the hash length may be used as an indicator for the hash algorithm. With a variable hash length this is more difficult.

For the Git hash change, see https://git-scm.com/docs/hash-function-transition.

Author: Chris Johns 2024-11-18T04:58:49.750Z

This MR was discussed in the last weekly meeting and @sebhub said only a full hash defines the commit and if a short hash is captured you can only assume it matches the full hash. You can never recover the full hash. This is not an issue when using releases however if you are using a workflow based around placing code from git into production then the full hash is important.

@gedare is it OK to change this MR to %"6.1" ?

Author: Amar Takhar 2024-11-18T04:58:49.750Z

We could just keep what we have short and also store the full hash as much as cutting it makes sense if the argument is the git hash could change in the future then what's "short" could change, too. So I would store both a pre-shortened version that we use and also store the full hash for others to use in production.

Author: Chris Johns 2024-11-18T04:58:49.750Z

How do you maintain the API we have?

Author: Amar Takhar 2024-11-18T04:58:49.750Z

Well, isn't the issue that we're not making the long hash available for use? Historically it's been the short one hasn't it? So adding a long one how does that change any API if we're just adding data to the VERSION file and what we make available?

Author: Chris Johns 2024-11-18T04:58:49.750Z

It was changed from long to short when I updated the version details thinking it would not ok. See this MR's description. I do not want to add or change the API so I think this change to revert back to the long is fine

Author: Amar Takhar 2024-11-18T04:58:49.750Z

Okay, well do what you feel is right I was suggesting to just leave your change in and add another field with the long version. As long as we don't have super long hashes evrywhere where you're always trying to cut and paste the first random amount of characters. I find that really annoying in other projects when they use a long verison people copy anywhere from 6-12 characters for the version string.

Author: Chris Johns 2024-11-18T04:58:49.750Z

Yes I agree with your view that long hashes are annoying and why I changed it. It is too late to change our API for the 6 release but it may evolve in the future.

Author: Amar Takhar 2024-11-18T04:58:49.750Z

When you say "Change our API" I don't know that I would call adding an extra line to the VERSION file and making it available a huge change. Nothing will be using it but it will be available for anyone to use.

If we make the default long that means anywhere we refer to the hash will have to cut it down and we'll have to be constant. We need to set what the default is and use that everywhere. I won't even use the long one in CI either it's just too annoying and it's not needed if the hash changes in the future then it changes lots of things change all the time.

Author: Chris Johns 2024-11-18T04:58:49.750Z

The version string is embedded into lot of things and that is driven off the API that captures the revision. The MR is a change for this release only. We can revisit the change on the `main` branch.

Author: Amar Takhar 2024-11-18T04:58:49.750Z

Okay then up to you as long as this doesn't break for CI in having to handle version strings differently between this release and 7.1

Author: Chris Johns 2024-11-18T04:58:49.750Z

I cannot answer that as I do not know what CI requires. Do you think the long hash is a problem for CI?

Author: Amar Takhar 2024-11-18T04:58:49.750Z

I think it being different is yes we don't have any official releases with the long hash do we? 5.x won't be under CI but I suspect 6.x will be around for a while.

Author: Gedare Bloom 2024-11-18T04:58:49.750Z

Yes, we should set this to 6.1 milestone to reduce the API breakage.

Sebastian's argument that only the full hash exactly identifies the commit is valid. The short commit is a convenience only, and its length depends on the git repo being used to ensure uniqueness (no collisions), see https://git-scm.com/docs/git-show#Documentation/git-show.txt—abbrev-commit

The short hash length can change if a collision occurs in the future within the current short hash length, which makes the short hash length unreliable.

We can certainly revisit the discussion during 7.1, but given the unreliability of the short hash length, I don't see that we can use abbreviated commit hashes.

Author: Amar Takhar 2024-11-18T04:58:49.750Z

I don't see how are arguments differ? I'm saying to have both stored and to set what we use as the 'short' version by default so we don't get a whole mix them everywhere developres will use anywhere from 8-12 characters.

Right now we are only storing the short version I'm saying to add both one for display and one for using where it matters.

Author: Gedare Bloom 2024-11-18T04:58:49.750Z

I linked the wrong place: https://git-scm.com/docs/git-config#Documentation/git-config.txt-coreabbrev

The command already gives different length short commits in our various repositories, because the appropriate size is inferred by the size of the repo. I get back 11 characters for rtems.git. So for sure an explicit size needs to be set. But any size we set eventually has to be increased to avoid conflicts.

I don't understand what you mean by "have both stored" because this change is about the release label, which is a string used to identify a release. There's no difference between what you display and what you use.

The change here is about what goes in the release label. The release label requires uniqueness and the ability to invert it to get back to the point where the release was made.

We can resolve this thread with an Issue against milestone 7.1.

Commit	e5854b2a6915dbc0f6905656ae4b577250973c87

Summary

LEON3: Update power-down function

This updates the implementation of the LEON3 processor power-down function.

It now contains the workaround for the GR712RC power-down errata described in GR712RC-UM, version 2.16, section 1.7.8. The workaround is compatible with other LEON3/LEON4 components.

Update #4875.

Commit	133b335bae86bcbc9ef02eaea8caeeb624320751

This change add shell read and write handler support to allow indirect access to a device using the FDT shell. A user can provide handlers that can map to a bus not directly connected to the bus of the CPU.

Note, this change only adds 2 calls and does not change any other interfaces. The code is only effects a shell command that is used for testing and debugging. I would like to see this change on 6.1.

Summary

timespec.h, etc.: Eliminate use of 32-bit for time_t

This code had a uint32_t local variable for seconds from a timespec. This was assigning a time_t to a uint32_t and ultimately returning it. This propgated to rtems_timespec_add_to().

Coverity CID 1512527

Commit	b3be636863f494c02b30320e24337d18f6d99ad1

Summary

This patch set adds full duplex support and IRQ support for SPI with BSP configuration to disable interrupt support.

Author: Kinsey Moore 2024-09-06T20:18:59.031Z

The return values in this driver make no sense to me. The documentation says:

```
/**
* @brief SPI bus control.
*/
struct spi_bus {
/**
* @brief Transfers SPI messages.
*
* @param[in] bus The bus control.
* @param[in] msgs The messages to transfer.
* @param[in] msg_count The count of messages to transfer.  It must be
* positive.
*
* @retval 0 Successful operation.
* @retval negative Negative error number in case of an error.
*/
int (*transfer)(spi_bus *bus, const spi_ioc_transfer *msgs, uint32_t␣
↪msg_count);
```

Using events is a bad approach since this may collide with application events. At least use a system event. You can also use a self-contained condition variable or a binary semaphore.

Summary

libmisc/shell: Only restore terminal settings on exit when captured

Signed-off-by: yang.zhang <zhangyang01@kylinos.cn>

Author: Chris Johns 2024-11-12T01:55:35.759Z

Please fix the commit message to be `libmisc/shell: Only restore terminal settings on exit when captured`.

We have a de-facto standard of adding the area of RTEMS the change relates to. It makes reviewing the git history easier.

Thanks

changed the description

Author: yang zhang 2024-11-12T03:18:44.290Z

I'm trying porting ssh. Currently ssh work on no-pty mode, shell's stdin/stdout/stderr is redirected on socket pair, it does not support tcgetattr and tcsetattr.

When exiting ssh session shell, if tcgetattr failed, i think it is not neccessary to call tcsetattr again to avoid some unnecessary logs. "PTY allocation request failed on channel 0

logs: RTEMS Shell on no console. Use 'help' to list commands. exit hell: cannot reset terminal attributes (no console)"

Author: Chris Johns 2024-11-12T03:18:44.290Z

Nice. Is this the full `ssh`? I almost had tinyssh ported. I could dig out the changes if you are interested?

I am fine with the change. You just need to edit the commit message.

Author: yang zhang 2024-11-12T03:18:44.290Z

Yeah, it is full ssh. But the work just begin, i have lots of prombems todo. You say you almost had tinyssh ported, could you share it, thanks.

Author: Chris Johns 2024-11-12T03:18:44.290Z

Yes. I can share it. I will need to dig it out.

Author: Chris Johns 2024-11-12T02:23:27.166Z

Thanks for updating the MR title however the MR title is not the first line of the commit message which also needs to be changed.

resolved all threads

Author: Sebastian Huber 2024-11-13T01:36:29.942Z

The assignment should move out of the `if`.

Author: Sebastian Huber 2024-11-13T01:36:29.942Z

According to the man page, `tcgetattr()` and `tcsetattr()` return `0` on success. So, the check should be changed accordingly.

Author: yang zhang 2024-11-12T06:31:55.352Z

changed this line in version 2 of the diff

Author: Sebastian Huber 2024-11-13T01:36:33.569Z

Given the various paths in this function, this variable should have a default value.

Author: Chris Johns 2024-11-13T01:36:33.569Z

And called `have_previous_term` so it tracks the state of the `previous_term` data.

Author: yang zhang 2024-11-13T01:36:33.569Z

yeah, i already found the issue, tc_result should be intialized by -1, i'm doing this, but not sure amend a commit, or generate a new MR, i'm learning the rules.

Author: Chris Johns 2024-11-13T01:36:33.569Z

Great you asked so we can help.

To amend the commit message use git and the `git commit --amend` options. This will let you edit the commit. Once done push the commit like you did but add the `--force` option. For example `git push --force origin this-branch` where you use your actual branch.

Author: yang zhang 2024-11-13T01:36:33.569Z

Thank you very much for your prompt and detailed response. I will try.

Author: yang zhang 2024-11-12T06:31:57.009Z

changed title from **{-libmisc/shell: -}Only restore terminal settings on exit when captured** to **Only restore terminal settings on exit when captured**

Author: Gedare Bloom 2024-11-13T01:36:38.290Z

I would just change this to:

`else if (have_previous_term == 0) {`

Author: yang zhang 2024-11-13T01:22:33.178Z

changed this line in version 3 of the diff

Author: Gedare Bloom 2024-11-13T01:36:42.118Z

The wording is strange, because of using 0 for checking for truth. It might be more readable to use:

```
int have_previous_term = 0;
...
have_previous_term = (tcgetattr(...) == 0);
if (have_previous_term) ...
```

Author: Sebastian Huber 2024-11-13T01:36:42.118Z

Maybe `bool have_previous_term = false;`.

Author: yang zhang 2024-11-13T01:22:34.106Z

changed this line in version 3 of the diff

Author: yang zhang 2024-11-13T01:36:42.118Z

Thank you for your suggestionsi have made further revisions, please review. Thanks.

Sorry for being pedantic, but what did you actually `Signed-off-by` with your commit message?

Author: Amar Takhar 2024-11-15T00:35:00.497Z

This is pretty common for DCO - Developers Certificate of Origin. https://developercertificate.org/

Please read the contents within to see what it means.

We will be using this in the future for everyone happy to see it here.

Author: Sebastian Huber 2024-11-15T00:35:00.497Z

I know what this is, but within the RTEMS Project this is meaningless right now. It should be documented in the contributing guidelines, if we want to use it:

https://docs.rtems.org/docs/main/user/support/contrib.html

Author: Chris Johns 2024-11-15T00:35:00.497Z

Is it a reason to block this MR at this point in time?

Author: Sebastian Huber 2024-11-15T00:35:00.497Z

No, this was more a note to the project.

Author: Amar Takhar 2024-11-15T00:35:00.497Z

Sure but it's not like it hasn't happened before from RTEMS:

```
# git log|grep -i signed-off-by|wc -l
381
```

Commit	d386baedb548c903b08105423e10d9cc05cee59b

Summary

rtems: Remove <rtems/rtemsdialer.h>

This header file belongs to the network stacks.

Author: Sebastian Huber 2024-11-11T01:16:38.675Z

assigned to @sebhub

Author: Gedare Bloom 2024-11-13T23:21:55.265Z

Is there a related MR to add the header file to the network stacks?

Author: Sebastian Huber 2024-11-13T23:21:55.265Z

It was already in libbsd. I noticed a double installation. I added a MR for the legacy network stack https://gitlab.rtems.org/rtems/pkg/rtems-net-legacy/-/merge_requests/5.

Author: Gedare Bloom 2024-11-13T23:21:55.265Z

Ok. I think the general direction we'd like to go with these is to move them into `rtems-net-services` but how we do that is still not that clear to me.

Commit	5ed0bf34570125efe85a516ddb92429824f4dc1d

Summary

spfatal34/spfatal36: Avoid RTEMS_UNREACHABLE()

The RTEMS_UNREACHABLE() is a hint to the compiler that this code location is unreachable. The compiler may use this information to optimize the code. If a test case fails and we reach this code location, then unpredictable things may happen making the test case debugging more difficult than necessary.

Commit	30fc123f8d65310772a07926acb7b0413e28b624

Summary

The event record handling had some reliability issues especially on SMP systems. This is fixed by a new approach to fetch the event records. See also: https://gitlab.rtems.org/rtems/tools/rtems-tools/-/merge_requests/36

I will try to take a pass through the code changes soon, but I wanted to give my first impression is that this is a big API-level change to be trying to get in before the release of 6.1. It's not clear to me though which of these changes are for external use, or for the internal implementation.

The API changes I noticed: * new function `rtems_record_fetch_recommended_item_count()` * new function `rtems_record_fetch_initialize()` * new function `rtems_record_fetch()` * new structure `rtems_record_fetch_control` * new type (enum) `rtems_record_fetch_status` * structure name change `uptime` to `rtems_record_client_uptime` (this is an improvement to avoid polluting the global namespace) * return type change for `rtems_record_client_init` * increment the `RTEMS_RECORD_THE_VERSION` with associated restructuring of the `rtems_record_event` structure

And the deprecated and obsoleted call: * `rtems_record_drain` * `rtems_record_writev`

It is unusual to directly deprecate and obsolete an API call, but, it seems this function was not documented and was not being used by the external tooling, so I'm willing

to let that slide. It should still be noted and treated as a deprecation, even if it was a "hidden interface" just on the chance someone happened to be using it for something.

Relatedly, it would help as part of this refactoring if you can keep the public API cleanly defined in installed `cpukit/include/record*.h` headers, and hide the implementation details a bit more. This API leaks a lot of implementation details and doesn't offer a great abstraction for creating the client-side tools, as seen in the associated https://gitlab.rtems.org/rtems/tools/rtems-tools/-/merge_requests/36/ which basically duplicates a lot of this MR. It's not clear to me why the header files are being duplicated between rtems.git and rtems-tools.git, instead of having the tool pick up the header from an installed build. This expectation should be documented within the header file.

I would like to see some better separation between what you view as the "stable API" of the `rtems_record_xxx` interface, and what may be a bit more flexible. It is good the tooling is updated also, but if someone created their own tools based on the Record Interface, those would become badly broken. That is unlikely but I'm taking a more careful view about API changes these days.

I can't tell if these changes need updates to the documentation in `user/tracing/eventrecording.rst` also, as I cannot tell what parts of the header files are internal and what parts are for the external/tools use.

Author: Sebastian Huber 2024-11-09T19:48:45.111Z

It is unlikely that a user will notice the API changes. The user can configure the event recording through application configuration options (which didn't change). The user can also generate events with functions not changed by this patch set. Getting the event records to the host is done through the dump functions (which didn't change) or a TCP stream. Since the record format version changed, you need matching tools.

I am sure there are lots of ways to improve how this is organized, however, I have only a limited amount of time which I can dedicate to this work. The patch set fixes some serious reliability issues. It was on my TODO list for a long time. I prioritized the work just for the release.

Author: Gedare Bloom 2024-11-09T19:48:45.111Z

Yes that is fine. We can just make note of these things in the release notes. As stated, it is unlikely anyone else has created their own external tools to process the records, and the rest of the API is the same. I will be fine to resolve this thread with an Issue to address some of these improvements in the future (and with update to the release notes).

marked this merge request as **ready**

Author: Gedare Bloom 2024-11-09T19:43:20.920Z

`size_t` usually should be used for sizes with units in bytes. I think this is just a count and it should be `uintxx_t` for some appropriate amount.

Author: Sebastian Huber 2024-11-09T19:43:20.920Z

The `size_t` should be not only used for things which are in bytes. It should be used for things which are somehow related to object sizes. For example, in `calloc()` the number of elements is also a `size_t` parameter. On a 64-bit system, you could have more than 4G items in principle.

Author: Chris Johns 2024-11-09T19:43:20.920Z

I am using `size_t` for "sizes" as it is simpler within a team to avoid warnings and casts. I also looked at `calloc` and came to the same conclusion.

Author: Gedare Bloom 2024-11-09T19:43:20.920Z

I don't agree with the analogy. `calloc` uses both its parameters to construct a size in bytes, so the types need to be multiplied safely together to create a `size_t`. I can live with it here though.

Author: Sebastian Huber 2024-11-11T01:31:48.843Z

changed this line in version 7 of the diff

Author: Gedare Bloom 2024-11-09T19:43:24.881Z

ditto.

Author: Sebastian Huber 2024-11-03T14:13:39.105Z

changed this line in version 4 of the diff

Author: Gedare Bloom 2024-11-09T19:41:30.353Z

same here with `size_t`. What does "recommended" mean? The name of this function is strange, because at first it seems like it should be fetching items. I think add `get` to the name, like, `rtems_record_get_fetch_recommended_item_count()` or `rtems_record_fetch_get_recommended_item_count()` still a bit strange but less likely to be confusing. At any rate, the documentation should be clear what is meant by recommended item count.

Author: Sebastian Huber 2024-11-09T19:41:30.353Z

I will rename it to `rtems_record_get_item_count_for_fetch()`. What about this comment:

```
/**
* @brief Returns the count of items which allows getting all available␣
↪items
*   for one processor through one call to rtems_record_fetch().
*/
size_t rtems_record_get_item_count_for_fetch( void );
```

Author: Sebastian Huber 2024-11-03T14:13:39.664Z

changed this line in version 4 of the diff

Author: Gedare Bloom 2024-11-09T19:41:30.353Z

that's great, thanks. I'm still not quite satisfied about the `size_t` but that topic is open elsewhere.

Author: Gedare Bloom 2024-11-09T19:41:47.823Z

`items` and `count` are not documented. Again use a different type than `size_t`. You could make the `count` an in,out parameter also?

Author: Sebastian Huber 2024-11-03T14:13:40.072Z

changed this line in version 4 of the diff

Author: Sebastian Huber 2024-11-09T19:41:47.823Z

I changed the fetch function to use only the control parameter.

Author: Gedare Bloom 2024-11-09T19:46:48.726Z

`bintime` would be more clear than `bt`

Author: Sebastian Huber 2024-11-09T19:46:48.726Z

In this isolated spot yes, however, the `_bt` abbreviation is used several times in this code area.

Author: Gedare Bloom 2024-11-09T19:46:48.726Z

at least it should have a comment as in other places. the structure could benefit from doxygen, since it is user-facing

Author: Gedare Bloom 2024-11-09T19:42:26.427Z

This appears to be a constant value. Probably the documentation should indicate how this is determined.

Author: Sebastian Huber 2024-11-09T19:42:26.427Z

The value depends on the application configuration. It is used to get the buffers for the TCP stream.

Author: Sebastian Huber 2024-11-03T14:13:41.026Z

changed this line in version 4 of the diff

Author: Gedare Bloom 2024-11-02T04:30:57.145Z

The code looks mostly quite good. Just a note about fixing the use of `size_t`, it looks like `unsigned int` is used already for the `item_count` in the configuration, so that would be ok or an explicitly sized `uint32_t`.

Author: Sebastian Huber 2024-11-03T11:30:10.184Z

The `unsigned int` is an implementation detail. The `size_t` is the right type for the API level from my point of view.

mentioned in issue #5148

Author: Gedare Bloom 2024-11-11T02:16:56.544Z

I can live with the `size_t`, although I don't agree. The `size_t` has a well-defined origin as the return type of `sizeof`. It doesn't make a lot of sense to use it for something that is not related to object sizes in the units of sizeof. If the `cpu_todo` is multipled by the size of the record to get the number of bytes to transfer, then I would be convinced. But it is not, it is just being used to keep track of how many items are left. Positive counters should just be some kind of unsigned integer type. It's a minor point, but this structure is part of the API between the record event recording and the client, so it should be done properly. In this case, the `size_t` becomes an opaque type for a counter which is awkward but I'm not going to block the MR on this account.

I suggest some doxygen in the recordclient.h, but also won't hold up the change on that account.

We should have release notes for any API Changes even if we think the API is only used by private tooling. The notes I put in this MR can be used directly. I turned that into an open issue for 6.1.

Author: Chris Johns 2024-11-11T02:16:56.544Z

@gedare I suggest you reach out to the Open Group to ask why the object number in `calloc` is `size_t`? It would be interesting to know their view. It could be related to C++'s view of std::size_t:

> `std::size_t` is commonly used for array indexing and loop counting. Programs that use other types, such as unsigned int, for array indexing may fail on, e.g. 64-bit systems when the index exceeds UINT_MAX or if it relies on 32-bit modular arithmetic.
>
> My experience of `int` of `unsigned int` being used as counts or sizes with code from a team of developers is problems soon appear. Signed vs unsigned is not often considered when selecting the size type nor is 32bit vs 64bit and that leads to a web of compiler warnings, sometime complex, often only seen on some compilers when porting code. MSC is good at being trough on this stuff. To deal with this quickly a team starts adding casts around comparisons and loops or calls, eg to `calloc` or C++ containers, to suppress the warnings and as the number of casts grow they become a source of bugs because they could be suppressing valid warnings. In C++ code I work on you need to have a _very_ good reason to have a cast and using `size_t` for size with counts and loop helps.

Author: Sebastian Huber 2024-11-11T02:16:56.544Z

I changed the structure to make it more clear which members are for the user and which are internal.

The `size_t` definition implies that it can be used for array indices. Since the `cpu_todo` is related to an array index, this is the right type. You can't use `uint32_t` for array indices on a 64-bit platform in general. Using `uint64_t` on 32-bit platforms could be a performance issue. These two issues are not present if you use `size_t`.

Author: Gedare Bloom 2024-11-11T02:16:56.544Z

Thanks this makes sense. I guess this guidance has probably changed over time. I'll try to remember this now!

Author: Sebastian Huber 2024-11-12T22:33:28.706Z

I am really sorry, I found another corner case which needed a fix. For the background, I use this tool currently for debugging.

Author: Kinsey Moore 2024-11-12T22:33:28.706Z

Does this mean this needs to be set back to draft until you work it out?

Author: Gedare Bloom 2024-11-12T22:33:28.706Z

He added a patch (“record: Use only related uptime low/high events”) that I Assumed fixed that corner case. It appears to be a low/high timer read sync issue where the High is read during an overflow. He added a simple 1-bit state machine to make sure the High is only read if the Low was also read since the previous read of High.

Author: Sebastian Huber 2024-11-12T22:33:28.706Z

Yes, exactly this is already fixed, but it did reset the approval again.

RTEMS style guide puts the opening brace of a function on its own line. “Put the opening brace of a function definition one line after the closing parenthesis of its prototype.”

Author: Kinsey Moore 2024-11-08T01:24:18.276Z

Any reason not to use “chip select” instead? This should be adjusted elsewhere as well.

changed this line in version 3 of the diff

Author: Kinsey Moore 2024-11-08T01:28:24.131Z

All conditionals need braces as the style guide does not mention their omission. “Put braces on the same line as and one space after the conditional expression ends.”

This needs to be applied elsewhere.

Author: Aaron Nyholm 2024-11-08T01:41:22.295Z

changed this line in version 3 of the diff

Author: Kinsey Moore 2024-11-08T01:32:39.972Z

When performing rx-only, transfer->start never gets reset to 0. Is that intentional?

Author: Aaron Nyholm 2024-11-08T01:32:39.972Z

Yeah intentional. There is always a TX component to each transfer. You have to send the read command and to receive data.

Author: Kinsey Moore 2024-11-08T01:40:20.550Z

I don’t see these two functions used anywhere.

Author: Aaron Nyholm 2024-11-08T01:40:20.550Z

They're used in `zynq-qspi-flash.c`. They're there to allow apps to run some code before and after a flash write in the case of the flash chip having the WriteEnable pin tied to a GPIO pin.

Author: Kinsey Moore 2024-11-08T03:32:17.840Z

Commit	f4875c8f4decce7cd177f5ae2ed77f037bc3f7d3

Summary

build: Fix spec cache

The updated waf version deletes the waf cache directory in the build tree. This removes also the build specification item cache. Move the cache directory so that it works across configure commands.

3.9.2.65 194 - Add BSP for BeagleV-Fire board

Id	194
State	merged
Merged by	Amar Takhar
Merged at	2024-10-25T21:36:11.190Z
Reviewer(s)	Chris Johns, Gedare Bloom

Commit	eaaeebedda43a9e9886078389b3af05d0c267a7a

Add Board Support Package (BSP) for the BeagleV-Fire board, originally developed by Dario (Francescodario Cuzzocrea, bosconovic@gmail.com), with key improvements and testing outcomes. The BSP has undergone renaming from bvf to beaglevfire to enhance clarity and align with standard naming conventions.

Key Changes: * Introduce BeagleV-Fire BSP: Integrate the BeagleV-Fire Board Support Package (BSP), developed by Dario, into the codebase. This BSP includes essential configurations, startup sequences, and hardware-specific implementations for clock management and interrupt handling tailored to the BeagleV-Fire board. * Rename BSP from bvf to beaglevfire: Rename the BSP from `bvf` to `beaglevfire` to improve clarity and consistency across the project. This change ensures that the BSP name accurately reflects the board's identity and adheres to established naming conventions. * Conduct Hardware Validation: Validate the BeagleV-Fire BSP on actual hardware using the Hart Software Services (HSS) method. This testing confirms the BSP's compatibility and reliability with the BeagleV-Fire board. * Execute RTEMS Tests: Test the BSP with RTEMS using selected test cases from the `samples`, `sptests`, and `smptests` suites. While the rtems-test framework is not fully equipped to run the entire testsuite on this BSP, the successfully executed tests confirm that the BSP operates correctly on the BeagleV-Fire hardware.

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

Does it work without Dario's first commit? Or is it required here

Author: Purva Yeshi 2024-10-25T20:50:50.620Z

I'm not sure about the exact impact of Dario's first commit yet. I'll test the BSP without that commit to see if it's required and get back to you with the results.

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

It will work also without that commit, altough I believe that the commit is needed because a potential misaligned access might happen when parsing the fdt. In particular the issue showed up when I built RTEMS 6 for the E51 core of Polarfire SoC, and that's why I had to do that.

Author: Joel Sherrill 2024-10-25T20:50:50.620Z

I think adding a comment above this explaining the same thing as your comment will help the next person who looks at this code.

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

Directly in the code or maybe with a better commit message?

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

@fcuzzocrea So usually if the processor/BSP don't handle unaligned accesses (and there's no M-Mode emulation for it), it will just pass `-mstrict-align` flag. I wonder if you tried that and got the same issue? If it works fine with this flag, I'd drop

this commit and instead add the flag to the BSP build options, instead of changing shared code.

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

Also E51 is a monitor/boot core. This MR is mainly targeting and tested for the `U54-MC` processor that I assume does handle unaligned accesses fine? The question of whether to support E51 (and how) is another issue we could address later (but I assume it's just a matter of changing the CPU_FLAGS to build for RV64IMAC and with the mentioned `mstrict-align`)

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

If I remember correctly I tried with mstrict-align and it didn't work. I would keep the code because we don't know when the misaligned access could happen.

For e51 another mod is needed, see https://github.com/fcuzzocrea/rtems/commit/76ec318b575cb8cf7df9ca80fae0f8b8fb1b3d26

If you believe the community may benefit from this I can open a mr (i don't use HSS at all so this is why I need rtems on e51).

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

@fcuzzocrea Definitely! Supporting E51 would be quite useful for the community as well, and that'll be much appreciated. I wonder if we could combine both U54 and E51 under a unified `beaglevfire` BSP and building for either with an config option?

We would really want to make sure `-mstrict-align` doesn't work, and why. It's rather a compiler issue I'd say.

May I ask how are you booting RTEMS on E51 without HSS? And what are you using RTEMS there for? Do you run other stuff on U54?

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

Actually instead of beaglevfire would be polarfire soc :slight_smile: .

I do not know if it is feasible to switch with a config options with the current build system, because the 2 different configurations requires 2 different device trees.

What would be great instead would be to avoid relying on a prebuilt device tree have the device tree being compiled before the compilation of rtems. This could let us easily add support for different boards using polarfire soc by including a common mpfs.dtsi. I always wanted to do this but never find the time sadly.

I can give another try at mstrict-align after I am back from vacations :slight_smile: .

To boot rtems on E51 on icile kit I use a custom bootloader developed with polarfire soc baremetal library. I store the image on an external spi flash (or I load it directly

in ram with a debugger). On beagle v fire one can think of storing the rtems image on the qspi flash instead.

On U54 I run Linux (one can start if from the rtems image which is loaded on E51 using opensbi). Otherwise it is also possible to run another rtems instance on the U54s (with SMP).

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

@fcuzzocrea While the SoC is PolarFire, we still have different peripherals for BeagleV Fire? I assume you already know there exists `RISCV_ENABLE_MPFS_SUPPORT` option (and DTS) in RTEMS. Do you think that can be (re)used to run on the board?

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/bsps/riscv/riscv/dts/mpfs.dts?ref_type=heads

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

On any Polarfire SoC FPGA based device you can have different controllers on or off, depending on how you configure the FPGA design and if you instantiate soft-IP controllers. I do not fully understand how to (re)use the RISCV_ENABLE_MPFS_SUPPORT for DTS though.

Author: Hesham Almatary 2024-10-25T20:50:50.620Z

The DTS for the existing `mpfs` BSP is exactly the same as the one in this MR, except for the UART; so I wonder 1) if you tried to build and run the existing mpfs BSP on beaglefire board and/or 2) if we can just the MPFS BSP for beaglefire by adding a second UART (uart1)

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

The existing MPFS DTS for mpfs BSP will not work on Beagle V Fire.

That MPFS DTS it is valid only on ICICLE Kit with Microchip reference design loaded on it, which is configured to have 4 UARTs (UART0,1,2,3), with UART0 being reserved for HSS. With this configuration, when you load RTEMS, on UART0 there will be the output of the HSS and on UART1 there is the output of RTEMS.

Beagle V Fire FPGA reference design is configured differently. It is configured to only have one UART (UART0) and HSS is configured to release UART0 after booting the payload, so UART0 can be used by the payload, which can be either RTEMS, Linux, or any other RTOS/OS.

DTS on Polarfire SoC FPGA based devices it is stricly coupled with the FPGA design which is loaded on the SoC itself, and as a consequence must be adapted according

to the hard controllers which are enabled in the Polarfire SoC configurator and to the soft controllers that are eventually added in the FPGA design.

Indeed I believe that in current RTEMS tree the DTS naming is misleading, that should really be mpfs-icicle-kit.dts, because it is valid for ICICLE Kit with reference design only.

What I was proposing in my previous comment was to rework DTS handling in the same way the Linux kernel handles it :

https://github.com/torvalds/linux/tree/master/arch/riscv/boot/dts/microchip

as you can see in here there is a common mpfs.dtsi, which includes the configuration for all the hard controllers which are present on the Polarfire SoC FPGA, defaulting with each controller being disabled.

Then, for each Polarfire SoC FPGA supported device there is a -fabric.dtsi fragment with the configuration for the soft peripherals.

Finally, for each board there is the mpfs-board-name.dts which inherits from the common and the fabric dtsi and enables the hard controllers which are configured on the board.

I believe this is the most common and straightforward way to use devicetree to configure those Microchip Polarfire SoC devices, but it requires some modification to the build system as I said before (we need to compile DTB at RTEMS build time instead of relying on a prebuilt DTB).

Author: Joel Sherrill 2024-10-25T20:50:50.620Z

@fcuzzocrea Your response sounds like the kind of information that needs to end up in the User Guide. It is hard to see the similarities and differences between different implementations of the same SOC/FPGA.

Author: Francescodario Cuzzocrea 2024-10-25T20:50:50.620Z

@joel indeed you are super right! Since Polarfire SoC FPGA is basically an FPGA with an ASIC inside (which is the Microprocessor SubSystem, the MSS) and the ASIC is configured using the Polarfire SoC configurator (which comes as part of Libero SoC), the user must always look at the Libero design to understand how it is configured the SoC and if there is any soft-ip core.

created #5137 to continue this discussion

Author: Joel Sherrill 2024-09-12T22:12:35.847Z

changed title from **Add BSP {-to-} BeagleV-Fire board** to **Add BSP {+for+} BeagleV-Fire board**

Author: Gedare Bloom 2024-10-25T21:23:03.185Z

Reword your commit message `Rename files from 'bvf' to 'beaglevfire'` to include a starting tag, probably `bsps/riscv`.

The `fixup!` commit should get rebased into the preceding commit, e.g.,

`git rebase --autosquash HEAD~3` should do this for you directly

Commit	bc8ffae115e7e7da87af4185c58d2f1d98bf845d

Add devcfg and slcr drivers to the XIlinx Zynq BSP.

The devfg driver loads the PL with a bitfile image. The driver can also support scrubbing.

These drivers are from Patrick Gauvin (pggauvin at gmail.com) and a thread on the devel list: https://lists.rtems.org/pipermail/devel/2017-May/017705.html

Commit	a1c3d4ba8e1d248434b215b817a13f9af4d8e381

Fix handling of the `VERSION` file in a release. The change output with the 6.1-rc4 `VERSION` file is:

```
*** BEGIN OF TEST HELLO WORLD ***
*** TEST VERSION: 6.1.0.rc4
*** TEST STATE: EXPECTED_PASS
*** TEST BUILD: RTEMS_DEBUG RTEMS_POSIX_API
*** TEST TOOLS: 13.3.0 20240521 (RTEMS 6, RSB␣
↪b95871822032635b2ccbee23b97a19e66d2b003e-modified, Newlib 1b3dcfd)
Hello World

*** END OF TEST HELLO WORLD ***

[ RTEMS shutdown ]
RTEMS version: 6.1.0.rc4
RTEMS tools: 13.3.0 20240521 (RTEMS 6, RSB␣

Compare with previous version

Author: Sebastian Huber 2024-10-11T06:23:22.519Z

What is the bug you want to fix? The VERSION file is already supported. Just place a `VERSION` file like this into the top-level directory:

```
[RTEMS_VERSION]
RTEMS_VERSION_CONTROL_KEY = foobar
__RTEMS_MAJOR__ = 6
__RTEMS_MINOR__ = 88
__RTEMS_REVISION__ = 99
```

This gives you:

```
*** BEGIN OF TEST RECORD 2 ***
*** TEST VERSION: 6.88.99.foobar
*** TEST STATE: EXPECTED_PASS
*** TEST BUILD: RTEMS_SMP
*** TEST TOOLS: 13.3.0 20240521 (RTEMS 6, RSB␣
↪46a5bfdc3fc95d503a63f9bee515e73d9198aa71, Newlib 1b3dcfd)
```

The existing solution works without a hand written special case parser.

Author: Chris Johns 2024-10-21T00:41:27.259Z

I have no idea why you decided to change it and break the release process. I have fixed it.

Author: Sebastian Huber 2024-10-21T00:41:27.259Z

We had a long discussion about this on the mailing list. Could you please explain what is broken?

Author: Chris Johns 2024-10-21T00:41:27.259Z

The VERSION file is more complex than just your values. The format has been documented for a while https://gitlab.rtems.org/rtems/tools/rtems-tools/-/blob/main/rtemstoolkit/version.py?ref_type=heads#L32

Why do you care?

Author: Sebastian Huber 2024-10-21T00:41:27.259Z

In the patch review, you said you want to update the release scripts:

https://lists.rtems.org/pipermail/devel/2023-August/076064.html

I still don't understand what is broken. Is the VERSION file in RTEMS used by external consumers?

I care because I use the existing VERSION file approach in our projects.

Author: Chris Johns 2024-10-21T00:41:27.259Z

The ticket has existed for a while so it was always going to be made consistent. I have no intention of changing all the other places.

The release scripts update was for gitlab not this.

Author: Sebastian Huber 2024-10-21T00:41:27.259Z

I immediately replied once the issue was opened. I still don't know what is broken. Why can't RTEMS use whatever VERSION format is suitable? Changing the release script to generate a VERSION file of the expected format is not an issue.

Author: Chris Johns 2024-10-21T00:41:27.259Z

Your version is your version. You comment no one else should care while at the same time you do care so I kind of feel you are answering your questions. The format I made a long time ago should persist. I am sorry this causes you problems but I have done my best to make it standard and maintain that.

Author: Sebastian Huber 2024-10-21T00:41:27.259Z

I think you are a bit unfair here, these changes were reviewed a while ago and now you act as this didn't happen.

Author: Chris Johns 2024-10-21T00:41:27.259Z

I am sorry you think that. I have done nothing more than be consistent with the release format used.

I took the time a long time ago to design the format and make all parts of the eco-system consistent.

Author: Sebastian Huber 2024-10-21T00:41:27.259Z

I have to maintain a bunch of build system patches which you don't like, so changing this stuff causes always extra work for me.

I am fine with the VERSION file format change. But the patch should be split up into more parts. The formatting changes should be in a separate commit. The VERSION format change should be an isolated commit. Adding the VERSION support to the options should be a separate commit. I think the `if key == "git"` related changes don't work.

Author: Chris Johns 2024-10-21T00:41:27.259Z

Thanks for the feedback. I ran yapf and it had changes which surprised me. I will update the MR. The git bit is specific where the format allows any label. I decided to change that in the code.

Author: Sebastian Huber 2024-10-21T00:41:27.259Z

So, you mean that someone uses a VERSION file like

```
[version]
revision = 6.0.git
```

and then gets the Git commit? I would say this is a feature and not a bug.

Author: Chris Johns 2024-10-21T00:41:27.259Z

My comment was wrong and meant to say I decided not to change the VC related bits other than remove the default. I will review it when I can.

Author: Chris Johns 2024-10-21T00:41:40.206Z

The VC key interface can remain for RTEMS 6 and be removed in RTEMS 7. The term key and git repositories is overloaded and can mean a sign in key or a key to sign a repo. The git hash is a type of release label and there are other types of release labels that are no git hashes or related to git or version control systems.

Author: Sebastian Huber 2024-10-21T00:39:26.541Z

Independent of the VERSION format changes, why is this change necessary?

Author: Sebastian Huber 2024-10-21T00:39:26.541Z

Did you test that after a new Git commit, the version header file in the build is updated?

Author: Chris Johns 2024-10-21T00:39:26.541Z

Ah no, thanks. I will take a look when I can.

Author: Sebastian Huber 2024-10-21T00:44:05.326Z

Why do we have to load the VERSION file for the options command?

Author: Chris Johns 2024-10-21T00:44:05.326Z

We have now so many communication channels (in contrast to a simply devel@rtems.org) that I loose track of were things are discussed. Could you please point me to the place were these API changes and additions are discussed.

Author: Chris Johns 2024-10-21T01:09:36.015Z

It is happening here and in the issue.

Author: Sebastian Huber 2024-10-25T06:17:03.661Z

This is the wrong place to document this. Possible locations:

- https://docs.rtems.org/branches/master/eng/release-mgmt.html
- https://docs.rtems.org/branches/master/eng/build-system.html

Author: Chris Johns 2024-10-25T06:17:03.661Z

Yes. I mentioned in the issue I would. I would like this to be here as well.

Author: Sebastian Huber 2024-10-25T06:17:03.661Z

We have too many places were things are documented and things can get out of sync easily. I would prefer to have this stuff only documented in the RTEMS Software Engineering manual.

Author: Sebastian Huber 2024-10-25T06:17:03.661Z

For example, the format of the VERSION file. It would be more helpful to have this documented in the manual and not just in some source file somewhere.

Author: Chris Johns 2024-10-25T06:17:03.661Z

Yes I agree and I have not done that properly so it was on me for it not happening.

Can we merge the doco fragment and I then update the documentation so it is clear. I can then remove this fragment and reference the documentation. I would like see a reference to the documentation once present so someone looking at the code can see where it is defined?

Author: Sebastian Huber 2024-10-25T06:17:03.661Z

I would place a comment in the code which simply references the manual and the section.

Author: Sebastian Huber 2024-10-25T06:17:03.661Z

What is documented here in the comment and what is documented here https://docs.rtems.org/branches/master/eng/release-process.html#release-version-numbering doesn't match (for example the revision number). This chapter is relatively new and already inconsistent.

Author: Chris Johns 2024-10-25T06:17:03.661Z

I added this about 4 years ago before the VC key changes happened and well before `waf`. I am working on this documentation.

Author: Chris Johns 2024-10-25T06:21:23.561Z

changed this line in version 6 of the diff

Author: Sebastian Huber 2024-10-25T06:21:56.660Z

It would be really great if this could be discussed first and then documented in the RTEMS Software Engineering manual. The `rtems_version_control_key()` is already present in the RTEMS 5 release.

Author: Chris Johns 2024-10-25T06:21:56.660Z

Yes and it is also wrong in 5. There are many interfaces that have changed over the years and this is one we need to clean up.

The VC key is not being removed in 6 and I am giving notice it needs to be removed. We should not overlap functionality in interfaces and VC key is to specific and does not fit the needed purpose of the release label.

I am sorry I have not been more accurate about this in the past. I have now had to time to deal with this and I believe this interface will serve us into the future.

Author: Sebastian Huber 2024-10-25T06:21:56.660Z

Is there any difference between `rtems_version_control_key()` and `rtems_version_release_label()` except the name?

Author: Chris Johns 2024-10-25T23:32:19.133Z

Functionally there is none. The git hash or VC key is a **_kind of_** release label and there are other types of release labels. The release process uses the release label to identify an RC release. I had documented this as an **_identifier_** and in this change I am sharpening the definition by moving to the term **_release label_**.

My original view over 4 years ago was this label can used by service providers or users who have extra changes to label a release to aid their deployment and our public support processes.

Only the RTEMS project can make a release with an empty release label.

This needs a release note.

Author: Chris Johns 2024-10-28T04:17:49.066Z

Yes. I will do this once the MR is merged.

Author: Gedare Bloom 2024-10-28T04:17:24.076Z

please use a verb in API function calls, I suggest `rtems_version_get_release_label` – we might not have this documented, but it is preferred.

Author: Chris Johns 2024-10-28T04:17:24.076Z

The call was a 1:1 replacement for the VC key call. I will change the interface to include `get`.

Author: Gedare Bloom 2024-10-26T21:47:26.741Z

Does this mean the function returns `false` for an RTEMS release (using `release_label=""`)?

Author: Chris Johns 2024-10-26T21:47:26.741Z

Yes. Only the RTEMS project can set the release label to `""`. This is a 1:1 replacement for the VC key call.

Author: Gedare Bloom 2024-10-28T04:17:15.989Z

This appears to exclude using `.` in a revision label?

Author: Chris Johns 2024-10-28T04:17:15.989Z

Yes the VC key (`git` hash) was delimited with a `..` I prefer it to be `-` but that would not be compatible with the labeling up to this point in the `^` code. If we are happy to make the change I can do that?

It would make this piece of the documentation simpler:

https://gitlab.rtems.org/rtems/docs/rtems-docs/-/blob/main/eng/release-process.rst?ref_type=heads&plain=1#L116

Author: Chris Johns 2024-10-28T04:16:06.506Z

changed this line in version 7 of the diff

Author: Gedare Bloom 2024-10-26T21:52:55.817Z

i'm not sure what this is for

Author: Chris Johns 2024-10-26T21:52:55.817Z

The `prefix` is version specific so it changes when the major number changes. The code was refactored to parse `VERSION` and set these values when the help is displayed as it was incorrectly printing the defaults before.

Also the prefix as it is does not handle Windows cleanly but that is a separate issue.

Author: Gedare Bloom 2024-10-28T04:16:59.151Z

The “RTEMS_REVISION” is not being set/used. The documentation should be clear on this.

Author: Chris Johns 2024-10-28T04:16:59.151Z

It can be used when someone is deploying a release. It is documented here:

https://gitlab.rtems.org/rtems/docs/rtems-docs/-/blob/main/eng/release-process.rst?ref_type=heads&plain=1#L116

This looks like a bug. I will fix it.

Commit	1b5549ae690e4e4c7f597a7bc8a5fac126b72175

Summary

When running Zynq on Xilinx QEMU (xilinx_zynq_a9_qemu) using the arm-generic-fdt-7series machine model for SMP support, QEMU starts both cores simultaneously causing the second core to enable the MMU before the page tables are configured. It then encounters repeating prefetch aborts. This fixes that by forcing the second core to wait until the first core is ready for it to start. The new code is only present on the QEMU BSP variant.

Author: Kinsey Moore 2024-10-30T18:36:59.078Z

assigned to @opticron

Author: Kinsey Moore 2024-10-30T18:56:25.357Z

For reference/reproduction, the full QEMU command line used is:

```
../xtools/bin/qemu-system-aarch64 -M arm-generic-fdt-7series -m 256M -
↪no-reboot -nographic -serial null -serial mon:stdio -dtb /desktop/
↪zynq-arm.dtb -kernel build/arm/xilinx_zynq_a9_qemu/testsuites/
↪smptests/smp09.exe
```

`../xtools/bin/qemu-system-aarch64` is the Xilinx QEMU installed from the RSB and `/desktop/zynq-arm.dtb` is provided in the default install of Xilinx Vitis.

Author: Kinsey Moore 2024-10-30T18:56:25.357Z

Also note that while I'm using the -aarch64 variant here, behavior of the -arm variant does not produce meaningfully different behavior (though it does vary slightly in timing on occasion).

Summary

bsps: Remove imported Xilinx headers

This removes the headers imported from the embeddedsw repository in favor of a much thinner shim. This also removes the complicated build system configuration necessary to support use of these headers. The primary reason for removal is that certain external Xilinx libraries also require use of these headers and this causes version mismatches and header conflicts that can be avoided.

assigned to @opticron

Author: Sebastian Huber 2024-10-28T14:52:25.446Z

This should be in <bsp/xil-compat-common.h>.

Author: Sebastian Huber 2024-10-28T14:52:25.446Z

I had a look at the changes. It looks good. I also built all BSPs. I didn't check for new warnings.

Commit	79bed0f191e8f63e7a48f1aa41a3434822214541

Summary

aarch64/raspberrypi: improve UART

- Add support for four new ports, UART2-UART5.
- Add build options to allow console device configuration.
- Segregate device-specific definitions from the device family files. X macros

are used to maintain a single source of truth and have the configuration done at compile-time * Add raspberrypi_uart_init() to make it convenient for users to install uart devices

Author: Chris Johns 2024-10-27T04:23:31.343Z

This looks like a header file. Why the `.def` extension?

Author: Ning Yang 2024-10-27T04:23:31.343Z

I'm waiting for @Barusu to reply, it seems the `.h` extension is more appropriate.

Author: Utkarsh Verma 2024-10-27T04:23:31.343Z

I was using X macros there and Wikibooks recommended to use the .def extension.

https://en.m.wikibooks.org/wiki/C_Programming/Preprocessor_directives_and_macros#X-Macros

It's functionally the same as a header.

Author: Gedare Bloom 2024-10-27T04:23:31.343Z

The way it's being used is more like a header file. It is not being included multiple times in the same source, and it uses a header guard accordingly. Please rename this to .h, and adjust the header guards as _H instead of _DEF

We don't currently have any distinction for header files that contain X-macros.

Author: Gedare Bloom 2024-10-27T04:23:31.343Z

Also the header file name should be more specific, or these macros should just get folded directly into the console-config.c file if they don't need to be exported to the user.

changed this line in version 9 of the diff

Author: Ning Yang 2024-10-27T04:23:31.343Z

I changed `raspeberrypi4B.def` to `raspberrypi-uart.h`. is it ok?

Author: Chris Johns 2024-10-07T14:48:28.727Z

What happens on the other RPys?

Author: Ning Yang 2024-10-07T14:48:28.727Z

Rpi4 have 5 pl011 uart ports, while there are two in rpi0, 1, 2, and 3. So this definition file cannot be universal.

Author: Kinsey Moore 2024-10-18T13:41:21.342Z

Please give X a more descriptive name like “DEFINITION_REWRITER” or “CONSOLE_DEVICE_DEFINITION_RENDERER”. In addition, a small comment above this might help with understanding this macro: “This macro exists to serve as a common point of definition for the parameters of the UARTs present in the Raspberry Pi 4. It is used in multiple locations with different rendering macros to prevent duplication of information.”

Author: Kinsey Moore 2024-10-18T13:41:21.342Z

Additionally, this definition style could be shared with the other Raspberry Pi BSPs if they each had their own UART definitions in a local raspberrypi_uarts.def, though I’m not a fan of introducing a differently named header file type in general.

Author: Ning Yang 2024-10-18T13:41:24.555Z

changed this line in version 5 of the diff

Author: Kinsey Moore 2024-10-18T13:41:25.123Z

Does the assert-in-set action not suffice here?

Author: Ning Yang 2024-10-18T13:41:25.123Z

UART1 and UART2 are missing from the set, they are mini-uart. I will add them when creating mini-uart driver MR.

Author: Kinsey Moore 2024-10-18T13:41:25.123Z

That's fine, but why doesn't this use:

```
- assert-in-set:
- UART0
- UART2
- UART3
- UART4
- UART5
```

Author: Ning Yang 2024-10-18T13:41:25.123Z

!`image <https://gitlab.rtems.org/-/project/uploads/b6162cac9e9d7b9e89f46eb01f76836a/image.png>`_

This winds up the only place these macros are used. Will they be used elsewhere in future patches? Otherwise this is a lot of CPP macro complexity for the simple use case.

Author: Ning Yang 2024-10-27T04:26:18.312Z

I think the Raspberrypi5 might use these.

Commit	a5f64ff27d19ca53aeb4d02729745beaa736028f

Summary

Gaisler was asked to fix 8 issues found by Coverity scans. Below is a list of the issues along with the actions taken: * CID 1399762: False Positive, no action taken. * CID 1399764: Dead code removed. * CID 1399770: Dead code removed. * CID 1399772: False Positive, no action taken. * CID 1399774: Bitwise and operation on non-shifted bit position, fixed. * CID 1399775: SLINK specification says that there are 3 IO cards capable of transmitting data but they can take addresses from 0 to 3. Due to this, we need to have 4 queues instead of just 3. This is intentional, no action taken. * CID 1399778: Evaluation order violation, split operation over two lines. * CID 1399782: Evaluation order violation, split operation over two lines.

Commit	d0e9ec85b067dbda19fc50e66830c3e1d92fb232

Summary

cpukit/libmisc/shell: Remove shell prompt carriage return

This removes the carriage return printed before the shell prompt as it can cause other output to be overwritten unexpectedly. This was discovered when using the “cat” shell command on a file whose content contained no trailing nr and was short enough to be entirely swallowed by the prompt.

Commit	e0f1c8fe0b20ae486f5b99c3a9155686bc3a11f2

Summary

Set Python scripts to use Python 3

Several of these already required Python 3 and would not run under 2.7.

Author: Amar Takhar 2024-10-21T22:43:24.628Z

assigned to @amar

Author: Amar Takhar 2024-10-21T22:44:09.147Z

I noticed this when trying to run `rtems-bsps`. Several of them already required Python 3 which I'm sure was not intentional but it makes sense to move everything to v3 since waf now requires it.

Commit	83c1a305f71e8a11b5c61e89b0191e09ff28b2a7

Summary

cpukit/libfs/jffs2: Prevent memory corruption due to corrupted data

The rtime decompression routine does not fully check bounds during the entirety of the decompression pass and can corrupt memory outside the decompression buffer if the compressed data is corrupted. This adds the required check to prevent this failure mode.

Updates #5072

Author: Kinsey Moore 2024-07-23T14:38:09.260Z

assigned to @opticron

Author: Kinsey Moore 2024-07-23T14:39:30.720Z

This was discovered upon reviewing the failure mode induced by #5072 with multiple JFFS2 filesystems using the same decompression buffer. I'm waiting for external verification before I mark this draft as ready.

Author: Kinsey Moore 2024-07-23T14:39:49.654Z

This fix will also need to be pushed upstream.

I have submitted this patch upstream to the maintainers for the JFFS2 code in the Linux kernel.

Author: Amar Takhar 2024-10-24T22:35:34.546Z

Got a link just so we can have it here?

Author: Kinsey Moore 2024-10-24T22:35:34.546Z

Unfortunately, no. This subsystem doesn't use a ML and the MAINTAINERS file directs you to email two people individually and that they only accept the random odd fix. This subsystem is basically on life support.

Author: Amar Takhar 2024-10-24T22:35:34.546Z

I see! That's not unusual at least it's recorded why there aren't any details. Thanks! :)

Author: Sebastian Huber 2024-10-24T22:35:34.546Z

Any feedback from the Linux maintainers?

Author: Kinsey Moore 2024-10-24T22:35:34.546Z

I've been told it will go into all releases as a bug fix during the next merge window, but I don't have any timing information on that.

Author: Sebastian Huber 2024-10-24T22:35:20.822Z

Why do we need the () around the + here and not four lines below?

Author: Kinsey Moore 2024-10-24T22:35:20.822Z

Technically, it doesn't. I tend to enforce readability when mixing arithmetic operators and conditional operators, but I can remove the extra parentheses if you prefer.

Author: Joel Sherrill 2024-10-24T22:35:20.822Z

What's the jffs2 style for this if there is an example?

Personally, I like the parentheses around the addition. Makes it very clear what you intended.

But follow the existing jffs2 style overrides us.

Author: Kinsey Moore 2024-10-24T22:35:20.822Z

I wasn't given any feedback on the patch I submitted (which is this patch minus the ifdef), so I assume it's going in as-is.

Author: Gedare Bloom 2024-10-24T22:35:13.588Z

Are we waiting for this to be upstreamed first?

Author: Kinsey Moore 2024-10-24T22:35:13.588Z

Progress on that front seems to be very slow and with very little feedback due to the nature/status of the JFFS2 stack. I don't know when it will go into a kernel merge window and I would suggest not waiting on that to occur.

Author: Kinsey Moore 2024-10-24T22:35:13.588Z

The Linux 6.12 merge window opened today, so I may poke the maintainer to see if he plans to submit it.

Author: Amar Takhar 2024-10-24T22:35:13.588Z

I would just merge it for now and on the next update if it's upstreamed it'll come down with that change. It's a lot of churn for a fix we know we need.

Summary

Issue #5101

Adding a new NIOS V BSP to the RISC-V architecture in the RTEMS repository

Author: Kevin Kirspel 2024-08-09T21:17:02.063Z

added 1 commit

- 039677d1 - adding a flash directory for the EPCQ driver as it is common across BSPs

Compare with previous version

Author: Sebastian Huber 2024-08-14T21:10:59.040Z

This file is not needed. Please remove it.

Author: Kevin Kirspel 2024-08-14T21:09:52.277Z

changed this line in version 3 of the diff

Author: Kevin Kirspel 2024-08-14T21:10:59.040Z

File was removed.

Author: Sebastian Huber 2024-08-14T21:11:57.339Z

Can't you use the shared start file?

Author: Kevin Kirspel 2024-08-14T21:11:57.339Z

Probably, I wanted to clear the registers for debugging purposes. Let me recompile with the shared start file and make sure everything works.

Author: Kevin Kirspel 2024-08-14T21:09:53.103Z

changed this line in version 3 of the diff

Author: Kevin Kirspel 2024-08-14T21:11:57.339Z

start.S file was removed from the NIOS V BSP and the shared start file is now used.

Author: Sebastian Huber 2024-10-17T22:45:52.653Z

If this is needed, why don't we unzip it?

Author: Kevin Kirspel 2024-10-17T22:45:52.653Z

This BSP is just an example NIOS V BSP which uses a Intel Cyclone 10 LP Evaluation Board with a FPGA configuration that is described in the README.md. The supporting.zip file contains files that are referenced in the README.md. The README.md is intended to be used as a guide for creating a real BSP based on a real NIOS V based FPGA system. It contains the steps necessary to start with a Quartus Prime project to building a RTEMS BSP. I could move the README.md contents into the user's manual but it would contain all the Quartus instructions that are unrelated to RTEMS. That is why I just left it in the BSP itself. Even if I move it into the user's manual, the supporting.zip file would still need to be accessible.

Author: Joel Sherrill 2024-10-17T22:45:52.653Z

@gedare @chris Do either of you have input to help resolve this?

@kirspelk Is it OK to add a subdirectory and unzip it into there? It is best to avoid zip's in the repository.

Author: Joel Sherrill 2024-10-17T22:45:52.653Z

@kirspelk Is it OK to add a subdirectory and unzip it into there? It is best to avoid zip's in the repository.

Repeated to get a notification triggered.

Author: Kevin Kirspel 2024-10-17T22:45:52.653Z

OK, I will make a sub directory and put the files in there

Author: Kevin Kirspel 2024-09-24T13:49:49.604Z

changed this file in version 11 of the diff

Author: Kevin Kirspel 2024-10-17T22:45:52.653Z

I just pushed the changes with the sub directory containing the contents of the ZIP file. I also moved the README.md into the sub directory.

Author: Chris Johns 2024-10-17T22:45:52.653Z

I think @amar has specific views on this?

Author: Amar Takhar 2024-10-17T22:45:52.653Z

I'm good with the merge no zip files or archives in repositories it's not a good idea.

Author: Sebastian Huber 2024-08-14T21:12:28.583Z

Please move it as opto3.yml to the same level as opto2.yml. Do you really need -O3 for this BSP? Should we use -O3 for all BSPs?

Author: Chris Johns 2024-08-14T21:12:28.583Z

I think it is too late to move to `-O3` for 6 for all BSPs. Also I thought `-O3` added aggressive unrolling of loops which increases code size and that can effect caching?

Author: Sebastian Huber 2024-08-14T21:12:28.583Z

I am not in favour of switching to -O3. I just wondered why this is the only BSP in the tree which needs -O3.

Author: Chris Johns 2024-08-14T21:12:28.583Z

That is what I thought but I was no certain. Thanks for clarifying this.

Author: Kevin Kirspel 2024-08-14T21:12:28.583Z

I only set it to -O3 because that is what is in the Intel documentation and what they use for their software tools. I don't care if its -O2 or -O3. It sounds like -O2 is preferred for RTEMS so I will configure the BSP to use that.

Author: Kevin Kirspel 2024-08-14T21:09:55.050Z

changed this file in version 3 of the diff

Author: Kevin Kirspel 2024-08-14T21:12:28.583Z

Optimization was changed to -O2.

Author: Amar Takhar 2024-10-04T01:23:17.304Z

@sebhub Sorry I accidentally deleted your comment about the `README.md`. I was making my own comment and accidentally submitted it as a review I was trying to delete that to re-submit but it deleted the whole comment!

Author: Amar Takhar 2024-10-04T01:23:17.304Z

What was going to say is that there are 99 other `README.md` files in `bsps/` so one more won't matter we need to figure out what we're going to do with all of them and having a 'front page' on GitLab isn't such a bad thing I think we need a wider discussion in what should go into a `README.md` and what should go into RTEMS Docs.

Author: Sebastian Huber 2024-10-04T01:23:17.304Z

All the READMEs in bsps/* are legacy documentation. The place for new BSP documentation is here:

https://docs.rtems.org/branches/master/user/bsps/index.html

Author: Kevin Kirspel 2024-10-04T01:23:17.304Z

So my README.md in the bsp directory is less about RTEMS specifically and more about how to build a Quartus Prime project to create a JIC file that can be downloaded to hardware. It's an iterative process between compiling various code bits and compiling in Quartus Prime. My RTEMS BSP specific information is in the user's manual. I will do whatever you guys think is best for RTEMS documentation. I just don't want other developers having to go through what I went through to get a NIOS V application running on real hardware.

Author: Kinsey Moore 2024-10-08T14:25:25.632Z

Hey, first off, thanks for working on this BSP for RTEMS. It clearly took a lot of work to pull together. This patch set needs to be rebased on the current main branch since it looks like some things in that area have changed.

We don't store test logs in the RTEMS repository, so please remove those.

While you're reworking these patches, please update the commit summaries and descriptions to adhere to the RTEMS commit message guidance.

Author: Kevin Kirspel 2024-10-08T14:25:25.632Z

I removed the test logs from the repo. I updated the commit messages to be less than 80 characters long. I also rebased the patch.

Commit	4c75bd88f3ce0cc36f4396bb264e24990a80aecc

Summary

Revert “libmisc/stackchk: Change stack checker reporter function signatures”

This reverts commit c1aa06dbd2f055afd14415f3e6f63fb74765d6ff.

Extending the rtems_stack_checker_info like this breaks the existing visitor API used by rtems_stack_checker_iterate(). After review, using an information structure contradicts the intention of the reporter to allow a minimal reporting. Filling up the information structure with all the details would pull in several dependencies, like _Thread_Get_name(). The API should be improved to provide the user with the necessary information from the TCB without having to access members directly.

Author: Sebastian Huber 2024-10-18T09:28:27.202Z

@Hamzi Sorry, I was on holidays and had no time to review !254.

Author: Mohamed Hassan 2024-10-18T09:28:27.202Z

No problem, I hope you enjoyed your holidays. So you suggest to go back to the original functions signature? or we can create another dedicated structure for the reporter's parameters.

Author: Sebastian Huber 2024-10-18T09:28:27.202Z

I had a closer look at the reporter feature and now I think that the original signature was fine. It would require too much code and dependencies to fill a higher level information structure.

Author: Mohamed Hassan 2024-10-19T09:33:40.449Z

Ok, sounds ok to me. When this issue is settled I will go on to add another feature `stack smash protection`.

Commit	b8bd1a1ce38886a4ca4cf6431a20737d802e15d9

Summary

spec/bsps/aarch64: Update BSP naming to be more consice

This removes the xilinx and lp64 identifiers from the ZynqMP BSPs and updates those names throughout the build system. The xilinx identifier is being removed because it is implied by zynqmp and lp64 is being removed because it is the default for AArch64.

This also renames grp_zu3eg.yml to grp_hardware.yml to more accurately reflect its purpose.

Commit	e6cadcf0ccc83fd7b68adf99d0f41db47f0879a7

Summary

spec/bsps: Clean up stale references to minimum.exe in test configurations

Now that minimum.exe is minimum.norun.exe, the tester will not attempt to run this sample test and will therefore not categorize it as a failure since it includes no output. BSP-level test configurations for this test can now be removed since those configurations only existed to prevent it from being run.

Summary

cpukit/libdl/arm: Support BLX relocations that require a trampoline

BLX relocations in Thumb code expect the target to be ARM code. This means that the trampoline must be generated in ARM mode.

Author: Kinsey Moore 2024-10-10T23:28:08.530Z

Why is ZynqMP being singled out here? The A53 cores support EL0/1/2/3 just like the generic A53 BSP. The same applies to the EL3 support flag in optstartel3.yml.

Author: Sebastian Huber 2024-10-10T23:28:08.530Z

With the default tooling from Xilinx, RTEMS is started in non-secure EL1. If you have a special configuration, then you can still change this option specifically for your application.

Author: Sebastian Huber 2024-10-10T23:28:08.530Z

We could also disable this option by default for all BSPs.

Author: xiaojun zheng 2024-10-10T23:28:08.530Z

Usually RTEMS is loaded by a bootloader, and runs on top of ATF, so I think RTEMS is started in non-secure EL1 in most cases. The comment below label '_el3_start' provides an explaination about this.

Author: Kinsey Moore 2024-10-10T23:28:08.530Z

I suppose it depends heavily on what you use for tooling. I avoid Vitis as much as possible and build my own BOOT.bin with custom bif definitions half the time, so the starting EL for RTEMS doesn't really have a default.

Author: Sebastian Huber 2024-10-10T23:28:08.530Z

I would say that the standard booting procedure uses the FSBL from Xilinx and the ATF. This means RTMES is started in EL1 by the ATF.

Author: Kinsey Moore 2024-10-10T23:28:08.530Z

At least some older versions of BOOT.bin with u-boot generated by the Xilinx toolchain (XDK, so pre-Vitis) started payloads in EL2 by default. I'm fine with EL3 being turned off on this platform, but EL2 startup does exist on older builds.

Author: Sebastian Huber 2024-10-10T23:28:08.530Z

Vitis launched in 2019, but all right, I changed the default to enable the EL2 boot for ZynqMP.

Author: xiaojun zheng 2024-10-10T21:02:19.691Z

I think using a singel macro to select either SMC or HVC is sufficent.

Author: Sebastian Huber 2024-10-10T21:02:19.691Z

Yes, we could change it to an `AARCH64_PSCI_CALL_INSTRUCTION` option which is `smc` or `hvc`.

Author: Kinsey Moore 2024-10-10T21:02:19.691Z

I'd have no problem with that versus the current implementation, but that should be in a new MR. This MR isn't introducing this mechanism, it's just adjusting its implementation to reduce dead code.

Author: xiaojun zheng 2024-10-10T21:01:55.496Z

PSCI has many functions(cpu on/off, suspend,reset,migrate...). We have only implemented ON and RESET. Do you think we should put these functions in one file? and use the assembly code as a general service call function. In this way, it may be easier to add functions later.

Author: Sebastian Huber 2024-10-10T21:01:55.496Z

We only need these two functions right now for the BSP. I will not add a general PSCI support for this MR.

Author: Kinsey Moore 2024-10-10T21:01:55.496Z

Agreed, this is beyond the scope of this MR. @zhengxiaojun please create an issue to track this refactoring if you can think of other PSCI services that RTEMS might make use of.

Commit	85ccfe24bf5d3edc869f1cda942a582eb2ebe628

Summary

bsps/aarch64/mmu: Align dynamically mapped blocks

Dynamically mapped blocks must be aligned to the MMU page size just like startup-configured blocks. This was not being enforced and could cause a hang with bad input.

This MR is draft. Should it still be draft?

Author: Kinsey Moore 2024-10-04T17:06:37.414Z

It could probably be committed as-is and definitely solves a problem, but I was waiting on more information about a possible second issue with the same code. I'll go ahead and unmark as draft since this should be fine to go in now that it already has an approval.

I do not understand this change? Maybe add some details on why this fixes the copyright to the commit message?

Author: Sebastian Huber 2024-09-19T08:59:12.145Z

The files contain nothing from DornerWorks. I will add this to the commit message.

Author: Chris Johns 2024-09-20T03:38:57.550Z

Would this reset the APU? If so this is not a good idea and something else will need to be figured out.

Author: Sebastian Huber 2024-09-20T03:38:57.550Z

Yes, it resets also the APU. This allows to run the tests. In a real application you have to provide your own fatal error handler to do the right application-specific steps.

Author: Chris Johns 2024-09-20T03:38:57.550Z

I prefer we look for other solutions. Is there an RPU reset? Can the PM be asked to reset the RPU?

Author: Sebastian Huber 2024-09-20T03:38:57.550Z

No matter which implementation we choose, there will be always applications for which this choice is wrong. In a complex system like the Zynq UltraScale+ you have to work out your own application-specific reset procedures. With the fatal extension RTEMS has an excellent place for this job.

In my test setup, the RPU is started by the FSBL running on the APU. So for the test runs it was quite handy to reset the overall system.

Author: Chris Johns 2024-09-20T03:38:57.550Z

The PM, also loaded by your FSBL is designed to handle these things.

Author: Sebastian Huber 2024-09-20T03:38:57.550Z

Ok, so what should I do now? Keep the infinite loop?

Author: Chris Johns 2024-09-20T03:38:57.550Z

I have been look at the PM and there an interface to assert a reset but that may be one of the PL reset signals.

My PM via SMC gives:

but there maybe more since I defined the id set.

There is this https://xilinx-wiki.atlassian.net/wiki/spaces/A/pages/18841820/Zynq+UltraScale+MPSoC+Restart+solution#ZynqUltraScale+MPSoCRestartsolution-RPUSubsystemRestart?

I see a couple of conflicting parts here, your desire to have a simple test solution and this is the case with the change and the ability to evolve this BSP and not break yours or others test setup. At the moment I cannot see us meeting both with this change.

Author: Sebastian Huber 2024-09-20T03:38:57.550Z

As I said, no matter which implementation we choose, there will be always applications for which this choice is wrong. In a complex system like the Zynq UltraScale+ you have to work out your own application-specific reset procedures. The default behaviour should be simple and targeted to RTEMS test suite runs. You can't expect that a BSP solves all your application issues.

The APU issues right now also a system reset. Is this good if your safety functions run on the RPU?

Author: Chris Johns 2024-09-20T03:38:57.550Z

I am assuming the APU is responsible for the RPU units but it could the other way around. As long as this can evolve then I am OK with this.

Will you document the FSBL BIF etc need to run the tests?

Could you please add a comment to the register write indicating the reset is system wide?

Author: Sebastian Huber 2024-09-20T03:38:57.550Z

Ok, I will update the comment. The important thing is that it is documented in the user manual.

Author: Chris Johns 2024-09-19T08:54:50.185Z

Please add a comment that Xilinx defaults to using OCM for u-boot and ATF and using it on the RPU could conflict with that.

Author: Sebastian Huber 2024-09-19T08:54:50.185Z

Ok.

Author: Chris Johns 2024-09-19T08:45:52.976Z

Does this effect other BSPs which use this code?

Author: Sebastian Huber 2024-09-19T08:45:52.976Z

No, because it enables more uses of this code. I doesn't restrict the usage.

Author: Chris Johns 2024-09-19T08:11:44.354Z

Interesting solution and I like it. Is this standard C code or a gcc extension?

Author: Sebastian Huber 2024-09-19T08:11:44.354Z

Anonymous unions were added in C11. Before it was a GCC extension.

Author: Chris Johns 2024-09-19T07:23:41.699Z

I have some specific questions but I am wondering how and in what mode of operation the RPU is being used on the ZynqMP, for example only LPD devices are running, the RPU and APU cores are all running?

Does this change effect the documentation in the User Manual?

Author: Sebastian Huber 2024-09-20T03:22:41.994Z

I don't know, I worked only with the BSP and no real application so far.

Author: Chris Johns 2024-09-20T03:22:41.994Z

If you had to develop an application would that change this MR?

Author: Sebastian Huber 2024-09-20T03:22:41.994Z

There are always reasons to change something. With respect to the user manual. I will have a look at it once this MR is integrated.

Regarding the UART changes, how are you typically starting the RPU image from the automated tester? I start it from the A53 u-boot and sharing the console with

u-boot on the first UART instance is somewhat limiting since both try to access it simultaneously.

Author: Sebastian Huber 2024-09-20T03:02:56.480Z

I did all the test runs for the APU and RPU sequentially using the same UART. Once the boot loader did its job to load the image it was silent.

Author: Kinsey Moore 2024-09-22T01:46:02.798Z

This is missing a description.

Author: Sebastian Huber 2024-09-22T01:46:02.798Z

It has intentionally no description since this is an internal option which should not be set directly by the user.

Author: Kinsey Moore 2024-09-22T01:46:02.798Z

So an appropriate description might be “This is an internal option to shuffle program sections between the ATCM and BTCM depending on available space due to split versus lock configuration and should not be set by the user in config.ini.”

Author: Sebastian Huber 2024-09-22T01:46:02.798Z

If you have a `description: null` it will not show up in the BSP defaults. With this note it will show up with the default value. When you adjust other settings the default value is no longer the right one and you have a misconfiguration.

Author: Kinsey Moore 2024-09-22T01:46:02.798Z

Given that it's not supposed to be user-visible, this form of the logic doesn't provide documentation, and it's only used in one place, is there a reason it isn't a conditional in the linker script?

Author: Sebastian Huber 2024-09-22T01:46:02.798Z

It is used for a memory region definition. I am not a aware the linker script language provides conditional expressions at this level.

Author: Kinsey Moore 2024-09-22T01:46:02.798Z

Linker scripts support the DEFINED() macro as well as arbitrary inequalities in conjunction with the ternary operator. There are usage examples of != and > in spec/build/bsps/riscv/linkcmdsbase.yml and spec/build/bsps/arm/atsam/linkcmds.yml.

Author: Sebastian Huber 2024-09-21T15:27:02.428Z

changed this line in version 6 of the diff

Author: Sebastian Huber 2024-09-22T01:46:02.798Z

This environment variable is used to define a memory region. The linker doesn't support expressions with memory regions.

I added new build option actions "comment" and "set-value-enabled-by" and moved the stuff into `spec/build/bsps/arm/xilinx-zynqmp-rpu/optlockstep.yml`.

Author: Kinsey Moore 2024-10-02T12:43:47.112Z

I'm a bit hesitant to rename this many options, but since it's not yet in a release we should also rename the base BSP to include some indication that it's running in lockstep mode since I'm currently using it in split mode and this set of changes will break that expectation.

Author: Kinsey Moore 2024-10-02T12:43:47.112Z

test

Author: Kinsey Moore 2024-09-20T01:16:28.890Z

requested changes

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

This BSP was contributed early this year. So I think there is no issue to rename things before the release.

How did you manage to run on both cores in split mode with the current BSP?

Author: Kinsey Moore 2024-10-02T05:10:52.541Z

I've only been running on the first core in split mode. I assumed that running the second core in split mode would incur additional complications.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

You can still do this, the new `xilinx_zynqmp_rpu_0` is intended for split mode core 0.

Author: Kinsey Moore 2024-10-02T05:10:52.541Z

Yes, the original BSP has been repurposed for lockstep operation and that will be surprising for existing users. It would be better to force those users to re-evaluate available options.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

I would agree if it was already released, but this BSP is basically brand new. I added the `xilinx_zynq_rpu` myself in March this year and it was always intended to be used for lockstep mode. This patch set is from roughly the same time frame, but I had other patch sets in the queue up to now.

Author: Kinsey Moore 2024-10-02T05:10:52.541Z

Regardless of the intent, the generically named BSP was created as an exact clone of the other BSP and still exists in that state (this patch set not withstanding). Neither reference lockstep at all. If it's going to be intended for lockstep usage, that should be clear since I've been using it in split mode. As you said, naming here is still fluid since none of this has been released, yet. I'd be happy with the mercuryxu5 BSP going away in favor of these configurations you're adding, but I can take care of that later if you don't want to add it to this patch set.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

What do you suggest instead? Rename `xilinx_zynqmp_rpu` in `xilinx_zynqmp_rpu_lock_step`? The BSP name is already quite long and this is even longer. If you just use a single core why shouldn't you run it in lock-step mode?

Author: Kinsey Moore 2024-10-02T05:10:52.541Z

```
is redundant, though I'd probably want to strip it from the AArch64␣
↪BSPs as well. I've been considering a name change there from
```

The

```
to
```

zu3eg

```
 for the same reasons you created the RPU BSP.
apu
```

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

We already have a generic APU BSP: xilinx_zynqmp_lp64_a53.

For the RPU, what about:

- zynqmp_rpu_lock_step
- zynqmp_rpu_split_0
- zynqmp_rpu_split_1

Author: Chris Johns 2024-10-02T05:10:52.541Z

Should the RPU then be labeled `r5whatever`? I like `rpu` so maybe the `a53` should be removed or change to be `apu` so it aligns with the Xilinx documentation?

Author: Chris Johns 2024-10-02T05:10:52.541Z

Do you need to identify the RPU when split? Could that be a `bootgen` or runtime loading choice?

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

The Cortex-A53 needs special compiler flags to work around processor errata. Maybe the UltraScale+ gets an update with a new core in the future.

We can name the RPU BSPs also * zynqmp_r5_lock_step * zynqmp_r5_split_0 * zynqmp_r5_split_1

The split mode and lock-step mode have different memory layouts. So, you need the different BSP variants. Also the split mode BSP has some extra tweaks in the interrupt controller support.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

Could we please agree on the BSP names before I update the patch set. I would pick up these names:

- zynqmp_r5_lock_step
- zynqmp_r5_split_0
- zynqmp_r5_split_1

Author: Chris Johns 2024-10-02T05:10:52.541Z

Could you please explain why there are qualifiers such as `_lock_step` and `_split_0` etc?

I am not in favor of `r5_*` for the same reason I do not think `a53` should be present. Those names are SoC implementation details and the documentation block diagrams from the manufacturer refers to RPU and APU.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

The `_lock_step` is for the lock-step mode BSP variant, the `_split_0` is for the split mode core 0 variant, and the `_split_1` is for the split mode core 1 variant.

Good, then back to the `rpu` naming instead of `r5` just like it was initially.

Author: Chris Johns 2024-10-02T05:10:52.541Z

I understand the types, I do not understand why we need to define BSPs. Is the ABI different?

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

They have a different memory layout and interrupt controller support.

Author: Chris Johns 2024-10-02T05:10:52.541Z

Is this to provide a separate base address for each build of the BSP?

What is the interrupt controller differences?

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

The details are in the patch set. For example, the DDR memory area assigned to the RPU BSPs is split in split mode. The TCM sizes are different in different modes.

The two cores share a GIC distributor. So, you have to agree on who does the basic initialization. You also have to make sure that the clock driver uses different TTC units.

Author: Chris Johns 2024-10-02T05:10:52.541Z

In regards to "the details are in the patch", I did not see this detail. This conversation makes it easier for others to see what is happening and how things are designed. I do not assuming everyone sees what you or I do.

Can the RPU determine if it is in lock step mode or which core it is?

I suggest a single BSP name `zynqmp_rpu` with defaults for a single address space block and basic initialization that can run the tests. INI options can then change the address map and the initialization as required.

A BSP name will go only so far before it does not help. There are too many combinations to expand into BSP names to be practical, for example `zynqmp_rpu_split_0_apu` etc. You would also need `zynqmp_apu_rpu_0` and `zynqmp_apu_rpu_0_1` etc if you wish to run all the APU codes with both RPU cores.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

The split and lock-step modes are system level configuration options. You should be able to pick up a BSPs for these configurations which just works as is for test runs. Forcing the user to define the right set of options is not that helpful. Adding runtime checks just leads to dead code in some configurations. The lock-step mode BSP was tested for 100% code and branch coverage.

Author: Chris Johns 2024-10-02T05:10:52.541Z

Would:

1. `zynqmp_rpu`
2. `zynqmp_rpu_lock_step`

work?

The coverage etc is a good point, thanks.

Who says the options you select are right? Why is the memory size you have selected correct for everyone?

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

I never said that the option selection is the right one for everyone. It is highly likely that you have to adjust the DDR memory usage for an application.

If you use a single BSP in split mode, how can you avoid a conflict in the DDR usage?

Author: Chris Johns 2024-10-02T05:10:52.541Z

A user will need to consider a memory map that works and that will be determined by their system design. An example (with make up bits and pieces) is:

```
[aarch64/zynqmp_apu]
BASE = 0x000a0000

[aarch64/zynqmp_rpu_0]
INHERIT = aarch64/zynqmp_rpu
BASE = 0x00010000
SIZE = 0x00040000
ZYQMP_RPU_INT_CONTROLLER_MODE = shared,primary

[aarch64/zynqmp_rpu_1]
INHERIT = aarch64/zynqmp_rpu
BASE = 0x00050000
SIZE = 0x00040000
ZYQMP_RPU_INT_CONTROLLER_MODE = shared,secondary
```

The user can build the suite of BSPs needed from the base ones we provide.

I have no idea if adjusting the base address of the APU like this works, it is just an example. It might be the RPU memory descend down from the top of the 2G area.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

You can do whatever customization you want, but we still need basic BSP variants which have a working set of default values. For the RPU, these are the three variants mentioned above. You can pick them up and let the test suite run.

Author: Chris Johns 2024-10-02T05:10:52.541Z

We have so many options we do not map to specific BSPs. I am fine with the two BSPs names I provided. I would also like to hear from @opticron about the differences with split mode.

in regards to testing, we have no means to test two BSPs in hardware at once. How do you do that?

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

I didn't test the split mode variants in parallel. They were tested one after another. The core 1 variant needs a core 0 application which performs the GIC distributor initialization. You can use the Xilinx Qemu to run the tests.

I don't have time to rework the patch set to use only two variants.

Author: Chris Johns 2024-10-02T05:10:52.541Z

Thanks for testing details. Lets wait to hear from @opticron

Author: Kinsey Moore 2024-10-02T05:10:52.541Z

Reading from the above, I think the naming suggested was zynqmp_rpu_lockstep, zynqmp_rpu_split_0, and zynqmp_rpu_split_1 which is fine with me. It'd be nice to make the primary/secondary more explicit like in Chris's suggestion, but that's far beyond the scope of this MR.

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

Thanks for having a look at this. I updated the patches and renamed the BSPs to:

- zynqmp_rpu_lock_step
- zynqmp_rpu_split_0
- zynqmp_rpu_split_1

Author: Chris Johns 2024-10-02T05:10:52.541Z

Thanks for the update.

Just so I understand the change, a user wanting to have the APU and two RPUs would build the APU with a suitable memory map and then the `split_0` and `split_1` BSPs only updating the memory map options?

Author: Sebastian Huber 2024-10-02T05:10:52.541Z

Yes, user very likely has to change the default setting for the DDR usage. The other options for a particular variant should be fine in most cases.

Author: Chris Johns 2024-10-02T05:10:52.541Z

Thanks. I am OK with this.

Commit	4ca49fc2000eba7b11c07111b636b7d49ae9aafa

Summary

This patch set:

1. Improves and simplifies the SMP start.
2. Updates ARM
3. Updates AARCH64

Why only start cpu 1?

Author: Sebastian Huber 2024-09-29T23:53:09.213Z

The hardware has only two CPUs.

Author: Chris Johns 2024-10-01T00:42:31.948Z

Is this what happens or is it something that should be done?

Author: Sebastian Huber 2024-10-01T00:42:31.948Z

All the current BSPs assume that starting a CPU works. This is just an option.

Commit	38bafce42de94a7408760ccfca059b0681d77d51

Summary

Aarch64 has had a conditional include paravirt.h but that file does not exist. This MR adds the missing file along with the other support items.

Author: Joel Sherrill 2024-09-10T19:39:33.764Z

assigned to @joel

Author: Chris Johns 2024-09-23T21:18:51.627Z

RTEMS is a single address space and so all code executes in “user space”. Is this a specific context of the AARCH64 device ie EL0, EL1 etc?

Author: Joel Sherrill 2024-09-23T21:18:51.627Z

This came from Deos support:

> User mode code runs in EL0. Kernel mode code runs in EL1. The boot, PAL (kernel mode driver) and PRLs (Platform resource libraries) are considered kernel mode code. We do have some requirements for boot to do some initialization of EL2/EL3 registers in the desk/help/deos-boot-software-requirements.htm, but I believe those will have to be revisited for running under a hypervisor as most of them prevent returning to EL2/EL3 and allow EL1 full access to secure registers (when possible) and the entire GIC.
>
> Hopefully that clarifies things for you and @opticron

Author: Chris Johns 2024-09-23T21:18:51.627Z

Should the sentence state:

- RTEMS executes at E0

?

Author: Joel Sherrill 2024-09-23T21:18:51.627Z

RTEMS is run in user mode in this environment so yes. It is at EL0.

I just copied their reply.

Commit	8fd3ed26e7f64af1ba6faff7125a2d0209c7213f

Summary

Merge all licenses into one large file with a TOC. This way we can link to one file and not have to worry about having many files everywhere.

The original licenses have been copied in without modification though it will render differently online.

Author: Sebastian Huber 2024-07-10T05:28:37.035Z

I would just name the directory “licenses”.

Author: Amar Takhar 2024-07-10T05:28:37.035Z

I thought about that but looking around every single project I saw called their license file LICENSE. I called it LICENSE_OTHER so it sorts with the original LICENSE file and is easily visible. ‘licenses’ – which I did try gets lost with the rest of the directories.

Author: Sebastian Huber 2024-07-10T05:28:37.035Z

Ok, never mind, this directory name just looked a bit odd to me.

With respect to the goal of this change, you would like to make it easier for RTEMS users to fulfill license requirements? Why don’t we provide a single top-level COPYING file like Newlib does:

https://sourceware.org/git/?p=newlib-cygwin.git;a=blob;f=COPYING.NEWLIB;h=176b3a4706cc99651d36b1116605747ad0a72a75;hb=HEAD

Author: Amar Takhar 2024-07-10T05:28:37.035Z

That's not a bad idea I'd call it `LICENSE` though as `COPYING` came later as part of the GNU/GPL project rules: https://www.gnu.org/licenses/gpl-howto.html

I added a `LICENSE.md` file as an example of what it would look like merged though I just remembered we can't call it *.md the LICENSE file needs to exist according to @gedare . We could have both a LICENSE that points to ``LICENSE.md``

- See https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/07106cc19883fbb45edd6f536663c26005f7e89f/LICENSE.md

For how it looks rendered. Not much can be done about that as we don't want to change the contents.

Author: Sebastian Huber 2024-07-10T05:28:37.035Z

I like this LICENSE.md approach.

Author: Amar Takhar 2024-07-02T08:08:54.075Z

added 1 commit

- 07106cc1 - Example LICENSE.md file.

resolved all threads

Author: Gedare Bloom 2024-07-11T00:22:36.586Z

Do we need the following text of all the licenses, or can we just link to their new locations in the tree?

Author: Amar Takhar 2024-07-11T00:22:36.586Z

Actually the one file is in response to @sebhub comment. `LICENSE.md` is all the licenses in one file those are links to the file in the directory see:

- https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/512b5703832f43271dc66c89ebec4f8f7ee84162/LICENSE.md

It's the first commit. I like the idea of just having 1 `LICENSE.md` file as it's what we've got with the rest of our repositories going forward there is no need to have several the link will never change, either and the contents will reflect in the revision of the source.

Author: Gedare Bloom 2024-07-11T00:22:36.586Z

Why keep them also in `LICENSE_OTHER`?

Author: Amar Takhar 2024-07-11T00:22:44.055Z

I have changed this MR to be the single `LICENSE.md`

Author: Gedare Bloom 2024-07-11T00:22:08.458Z

Historically, this one was called "RTEMS License"

Author: Amar Takhar 2024-07-11T00:20:32.746Z

changed this line in version 4 of the diff

Author: Amar Takhar 2024-07-11T00:22:08.458Z

I made this change and also killed off the other commit now this is just `LICENSE.md`.

Author: Gedare Bloom 2024-07-11T00:25:03.128Z

Some of these license we may be able to remove. I would probably have to do more research on that to be sure though. For example, the LICENSE.NET and LICENSE.RPCXDR.

Author: Amar Takhar 2024-07-11T00:25:03.128Z

We can deal with that after I'm trying to convert everything in the root of all repos to MarkDown so it looks clean for the %6.1 release. We can deal with that after the branch.

Oh shoot I deleted the wrong comment mine said 'pending' so I copied it but I seem to have deleted @opticron 's comment about the mismatched quotes. This is what I said:

Yes those I saw but given they are licenses I was focused just on the conversion if we want to edit them for formatting we can do that after or just leave it as-is since the TOC works.

Author: Joel Sherrill 2024-09-24T19:13:39.438Z

Is there a way to have a test case for something this specific?

Author: Chris Johns 2024-09-24T19:13:39.438Z

I do not think you can easily in C or C++. Maybe asm? I did a quick scan of the thumb libs built with gcc and there was no references to these reloc types. In a thumb stdc++ archive the only thumb reloc was `R_ARM_THM_CALL`.

Author: Kinsey Moore 2024-09-24T19:13:39.438Z

I have a test case that reproduces the problem for certain alignments of address space usage and luck on the Zynq QEMU BSP, but I'm fairly certain it doesn't guarantee a reproduction.

Author: Chris Johns 2024-09-24T19:13:39.438Z

Is the test going to be added?

Author: Kinsey Moore 2024-09-24T19:13:39.438Z

The same customer just showed me another relocation that's broken, also Thumb to ARM. I'm marking this as draft until I get that worked out as well and then THM_PC22 and THM_JUMP24 should be good. I'll add the test along with that updated patch.

Author: Kinsey Moore 2024-09-24T19:13:39.438Z

A test enabled only on ARM has been added that contains both test cases.

Did you build the BBB? It is an ARM only build, no thumb? I use it to check any ARM/thumb related changes.

Author: Kinsey Moore 2024-09-25T02:02:55.113Z

I hadn't and I'll double-check. The changes are highly specific to loaded Thumb code and I wouldn't expect that to get generated on an ARM-only build.

Author: Chris Johns 2024-09-25T02:02:55.113Z

Yes but the test is built for all ARM BSPs so lets check.

Author: Kinsey Moore 2024-09-25T02:02:55.113Z

I have checked and there are no compilation issues with the BBB BSP.

Commit	6003ea9d94574554dde2173402aa4f3df87a33f0

Summary

This allows BSPs to customize how the current processor index is determined during system start.

Update #5064.

Author: Sebastian Huber 2024-09-20T04:19:59.011Z

mentioned in merge request !113

Author: xiaojun zheng 2024-09-20T04:46:37.467Z

This addresses the issue at startup. What about SGI? It needs target MPDIR, add more BSP-specific functions?

Author: Sebastian Huber 2024-09-20T04:49:54.521Z

The SGI is another issue not related to this MR. Could we please focus on a step wise approach. Does this API work for your BSP?

Author: xiaojun zheng 2024-09-20T05:02:10.116Z

From my perspective, these issues are all related to MPIDR map, so I think they should be considered together. Apply this patch, I need to provide the function _AArch64_Get_current_processor_for_system_start for my BSP, so I can not test now.

Author: Sebastian Huber 2024-09-20T05:12:42.150Z

Yes, please try to implement the _AArch64_Get_current_processor_for_system_start() for your BSP and then you can open another draft MR and we discuss the next step.

Your _AArch64_Get_current_processor_for_system_start() is just the new code block for start.S in your original MR.

Author: xiaojun zheng 2024-09-20T05:21:35.014Z

In my original MR, it is implemented in C, and now it needs to be converted to assembly. I'm trying.

Author: Sebastian Huber 2024-09-20T05:27:06.097Z

No, I mean your new code block in start.S. This could be simply:

```
FUNCTION_ENTRY(_AArch64_Get_current_processor_for_system_start)

ldr x0, =aarch64_cpu_boot_params
ldr x0, [x0, #BOOT_PARAM_CPUN_OFFSET]
ret

FUNCTION_END(_AArch64_Get_current_processor_for_system_start)
```

Author: xiaojun zheng 2024-09-20T05:31:43.350Z

here is just get the cpun from struct aarch64_cpu_boot_params, but cpun should be searched from the map table first.

Author: Sebastian Huber 2024-09-20T05:35:59.544Z

Sorry, I don't understand your problem. The original patch is this:

```
@@ -219,9 +219,8 @@ _el2_start:
_el1_start:

#ifdef RTEMS_SMP
-  /* Read MPIDR and get current processor index */
-  mrs x7, mpidr_el1
-  and x7, x7, #0xff
+  ldr x3, =aarch64_cpu_boot_params
+  ldr x7, [x3, #BOOT_PARAM_CPUN_OFFSET]
#endif

#ifdef RTEMS_SMP
```

Now you have to move it to the _AArch64_Get_current_processor_for_system_start() function, that is all.

Author: xiaojun zheng 2024-09-20T05:45:12.508Z

Oh, I see. aarch64_cpu_boot_params should still be used. I'm stuck on deleting the variable aarch64_cpu_boot_params.

Author: Sebastian Huber 2024-09-20T05:47:50.088Z

There is no need to delete it. With the new _AArch64_Get_current_processor_for_system_start() function, its use is

hidden from the generic start code. However, as I said before, you may have synchronization issues if multiple cores are started in parallel.

Author: xiaojun zheng 2024-09-20T06:19:16.007Z

It works on my BSP.

```

Author: Chris Johns 2024-09-19T13:23:33.462Z

Looks like the 32bit BSP will need a different `linkcmd` file. I suggest it be based on the version before this one unless you know a way to handle both?

Author: Sebastian Huber 2024-09-19T13:23:33.462Z

I didn't look into the details.

Author: Chris Johns 2024-09-19T13:23:33.462Z

Hmm maybe it is opposite, the BSPs share the MMU config but different `linkcmd` files which could make the unresolved symbols. If it is a conditional define might work?

Sorry I would need @opticron to comment because I have never built the 32bit BSP and I will never use it. @joel explained the reasons for it but I cannot remember.

Author: Kinsey Moore 2024-09-19T13:23:33.462Z

The reason for the ILP32 BSP is minimized code and memory footprint for applications that don't reach beyond the 4GB barrier. This situation is common, but most (if not all) people go with the LP64 BSPs anyway. Clearly it isn't regularly built and has also suffered historically from a lack of proper newlib support which we rectified via patch in RSB until the code got integrated from arm-optimized-routines last year thanks to Sebastian.

Author: Utkarsh Verma 2024-05-26T02:34:28.871Z

I'll summarise how you could go about this patch.

- `arm-pl011.h`:
- Add the IRQ struct fields from our `pl011.h` file.
- Add the clock struct field.
- `arm-pl011.c`: Port functions from our new driver to this file. Things should pretty much be the same except for the register access which now utilises structs instead of macros.

Additionally, you'll notice how I've placed `const` everywhere I could. It's a good practice for optimisation, and more importantly, it enforces constraints on values that should not be modified.

With these changes, you'll be done with the base ARM PL011 driver. As Gedare and others pointed out, it is just a base spec, and other manufacturers build devices on top of it. This results in the derivatives having a different register map at the end. I think Versal and RPi both have these differences. What we'll do in these cases is as follows.

- Create a new driver under the BSP directory (`bsps/aarch64/rasperrypi/{dev/pl011.c,include/pl011.h}`)
- `pl011.h`: Define the device-specific registers in a new struct extending from `arm-pl011-regs.h`. (See below how)
- `pl011.c`: Create a new driver that wraps over `arm-pl011` with the registers from `pl011.h`.

Since C does not have inheritance, we mimic it using structs here. Any device following the ARM PL011 spec will have the layout set by (https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/bsps/include/dev/serial/arm-pl011-regs.h?ref_type=heads). The new registers should follow them.

Hence, in `pl011.h`, we create a new struct for the regs that our driver uses.

```
#include <arm-pl011-regs.h>

typedef struct {
pl011 base;

/* Any new registers that you have specific to RPi. */
} raspberrypi_pl011;

typedef struct {
rtems_termios_device_context base;
```

(continues on next page)

(continued from previous page)

```
volatile raspberrypi_pl011 *const regs;
const rtems_vector_number irq;
const uint32_t initial_baud;
} raspberrypi_pl011_context;
```

Author: Utkarsh Verma 2024-05-29T12:08:52.690Z

Before creating a new `raspberrypi_pl011` driver, please compare the register maps from the Raspberry Pi datasheet and PL011 reference. The `arm-pl011` might just be enough for what we want as of now. AFAIR, the new driver doesn't use any register specific to the RPi.

changed this line in version 15 of the diff

Author: Gedare Bloom 2024-06-18T05:46:19.073Z

restructure this to use the same layout as the other `xxx_pl011_context` structs, with a `arm_pl011_context pl011_ctx;` (or similarly named) as the first element. You can just ignore unused fields. It looks like there might be some variables in the `arm_pl011_context` for the interrupt-based driver that have slightly different variable names (like `tx_queued` and `tx_queued_chars` and maybe `first_send` is the same as `needs_sw_triggered_tx_irq`). Make them consistent.

Author: Gedare Bloom 2024-06-18T05:46:19.073Z

Some of these variables appear to be redundant now to `pl011_ctx.{needs_sw_triggered_tx_irq,tx_queued_chars}`

Author: Ning Yang 2024-06-18T05:46:19.073Z

These variables are used by the UART interrupt mode. I think it's better to modify them in refactored UART interrupt mode MR.

Author: Gedare Bloom 2024-06-18T05:46:19.073Z

I would like you to try to make them consistent now.

Author: Gedare Bloom 2024-06-18T05:46:39.813Z

Please compare this code with the `aarch64/xilinx-versal/dev/serial/versal-uart.c` I think some improvements can be made (in both). I will review this file again after consideration is given to making them be more consistent. They cannot be the same (due to some Versal oddities).

You might consider splitting the interrupt-driven PL011 submission to a separate MR, and focus on merging the refactoring of the polling one first.

Shouldn't this fit better in `arm-pl011-regs.h` under the `arm_pl011_regs` struct?

@gedare @opticron

Author: Ning Yang 2024-07-06T02:58:28.959Z

The fields at the end are different from the PL011 registers of the Raspberry Pi.

The pl011 registers of the Raspberry Pi 4b are as follows: !`image <https://gitlab.rtems.org/-/project/uploads/0473c4c3dad9d21641ed1a8e7fd6f876/image.png>`_

Author: Gedare Bloom 2024-07-06T02:58:28.959Z

I agree with how @yangn0 has approached this. The PL011 registers are different in a few of the specific UART implementations. So the `arm_pl011_uart` is the right way how to "specialize" the PL011 for the usual PL011 register map.

Author: Utkarsh Verma 2024-07-06T02:58:28.959Z

Oh, now I understand the problem we face and the solution makes sense. However, now that we are treating `pl011` as its own entity, i.e. utilising its register map and declaring functions from it. Shouldn't we move all that functionality to its own file?

Maybe something like this: * `pl011.h`: Contains `pl011_context` base PL011 functions that all the derivatives use or wrap around. * `pl011-regs.h`: Used by `arm-pl011.h` and other device-specific drivers. We do not have an `arm-pl011-regs.h` anymore.

Author: Utkarsh Verma 2024-06-18T05:51:28.219Z

Shouldn't we have the `raspberrypi_pl011` have its own functions that wrap over `arm_pl011` once?

In terms of structure, believe we should only have `raspberrypi-pl011.h` include in this file and we should call `raspberrypi_pl011_xx()` instead of directly calling `arm_pl011_xx()`.

@opticron @gedare

Author: Gedare Bloom 2024-06-18T05:51:28.219Z

I'm ok with it either way, whatever is more convenient. If this can work by directly calling the (shared) `arm_pl011_xxx` functions, that seems better than redefining some redundant functions that just wrap them.

Author: Utkarsh Verma 2024-06-18T05:51:28.219Z

Understood. This can be marked as resolved.

- bb50934d - dev/serial: Refactor the pl011 driver

Compare with previous version

Author: Ning Yang 2024-07-06T03:01:44.861Z

Hi @gedare,

I carefully compared the versal uart driver and the pl011 driver. I think the new pl011 driver is fully compatible with the versal uart.

I have tested it and the versal uart can work.So I deleted the versal uart driver and used the pl011 driver directly.

What needs to be discussed about the two drivers is:

In versal-uart.c line164:

```
static void versal_uart_write_support(
rtems_termios_device_context *base,
const char *buf,
size_t len
)
{

...

/*
* The PL011 IP in the Versal needs preloading the TX FIFO with
```

(continues on next page)

(continued from previous page)

```
* exactly 17 characters for the first TX interrupt to be
* generated.
*/
if (ctx->first_send) {
ctx->first_send = false;
for (int i = 0; i < 17; ++i) {
regs->uartdr = VERSAL_UARTDR_DATA('\r');
}
}
while (versal_uart_flags_clear(regs, VERSAL_UARTFR_TXFF) &&
len_remaining > 0) {
regs->uartdr = VERSAL_UARTDR_DATA(*p++);
--len_remaining;
}
ctx->tx_queued = len - len_remaining;
ctx->transmitting = true;
}
...
}
```

The pl011 driver also encounters the problem of triggering the first TX interrupt. I think the handling method in the pl011 driver is better. It does not require writing extra \r characters.

In addition, I modified pl011 driver with reference to versal uart driver.

Thanks for your help!

Author: Gedare Bloom 2024-07-06T03:01:44.861Z

@chris I would like you to take a look at the Versal changes, and eventually may need you to test them in the hardware. @yangn0 I believe that the qemu model for the Versal cheats and uses the PL011 so it may work on the simulator, but might break on the hardware phy.

Author: Ning Yang 2024-07-06T03:01:44.861Z

I splited the versal uart part from MR.

This should be placed higher up in the spec folder as it directly corresponds to the ARM PL011 driver. That you'll avoid repeating this for other devices.

You can place it either in `spec/build/bsps/dev/serial/` or directly under `spec/build/bsps/` but change the name to `optarmpl011fifo.yml`.

Author: Ning Yang 2024-07-06T03:26:48.629Z

The fifo size is different for different BSPs. Is it better to set the fifo size for each BSP separately?

Why wouldn't you use "&pl011_context.pl011_ctx.base" here? The cast being performed here is technically correct for the current implementation, but if the struct ever changes then bad things can happen since the cast will become invalid. This question applies to the other uses of the raspberry pi wrapper context as well.

Author: Ning Yang 2024-06-25T12:23:52.217Z

changed this line in version 23 of the diff

Author: Kinsey Moore 2024-07-06T02:57:38.874Z

If there is only one member of this struct, why is it being wrapped at all? It doesn't seem to be necessary.

Author: Ning Yang 2024-07-06T02:57:38.874Z

Some PL011 has device-specific registers, which may require some device-specific context fields.

In order to be more unified, I created device-specific context structure to all BSPs with pl011.

The context of Versal UART driver has some unique fields. But I think the current PL011 driver can completely replace the Versal UART driver. I tested it on Versal Qemu, and it needs to be tested on the hardware. (https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/47#note_107457)

If the test passes, I think device-specific context is unnecessary. Because all device-specific contexts have only one member.

Author: Kinsey Moore 2024-07-06T02:57:38.874Z

Does this mean the current patch is incomplete? The issue I'm bringing up is that the `raspberrypi_pl011_context` structure only exists to provide an accessor for the

`arm_pl011_context`. That part of this patch is essentially a no-op as the outer context is never used or passed to any other function.

BSPs that use the base implementation don't need the wrapper struct at all and can just use the base struct directly.

Author: Ning Yang 2024-07-06T02:53:54.175Z

changed this line in version 28 of the diff

Author: Ning Yang 2024-07-06T02:57:38.874Z

Done. All BSPs except `xilinx-versal` now use the base struct directly.

I also deleted the `raspberrypi-pl011.h` file because it was not used.

If I recall correctly, the reason to wrap the pl011 registers with a unique Versal struct was because there were additional registers beyond the base register set on some implementations, but I don't see those here. Did they get accidentally left out? If not, this does not need to be wrapped.

Author: Ning Yang 2024-07-29T05:16:04.669Z

https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/43#note_106149

Gedare said it would be cleaner.

Author: Kinsey Moore 2024-07-29T05:16:04.669Z

It's cleaner if you need to add more registers when implementations vary, but that's not happening here. That's why I'm asking if there are missing registers that were intended to be used.

I think these functions / this file should have doxygen comments.

Author: Gedare Bloom 2024-08-23T17:39:11.341Z

I think this object is only used in the `arm-pl011.c` file. Avoid declaring a global symbol here, and instead declare it in that file (with `static`). It is good practice to reduce the number of global symbols.

Author: Ning Yang 2024-08-23T17:39:11.341Z

The variable `arm_pl011_fns` needs to be used in the `console.c` file of BSP. such as: rtems/bsps/aarch64/a53/console/console.c line56

Author: Gedare Bloom 2024-08-18T18:40:00.273Z

I don't think `volatile` is needed for any of these uses of `pl011_base`.

Hi @gedare,

I reduced the use of `volatile` as much as possible. And finally found that it is necessary for the following functions to use `volatile`:

`arm_pl011_write_char` : If there is no `volatile`, there will be problems with the output of printf.

`arm_pl011_is_rxfifo_empty`

`arm_pl011_is_txfifo_full`

```
/*
* Wait for any data in the TXFIFO to be sent then wait while the
* transmiter is active.
*/
while (
(((volatile arm_pl011_uart *) regs)->base.uartfr &
PL011_UARTFR_TXFE) == 0 ||
(((volatile arm_pl011_uart *) regs)->base.uartfr &
PL011_UARTFR_BUSY) != 0
) {
/* Wait */
}
```

There are a lot of places where you're casting to volatile on accesses instead of making variables volatile. The variables themselves should be volatile when possible to reduce the chance that someone forgets to cast the pointer before using it to access struct-mapped fields.

Author: Ning Yang 2024-08-27T15:52:48.447Z

changed this line in version 42 of the diff

Author: Ning Yang 2024-08-28T14:49:19.314Z

If I add `volatile` in this line, the parameters of functions `arm_pl011_enable_irq` and `arm_pl011_clear_irq` must also be added volatile(Otherwise the compiler will issue a warning), which is unnecessary.

Only in these position `volatile` is necessary: https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/47#note_111352

Add `volatile` to them all?

Author: Kinsey Moore 2024-08-28T14:49:19.314Z

@gedare I would argue that anything that directly represents memory-mapped registers and makes it trivial to access them should always be marked as volatile to avoid cases where volatile needs to get applied and it's forgotten. You seem to suggest otherwise in https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/47#note_111073

Author: Sebastian Huber 2024-08-28T14:49:19.314Z

Everything which points to device memory need to be volatile, so the `arm_pl011_get_regs()` should return a volatile pointer and all users should have this as well.

Commit	d304a817db120a28fc82efda288bd5da3ab3574a

Summary

This patch removes unnecessary actions from the dev/serial/zynq driver. It also improves the baud calculation.

Author: Sebastian Huber 2024-08-29T02:14:19.309Z

assigned to @sebhub

Author: Amar Takhar 2024-08-29T02:34:16.404Z

Is there an MR or issue that can be linked for the change to `tms570-sci.c`? Easier to keep track then thanks.

Author: Sebastian Huber 2024-08-29T02:34:16.404Z

I picked up this patch from January as is. It is not from me.

Author: Amar Takhar 2024-08-29T02:34:16.404Z

No worries I was hoping you knew if there was a ticket/issue of course there wouldn't be an MR from January. Thanks.

changed the description

Author: Chris Johns 2024-09-17T03:28:20.781Z

The commit comment is correct. It should be noted the flush sending the data worked around an issue or bug in the Versal UART related to how our termios works. With interrupts active our code assumes an TX interrupt can be triggered by a single termios character write to a TX holding or shift register. The Versal UART with a FIFO mod to the ARM cell design required half the programmed FIFO to be filled to generate the first TX interrupt after which things worked normally. I reviewed the Linux driver and our driver and could not see any functional differences other than Linux sends a 10+ character string as its first boot message. I am fine with the send of the `\r` being removed from the TX flush but the commit comment and the change do not line up.

We should wait for all TX data to be sent before we touch the UART hardware and this means the TX shift register being empty. A deep FIFO may have data from the bootloader a user may be requited to see. Is there a TX flush before the UART hardware is touched?

Author: Sebastian Huber 2024-09-17T03:28:20.781Z

The `zynq_uart_initialize()` waits for the TX FIFO to be empty and TX to be inactive before it changes the settings. This patch removes code which was done after the settings were applied.

The patch is seven months old picked up from the mailing list. I would prefer to not change it just to get a better commit message.

Author: Sebastian Huber 2024-09-17T03:28:20.781Z

Is there anything left to do with respect to this thread?

Author: Kinsey Moore 2024-09-17T01:53:48.660Z

It should be made clear that this is explicitly bit 0. I would suggest changing this to a boolean parameter and renaming it accordingly. The original code checked a specific bit where the new code uses this as a scaling factor for a bit shift which can be misleading.

Author: Sebastian Huber 2024-09-17T01:53:48.660Z

In the description we have: `@param mode_clks is the value of the CLKS bit of the Zynq UART mode register.`.

Using a bool just leads to more branches. I can add an `_Assert((mode_clks & ~ZYNQ_UART_MODE_CLKS) == 0)` to zynq_uart_calculate_baud().

Author: Sebastian Huber 2024-09-17T01:53:48.660Z

Also the callers of zynq_uart_calculate_baud() have to make sure that they write back the CLKS bit as is. I think with the assert, the code should be fine.

Author: Sebastian Huber 2024-09-17T01:53:48.660Z

@opticron Is the new _Assert() acceptable for you?

Author: Kinsey Moore 2024-09-17T01:53:48.660Z

A bool implicitly casts to 0 or 1, but the assert is acceptable.

Author: Kinsey Moore 2024-09-17T13:33:25.610Z

The previous implementation only checked bdiv=4 to bdiv=254. The new implementation checks up to bdiv=255. Was that an intentional change? The commit that makes this change is very similar in logic, but it is completely reorganized so I've had to spend quite a bit of time unwinding the modifications to verify what parts of the logic have changed.

Author: Sebastian Huber 2024-09-17T13:33:25.610Z

According to the TRM: `BDIV is a programmable field in the Baud Rate Divider register and can be programmed with a value between 4 and 255.`

Author: Sebastian Huber 2024-09-17T13:33:25.610Z

The key difference to the previous implementation is that the code is easier to test and that the function tries to yield a sample set around 16 per RX-bit.

Author: Chris Johns 2024-09-17T13:33:25.610Z

For clarification, does selecting a clock that gives around 16 samples per bit improves the noise immunity compared to a clock that is closer but has less samples per bit?

Author: Sebastian Huber 2024-09-17T13:33:25.610Z

The previous code just selected the best error. In the new code we have this:

```
1 /*
2 * The procedure to detect a start bit uses three samples in the middle␣
  ↪of
3 * an RX-bit.  If the sample set is too small, there may be a sample in
```

(continues on next page)

(continued from previous page)

```
* another bit in case the baud setting is not accurate.  Most noise is
↪in
* the form of small peaks, if the sample rate is too high, then noise
↪may
* get detected as a bit.
*
* Prefer an sample set of around 16 per RX-bit.
*/
if (error < best_error || (bdiv_plus_one <= 20 && error <= best_error))
↪{
best_error = error;
best_cd = cd;
best_bdiv_plus_one = bdiv_plus_one;
}
```

In my tests I got this on the ZCU104:

```
desired baud: 9600, actual baud: 9600, error 0, max error: 288, cd: 651,
↪ bdiv: 15
desired baud: 19200, actual baud: 19201, error 1, max error: 576, cd:
↪372, bdiv: 13
desired baud: 38400, actual baud: 38402, error 2, max error: 1152, cd:
↪186, bdiv: 13
desired baud: 57600, actual baud: 57603, error 3, max error: 1728, cd:
↪124, bdiv: 13
desired baud: 115200, actual baud: 115207, error 7, max error: 3456,
↪cd: 62, bdiv: 13
```

Author: Chris Johns 2024-09-17T13:33:25.610Z

Commit	3aa1f1faeef9345929a3e3f550750601797cf32b

Summary

poll.h and sys/poll.h were in both RTEMS and Newlib

Remove the copies in RTEMS. Most POSIX headers are in Newlib.

CLoses #5126

Summary

bsps/i386/include/bsp/irq.h is pc386 specific

The IRQ list in this file are specific to PC hardware and should be part of the BSP. Further, there are paravirtualized environments which do not follow the PC hardware IRQ list. Moving this avoids collisions.

This is a sentence not a Table of Contents style entry.

Author: Joel Sherrill 2024-08-16T15:20:56.120Z

You still need the @brief

Author: Joel Sherrill 2024-09-12T02:31:47.127Z

This is not a proper brief. It should be a Table of Contents entry.

Author: Sebastian Huber 2024-09-12T02:31:47.127Z

The `@brief` comments should be proper sentences and not just head lines. In particular for `@file` blocks, see also the Doxygen guidelines:

https://docs.rtems.org/branches/master/eng/coding-doxygen.html#files

I spent a considerable amount of time to add these `@file` comments to quite a lot of files and it would be really nice if my work doesn't get reverted.

Author: Mohamed Hassan 2024-09-12T02:31:47.127Z

@sebhub I made the required changes following the Doxygen guidelines. Should I issue a separate merge request or you could pull these updates to your branch?

Author: Sebastian Huber 2024-09-12T02:31:47.127Z

Since this MR is older, I would prefer to merge it first and then you can rebase your MR.

Author: Mohamed Hassan 2024-09-12T02:31:47.127Z

Ok, whenever it's got merged. I will submit these changes.

Commit	f075fa55cd89efe32547c8558f23d616b3d9ad4d

Summary

spmsgq_err[12]: Add message sizes to configuration

The test had hard-coded numbers for maximum messages and message sizes. As a result, it did not configure the memory required for message storage.

Author: Joel Sherrill 2024-09-09T23:52:20.983Z

assigned to @joel

Author: Sebastian Huber 2024-09-10T02:05:36.097Z

If MAX_MESSAGES == 2, then this changes the test case.

Author: Sebastian Huber 2024-09-10T02:05:36.097Z

Ok, probably doesn't matter for the error conditions checked.

Commit	6dee3075426b65d830e8e9957f8a1b644825934a

This patch set resolves several warnings (mostly specific to stm32h7 or ARMv7m) and adds SPI support with an example configuration for SPI2 on the stm32h750b-dk development board on the STMOD+ header.

Author: Kinsey Moore 2024-09-04T18:18:20.158Z

assigned to @opticron

Author: Sebastian Huber 2024-09-05T14:20:52.720Z

I am a bit surprised that this fixes the warning. We have RTEMS_DECONST() to get rid of it.

Author: Kinsey Moore 2024-09-05T14:20:52.720Z

I'll adjust these changes to use RTEMS_DECONST().

Author: Sebastian Huber 2024-09-05T14:38:30.221Z

Should this be also under `#ifdef SPI2`?

I only briefly reviewed the rest. I found nothing obvious.

Author: Kinsey Moore 2024-09-05T14:38:30.221Z

I'll gate it behind STM32H7_SPI2_ENABLE. SPI2 is a CPU variant definition and is guaranteed to exist on this board.

Author: Cedric Berger 2024-09-09T18:45:47.928Z

Hello Kinsey, thanks for doing that. I'm in the train reading your patch, `stm32h7_spi_transfer()` specifically, and I've one comment: SPI can be full-duplex, And I think you don't handle the case where both a TX and RX buffer are provided. In that function, if `(msg->rx_buf != NULL && msg->tx_buf != NULL)`, then you should call `HAL_SPI_TransmitReceive()`, and not `HAL_SPI_Transmit()` followed by `HAL_SPI_Receive()`

Author: Kinsey Moore 2024-09-09T18:45:47.928Z

Good catch! I have some more work to do related to the DMA engines, so I'll include this in my next patch set.

Commit	1b6684ee2bc2320327b56d5ed090d6f7a6e82d61

Summary

Implemented lio_listio() and added a test (psxaio05) to verify the new code is working. To avoid duplicating too much code, the content of aio_read() and aio_write() has been extracted in two helper methods so that it can be used in lio_listio().

```

Running the tests and check for regressions would be also quite nice.

Author: Amar Takhar 2024-09-05T10:36:42.358Z

@AlessandroNardin Can you please open an issue for this and figure out what went wrong? Thank you.

Author: Alessandro Nardin 2024-09-05T10:37:02.036Z

I'll look into it. I built the project using sparc/erc32 before submitting the changes, and everything was working correctly. I'll try with a different architecture to see if I can reproduce the error.

Also, I didn't notice it before, but I should also remove the call to lio_listio() form the psxenosys test, since it has been implemented. I'll also open an issue for that.

Commit	adce3801380af04c5a70dec734bd41085f0b22ca

Summary

cpukit/posix/aio*: added support for O_DSYNC

The aio_fsync function now supports the value O_DSYNC for op. Tests are added to improve coverage and test new features.

Closes #5040.

These two **LIO_** constants do not appear to be in the POSIX standard. aio.h is specified at https://pubs.opengroup.org/onlinepubs/9699919799/basedefs/aio.h.html. Where did you find these?

There are O_RSYNC and O_DSYNC that are to be used with aio_fsync().

Perhaps you need these internally in which case they should have been defined in aio_misc.h in a way that doesn't have potential to conflict with aio.h constants.

Author: Alessandro Nardin 2024-07-30T09:29:21.111Z

changed this line in version 8 of the diff

Author: Alessandro Nardin 2024-08-02T14:29:18.816Z

LIO_SYNC was already defined when I started working on the code. I noticed it wasn't defined in the POSIX specifications, but since it was there, I figured I could add another constant.

I've changed this and defined internal constants in aio_misc.h for each operation.

Author: Joel Sherrill 2024-07-30T09:41:47.731Z

As I suspected. In this case you need private opcodes defined in aio_misc.h and be sure they do not conflict.

Commit	3b96aadddef2c972dd4a1fbc7741ab4f5aedf7b4

Summary

Addition of notification upon AIO request completion, using the `aio_sigevent` field in the `aiocb` struct.

Closes #5068

Author: Joel Sherrill 2024-07-18T15:59:06.936Z

Shorten the brief. Think section heading in Table of Contents.

Turn the details into a first paragraph.

Add @param for the argument.

Author: Alessandro Nardin 2024-07-18T15:59:06.936Z

I have rewritten it. Now it should be better.

Author: Joel Sherrill 2024-07-19T14:42:48.777Z

Remove extra blank line.

Author: Alessandro Nardin 2024-07-17T13:09:48.580Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-07-19T14:42:48.777Z

removed

Author: Joel Sherrill 2024-07-19T14:43:06.015Z

Is this for your debugging or needed permanently?

Author: Alessandro Nardin 2024-07-17T13:09:48.902Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-07-19T14:43:06.015Z

It was for debugging, I removed it.

Author: Joel Sherrill 2024-07-21T13:58:48.825Z

Space needed. “){” should be “) {“.

I see this multiple places. Search and destroy.

Author: Alessandro Nardin 2024-07-17T13:09:49.225Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-07-21T13:58:48.825Z

Now it should be correct

Author: Joel Sherrill 2024-07-21T13:58:48.825Z

Someone commented on the indentation of the cpp directives. They look off here also around line 366.

Also 368 should be formatted onto multiple lines. But if this is not something that could occur, it may be better to turn it into an rtems debug assert.

Author: Alessandro Nardin 2024-07-21T13:58:48.825Z

The directives indentation should be right now. I turned the if in an assert.

Author: Joel Sherrill 2024-07-21T13:58:48.825Z

Info should be in another comment but use _Assert() which is tied to the RTEMS Debug build configuration. rtems/score/assert.h should be the header.

Author: Joel Sherrill 2024-07-21T13:58:48.825Z

I'm sorry that I didn't think this this earlier. You can use "(void) result;" to indicate you are explicitly not checking the result.

Author: Alessandro Nardin 2024-07-21T13:58:48.825Z

I've added it just below the variable declaration, is this okay or should i put it inside some `#ifdef [SOMETHING]` directive?

Author: Joel Sherrill 2024-07-19T17:14:35.479Z

There isn't really anyway to handle an error here. Should this be caught at the API level so an error can be returned to the caller?

If so, then the checks which were in here can become debug asserts.

Author: Alessandro Nardin 2024-07-17T13:09:49.548Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-07-19T17:14:35.479Z

Yes, it was one of my main doubts. I added a function to check if the sigevent struct is valid. My plan is to call this function in aio_read, aio_write, and aio_sync, and return an error if the struct is invalid. I was uncertain if this was the right approach because it is not mentioned in the POSIX specification.

Author: Alessandro Nardin 2024-07-19T17:14:35.479Z

Since there are no specification about that, what error code should return on a wrong sigevent struct ?

Author: Joel Sherrill 2024-07-19T17:14:35.479Z

EINVAL I guess. It is a catchall for bad parameter. And it looks like the indentation on 441-442 is off.

Author: Joel Sherrill 2024-07-19T17:14:35.479Z

And any assert() should be the RTEMS internal _Assert().

Author: Alessandro Nardin 2024-07-19T17:14:35.479Z

Now every assert should be _Assert()

Author: Joel Sherrill 2024-07-19T15:14:03.512Z

You need to wrap the sigev_notification function in a wrapper thread body which has the proper signature. Pass in the notify function as the argument, cast it, call it, and return NULL. It may also make sense to explicitly call pthread_exit() at the bottom of the wrapper function.

Author: Alessandro Nardin 2024-07-17T13:09:50.225Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-07-19T15:14:03.512Z

Now it should be right if I understood correctly what you meant. I passed the sigevent structure as a parameter to the wrapper function since it contains the pointer to the function and its parameters.

I was curious to understand why this is necessary. Is it to improve code readability, or are there other reasons?

Author: Joel Sherrill 2024-07-19T15:14:03.512Z

The sigev_notify_function does not have the signature required for a pthread body.

On line 454, you do not need the & to get the address of a function. The name of a function (or array) is itself an address.

Author: Joel Sherrill 2024-07-19T12:23:47.360Z

Parentheses are not needed.

Can fit on one line.

Author: Alessandro Nardin 2024-07-17T13:09:50.542Z

free_aiocb does not need a space after the free function name or a cast of the parameter.

Author: Alessandro Nardin 2024-07-19T17:08:39.208Z

I don't know if it is what you meant, but removing the cast generates a warning.

Author: Joel Sherrill 2024-07-19T17:08:39.208Z

OK. aio_buf is oddly "volatile void *" in the POSIX standard and our aio.h. The cast is needed to remove the volatile part because free() expects just a "void *"

There is still the issue of a space after the method name.

Author: Joel Sherrill 2024-07-19T14:47:59.279Z

Is this completely new? Modified? Does your copyright and 2024 need to be added?

I should have been clearer on assert. Do not use the C Library assert. Use the rtems debug assert _Assert(). This is only enabled when RTEMS is built with debug mode enabled.

It is prototyped in <rtems/score/assert.h>

Author: Alessandro Nardin 2024-07-19T16:49:47.113Z

That's my fault, i changed the assert in _Assert but forgot to change the header.

Commit	d81bf04501cb83de4586f431ae91123e4965d86a

Summary

bsps/stm32h7: Workaround STM32 H7 errata by enforcing aligned access only

The patch changes compiler ABI flags option and adds -mno-unaligned-access there. Usage of this option is also officially recommended way by the errata document how to work around the issue. For more details about the errata please see referenced issue number.

Closes #5110.

Closes #5110

Author: Kinsey Moore 2024-08-09T19:44:44.098Z

The errata this is trying to work around only applies to the FMC peripheral. This should not be applied to all code.

Author: Karel Gardas 2024-08-09T20:14:40.951Z

GitLab schism. Should we discuss this here or in the issue itself? I prefer issue, so let's go there if you do not object.

Commit	ad51286e2b00f0e2bdd080397f4287646f512ef1

Summary

cpukit/stackchk: Remove additional offset of SANITY_PATTERN_SIZE_WORDS

This offset is already accounted for by Stack_check_Usable_stack_start() called from Stack_check_Visit_stack() and adding it a second time can cause interaction beyond the bounds of the stack.

Author: Sebastian Huber 2024-08-29T00:13:42.142Z

The change is correct, but there is no out of bounds access of the stack. The stack is definitely larger than SANITY_PATTERN_SIZE_WORDS. You get an inaccurate usage value if the stack usage is close to the maximum.

Commit	cb0a5305039f32197674f9faa176774bdb391a0c

Summary

This patch set improves the arm default exception handling. A test program is work in progress.

Author: Sebastian Huber 2024-08-28T02:24:08.551Z

assigned to @sebhub

Author: Chris Johns 2024-08-28T06:58:44.910Z

Can you please explain how it is improved?

Author: Sebastian Huber 2024-08-28T06:58:44.910Z

I would go though the individual commits. These are small changes which showed up while testing the default exception handlers.

Author: Chris Johns 2024-08-28T06:58:44.910Z

I have gone through them and I do not understand why you say this is an improvement? There is movement and changes in code and an overview would be helpful when reviewing. Thanks

Author: Sebastian Huber 2024-08-28T06:58:44.910Z

Nobody tested this code systematically in the past. So this MR is really just a mix of things which in general improve the default exception handling on arm.

Author: Chris Johns 2024-08-28T06:58:44.910Z

How did you test it?

Author: Sebastian Huber 2024-08-28T06:58:44.910Z

I prepared values for all saved registers, then triggered an exception and checked what was stored in the exception frame. The test doesn't compile for all BSPs. I would be a bit of work to integrate this test.

Author: Chris Johns 2024-08-28T06:58:44.910Z

Thanks this provides a nice history and summary.

It is up to you to make the test available somewhere. I understand and appreciate these types are tests are hard to make something we can accept and maintain.

Author: Sebastian Huber 2024-08-28T06:58:44.910Z

For example, to test the FIQ exception you have to be able to trigger an FIQ. This is BSP specific and some targets may not support FIQs.

Author: Chris Johns 2024-08-28T06:58:44.910Z

You could attach it to this MR? :smile:

Author: Sebastian Huber 2024-08-28T06:58:44.910Z

0001-validation-Test-ARM-default-exception-handling.patch

Author: Chris Johns 2024-08-28T06:13:40.993Z

Can you please explain how this change works? The `udf` means the instruction is never defined.

Author: Sebastian Huber 2024-08-28T06:13:40.993Z

This vector table is used by the hypervisor mode. If it is used, then this is a fatal error.

Author: Chris Johns 2024-08-28T06:13:40.993Z

This is a good change.

Author: Chris Johns 2024-08-28T06:12:07.567Z

Which BSPs are effect? Have all BSPs been reviewed?

Author: Sebastian Huber 2024-08-28T06:12:07.567Z

The change affects all BSPs using the shared start file. Only the LPC2400 based BSPs use this signature as far as I know.

Author: Chris Johns 2024-08-28T06:12:07.567Z

Thanks.

Author: Chris Johns 2024-08-28T06:13:13.216Z

Why can the this be lowered?

Author: Sebastian Huber 2024-08-28T06:13:13.216Z

Because register r8-r12 is not used before it is saved later.

Author: Chris Johns 2024-08-28T06:13:13.216Z

Thanks

Is this resolved? Should it be a C++ comment or C comment?

Author: Matheus Pecoraro 2024-08-24T16:46:46.457Z

To be honest I'm not sure what this comment even refers to. I would say it's not needed, should I remove it?

Author: Joel Sherrill 2024-08-24T16:46:46.457Z

No. Someone was worried about saving the interrupt mask part of a register. Best to leave it until someone more confident than you or I sees it.

Perhaps add an issue and cite it in the comment there. Resolve this comment with "resolve by issue" and be sure the comment references that issue.

Summary

Rename COPYING to LICENSE.md

This follows the current convention we're using.

Even for source that is imported we should be renaming files following our convention to keep consistency.

Author: Kinsey Moore 2024-08-15T17:30:24.041Z

I have no problem with the POSIX COPYING being renamed, but I disagree with renaming the COPYING files in the imported libraries. As far as I'm aware, all the other code we've imported has retained filenames with necessary deviations in directory location and as little modification to the contents as possible. Someone else can feel free to correct/override me.

Author: Amar Takhar 2024-08-15T17:30:24.041Z

I thought about that but none of those are pure imports – I checked. If we were importing 100% of the library I wouldn't touch it but we aren't. So if we're already doing a selective import I don't see why we shouldn't follow our own conventions for documentation. We're renaming our own ``COPYING`` files to ``LICENSE.md`` so I don't see why not. It's not like these are updated often and it would be nice to say all our licenses are in `LICENSE.md`. I don't have strong feelings about it though.

Author: Amar Takhar 2024-08-15T17:30:24.041Z

Any updates to my response here? Thanks

Author: Gedare Bloom 2024-08-15T17:30:24.041Z

Please remove the `xz` and `uuid` changes for now.

Author: Amar Takhar 2024-08-15T17:30:24.041Z

We talked about this on Discord and `uuid` has been modified locally now are you planning an update soon?

Author: Amar Takhar 2024-08-15T17:30:24.041Z

Commit	c2b3a517f620111be2c634bea61821cced866d5e

Summary

bsps/stm32h7: Honor the intent of the MPU alignment option

Currently, if a BSP is built without MPU alignment enforcement, the MPU is still enabled and can produce a non-functional binary since code can be mixed with data within a memory region and memory regions are marked as read-only or no-execute based on section addresses and sizes leading to overlapping regions being defined which causes the later-defined region to take precedence. This change disables the MPU when alignment is not enforced, allowing the binary to function.

You don't need the `&& STM32H7_ENABLE_MPU_ALIGNMENT == 1`. A simple `#ifdef STM32H7_ENABLE_MPU_ALIGNMENT` is enough for BSP options defined by `-define-condition: null` actions.

Commit	3332e54772fb477e81dbe87921fb3a1cca7e3b14

Summary

This patch set unifies the BSP fatal extension so that all BSP use the default implementation.

The bsp_reset() function is marked as no return and has now fatal source/code parameters.

In _Terminate(), everything after invoking the fatal extensions is essentially dead code. Simplify this code block and provide a reasonable safe fall-back for badly configured applications. Just execute an idle loop with maskable interrupts disabled.

Remove the now unused _CPU_Fatal_halt() handler.

Author: Sebastian Huber 2024-07-17T17:07:44.747Z

assigned to @sebhub

Author: Gedare Bloom 2024-07-18T11:42:25.880Z

Is this ready to review?

Author: Sebastian Huber 2024-07-18T11:42:25.880Z

Yes, however, I have to rebuild the BSPs after the resent changes with an updated tool set.

Does this MR change the function signature for `bsp_reset` ?

Author: Sebastian Huber 2024-08-14T23:37:36.942Z

The bsp_reset() function is marked as no return and has now fatal source/code parameters:

```
1 void bsp_reset( rtems_fatal_source source, rtems_fatal_code code );
```

This was necessary to unify the fatal extension of all BSPs.

Author: Chris Johns 2024-08-14T23:37:36.942Z

Reset can be overridden by an app by overriding the call using the linker. An example is a Zynq app I know of where the hardware uses a watchdog to override the default reset behavior because the SoC generated reset does not drive POR low. The system level requirement is all hardware must be reset by software. This change sort of breaks that decade old application. You could argue the additional arguments will be ignored. I would rather we acknowledge that than ignore it.

The other problem is deciding if these `bootcard` calls are interfaces we need to maintain? I do not have an answer for this because it is double edged and can cut both ways.

I like `void bsp_reset(void)` because it is clearly about performing a reset and nothing more. The addition of the options implies extra functionality. Do the arguments mean there can optionally be an extra layer added in a BSP before the actual reset is performed? What do you see the arguments being used for?

I also noticed BSPs have slightly different signatures, some with attributes? Does this means the function signature is BSP specific?

Author: Sebastian Huber 2024-08-14T23:37:36.942Z

The function is declared in <bsp/bootcard.h>:

```
RTEMS_NO_RETURN void bsp_reset(rtems_fatal_source source, rtems_fatal_
↪code code);
```

The system termination changes are something for the hand written release notes. In existing applications, you can use RTEMS version defines to ensure compatibility to a certain RTEMS version.

The sparc `bsp_reset()` uses a system call with two parameters to do the reset:

```
SYM(bsp_reset):
SYM(sparc_syscall_exit):

mov     SYS_exit, %g1
mov     %o0, %g2        ! Additional exit code 1
mov     %o1, %g3        ! Additional exit code 2
ta      SPARC_SWTRAP_SYSCALL
```

Another use case could be to save the source/code in a reset safe register. After reset, the boot code could check this register and do do some actions depending on the reset cause.

Author: Chris Johns 2024-08-14T23:37:36.942Z

Thanks for the information. I suggest the release notes update reference this MR as MRs are now in the release notes.

3.9.2.127 98 - Add new section: .debug_gdb_scripts, across all executables on RTEMS

Id	98
State	merged
Merged by	Amar Takhar

Commit	e13236123ca8a6d7934b75aee03ba0c8bfb268ba

Summary

This MR will modify linker scripts across all architectures (and every BSP for some older architectures), to let their respective linkers know about the new section, `.debug_gdb_scripts` added when linking (from `cpukit/sapi/src/exinit.c`). This is required for auto-loading of Python script(s) specified in the section, which in turn allows for GCC's pretty-printing scripts to load automatically - thereby adding pretty-printing support to RTEMS GDB.

Closes rtems/rtos/rtems#5035

For some reason you have a tab instead of two spaces here. You have that a few more times.

Author: Suraj Kumar 2024-07-11T20:50:52.180Z

changed this line in version 10 of the diff

Author: Suraj Kumar 2024-07-12T06:12:28.324Z

Seems to have been an issue with my code editor, even though I had configured tab to 2 spaces instead of 4. Nevertheless, I have fixed all the formatting issues. Thanks for pointing them out.

Author: Christian Mauderer 2024-07-16T14:47:32.414Z

Is it necessary to have it inside of a function or could you place it outside of one? I'm not sure whether the `asm()` works outside of a function so please just tell me if it doesn't work.

If it works outside of a function, you might can remove the macro too and just add the `asm()` directly. Inside the function I like the solution because it does look quite clean.

Author: Suraj Kumar 2024-07-16T14:47:32.414Z

@c-mauderer Sorry for the late reply, I missed this comment.

Yes, `asm()` works outside of a function as well, would you like me to remove the macro and the function call and just add it directly as global code, or inside the function?

I'm not sure what you meant by:

> Inside the function I like the solution because it does look quite clean.

Author: Sebastian Huber 2024-07-16T14:47:32.414Z

I hope this GDB stuff doesn't need anything which executes on the target. If this `DEFINE_GDB_PY()` just produces a couple of debug sections, then it should be placed at file scope.

Author: Chris Johns 2024-07-16T14:47:32.414Z

It should be stripped by our linker command files. I doubt we have a wildcard that would catch these sections.

Author: Suraj Kumar 2024-07-16T14:47:32.414Z

@sebhub Yes, I think placing `DEFINE_GDB_PY()` at the very top might be a more suitable and clean solution. I was waiting for @c-mauderer's reply as well on this.

Author: Christian Mauderer 2024-07-16T14:47:32.414Z

If it works at a file scope: Please place it at that scope.

You only add the code once. So I don't think the macro is necessary. I would suggest to use the `asm()` statement directly.

Why don't we add the Python code directly here? Relying on a matching RTEMS Tools installation could be a bit brittle.

Author: Chris Johns 2024-07-17T02:04:12.572Z

The idea was to minimize the amount of code we add here and to align the contents of `stdcxx.py` with what ever GCC does. Adding the needed code here means this code is then keyed into how GCC lays out out the pretty printers.

How would you find the version string for GCC? I cannot find it in the built in defines? The `stdcxx.py` is updated by the RSB when installing `gcc` to point to the specific release of `gcc` being built. The RSB finds the version by running the freshly built `gcc`.

Being in `rtems-tools` we could use it to handle RTEMS specific pretty printers as well. I suppose in respect to that maybe the file should be called `rtems.pprinters` and it loads `stdcxx.py`?

Author: Suraj Kumar 2024-07-17T02:04:12.572Z

@sebhub Also, we need not ever change this code as it essentially only points to (loads) another script in `rtems-tools`, which we can modify at will. The `stdcxx.py` script, as Chris has already mentioned, would be installed fresh with every new build with the modifications to the RSB.

@chris Are you suggesting we make a new file (`pprinters.py`) and have that load `stdcxx.py` and other printers? What I had in mind was a little different: We could have a separate directory under `share/gdb/python/rtems` specially for RTEMS specific pretty-printers, and leave `stdcxx.py` as it is since it is only for loading the printers that GCC provides. I felt that would also provide a nice distinction between the two. We can modify `__init__.py` under `gdb/python/rtems` to automatically import every file under that directory at initialisation time, so the support is always

there for both regardless and we would not need to modify the custom section at all. Please let me know what you think of this.

Author: Chris Johns 2024-07-17T02:04:12.572Z

Yes I think we should add a new file to `rtrems-tools` called `pprinters.py` and the debug section in the MR loads that file. This file can load the installed `stdcxx.py`. This extra layer gives us the ability to update `rtems-tools` to automatically load any other printers we development. For example the pretty printers to inspect internal structures.

Author: Suraj Kumar 2024-07-17T00:21:02.201Z

changed this line in version 12 of the diff

Author: Suraj Kumar 2024-07-17T02:04:12.572Z

I have updated the file (`exinit.c`) with the necessary changes.

Author: Chris Johns 2024-07-17T02:05:15.402Z

Thanks. Looks good to me. I will resolve this thread and if @sebhub has any issues it can be unresolved.

Summary

msdos: Fix file truncated to 0

Previously the first cluster of the file was not updated when truncating to 0 but was in any case freed. Now the first cluster of the file is updated during the truncation, leaving the directory entry in a consistent state.

Closes #2757

Is there a test case for this anywhere?

Author: Loris Nardo 2024-08-17T04:41:54.485Z

There is a testcase about truncate to zero length (fsrdwr), but that testcase passes also before the changes of this MR. It seems that the FAT implementation ignores the value of the first cluster if the file length is zero.

Commit	dc123bb828251b4e567390e9b6cfcae48af967b4

Summary

In this draft merge request I added a feature that make the stack checker function that reports a blown stack configurable. I followed the same pattern of `CONFIGURE_TASK_STACK_ALLOCATOR` which is configure at `rtems/cpukit/include/rtems/confdefs/wkspace.h` as follows: 1. At include/rtems/confdefs/extenions.h I added the conditional configuration macros following `CONFIGURE_TASK_STACK_ALLOCATOR` provided here include/rtems/confdefs/wkspace.h 2. Here include/rtems/confdefs/percpu.h I remove everything related to stack check configuration macros I added before. 3. At include/rtems/stackchk.h I've defined the function pointer, declared a variable of it's type same as [include/rtems/score/stack.h](https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/include/rtems/score/stack.h#L78) and mapped the configuration constants to the reporting function like [bsps/include/bsp/stackalloc.h](https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/bsps/include/bsp/stackalloc.h?ref_type=heads) 4. Modified libmisc/stackchk/check.c so that `rtems_stack_checker_switch_extension` call the function pointer instead of the default `Stack_check_report_blown_task`.

Author: Mohamed Hassan 2024-06-20T23:52:41.869Z

mentioned in issue #5047

Author: Joel Sherrill 2024-07-05T19:31:24.576Z

Why do both configure the same value?

Author: Mohamed Hassan 2024-07-05T19:31:24.576Z

Sorry I don't get this, I have one function pointer `_Stack_checker_reporter_initialize: * if CONFIGURE_STACK_CHECKER_REPORTER` defined it will point to `CONFIGURE_STACK_CHECKER_REPORTER * else` it will point to `DEFAULT_STACK_CHECKER_REPORTER`

this pointer is called inside `rtems_stack_checker_switch_extension` can you elaborate more.

changed this line in version 4 of the diff

Author: Joel Sherrill 2024-07-08T19:53:55.297Z

This has the right signature but the name isn't right. The type would be something like Stack_checker_Reporter_extension.

I can't tell from the web but the line looks to be too long and probably should be split. Check me.

Author: Mohamed Hassan 2024-07-08T19:53:55.297Z

ok noted will be modified.

Author: Mohamed Hassan 2024-06-28T09:23:55.140Z

changed this line in version 4 of the diff

Author: Joel Sherrill 2024-07-08T19:53:55.297Z

I think I noted that this should be formatted like a function prototype.

Author: Joel Sherrill 2024-07-05T20:20:36.838Z

Why are the type and variable name and method all the same? It isn't an initialize method anyway. Think about the naming.

Author: Mohamed Hassan 2024-07-05T20:20:36.838Z

I tried to follow the stack allocate pattern

```
const Stack_Allocator_allocate _Stack_Allocator_allocate =
_CONFIGURE_ASSERT_NOT_NULL(
Stack_Allocator_allocate,
CONFIGURE_TASK_STACK_ALLOCATOR
);
```

however I will revisit the naming.

Author: Mohamed Hassan 2024-07-16T20:09:58.908Z

changed this line in version 14 of the diff

Author: Joel Sherrill 2024-07-08T19:44:20.767Z

If this is the default reporter, the name would be better as _Stack_check_Report_blown_defalut or something along that line._

Author: Mohamed Hassan 2024-07-08T19:44:20.767Z

ok noted

Author: Mohamed Hassan 2024-06-28T09:23:56.158Z

changed this line in version 4 of the diff

Author: Joel Sherrill 2024-07-08T19:44:20.767Z

The stack checker should have a custom checker. The user application/test will provide that and it can be named anything. Yours could be "stackchk03_blown_stack_reporter" and it should work.

Author: Joel Sherrill 2024-07-08T19:44:20.767Z

If this code is current, the custom reporter should not be here. It is a user provided method. It is hooked in by defining the right macro which sets the variable to the user's routine, not the default.

Author: Mohamed Hassan 2024-07-08T19:44:20.767Z

Noted, sorry in the most updated code I relocated the function implementation to the test but kept it's prototype.

Author: Joel Sherrill 2024-07-09T17:09:51.399Z

Same naming issues as stated above.

Author: Mohamed Hassan 2024-07-09T17:09:51.399Z

ok

Author: Mohamed Hassan 2024-06-27T20:42:27.620Z

changed this line in version 3 of the diff

Author: Joel Sherrill 2024-07-09T17:09:51.399Z

This is still showing the type as `Stack_checker_reporter_initialize`. Hopefully that's just a gitlab artifact. I thought I saw this renamed.

Author: Mohamed Hassan 2024-07-09T17:09:51.399Z

Yes it is, it was modified earlier. you can view the updated code

Author: Joel Sherrill 2024-07-09T17:09:51.399Z

Line 254 (closing parenthesis) should be in column 1.

Author: Mohamed Hassan 2024-07-09T17:09:51.399Z

Ok, done.

Author: Joel Sherrill 2024-07-08T19:54:31.632Z

When seen in context, the name looks wrong. The variable set could be "Stack_check_report{-_blown_task" and the current function renamed to "-}Stack_check_report{-_blown_task_default". -}

Looking at the stackchk.h header, the public types and functions follow the rtems_ naming patterns which leads us to something more like:

- rtems_stack_check_report_blown_task_handler - For the type ???
- rtems_stack_check_report_blown_task - variable name
- rtems_stack_check_report{-_blown_task_default - default handler-}

@gedare What are your thoughts on the names of type, variable set, and default reporting function?

Author: Mohamed Hassan 2024-07-08T19:54:31.632Z

Alright, all will be revised.

Author: Mohamed Hassan 2024-06-28T09:23:56.843Z

changed this line in version 4 of the diff

Author: Joel Sherrill 2024-07-08T19:54:31.632Z

It just occurred to me what might help. Using “initialize” in the name of the type or function name is bad and confusing. All names I suggest likely could still be better but it is a step in the right direction.

- ``_Stack_checker_reporter_initialize``is a bad name for the reporter function or type.
- `_Stack_checker_Reporter_handler` is better name for the type.
- `_Stack_checker_Reporter` is a better name for the variable configured.
- Eventually providing the current blown task handler and a quieter alternative would be useful. Both will be prototyped in stackchk.h and implemented in check.c. Further
- `_Stack_checker_Reporter_print_details` is a better name for the current reporter function.
- `_Stack_checker_Reporter_quiet` can be an alternative reporter implementation that JUST calls fatal error.

Notice the use of _ and a capital letter to indicate grouping and item within that group. In C++, the variable might be Stack_Checker::Reporter.

Author: Joel Sherrill 2024-06-25T06:26:15.076Z

The name changes will impact more than I marked.

The blank line #15 will be removed.

Author: Joel Sherrill 2024-07-08T19:52:50.175Z

This should be defining the name of a custom reporter function which is part of this test.

Author: Mohamed Hassan 2024-07-08T19:52:50.175Z

do you mean relocated

```
1 #define STACK_CHECKER_REPORTER_CUSTOM rtems_stack_check_report_blown_
  ↪task_custom
2 #define STACK_CHECKER_REPORTER_DEFAULT rtems_stack_check_report_blown_
  ↪task_default
```

from `stackchk.h` to here? are these definition remain the same regardless of what the custom reporter does, so should it be kept at a header file like `stackchk.h`?

Author: Joel Sherrill 2024-07-08T19:52:50.175Z

Line 16 above should be setting the macro to the name of the user provided custom reporter. Each test/application can provide a unique handler.

The custom handler is not in the RTEMS source. It is part of the application.

Author: Mohamed Hassan 2024-07-11T18:38:17.239Z

changed this line in version 10 of the diff

Author: Joel Sherrill 2024-07-08T19:41:49.458Z

No double blank lines. No blanks between includes unless changing from POSIX ones to RTEMS ones to application specific one. Again, blank lines to indicate groups.

Author: Mohamed Hassan 2024-07-08T19:41:49.458Z

understood, I will will follow `stackchk02/init.c` format.

These and the other header addition from this commit (libmisc/stackchk: Fix inculsion/dependencies and develop a testsuite) look unrelated to the remainder of the content. They need to go with the code that needed them and not in a later commit to fix broken compilation. The codebase should compile after applying each commit in sequence.

Author: Kinsey Moore 2024-07-18T21:26:45.830Z

As I said on Discord, I'd recommend squashing all of your commits for this down to a single commit. This isn't so expansive that it needs multiple commits and squashing avoids having to untangle everything.

Author: Mohamed Hassan 2024-07-18T21:26:45.830Z

Aha, understood, anyways I will squash all the changes into one commit so it will not be confusing anymore.

I delete this file in the latest update, I'm using stackch for testing reporting function: * stackchk * stackchk03

Author: Kinsey Moore 2024-07-23T19:05:04.037Z

This appears to be corrected.

Author: Joel Sherrill 2024-07-18T21:30:16.077Z

Look at stackchk for rtems_task_create() and the file blow.c. Really create a task and let it blow the stack. In fact, if you put the rtems configuration in its own file in stackchk (keep what's there) and put your's from stackchk03 in its own file (w/custom handler), then you can adjust the yaml build spec file to share everything else from stackchk. If this isn't clear, chat me.

- d4564f52 - libmisc/stackchk: Optimize the implementation of making stack checker reporter configurable

Compare with previous version

Author: Joel Sherrill 2024-07-22T14:44:44.463Z

Please do not change from the current noisy reporter to a quiet one as part of adding this functionality. This will change behaviour for users from the noisy reporter which has the default since before May 1995 when the git history starts.

Add the configuration option with the noisy reporter in this MR. File an issue to change the reporter to the quiet one. This will let us have a discussion solely on that change of behaviour. You can resolve this comment by filing an issue.

Author: Mohamed Hassan 2024-07-22T14:44:44.463Z

Ok will be changed & an issue will be filed.

Author: Kinsey Moore 2024-07-22T20:00:45.229Z

Both commits need their commit messages modified to match the RTEMS commit requirements.

Author: Mohamed Hassan 2024-07-22T20:00:45.229Z

I think I'm following RTEMS Commit requirements. otherwise please advise.

Author: Kinsey Moore 2024-07-22T20:00:45.229Z

For some reason I thought we had a more strict summary length limit. Given that a more strict limit doesn't actually exist, I don't have any additional change requirements for the commit message, but I would suggest more details in the commit message body.

Author: Mohamed Hassan 2024-07-22T20:00:45.229Z

No problem, thanks for you time and your feedback. Noted, I will add details on the commit message body.

Author: Kinsey Moore 2024-07-22T14:45:34.853Z

Please remove these end of file changes from your patches.

Author: Mohamed Hassan 2024-07-22T14:45:34.853Z

I re-added a removed blank line at the end of the file manually to match the original file, otherwise how to remove these changes? original modified

Author: Joel Sherrill 2024-07-22T14:45:34.853Z

The simplest thing is to manually edit the line back to the original version.

Author: Mohamed Hassan 2024-07-22T14:45:34.853Z

Yep, that's what I did. This file in my repo has identical endings to that's of the upstream repo.

Author: Joel Sherrill 2024-07-25T15:00:47.817Z

I don't understand this include followed by an include of a local directory system.h.

Author: Mohamed Hassan 2024-07-25T15:00:47.817Z

Yeah I'm using almost all files of stackchk including `init.c`. And I had to include `/stackchk03/system.h` first - before including the confdefs - because it configures:

```
#define CONFIGURE_STACK_CHECKER_ENABLED
#define CONFIGURE_STACK_CHECKER_REPORTER  stackchk03_blown_stack_
↪reporter
```

otherwise it will go to the default detailed reporter every time.

Author: Joel Sherrill 2024-07-25T15:00:47.817Z

Add a comment above the include to explain that.

Author: Mohamed Hassan 2024-07-26T19:21:14.407Z

changed this line in version 20 of the diff

Author: Joel Sherrill 2024-07-25T15:01:03.036Z

Why is stackchk03 in here? Move stackchk and stackchk03 specifics into their own files. Their unique code should not be intermingled.

Author: Mohamed Hassan 2024-07-25T15:01:03.036Z

I'm sharing init.c of stackchk testsuite to be used in stackchk03 testsuite in order to avoid duplicating files. that's why I added things related to stackchk03 here.

Author: Joel Sherrill 2024-07-25T15:01:03.036Z

Then split this reporter function into a file that is unique to stackchk03.

Author: Mohamed Hassan 2024-07-25T12:15:50.833Z

changed this line in version 19 of the diff

Author: Mohamed Hassan 2024-07-25T15:01:03.036Z

The latest updated version compiles successfully after including `#include "../stackchk/system.h"` at stackchk03/system.h. However, as

```
1 #define CONFIGURE_STACK_CHECKER_REPORTER stackchk03_blown_stack_reporter
```

comes after the `confdefs`. therefore, it always goes to the default detailed reporter. And whenever I try: * Configure the macro before the `#include "../stackchk/system.h"` it doesn't recognize `stackchk03_blown_stack_reporter` * Then, if I place the prototype at the top, it gives me linker error `undefined reference to stackchk03_blown_stack_reporter`.

Author: Joel Sherrill 2024-07-23T22:35:01.393Z

I had comments that didn't get pushed earlier. When I went to double check everything, they were still pending.

changed this line in version 20 of the diff

Author: Mohamed Hassan 2024-07-26T21:40:06.394Z

it's a typo and it has been fixed, please refer to the updated version.

Author: Kinsey Moore 2024-07-29T13:51:08.023Z

I think this is missing some of your local changes or you have some stale build artifacts that aren't being regenerated correctly. Both stackchk.exe and stackchk03.exe produce the default "BLOWN STACK!!!" output and stackchk.exe would fail to build if it were being built according to your comment since it is missing the reference to stackchk03_blown_stack_reporter that is only compiled into stackchk03.exe.

Author: Mohamed Hassan 2024-07-29T13:51:08.023Z

yeah, I reported this issues to my mentor. I uploaded a new version of the code after this issue has been fixed.

Just make sure it has a proper end of file.

Author: Mohamed Hassan 2024-07-31T21:12:45.265Z

Confirmed.

Author: Joel Sherrill 2024-07-30T14:09:26.547Z

Update all file headers in stackchk and stackchk03 to follow the proper style. SPDX, then Doxygen file block, then license block – as separate comment blocks. You have to be careful that comments and the license do not intermix or show up in Doxygen output together.

Author: Mohamed Hassan 2024-07-30T14:09:26.547Z

I update all files' headers as shown here I removed the file description text as I understood from you previous comment. Please take a look and give me a feedback.

Author: Joel Sherrill 2024-07-30T14:09:26.547Z

Very close. The text for an @brief should be thought of as an entry in a table of contents not a full sentence. Usually when someone does this, it is easy to use the sentence that was the original @brief into the paragraph following the @brief.

From. . .

@brief This is a very long sentence which says this file is for raising the Titanic

To. . .

@brief Titanic Raiser Class Interface

This very long sentence describes what the file contains and often isn't really saying much beyond the @brief above. "This file defines the class interface for the Raising the Titanic class." If it isn't adding anything, do not add the longer version.

Author: Mohamed Hassan 2024-07-30T14:09:26.547Z

Noted, please refer to the updated files.

Author: Joel Sherrill 2024-07-29T18:32:08.973Z

No newline at end of file.

Author: Mohamed Hassan 2024-07-29T18:32:08.973Z

this file has been renamed to config.c

Author: Joel Sherrill 2024-07-29T22:10:17.941Z

In the edits I sent you, I added a config.c to both stackchk and stackchk03 so they could instantiate the configuration differently. Why doesn't that show up here?

Author: Mohamed Hassan 2024-07-29T22:10:17.941Z

Yeah I corrected that yesterday here and [here](https://gitlab.rtems.org/Hamzi/rtems/-/blob/0b93f687e23bdf24fa9bd339a4eb5aa4eb249685/spec/build/testsuites/libtests/stackchk03.yml)

Author: Joel Sherrill 2024-07-29T22:10:17.941Z

stackchk03.yml doesn't appear to have a copyright in it.

Author: Mohamed Hassan 2024-07-29T22:10:17.941Z

It was added stackchk03.yml

Parameter documentation blocks should be spaced appropriately so that the additional lines of the description align with the beginning of the description for better readability. In this case it would look like this:

```
* @param[in] running Points to the currently executing thread which
is being context switched out.
```

This applies to other documentation blocks as well.

Author: Mohamed Hassan 2024-07-31T21:16:13.371Z

Why was this file comment changed?

Author: Mohamed Hassan 2024-08-14T17:17:44.866Z

It was meant to change the brief comment to be similar to tables headers. this was to make it shorter and direct.

Author: Sebastian Huber 2024-08-14T23:41:12.439Z

Could you please read the Doxygen guidelines before you change existing Doxygen comments:

https://docs.rtems.org/branches/master/eng/coding-doxygen.html

Author: Mohamed Hassan 2024-08-15T17:36:16.600Z

Ok, noted it will be reverted back to the original comment.

Author: Mohamed Hassan 2024-08-15T18:16:29.046Z

@sebhub Please refer to the new MR.

Author: Sebastian Huber 2024-08-14T03:40:40.706Z

Why was this changed as well? This removed the file comment and the group association.

Author: Mohamed Hassan 2024-08-14T17:20:55.004Z

please refer to the previous response.

Author: Sebastian Huber 2024-08-14T03:42:04.644Z

Including this implementation header file here is just wrong.

Author: Mohamed Hassan 2024-08-14T17:28:08.439Z

It's required, removing it causes compilation errors.

Author: Sebastian Huber 2024-08-14T23:42:38.896Z

You can use a forward declaration to avoid the compilation errors and the inclusion of this implementation header, see !187.

Author: Mohamed Hassan 2024-08-15T17:44:50.239Z

Thanks for the info, will follow.

Author: Sebastian Huber 2024-08-14T03:43:12.765Z

This is potentially an in and out parameter.

Author: Mohamed Hassan 2024-08-14T18:34:09.114Z

I think you're right, arg parameter can be both input and output. will be modified.

Author: Sebastian Huber 2024-08-14T03:43:48.950Z

Why was the formatting changed?

Author: Mohamed Hassan 2024-08-14T17:34:04.063Z

It was changed to improve readability by making all lines aligned. !`image <https://gitlab.rtems.org/-/project/uploads/86fb62dd043fff248aaf013e278fcf8d/image.png>`_

Author: Sebastian Huber 2024-08-14T23:47:35.298Z

This style is not in the existing Doxygen guidelines. The new formatting is fine from my point of view. We could even update the guidelines to recommend this style. However, changing the format of existing comments which are in line with the current Doxygen guidelines is not all right.

Author: Kinsey Moore 2024-08-15T14:16:30.900Z

Both lines were already being modified, so the readability was improved in the process.

3.9.2.130 186 - cpukit/libblock: Close all valid FDs

Summary

cpukit/libblock: Close all valid FDs

This is intended to close any valid FDs that were opened, but 0 is also a valid FD. This change ensures that a FD of 0 is also closed properly.

Author: Kinsey Moore 2024-08-12T17:54:29.683Z

requested review from @joel

Author: Kinsey Moore 2024-08-12T17:54:29.702Z

assigned to @opticron

Author: Joel Sherrill 2024-08-12T18:21:51.349Z

Add the coverity ids. This is what I had in the fix I thought I had a MR for.

Coverity CID 1467408 (original)

Coverity CID XXX (followup)

close() was called and fd can potentially be negative. Original patch was “> 0” but should have been “>= 0”

Commit	9c57576a4b89e513f003e390648c8af00b978e60

Summary

open: Fix race condition when called with O_TRUNC

Fix a race condition in which a file opened with O_TRUNC is made available to other file functions expecting a file descriptor before the truncation is performed.

This is only possible if the other thread was using an invalid file descriptor as the open call has yet to finish.

Closes #5109

Author: Chris Johns 2024-08-08T07:54:30.835Z

Can the commit message please be formatted to less than 80 columns per line?

Please run `git log` on `main` to see how the messages are formatted :smiley:

Thanks

Commit	74402646018dfddb652dd0af5962212f7f5caad2

Summary

The whole code for APIC support was contained inside clock.c. This does some restructuring and moves the APIC implementation to it's own file since it will be expanded and used for SMP.

Commit	f920b6f1e49e06f8e8077cc8d4db69939788086f

Summary

cpukit/score/src/kern_ntptime.c: Use time_t not a 32-bit type

A time_t (tv_sec) was being assigned to a 32-bit variable. This introduced a Y2038 issue.

Coverity CID 1512505

Closes #5111.

The interface for this could probably be copied from `sparc/leon3/include/bsp/watchdog.h`. Although there is no standard, it is a good idea to try to be close to similar interfaces in other BSPs when it makes sense.

The number of timer clocks is somewhat nebulous. Is this configurable in the watchdog itself or is this dependent on a system clock rate? Is there a way for the user to know how long the watchdog clock interval is?

This should likely be static, but I'm not sure I understand its purpose other than indicating whether the watchdog is "enabled" and once it's enabled it can't be disabled. It feels especially useless since any calls that depend on it being non-zero call the initialization function to set it to 1 if it isn't.

Author: Ning Yang 2024-07-30T15:47:09.858Z

https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/120#note_109477

I designed the interface with reference to `sparc/leon3/include/bsp/watchdog.h`. It seems to have multiple wdt devices. But in rpi4 there is only one, should I keep it consistent?

Author: Kinsey Moore 2024-07-30T15:47:09.858Z

You should adjust the implementation to the Raspberry Pi hardware.

Author: Ning Yang 2024-07-30T15:46:03.199Z

changed this line in version 6 of the diff

Author: Kinsey Moore 2024-07-30T15:46:18.945Z

I think this has just about all the right parts to implement full watchdog functionality, but they're in a slightly odd form.

I would expect these functions to be available: * init (in this case it would do nothing, so not necessary for this implementation) * start (turn on the watchdog/begin the counter at the desired value) * stop (turn off the watchdog) * reload (often called petting the watchdog or tickling the watchdog, it appears this currently also serves the role of the start function) * get_remaining_time (get_timeleft in your code, not always available depending on the implementation)

I would expect to call them in this order: * init * start * reload * reload * ... * reload * stop

The documentation for get_timeleft should specify whether the return value is valid when the watchdog has been stopped.

reset_system is unnecessary since it is such a thin wrapper around reload.

Once you've done some rework on this, the header file should contain a brief example of expected usage.

Author: Ning Yang 2024-07-30T15:46:18.945Z

I designed the interface with reference to `sparc/leon3/include/bsp/watchdog.h`.

Should the WDT interface design of rpi4 be consistent with the existing interface?

Author: Kinsey Moore 2024-07-30T15:46:18.945Z

There isn't a watchdog timer driver framework in RTEMS as far as I know, so you should only use that WDT driver as a guideline.

Author: Joel Sherrill 2024-07-30T15:46:18.945Z

There are only 3 BSPs with a watchdog driver. The leon3 has bsp/watchdog.h which looks to be a generic BSP-independent API. Could this support use the same API? Or is it missing something?

I am not proposing you completely solve the generic watchdog API problem. Just see if you can align with the leon3 API or if it needs additions.

Author: Kinsey Moore 2024-07-30T15:46:18.945Z

Joel and I had a conversation about this and the leon3 API isn't quite ready to be a public watchdog API for a few reasons, so you should adhere to that model only when it makes sense to do so. There is only 1 watchdog on the rpi4, so the API should be adjusted to fit that. As mentioned elsewhere, a sample watchdog call sequence should be included in the header file with the API provided.

I would recommend against using floating point math here since it's not necessary. Instead, you can use a uint32_t and reorder the operations such that the multiplication occurs first followed by the division. The get_remaining_time() function should also return a uint32_t utilizing similar principles.

Author: Ning Yang 2024-08-07T07:08:31.599Z

changed this line in version 9 of the diff

Author: Kinsey Moore 2024-08-07T07:08:54.712Z

This should use an explicitly sized type. In this case, uint32_t is appropriate.

Author: Joel Sherrill 2024-08-07T07:08:54.712Z

And it should be unsigned. The timeout cannot be negative.

Author: Joel Sherrill 2024-08-06T14:03:01.135Z

Shouldn't these be aligned?

Author: Chris Johns 2024-08-06T14:03:01.135Z

If you mean the `Type 1:`. no it is indented for each of the types.

Author: Joel Sherrill 2024-08-06T14:03:01.135Z

OK. Must have just looked funny in the review mode.

Author: Joel Sherrill 2024-08-06T03:04:17.907Z

Do you want to define an error code in rtems/score/interr.h and use that here?

Author: Chris Johns 2024-08-06T03:04:17.907Z

Sure. You have entered `k` in `gdb` to end up here so I do not mind.

Author: Chris Johns 2024-08-06T03:04:17.907Z

After having a look I do not think there is any value in adding a special error code. The value is the TCP port number :smile:

Author: Kinsey Moore 2024-08-07T04:53:23.536Z

The first patch has quite a bit of reformatting of code and comments that seems unrelated to the change specified. It also contains the addition of a sleep(2) that I wouldn't expect in a code reorganization patch.

Author: Chris Johns 2024-08-07T04:53:23.536Z

The `sleep(2)` has been added to allow the response on the networking to happen and the connection to be taken down because a reset happens. It is needed on the legacy stack or the legacy stack and the PowerPC BSPs.

This code is not written under the RTEMS coding standard. Moving it would need to be discussed and then the format tool in place. The formatting changes I made where to bring the code inline with the rest of the `libdebugger` code.

Author: Kinsey Moore 2024-08-07T04:53:23.536Z

Sure, all those changes are fine for those reasons, it's just unexpected in a narrowly targeted code refactoring patch.

Author: Joel Sherrill 2024-08-07T04:53:23.536Z

@kiwichris Would you mind putting a comment above that block of code to explain that like you did here?

Author: Chris Johns 2024-08-07T04:53:23.536Z

Done.

Commit	a51b7d4b573b6682d1dcd024bab0b9a3d2e78fba

Summary

objectinitializeinformation.c: Add Assert for API index too high

Coverity Scan spotted the possibility that the _Objects_Information_table could be over-indexed if the API value provided was too high. This function is only used during initialization and the input should be trusted. Adding a debug _Assert() emphasizes this trust.

Coverity CID 1512508

Closes #5084.

Commit	fc68da47d5a24f15c473891af1878c9613056cab

Summary

Add a generic bit banged SPI driver that should work with all BSPs if they provide a GPIO get / set function. Implement one for the arm/imx and arm/imxrt BSPs.

A few limitations of the imx* GPIO and IOMUX drivers appeared when working on that. They have been fixed together with that.

Fixes #5014

Author: Amar Takhar 2024-05-18T16:57:26.900Z

Closing and re-opening to see if the approvers change.

changed this line in version 4 of the diff

Author: Christian Mauderer 2024-05-24T04:20:55.826Z

I removed these lines and updated the pull request. Thanks for the suggestion.

Author: Chris Johns 2024-06-03T13:54:47.224Z

How is this file generated and from what?

Author: Christian Mauderer 2024-06-03T13:54:47.224Z

It's generated from the dts file with the command listed in the comment in that file: https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/bsps/arm/imxrt/dts/imxrt1166-cm7-saltshaker.dts?ref_type=heads#L28

When I originally added the i.MXRT BSP, we didn't have a dtc that would run on all platforms (at least I think it wouldn't run on Windows). Therefore I couldn't auto-generate the C file without breaking the build on some platforms and - as a workaround - generated it by hand. I planned to revisit that some-when but haven't found the time yet.

Author: Gedare Bloom 2024-06-03T13:54:47.224Z

i think you should technicallyl include a 2-bsd header in the generated file. This may be something worth adding to `rtems-bin2c`

Author: Christian Mauderer 2024-06-03T13:54:47.224Z

I think adding this feature to rtems-bin2c is a separate issue that will need a bit of discussion like which licenses we need to support and whether a simple tool like that should really have that ability. Do you want me to create a issue for that discussion?

I can add the header manually till then if you want.

Author: Gedare Bloom 2024-06-03T13:54:47.224Z

yes, open an issue and add a header manually, thanks

Doxygen?

Author: Christian Mauderer 2024-06-03T13:55:46.881Z

Do you want me to remove the Doxygen or should I split it up in a short and a long description?

Author: Gedare Bloom 2024-06-03T13:55:46.881Z

Using the doxygen should be consistent, usually using `@brief` and other labels etc.

Author: Christian Mauderer 2024-06-03T13:52:22.126Z

changed this line in version 6 of the diff

Author: Christian Mauderer 2024-06-03T13:55:46.881Z

I relied on Doxygen to use the first sentence as brief description. But you are right that I should have written a better description. It's improved now.

Author: Gedare Bloom 2024-05-24T05:58:10.911Z

why not `active_level == GPIO_ACTIVE_LOW` it seems intuitive

Author: Christian Mauderer 2024-05-24T05:58:10.911Z

Because GPIO_ACTIVE_HIGH is a 0 while GPIO_ACTIVE_LOW is a 1. I somewhen started to compare for equal or not equal to 0. I'm not entirely sure but I think in some architectures, that should be more efficient. But in this case, efficiency isn't really a problem so I'll change that to prefer readability.

this is a NULL pointer exception in case the first `spi_bus_alloc_and_init` failed.

Author: Christian Mauderer 2024-05-24T05:59:26.920Z

Thanks. I'll fix it.

Author: Gedare Bloom 2024-05-31T19:49:32.959Z

unnecessary

Author: Christian Mauderer 2024-05-31T19:49:32.959Z

The `node=-1` is necessary because it is a parameter to `fdt_node_offset_by_compatible` inside of the loop. It searches the next compatible node starting from the one passed to it. When calling that function the first time, the parameter should be -1 according to the documentation.

Author: Gedare Bloom 2024-05-31T19:49:32.959Z

thanks i missed that.

Author: Gedare Bloom 2024-05-24T05:59:37.812Z

What happens if some of the nodes completed successfully but some did not?

Author: Christian Mauderer 2024-05-24T05:59:37.812Z

You are right. I will add a `&& sc == RTEMS_SUCCESSFUL` to the loop condition so that the return value is correct.

Author: Gedare Bloom 2024-05-24T05:59:41.729Z

decl i. why size_t?

Author: Christian Mauderer 2024-06-03T13:57:26.455Z

I'll move the declaration out of the loop.

As far as I know, size_t should be the type that is able to hold any array index. Therefore I usually use size_t if I iterate over an array. For a small index like here it doesn't really matter whether I use `int` or `size_t`. But for _really_ and usually unrealistic big arrays (like one starting at `0x0` and addressing the index `0x80000000`) it would be relevant.

Author: Christian Mauderer 2024-05-24T05:57:46.725Z

changed this line in version 5 of the diff

Author: Gedare Bloom 2024-06-03T13:57:26.455Z

The `size_t` type should usually be for something in units usually of bytes. It is about storing the size of an object. it's basically the same as an `unsigned long`. It shouldn't make any real difference here although `int` might be slightly faster in some architectures.

Author: Christian Mauderer 2024-06-03T13:57:26.455Z

I'm not entirely sure whether size_t is really thought only for bytes. I would have to look that up in the C-standard. But it really doesn't matter here. I used an int for the chip selects and I used a separate size_t for the byte array later.

Author: Gedare Bloom 2024-05-24T06:00:16.372Z

decl variables at start of the block

The driver should have its own Doxygen group. The driver documentation should be moved to this group. The file comment should use the template text.

Author: Christian Mauderer 2024-06-05T07:02:22.434Z

changed this line in version 7 of the diff

Author: Christian Mauderer 2024-06-07T06:44:27.992Z

I created a new group, improved the description and adapted to the template here: https://docs.rtems.org/branches/master/eng/coding-file-hdr.html#c-c-header-file-template

Author: Christian Mauderer 2024-06-07T06:44:27.992Z

@sebhub: Is the doxygen in the latest version OK now so that I can resolve that thread? For some reason gitlab didn't pick up the change here. So here is a link to the changes:

https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/35/diffs?diff_id=807&start_sha=b3fcb10b1fee8807bbbd8187ff2817993c118043#8c490237f998cdaf4d5ef173bfd7675370f93d98

Author: Sebastian Huber 2024-06-05T07:03:20.178Z

Do we really need an argument for each callback? Can't we just pass the structure to each call back. Specialized drivers can then use the structure as a base component and add their own stuff below:

```
typedef struct {
struct spi_gpio_params base;
int my_device_stuff;
} my_device_control;
```

I suggest to use `typedef struct { } spi_gpio_control`.

Author: Christian Mauderer 2024-06-05T07:03:20.178Z

Having an argument for each callback allows to distinguish the pin using the argument. I used that for example here:

https://gitlab.rtems.org/c-mauderer/rtems/-/commit/3612f00378b6ed174964e7377733c526bd737ef9#863225c0b5ffd1d117d3b36ad01ac524ba8bc5ea_0_122

I used a single pin setter function with different arguments.

If I would only use only one argument, I would have to define multiple functions for setting MOSI, SCLK, CS and so on. Alternatively I could pass a parameter which pin should be set. In that case I could remove the function per pin. Something like

```
spi_gpio_set_pin_fn(my_ctx, SPI_MOSI, true);
```

Most likely that will reduce the performance because it adds an extra `switch case` on every pin toggling. I didn't optimize that much for performance but for a bit banged SPI, every instruction reduces the maximum possible speed.

I'll take care of the missing new line and doxygen later or (more likely) tomorrow.

Author: Sebastian Huber 2024-06-05T07:03:20.178Z

Ok, from a performance point of view it makes sense to not have a switch case.

Multiple functions for MOSI, SCLK, CS and so on could make the driver more generic, but I am fine with the multiple arguments version as well.

Commit	1dd7a6e2d65ed2cb4531eb372650355b479ab9fd

bsps/powerpc: Introduction of interrupt locks

Interrupt locks are introduced in shared vme device drivers to enable compilation in an SMP configuration of the qoriq BSP.

[this merge request has been ported from a pending patch submitted on the mailing list]

Author: Amar Takhar 2024-05-03T20:13:20.265Z

Please ignore the noise I'm about to create just testing out some approval rules. :)

Author: Chris Johns 2024-05-06T03:43:02.568Z

The changes had a review on the devel@ mailing list before we moved to GitLab. The important detail is:

> Hello Chris, it is tested on an MVME2500 which uses the powerpc/qoriq_e500 in an SMP configuration. Best regards Christian On 2024-04-18 04:04, Chris Johns wrote:

Author: Chris Johns 2024-05-06T05:35:57.668Z

Is there any documentation on how this name is constructed? I found some in the Eng manual specific. Is the naming mature enough we could formalize of the naming?

Author: Sebastian Huber 2024-05-06T05:35:57.668Z

We have documentation here:

https://docs.rtems.org/branches/master/eng/coding-doxygen.html#group-names

We could probably also provide a regular expression. However, third-party code may use different rules.

Author: Chris Johns 2024-05-06T03:56:26.256Z

These changes have me wondering why we have churn like this? Some seems to be style driven and some because it is broken. I am fine with the style and my comment is more directed at why there are differences? I know I struggle to understand what is right and acceptable as Doxygen is tolerant of various styles.

1. Are we lacking needed documentation on how to add Doxygen comments?
2. Would a CI builder help?

Author: Sebastian Huber 2024-05-06T05:35:21.062Z

If you want to use the Doxygen generated documentation, it helps if you have a good group hierarchy and files are connected to the right group. In the BSP area this is still work in progress.

Commit	b89101116fbce2bffed4b79a5b39fdc604f91975

Summary

validation: Improve interrupt controller tests

Update #3716.

Author: Chris Johns 2024-05-28T21:21:29.783Z

Why no `T_*` handling of `sc` from this last call?

Author: Sebastian Huber 2024-05-28T21:21:29.783Z

If you can't set the task affinity to the present interrupt affinity, then this interrupt may belong to another executable, for example a Zynq RPU in split mode has a shared GIC distributor.

changed this line in version 5 of the diff

Author: Joel Sherrill 2024-05-25T16:36:41.909Z

I do not think RTEMS style has a space after the method name.

Author: Alessandro Nardin 2024-05-25T16:36:41.909Z

I looked at all aio*.c files and they are mostly consistent in having a space after method name. I looked at other files ant they seem to not have any space after

method name. I did not find anything specific in the coding conventions. Should i remove all the spaces?

Author: Joel Sherrill 2024-05-25T16:36:41.909Z

https://docs.rtems.org/branches/master/eng/coding-formatting.html#rules says no space after method name.

“No space between a function name or function-like macro and the opening parenthesis.”

changed this line in version 5 of the diff

Author: Joel Sherrill 2024-05-25T21:36:18.217Z

I looked at the diff and think there are some more formatting issues. Just scroll through it looking at indentation and braces style.

Author: Alessandro Nardin 2024-05-25T21:36:18.217Z

I just went through the file. The only thing i found was a missing space before a parenthesis on line 161 (I have not committed this change yet). Since you said on discord that there are still some issues to fix i’m afraid i’m overlooking something. When you find the time could you provide me with an example of what to look for?

Author: Joel Sherrill 2024-05-25T21:36:18.217Z

I was just saying it had enough issues where a top to bottom review was needed. Glad you only found one issue. Set this up to be merged and closed.

Author: Chris Johns 2024-05-25T16:37:09.278Z

Should this call be `static`? I cannot see it being exported anywhere?

Author: Alessandro Nardin 2024-05-25T16:37:09.278Z

Yes, it should be static. i'll fix that

Question.. What's with all the spaces after and before all the parenthesis?

Author: Alessandro Nardin 2024-05-29T16:19:14.063Z

I did it to adhere to the formatting standards, following the rules and mimicking what i saw in other files when i had a doubt. Although now I realize that i probably misinterpreted the "Put a single space inside and outside of each parenthesis of a conditional expression" rule since i added the spaces also in ifs and whiles.

Author: Alessandro Nardin 2024-05-29T16:19:14.063Z

Would it be better if i changed it?

Author: Amar Takhar 2024-05-29T16:19:14.063Z

No, what you've done is correct all these years and my eyes have glossed over that. Sorry for the noise.

Commit	b874f4c99de76c41096bf4c0e33cfca04101a5e0

Summary

The amd64 BSP was broken and would always generate a general protection fault.

The GPF was being caused by an instruction attempting to move an SSE register to an address on the stack not aligned to 16 bytes. The code for setting up the stack frame for a context would result in it being misaligned by 8 bytes as to what is expected by the x86-64 SysV ABI, thus leading the compiler to unknowingly cause the exception (when control is transferred to the function entry point RSP+8 is supposed to be a multiple of 16, without these changes RSP itself was a multiple of 16).

Commit	20939b213a0fa7b5354462dfc45cd837a5e5adc5

Summary

microblaze: Move interrupt context save to BSP

The interrupt context save is now done in the BSP. This avoids an issue where a register is modified by the interrupt handler before it is saved. Specifically, the MSR register was modified by the `addi` instruction in the interrupt handler before the MSR was saved. This caused the MSR to be saved with the wrong value.

Closes #4962

Author: Kinsey Moore 2024-06-11T14:48:35.193Z

assigned to @opticron

Author: Kinsey Moore 2024-06-11T14:53:25.408Z

The tabs vs spaces issue has been resolved. Sebastian's suggestion of merging the two functions has not yet been undertaken as I don't have the setup to test this BSP at the moment and I'm not as familiar as I need to be with MicroBlaze assembly.

Edit: I am also not familiar with why the two pieces of the ISR entry were kept separate in the first place. Perhaps @alex can shed some light on the matter.

Commit	68951fb2a4fb98abda6a88750a0b37be129d0a9d

Summary

cpukit/posix/aio*: Updated aio files documentation

Updated the documentation in all aio files. Moved the Doxygen comments to the headers when possible. Fixed some formatting errors.

Updates #5027

Author: Alessandro Nardin 2024-06-11T12:01:11.171Z

The documentation should be all okay. However, I noticed that when I build it on my machine, the documentation I put in aio.h is not shown. I have noticed that the same happens even before my modifications. I tried looking online and messing around with the code, but I could not manage to fix it.

Author: Joel Sherrill 2024-06-11T12:01:11.171Z

Can you share how you build it? It usually comes down to something wrong with the INCLUDE or EXCLUDE directives that include/exclude files and directories.

Author: Alessandro Nardin 2024-06-11T12:01:11.171Z

I simply used `doxygen Doxyfile` using the Doxyfile that was in the repo.

Author: Sebastian Huber 2024-06-11T15:28:01.562Z

If this is really just an input, then it should be made `const`. Likewise for the other inputs.

Author: Alessandro Nardin 2024-06-11T15:28:01.562Z

I checked and the function modifies the chain in `r_chain->perfd`. I have to make that line, and likely other inputs into `@param[in,out]`.

Author: Alessandro Nardin 2024-06-04T17:37:39.909Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-06-11T15:28:01.562Z

I checked the inputs and now it should be all ok.

Author: Joel Sherrill 2024-06-11T15:37:15.194Z

Might as well convert these per element comments into Doxygen. Adding the comments lines above the structure element will give you more space for text.

Author: Alessandro Nardin 2024-06-04T17:37:40.902Z

changed this line in version 2 of the diff

Author: Alessandro Nardin 2024-06-11T15:37:15.194Z

Yes, now it should be better.

Author: Joel Sherrill 2024-06-11T15:37:26.379Z

This comment can be improved. Any existing comments can be converted to Doxygen. Per field comments can go above the field.

Author: Alessandro Nardin 2024-06-11T15:25:56.196Z

fixed the formatting

Author: Joel Sherrill 2024-06-04T22:00:12.874Z

Is this missing the C++ extern C wrapper? What about aio_misc.h?

Author: Alessandro Nardin 2024-06-04T22:00:12.874Z

I belive both aio.h and aio_misc.h have the wrapper. Both files have

```
#ifdef __cplusplus
extern "C" {
#endif
```

and

```
#ifdef __cplusplus
}
#endif
```

around the code.

Author: Joel Sherrill 2024-06-11T15:26:12.662Z

I do not think we put space between function names and (, after (or before). This is across the file.

Author: Alessandro Nardin 2024-06-11T15:26:12.662Z

It's how I formatted the code also in the previous MR (!42). Looking at other recently modified files, it seemed the right way to do it. There's also an example of that in the formatting rules, in the breaking long lines part. When it talks about function declarations, the declaration in one line has the spaces.

Author: Joel Sherrill 2024-06-11T15:26:12.662Z

We need to check with @gedare. I spot checked some cpukit code and it isn't this way. No fault of yours and it could be an issue with transitioning to eventually using a code formatter.

Author: Gedare Bloom 2024-06-11T15:26:12.662Z

I don't think we have this case well-defined. Most likely, it will end up being a space inside of all parentheses.

Author: Alessandro Nardin 2024-06-11T15:26:12.662Z

Perfect, I will keep the spaces then.

Author: Joel Sherrill 2024-06-11T15:26:34.658Z

We are still adding license text blocks.

Author: Alessandro Nardin 2024-06-11T15:26:34.658Z

Sorry, I'm not understanding. What should i do to fix this?

Author: Joel Sherrill 2024-06-11T15:26:34.658Z

See https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/include/rtems/score/corebarrierimpl.h?ref_type=heads#L12 – no license text is included.

That file also shows the formatting as I expected it.

Author: Alessandro Nardin 2024-06-11T15:26:34.658Z

The only difference i found with the file you linked is in the copyright part. Some of the aio files have

```
Copyright 2010, Alin Rus <alin.codejunkie@gmail.com>
```

While the code you linked (and other other aio files)

```
COPYRIGHT (c) 1989-2006.
On-Line Applications Research Corporation (OAR).
```

Should i change the copyright notice to the second one in all aio files, or am i misunderstanding?

Author: Joel Sherrill 2024-06-11T15:26:34.658Z

Add the license text block and list every individual/organisation on a separate copyright line above the license text. This is a link to a file showing two authors:

https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/include/rtems/score/chain.h?ref_type=heads#L12

Author: Alessandro Nardin 2024-06-11T15:26:34.658Z

Thanks for the clarification, now I should have added all that was missing.

Author: Joel Sherrill 2024-06-11T15:41:29.665Z

License block.

Author: Joel Sherrill 2024-06-11T15:42:34.831Z

No license block.

Author: Joel Sherrill 2024-06-11T15:42:34.831Z

See above.

Commit	ad24b764d654c36b40ad2099d08d95bff9856cdd

Summary

amd64: Add bsp_reset

Add a temporary implementation of bsp_reset to avoid the RTEMS tester running in loop until timeout for every test

Author: Sebastian Huber 2024-06-10T15:42:59.390Z

The file should be added to the Doxygen group of the BSP.

Author: Matheus Pecoraro 2024-06-10T15:42:59.390Z

Looking at the source files it doesn't seem like the BSP currently has a doxygen group, wouldn't it be better to have a separate MR solely for defining the group and adding the files to it?

Author: Gedare Bloom 2024-06-10T15:42:59.390Z

Yes, you can open an Issue to add doxygen for this bsp.

Author: Matheus Pecoraro 2024-06-10T15:42:59.390Z

Done.

Author: Sebastian Huber 2024-06-13T17:05:59.656Z

This is not relevant to the current change. These two BSP items contain a lot of duplication. They should use the approach of other multi-variant BSPs using a common group and object item.

Author: Matheus Pecoraro 2024-06-13T17:05:59.656Z

Makes sense. I created an issue and will start working on another MR to address this.

Author: Amar Takhar 2024-06-13T17:05:59.656Z

What's going on with this MR? was there a modification required? Should it be closed in lieu of the ticket?

Author: Kinsey Moore 2024-06-13T17:05:59.656Z

If I'm reading it correctly, the dedup that needs to occur is unrelated to this MR (see separate issue for it) and is not a blocker for this MR.

Author: Kinsey Moore 2024-06-13T17:05:59.656Z

As far as I can tell, creating the issue should have resolved this comment chain.

Author: Amar Takhar 2024-06-13T17:05:59.656Z

Thanks I'll resolve it what you said makes sense.

Author: Gedare Bloom 2024-06-11T04:56:35.061Z

These should probably be defined in a bsp.h or other header. It looks like they are the same as the i386 BSP. There is likely some header/code sharing that can be done.

Author: Matheus Pecoraro 2024-06-11T04:56:35.061Z

Where would a shared header for two specific archs be located? Also considering these values won't be used on the BSP after ACPICA is implemented is it worth to create a shared header?

Author: Gedare Bloom 2024-06-11T04:56:35.061Z

That probably would not be worth the hassle then.

Author: Gedare Bloom 2024-06-11T04:56:42.543Z

Open an Issue for the TODO.

Author: Matheus Pecoraro 2024-06-11T04:56:42.543Z

Done.

Commit	175dad270b3ba403fb4bab9afe653bc9f76ce4ea

spec/stm32h7: Default nucleo-h755zi BSP to build for CORE_M7

Some of the STM32H7 parts have a secondary Cortex M4 core included and require the user to select which core they are compiling for. The `arm/nucleo-h755zi` BSP was lacking a default core selection, causing the BSP to fail to build with the default options selected. This PR changes the default option to select the larger Cortex M7 core by default.

Commit	f969387817fadf8a25a35d62d7372d439c17440a

Implement a new ST Nucleo STM32H755ZI BSP

Hi all, for a project I recently acquired a Nucleo STM32H755ZI. Thanks to the work of @sebhub, @c-mauderer, and Karel Gardas, it was pretty easy to create a new Nucleo BSP for this chip by copying the Nucleo H743 BSP. I was not able to get the 8 MHz HSE clock enabled, so this is currently clocked off of the PLL using the 64 MHz HSI clock and the RTC clock is disabled. Other features haven't been thoroughly tested, but since they rely on the high quality STM32H7 HAL from ST, I have pretty high confidence in them. I've been able to run most testsuites.

I have tested:

- The CM7 core
- The CM4 core

- Console output on UART3 (the default USB UART) and the shell
- GPIO
- Sample programs like `hello`, `fileio` (and shell), `paranoia`, `unlimited`, etc.

Known Broken:

- Debugging with OpenOCD is wonky. I can set breakpoints, halt the processor and inspect memory and registers and return from functions, but stepping does not work.
- The program begins to run after being flashed but soon (under 1 second) stops running. Pressing the reset button makes the program run continuously afterward. The board resets nearly instantly.
- Shell commands `ls`, `cd`, `cpuuse`, etc. hang for a while before executing. I'm not sure where the time is spent because the built-in `time` command reports that these commands execute nearly instantly.

I haven't tested:

- Pretty much everything else

Does it really work to just add two enabled-by lines right after each other or does this break the h743zi BSP? Other files (like the `optlinkcmds.yml`) use a list in the form of

```
- enabled-by:
- arm/nucleo-h743zi
- arm/nucleo-h755zi
value: WHATEVER
```

You have that in multiple of the `opt*.yml` files.

changed this line in version 4 of the diff

Author: Jacob Killelea 2024-06-04T01:08:33.944Z

Fixed!

Author: Christian Mauderer 2024-06-04T01:08:33.014Z

Beneath the two points I have noted in the code: Usually the commit summary should have a prefix. In the STM32H7 BSP, that's usually `bsp/stm32h7` or `bsps/stm32h7`. See https://gitlab.rtems.org/jkillelea/rtems/-/commits/main/bsps/arm/stm32h7?ref_type=heads

Author: Jacob Killelea 2024-06-04T01:08:33.014Z

Thanks, I will make those fixes

Author: Jacob Killelea 2024-06-04T01:08:33.014Z

Took a little rebasing and `git push --force`, but the commit history now shows 1 commit with the preferred syntax.

@sebhub, if you approve of this, would you mind reviewing as well? Thank you.

Author: Sebastian Huber 2024-06-06T05:19:33.792Z

The patch set is all right, however, I can't approve it.

Author: Amar Takhar 2024-06-06T05:34:34.014Z

@sebhub you can approve it you need to rebase first if you look underneath 'merge blocked' you'll see the reasons why it can't be merged to the right of 'merge request must be rebased' click 'rebase without pipeline' if it rebases without conflicts the merge button will show up.

Hey Sebastian,

I just copied what was implemented in the `nucleo-h743zi` BSP. After generating a `config.ini` file, you need to edit the `STM32H7_BOOT_CORE` line to select whether you are targeting the Arm Cortex M7 or the Arm Cortex M4 processor in the chip. If we should pick a default target so it 'just builds', that could also work.

I'm not sure why you are getting errors about `uint32_t` being undefined, but I assume there is a missing header that is being ``#include``d through the appropriate HAL header.

Author: Sebastian Huber 2024-06-12T02:45:42.751Z

The BSP should just build with this config.ini:

```
[arm/nucleo-h755zi]
```

Author: Jacob Killelea 2024-06-12T02:45:42.751Z

My apologies, I have created a bugfix here

Author: Amar Takhar 2024-06-12T02:45:42.751Z

You can refer to other merge requests by using !66 or actually pasting the full URL like this: https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/66 .. GitLab shortens it.

Author: Sebastian Huber 2024-06-12T02:45:42.751Z

Thanks for the quick fix.

Author: Jacob Killelea 2024-06-12T02:45:42.751Z

Sure thing, sorry for not checking this!

Commit	39da0b7fd4b224f41966117a4372a34b7473d5f7

Summary

bsps/xqspipsu: Add timeouts to NOR transfers

This switches the XQspiPsu NOR driver layer to use the RTEMS event system so that waits for interrupt-based data transfers can time out instead of waiting indefinitely. It is sometimes possible for either the controller or the NOR chip to fail to issue a transfer completion event and recovery is preferable to a hang.

Fixed.

Author: Gedare Bloom 2024-06-24T20:58:30.784Z

Unrelated to this patch, can we change how this global `Error` variable is being used? We should generally avoid having global symbols. This file has a few of them. I understand some of this comes from the Xilinx code, but we appear to be modifying this stuff heavily already.

Author: Kinsey Moore 2024-06-24T20:58:30.784Z

This particular file was originally sourced from the Xilinx repo, but is not in its original form as its original form was not suitable for purpose.

This file is now owned by RTEMS as an adapter of sorts. Unfortunately, this Error variable is not part of the QSPI driver, but part of the flash wrapper code that was brought in. It's technically possible to remove the Error variable here by resetting the status handler prior to each call which would allow replacing the void* argument that's passed in, but that runs the risk of leaving a stale pointer into the stack since you can't pass NULL for that field to clear it out (there's an assertion in the underlying code preventing it). This could be rectified by a global struct that houses the XQspiPsu pointer (currently unused) and additional NOR-layer attributes such as the error counter.

Realistically, nothing consumes the error count and it can just be removed until it's actually needed. I'll add another commit that removes it.

Author: Kinsey Moore 2024-06-24T20:57:18.439Z

changed this line in version 4 of the diff

Author: Kinsey Moore 2024-06-24T20:58:30.784Z

I have removed the Error and Test globals. There are still a few in this file. To resolve any more of them, this code needs a refactoring that changes the interface and includes a structure for managing these items.

Author: Gedare Bloom 2024-06-25T02:10:50.548Z

I guess 5 seconds is a long enough time for any reasonable timeout, but should this be configurable?

Author: Kinsey Moore 2024-06-25T02:10:50.548Z

This runs into the same problems as the Error issue. There is currently no place to store NOR configuration and reporting information.

Author: Gedare Bloom 2024-06-25T02:10:50.548Z

Maybe create an Issue to track these concerns?

Author: Kinsey Moore 2024-06-25T02:10:50.548Z

I have created issue #5054 to track these additional improvments.

Commit	263cbb940831987e618e63fdd520d31bdc8da3f8

Summary

Removes unneeded paging flags from **PAGE_FLAGS_DEFAULTS**

- **PAGE_FLAGS_GLOBAL**: There's no reason to set this since we currently don't switch the page table. Also setting it on PML4 entries is incorrect and would cause QEMU with KVM to crash (#5052).
- **PAGE_FLAGS_USER_ACCESSIBLE**: Privilege level is not changed.
- **PAGE_FLAGS_WRITE_THROUGH**: Cache is already disabled.

Closes: #5052

Commit	cd4b6761ea2f504c993ba2b817f152ee0c0dadd4

Summary

cpukit/posix/aio*: Corrected aio_return() and aio_error() behaviour

Added field to the aio control block to track when a result is retrieved and modified code accordingly.

Updated documentation for aio_return() and aio_error(). Updated test psxaio01 to make it compatible with specifications.

Closes #5039

This definitely needs a comment. First because it doesn't have one but second because aio functions have the unique behaviour that errors returned BEFORE enqueuing including unable to enqueue are returned normally and directly. Errors from the asynchronous operations are returned via the aiocb and aio_return().

Errors in aio_fscync() aio_read(), and aio_read() before the aio_enqueue operation should just return -1 and set errno. This appears to be wrong in the current code and is not your error. You just need to fix it as you add aio_error(). Clearly aio_error() was not considered before. The special case of putting the return code in the aiocb is only after it is successfully enqueued. This is clear reading the POSIX standard and glibc implementation.

- POSIX standard for aio_fsync. See the Return Value and Error sections. https://pubs.opengroup.org/onlinepubs/9699919799/functions/aio_fsync.html
- GLIBC source code which implements what the POSIX standard specifies: https://codebrowser.dev/glibc/glibc/rt/aio_fsync.c.html

changed this line in version 3 of the diff

Author: Alessandro Nardin 2024-06-22T15:37:34.227Z

I pushed the corrections

Author: Joel Sherrill 2024-06-22T15:37:34.227Z

Code deleted for uncommented and now unused macro

Author: Joel Sherrill 2024-06-20T14:03:25.329Z

aio_read, aio_write, and aio_fsync should use the normal set errno and return -1. Only after enqueueing should the aio_return value kick in.

Also I think the aio*.c POSIX methods may be missing NULL checks on parameters. Again not your fault.

Commit	ef5ed795ec001cca1639da77bb766b82387838ea

Summary

Fixes two possible causes of interrupts being fired during system initialization: * The amd64 clock driver would enable interrupts during initialization; * The context restore routine would load RFLAGS before RSP making it possible for an interrupt to be fired while RSP still points to the ISR stack area

`if ( !_level )` whitespace, or more explicitly `if ( _level != 0 )`

Author: Matheus Pecoraro 2024-06-25T17:11:43.687Z

changed this line in version 8 of the diff

Author: Gedare Bloom 2024-07-01T15:36:01.574Z

ditto

Author: Sebastian Huber 2024-07-01T15:36:01.574Z

See intr_disable() in https://github.com/freebsd/freebsd-src/blob/main/sys/amd64/include/cpufunc.h#L814 how the interrupt disable/enable can be done efficiently.

Author: Matheus Pecoraro 2024-07-01T15:36:01.574Z

Considering “rtems_interrupt_level” is a typedef to uint32_t how could I make it so the upper 32 bits of RFLAGS aren’t lost if done that way? (I’m pretty sure those 32 bits are not used for anything nowadays but according to Intel they are reserved so I imagine it would be better to maintain them).

Author: Sebastian Huber 2024-07-01T15:36:01.574Z

Ok, then this is probably something for later. I think the interrupt level should use a CPU port provided type and not just an unsigned 32-bit integer.

Author: Gedare Bloom 2024-07-01T15:36:01.574Z

https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5051

Author: Matheus Pecoraro 2024-07-01T15:36:01.574Z

I noticed that with the changes in this MR the test **tmfine01** can take way longer than expected in the “Obtain/Release Private <sys/lock.h> Mutex” section, I’m not really sure why (probably due to some QEMU emulation stuff though since it works with KVM enabled).

With the rflags method Sebastian linked (which is also used on i386) this issue doesn’t happen. Since the upper 32 bits aren’t used anyways (though this is a risky

assumption to make) we could maybe still use this method even before solving #5051?

Alternatively I found that adding a “nop” after “sti” in amd64_enable_interrupts also fixes whatever is happening so that could be the temporary solution?

Author: Sebastian Huber 2024-07-01T15:36:01.574Z

I would not drop the upper 32 bits, this could lead to some nasty debugging in the future if it is not fixed.

Author: Matheus Pecoraro 2024-06-25T17:11:45.405Z

changed this line in version 8 of the diff

Author: Matheus Pecoraro 2024-07-01T15:36:01.574Z

Then I think the way it’s currently done is fine for now. I just did the whitespace and syntax change Gedare had originally suggested.

Author: Joel Sherrill 2024-07-01T15:36:01.574Z

The interrupt disable is 32 bits to map cleanly from the public Classic APIs all the way down. As long as the CPU does not need more bits than that, we are ok.

Commit	e46135290abdf08f26b1d1dbefea2d63b004e44d

Summary

Heavily based off the i386 SSE code (SSE is a minimum requirement for x86_64 and is already initialized by the UEFI firmware)

Compare with previous version

Author: Joel Sherrill 2024-07-01T15:31:02.367Z

I am assuming the formatting looks better in the source code. Please make sure this looks reasonably formatted.

Author: Matheus Pecoraro 2024-07-01T15:31:02.367Z

Unless I'm missing something the formatting looks fine for me even on gitlab.

Author: Joel Sherrill 2024-07-01T15:31:06.991Z

This alone implies that the ISR Stack size for x86_64 must be at least 512 bytes. Plus some more context saved and a little bit left for calling a driver, I would expect that anything less than 1K is very bad. Make sure there is a check for minimum ISR stack size. There likely is a check in confdefs about this.

Author: Matheus Pecoraro 2024-07-01T15:31:06.991Z

It currently defaults to 4K which is the port's **CPU_STACK_MINIMUM_SIZE** but I don't see any check under cpukit/include/rtems/confdefs/percpu.h to make sure **CONFIGURE_INTERRUPT_STACK_SIZE** isn't less than that.

Author: Joel Sherrill 2024-07-01T15:31:11.160Z

Is this guaranteed to be 16 byte aligned as required?

Author: Matheus Pecoraro 2024-07-01T15:31:11.160Z

Yeah, its aligned on line 110.

Author: Joel Sherrill 2024-07-01T15:31:38.705Z

I am not finding the number of cycles this save and the later restore can take. Is this a constant number of cycles or variable like the mc68881/2 were? It would be good to know this for some common CPU cores and document it.

Author: Matheus Pecoraro 2024-07-01T15:31:38.705Z

This was the only resource I could find and I don't think it's possible to determine a reliable number.

I think "Latency" would be the best metric to determine this and in the ones where it's reported for the 64 bit mode of the instruction it seems to average around ~65 for FXSAVE and ~80 for FXRSTOR.

Author: Joel Sherrill 2024-07-01T15:31:38.705Z

Maybe put that in the port documentation.

Author: Sebastian Huber 2024-07-01T15:31:43.873Z

I would like to get rid of the CPU_ALL_TASKS_ARE_FP at some point in time. Can't you simply add the FP context to Context_Control? This should be slightly more efficient.

Author: Matheus Pecoraro 2024-07-01T15:31:43.873Z

So **_CPU_Context_save_fp** and **_CPU_Context_restore_fp** would be empty and that process would be done on **_CPU_Context_switch** correct?

Author: Sebastian Huber 2024-07-01T15:31:43.873Z

Yes, it would be all handled by `_CPU_Context_switch()`.

Commit	ffa6e268792e6e25017ec9b7820de755bf4d9879

Summary

dhrystone: Prevent procedure merging

From the Dhrystone RATIONALE:

o No procedure merging

Although Dhrystone contains some very short procedures where execution would benefit from procedure merging (inlining, macro expansion of procedures), procedure merging is not to be used. The reason is that the percentage of procedure and function calls is part of the "Dhrystone distribution" of statements contained in [1]. This restriction does not hold for the string functions of the C version since ANSI C allows an implementation to use inline code for these functions.

Close #5058.

Summary

smptests/smpipi01: Fix more sporadic test failures

The last fix in commit 70029fc7be6f5179cef99110b5922411b2d8b121 did not work on targets where you can have active and pending interrupts.

mentioned in issue #5049

Author: Sebastian Huber 2024-06-24T02:25:53.505Z

This file should move to <rtems/score/*.h>, for example <rtems/score/bsd-tree.h>. The file origin should be clearly stated at least in the commit message.

Author: Aaron Nyholm 2024-06-24T02:25:53.505Z

Good points, thanks. Updated.

Author: Sebastian Huber 2024-06-24T02:25:53.505Z

It helps if you put the last Newlib commit message of this file into the commit message.

Author: Aaron Nyholm 2024-06-24T02:25:53.505Z

What about a commit message like this:

```
score: Import <sys/tree.h> from Newlib

Import <sys/tree.h> from Newlib as <rtems/score/bsd-tree.h> using␣
↪Newlib commit:

commit eb03ac17f16f1bd354482148426353fd35cd879d
Author: Sebastian Huber <sebastian.huber@embedded-brains.de>
Date:   Tue Oct 5 15:53:47 2021 +0200

sys/tree.h: Red child with black sibling rotations

```

(continues on next page)

(continued from previous page)

```
Add specialized rotations RB_RED_ROTATE_LEFT() and RB_RED_ROTATE_
↪RIGHT() which
may be used if we rotate a red child which has a black sibling.  Such a␣
↪red
node must have at least two child nodes so that the following red-black␣
↪tree
invariant is fulfilled:

Every path from a given node to any of its descendant NULL nodes goes␣
↪through
the same number of black nodes.

PARENT
/      \\
BLACK     RED
/   \\
BLACK BLACK

Close #5049.
```

Author: Sebastian Huber 2024-07-09T22:39:36.140Z

It seems you modified the file. You should first import an unmodified file and then apply the changes.

The header guard no longer matches with the file name.

Author: Aaron Nyholm 2024-07-09T22:39:36.140Z

Updated the guard headers to reflect the moved file. I only changed the guards in the file to reflect the new file name and path as well as to maintain build-able merge requests.

Author: Aaron Nyholm 2024-06-25T01:04:04.538Z

changed this line in version 8 of the diff

Author: Sebastian Huber 2024-07-09T22:39:36.140Z

I have a lot of experience in maintaining third-party imports, so it would be nice if you don't dismiss my comments so lightly and instead learn best practices. You can:

1. Create one commit which just imports the file as is.
2. Create one commit which changes existing files to use the new file, updates the imported file, and adjusts the build system.

Author: Gedare Bloom 2024-07-09T22:39:36.140Z

I have split the commit, although in this case it doesn't really matter since we are apparently going to be 'owning' this file within score moving forward.

Author: Sebastian Huber 2024-07-09T22:28:17.445Z

What happens if you include <rtems/score/tree.h> and <sys/tree.h>?

Author: Aaron Nyholm 2024-07-09T22:28:17.445Z

If both <rtems/score/tree.h> and <sys/tree.h> are included the build is still successful.

Author: Sebastian Huber 2024-07-09T22:28:17.445Z

With this test file

```
#include <rtems/score/rbtree.h>
#include <sys/tree.h>
```

and <sys/tree.h> from FreeBSD 14 I get:

```
In file included from tree.c:2:
include/sys/tree.h:173: warning: "SPLAY_GENERATE" redefined
173 | #define SPLAY_GENERATE(name, type, field, cmp)                 ␣
 ↪      \\
|
In file included from /opt/rtems/6/sparc-rtems6/gr740/lib/include/rtems/
 ↪score/rbtree.h:41,

 ↪note: this is the location of the previous definition
312 | #define RB_ENTRY(type)
...
```

Author: Aaron Nyholm 2024-07-09T22:28:17.445Z

What options did you build with to get these warnings? I don't get them when I build. These are just warnings and as far as I can tell shouldn't stop you from building (albeit with the warnings). Furthermore, the these warnings show to importance of pairing the removing `sys/tree.h` from newlib with this MR.

Author: Sebastian Huber 2024-07-09T22:28:17.445Z

These are not just warnings. They show that your patch didn't fix the problem.

Please read my comments more carefully. I said the `<sys/tree.h.>` from FreeBSD 14. This is not the version from Newlib.

Removing `sys/tree.h` from Newlib is an entirely different topic.

Author: Gedare Bloom 2024-07-09T22:13:00.405Z

changed this line in version 10 of the diff

Author: Gedare Bloom 2024-07-09T22:28:17.445Z

I have added this as a test case, and also fixed the problem.

Commit	02a89356985b05da21baad3e4e579547020d570f

Summary

Import ACPICA and implement support for it on the amd64 BSP.

The ACPICA code was imported from the GitHub repo. A script will be created in rtems-tools for allowing future commits to the ACPICA code to be applied to the RTEMS source tree ([Issue #11](https://gitlab.rtems.org/rtems/tools/rtems-tools/-/issues/11))

Is all of this code from Intel? And unmodified as imported?

Author: Matheus Pecoraro 2024-08-06T19:35:45.857Z

On commit 128336ebebbadfdb8e452ad9c49acd77317d744c it is all unmodified code from the commit (a8b050df914875839b717a51e1b32d6c6b86ae96) on the

ACPICA tree. Then on 87e80b723efaa5ebe59a4a36640658de66557f51 there's a single change to add the RTEMS specific include.

Author: Joel Sherrill 2024-08-06T19:30:49.415Z

I have a question of whether we need to add something somewhere to note we choose the BSD permissive style license – not the proprietary or GPL.

Author: Amar Takhar 2024-08-06T19:30:49.415Z

Intel offers two different downloads here:

- https://www.intel.com/content/www/us/en/developer/articles/license/acpica-licensing.html

With the BSD/GPL download here:

- https://www.intel.com/content/www/us/en/download/776307/acpi-component-architecture-downloads-unix-format-source-code-and-build-environment-with-a-html

The GitHub source code here:

- https://github.com/acpica/acpica

Offers three licenses.

We should create a `LICENSE.md` file that states we choose the 2nd or BSD license for the source code license. Just a simple statement:

```
The RTEMS Project chooses the 2nd or BSD license as per:

https://www.intel.com/content/www/us/en/developer/articles/license/
↪acpica-licensing.html
```

Author: Joel Sherrill 2024-08-06T19:30:49.415Z

I am OK with this. Just want to be clear to an end user.

Author: Matheus Pecoraro 2024-08-06T19:30:49.415Z

I'm not sure if it's necessary but I agree it's best to have it. Should there be a copy of that file in both bsps/include/acpi/acpica and bsps/shared/acpi/acpica ?

Author: Amar Takhar 2024-08-06T19:30:49.415Z

It states we have to choose so there is no way around it we have to state it somewhere. I would put it in `bsps/shared/acpi/acpica`.

Summary

bsps/stm32h7: Fix typo causing crash on USB 2 initialization

There is certainly no USB 20 TG while there is a known USB 2 OTG tech. The crash caused by this is well observed from media01.exe from libbsd compiled for H7 and run on the board.

There appears to be quite a bit of file renaming, code reformatting, code movement, and configuration movement that I'd qualify as fixups in the second patch that really should just be in the first patch since that's where the non-fixed-up version is introduced. It makes the second patch significantly harder to read for functional content. It would be easier (and perfectly acceptable) to squash the patches together than to extract and move the non-functional changes.

Summary

bsps/stm32h7: update STM32 H7 HAL

This patch updates STM32 H7 HAL source files. The files are taken from two STM projects from their github.com repositories:

(i) https://github.com/STMicroelectronics/stm32h7xx_hal_driver.git

The project files are still available under BSD-3 license and the version/commit used is:

fec141ce999da655a48e1a15db83a72d564a1312

which represents Release v1.11.3 exactly.

(ii) https://github.com/STMicroelectronics/cmsis_device_h7.git

The project files are available under Apache 2.0 license. Fortunately the project does not contain NOTICE file so no need to do anything special when used in RTEMS.

The project version/commit imported is:

faccfec37f82f7a1319c21638111b0f7335de7fe

which represents Release v1.10.4 exactly.

Closes #5075

Summary

getdents: hold the IOP while performing the operation

As all the other functions about file descriptor, `getdents` should hold the IOP of the file descriptor it is working on.

Closes #5074

Single letter variable names are strongly discouraged outside of simple loop indices. This should be at least “ret”.

Commit	6ab27bb54e5c056ca7ef605f79fffc7869d1ce9b

Summary

libtests/stackchk04: Add a new testsuite for the detailed reporter

Now as the default reporter is set to be a quiet reporter, we have stackchk test case for the default quiet reporter, stackchk03 for a custom user-defined reporter and stackchk04 for the detailed reporter function

Author: Joel Sherrill 2024-08-06T18:23:19.692Z

No end of line.

Author: Mohamed Hassan 2024-08-06T18:23:19.692Z

sorry, newline will be added.

approved this merge request

Author: Kinsey Moore 2024-08-06T18:16:32.147Z

The commit message needs to explain why the default reporter is being changed.

As far as the contents of the change, wouldn't the stackchk.scn file need to be changed since its behavior is changing with this patch? I wouldn't expect the stackchk03.scn output example to change at all since it's still defining the same custom reporter.

Author: Kinsey Moore 2024-08-06T18:16:32.147Z

Would stackchk.doc need to change as well?

Author: Joel Sherrill 2024-08-06T18:16:32.147Z

Yes. To reflect that it is using a non-default reporter if the output didn't change.

Author: Mohamed Hassan 2024-08-06T18:16:32.147Z

- Regarding the `stackhck.scn` file, yes, it needs to be updated due to the use of a more basic quiet reporter.
- The `stackchk03.scn` output was previously inaccurate because I didn't fully understand the SCN files. I have now corrected it with an example of the actual output.
- stackchk04.doc will be revised and changed.

Author: Kinsey Moore 2024-08-06T18:16:34.138Z

Doesn't this test explicitly define the detailed reporter function?

Author: Mohamed Hassan 2024-08-06T18:16:34.138Z

Alright will be changed.

Commit	bd7e02d96b5e22487656f95cfad8c078ce20c7c5

Summary

testsuites: Fix fstests/fsrmdirparent testcase

The testcase failed because the `rmdir` call in that case had two possibilities to fail and the implementation of `rmdir` checked the other possibility first.

@joel this will need you.

Author: Suraj Kumar 2024-08-08T05:55:28.310Z

@sebhub Was the build breaking without this inclusion to the linker script?

When making the changes, I added this snippet to those linker scripts that needed it since it was being added automatically without issues for some Architecture/BSPs.

Author: Suraj Kumar 2024-08-08T23:19:31.407Z

@amar Not sure, like I said above I had added the snippet to those linker scripts whose builds were breaking (which was across the newer architectures), the older ones built fine for me without this inclusion.

Author: Amar Takhar 2024-08-08T23:19:31.407Z

Well, wait to see what @sebhub says and maybe we'll have to figure out how to add it to all of them if there was any kind of breakage. It's no big deal these things happen

Author: Suraj Kumar 2024-08-08T23:19:31.407Z

Yeah if the build is breaking I can run through all the architectures once more and do another sweep to make sure everything works, no worries.

Author: Sebastian Huber 2024-08-08T23:19:31.407Z

I did build all BSPs to test my system termination changes in !121. It seems this BSP was the only one with a broken linker script.

Author: Suraj Kumar 2024-08-08T23:19:31.407Z

Okay, thank you for catching this. If all other BSPs built fine then no issues, right?

Author: Amar Takhar 2024-08-08T23:19:31.407Z

Yes that is what he was implying that this was the only one that broke so that's great!

Commit	f29986391dbc9cda88ec0f90699a00857391ef7e

Summary

aio_fsync.c: Address Coverity dead code issue

Coverity CID 1616018

O_SYNC and O_DSYNC have the same value which led Coverity to note that checking for both values in if's or switches leads to dead code. The solution is to add a cpp check that they are equal and enough commentary so if they ever are not the same, there is a hint as to why the cpp check got tripped.

Closes #5100.

It looks like a LOT of these need reviewing for being current. I think we should consider migrating those that survive the upcoming deprecation to the Users Guide. That’s where this type of information is now.

Author: Amar Takhar 2024-08-02T19:57:39.095Z

Yep this is a big reason why this move is good it will make them front and center on GitLab when people browse to directories and make them indexed by search engines it will encourage us to fix them.

Commit	07bd3871ab2c409c836f596a529fde643e4b6210

Summary

msdos: update inode during rename

rename now actively changes the inode of the file being renamed. This change has been done to fix an issue when the file being renamed is already opened before the rename, in particular failing to update the inode number (and the two lookup tables) could cause at least two problems: 1) A new file created in the same source folder of the file being renamed may get the same fat file descriptor of the renamed file 2) An open to the renamed file opens a new fat file descriptor, thus putting out of sync the operations on the file (two distinct fat file descriptor working on the same clusters and entries)

Previously the inode was in any case changed once the file was closed.

Another possible solution would have been to separate the inode number from the lookup table, but this solution would have required much more memory because it needed to keep track of all files seen in the file system up to the last operation and not only the opened ones.

Closes #5044

Author: Amar Takhar 2024-06-19T05:32:56.655Z

Sorry I just noticed now but can you add the ``Closes #5044``to the commit message at the bottom. This way we can see the issue that the commit is related to in the repo history. Via GitLab is gets lost in the MRs. Thanks!

Author: Loris Nardo 2024-06-19T05:32:56.655Z

I've added the line at the end of the commit message

Author: Amar Takhar 2024-06-19T05:32:56.655Z

Sorry that \ wasn't supposed to be there I thought that's how you stop it from showing up as a reference. It's just supposed to be:

- `Closes` #5044

See, unfortunately it makes it a reference, sorry for the trouble.

Author: Loris Nardo 2024-06-19T05:32:56.655Z

No problem, it is the first time I'm contributing

Author: Chris Johns 2024-07-25T18:01:17.258Z

Should there be a test case for this?

Author: Sebastian Huber 2024-07-25T18:01:17.258Z

Yes, there should be a test case for this.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

I've followed the hint of @chris and added the code in the fsrename test but I'm almost sure that the test is never run on FAT file system, so I've added it in `spec/build/testsuites/fstests/grp,yml` (not committed here) and I have created a file

for the test (also not committed), however there are a lot of tests that fails (with or without the changes of the merge request), I can fix some of them but then the issue and the merge request become more broad. This is the list of test cases that fails: * Rename file with directory fails (wrong errno) * Rename directory with file fails (wrong errno) * Rename same file fails * Rename empty directory with another empty directory fails * Rename directory with ancestor directory fails (wrong errno) * Testing empty filepath fails (wrong errno) * Symlinks tests fail, but this is expected because FAT does not handle them * The tests that deal with permissions (I guess also these are expected failures)

Author: Joel Sherrill 2024-07-25T18:01:17.258Z

That's a long list of challenges. Let's see if we can narrow them down. Sorry this changes the order but hopefully this is easy to follow.

These are probably just a matter of changing the error return code that is used by dosfs and should be one line changes:

- Rename file with directory fails (wrong errno)
- Rename directory with file fails (wrong errno)
- Rename directory with ancestor directory fails (wrong errno)
- Testing empty filepath fails (wrong errno)

The following test cases should be split out to a separate executable or moved if there is another test where they could go that is already not run on the dosfs. Somehow they just get included in an executable that makes sense.

- Symlinks tests fail, but this is expected because FAT does not handle them
- The tests that deal with permissions (I guess also these are expected failures)

That leaves these which "feel" harder to fix.

- Rename same file fails
- Rename empty directory with another empty directory fails

If you can address the first two groups which seems manageable, that leaves the two last rename ones. Any idea what these two need to be checking for? It just seems like these are missing a check.

Disclaimer: I haven't worked on the dosfs.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

From the last time I've written a message here, I've checked better the testcases, the issue about the failing test cases is more broad than the FAT file system, it is related to #2169, in fact the fsrename test for every filesystem fails on the same points (except for maybe symlinks and permissions which I have already moved from the fsrename testcases). All the failures are from the `_rename_r` implementation that evaluates the paths with the exclusive flag, thus failing all the testcases with EEXIST. I have almost completed a proof of concept that should pass all the testcases for the FAT filesystem except for the ones already moved and one related to the EMLINK

errno. Right now I have to think on how to check for the case where the old path is an ancestor of the new path.

Still, about the testcases if I run them with rtems-test I see that all are passed even though running them with `--log-mode=all` shows the FAIL messages, maybe I am missing some points here I am not familiar with the testsuite or the expected results

Author: Joel Sherrill 2024-07-25T18:01:17.258Z

If you have all possible cases passing except those due to #2169, perhaps moving those test cases into their own executable would allow them to be marked as XFAIL with a pointer to #2169. I am more asking than telling. I am just trying to find you an exit point on this issue and have issues filed for any remaining failures.

If #2169 is happening in your application, it still may make sense to wrap up what makes sense here and work on the rename issues under that issue.

Sometimes it is good just to fix a few things and file tickets for the next set. If you can find a clean exit on this issue. I hope that makes sense.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

For our use case #2169 is not important, even if it is not aligned with POSIX it still is a well defined behavior, it is just the reason why the test fails.

I've pushed a new commit where I've made some changes to the fstests, there are still two testcases missing both inside fsrenamelimits: * One is related to `ENAMETOOLONG` which on some filesystem (RFS for instance) fails * The other is related to `LINK_MAX` which fails on some filesystem

Should I make two separate tests? Regarding the expected failures of the test cases I've placed the `set-test-state` inside `spec/build/bsps/tst.yml` is it the correct place?

Author: Joel Sherrill 2024-07-25T18:01:17.258Z

Sure create separate test for those. File issues.

@opticron @chris Is he doing the test state right?

Author: Kinsey Moore 2024-07-25T18:01:17.258Z

The test state additions look mostly correct. Each section needs a reason and should have a linked issue referenced in that reason as to why the group of tests is failing. That last one has "null" as a reason and that's especially bad.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

I've checked the reason why the tests failed on the "null" group, here is the list: * jffs2fsrenamelongname and jffs2nandfsrenamelongname fails because the rename

succeed * rfsfsrenamelongname fails because the limit on the name is mostly related to the block size and in the case of the test the block size is twice the NAME_MAX, however when testing with a filename longer than the block size then the operation fails after having allocated all the blocks to try to find a suitable empty directory (which will never happen) with ENOSPC * *fsrenamemaxlinks I'm not quite sure if the test is valid, it makes an assumption that every file in a directory holds a reference to the folder itself and this counts toward the LINK_MAX value. * mdosfsfsrenamemaxlinks fails because LINK_MAX is set to 5, but FAT cannot have links to files and the number of files a directory can hold depends on how many entries have been used for long file names (rename succeed) * jffs2fsrenamemaxlinks and jffs2nandfsrenamemaxlinks fails because rename succeed * mimfsfsrenamemaxlinks fails because rename succeed, LINK_MAX applies only to linked files and not to the parent directory * mrfsfsrenamemaxlinks fails because rename succeed

Moreover for the *fsrenamemaxlinks I've only found IMFS_link that sets the errno to EMLINK. I can add this explaination to the set-test-state

Author: Amar Takhar 2024-07-25T18:01:17.258Z

FYI to the right of the resolve thread button there is another one that says 'create issue to resolve thread'. That will take the context here into the issue to have a larger discussion and fix there so this one doesn't get too far out of scope.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

Thanks didn't notice the button, I was also under the impression that this was going out of scope. I can leave the merge request with just the first two commit, without touching all the fstest cases, and then once merged I can make an issue and a merge request with the changes to the fstest cases (just the third commit). Tell me what is the preferred way

Author: Joel Sherrill 2024-07-25T18:01:17.258Z

I think there is no need to undo things as long as you have filed issues for failure cases and disabled them or set the expected test state for those filesystems.

Cite the issue numbers back to me and I will close this thread and let this proceed.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

@joel I've created the issues #5069, #5070 and #5071 to cover the failing test cases, it is missing only the one related to JFFS2 long file name I'm not sure how to proceed for that case, I can create another issue and say that the test case fails and write that it is probably due to JFFS2 not having an hard limit on file names but I'm not sure about it; I tried to search online for some limits of JFFS2 but I've not found any.

I've updated the reasons for the expected to fail testcases also.

Author: Kinsey Moore 2024-07-25T18:01:17.258Z

Go ahead and create another issue for JFFS2 so that it can be addressed later.

Author: Loris Nardo 2024-07-25T18:01:17.258Z

I've created issue #5073, I've also rebased the commits and updated the `tst.yml` with the new issue number

First, thanks for digging into this and making submissions.

You probably have noticed that the fstests are setup so that the same "test C file" is linked against support for various file systems. The rename test.c is only currently associated with tests for the mimfs (mounted IMFS) and mrfs (mounted RTEMS File System) file systems. The shared "test C files" contain cases that should work on all file systems. In this case, sym links are not supported on FAT file systems. The test C file includes some symlink test cases which really should be in a different test. There is an fssymlink so maybe it can just be moved there. If not, a new "shared test C file" needs to be created and a new set of appropriate executables. Highlights in recap:

- Shared test sets are (.c -> .o) are used with various file system specific initialisation to create file system specific executables.
- This allows exactly the same file system test cases to be used on different file systems as appropriate.
- Sometimes, a file system capability is not universally supported and those cases need to be arranged to be easy to avoid where they are known to be broken. I recall something with access or modify time is also an issue on FAT file systems.
- For this case, symlink tests should not be attempted on FAT FS tests.

I hope this helps and gives you an idea of how we quickly increased test coverage on file system implementations by reusing the test code as much as possible.

I've moved some test functions over fssymlink and fspermission. The test of fsrename now proceed on FAT, still there are all the other failures but I think that some are common to all the filesystem as rename does not allow the destination file to exists.

If it is fine I'll resolve the thread

That is so strange I used `git mv` for the files then edited them but it left the moved files behind but recorded the move on commit? I had to 'git add' them and include them after and squash. Strange.

Commit	e8e099d5f8c9c02e7cfba0b8ae5e3e15766a596c

Summary

testsuites: Convert README to MarkDown

This also merges PROBLEMS and README.testdata into a single README so it displays nicely in the parent directory.

created #5091 to continue this discussion

Author: Joel Sherrill 2024-08-02T20:38:57.167Z

This is horribly out of date. The tests always run with a polled version of the console driver. Tests which require a clock tick, etc are accounted for. This is old and crusty. There is likely nothing in here to salvage.

Commit	1b430bdff82c2eeb5984479042ea0ceee0ee47f7

Summary

Remove ACKNOWLEDGEMENTS file.

This file is ancient and there have been many, many contributors to RTEMS that deserve equal acknowledgement.

I have opened an issue to create a new contributors section in the documentation in the docs projects:

- rtems/docs/rtems-docs#21

I have linked this version of the file there but this file should not ship with the next version of RTEMS given the GitLab migration it will not be converted to MarkDown.

Joel: Let's see if it is possible to include a short overview of the pre-1995 history and what the original "public" source contained.

This review is incomplete. I did it using my phone in moving vehicle. I am not sure all comments posted and I didn't get to the bottom

Author: Amar Takhar 2024-07-28T20:58:02.222Z

So I am converting these to MarkDown you're free to edit them after but I'm not doing any content modifications, sorry it's way too much to do at once and the markdown.

As per @joel via chat I'm resolving all of these with an issue we can deal with them later.

Remove this comment. Per functions are clearly enabled in the arguments. That is an 8 year old ticket and is closed.

Author: Amar Takhar 2024-07-26T20:49:11.179Z

I removed it but it really should have been it's own MR not in the scope of what I'm trying to do here.

Author: Joel Sherrill 2024-07-26T20:49:27.362Z

This is closed. Can the comment be “See .. for explanation”?

Sorry to push clarifying comments while updating URLs but when I see a comment like that, I expect an open issue – not a link to a long closed issue that explains what this is doing. :(

Author: Amar Takhar 2024-07-26T20:48:52.505Z

changed this line in version 3 of the diff

Author: Amar Takhar 2024-07-26T20:49:27.362Z

I fixed it but it really should have been it’s own MR not in the scope of what I’m trying to do here.

Author: Joel Sherrill 2024-07-26T21:48:01.220Z

We probably need to have some rules on linking to issues in the code. FIXME types are probably ok but when an issue is closed and the comment links to it with no clarifying text, then it looks like an open issue instead of a reference for details. Not your problem but pretty clear we need some guidance in the SW Engineering Guide.

Author: Amar Takhar 2024-07-26T21:48:01.220Z

Should open an issue for this in rtems-docs so it doesn’t get forgotten. There is a ton of inconsistency everywhere about this. I wouldn’t expect an open issue because there is a 0% chance anyone is going back to fix any references once it’s been created.

Commit	2ba94118a0867a1cae543af7d85603d8074cd6c6

Summary

Remove MAINTAINERS file

This file is now obsolete now that we have moved to GitLab. A ticket has been opened in ` rtems/docs/rtems-docs#21 <https://gitlab.rtems.org/amar/rtems/-/merge_requests/new?

merge_request%5Bsource_branch%5D=maintainer>`_ to discuss adding a contributors section.

GitLab lists who the 'Code Owners' are on top of every file in the web source browser this is the canonical way to find out who maintainers are of those files or directories.

Even with knowing who the maintainers are the best way to figure out who is looking after what is to open an issue or an MR. This way we can keep a group level of maintainership over the code base and have CODEOWNERS enforce approvals before merging.

Author: Amar Takhar 2024-07-26T01:56:19.238Z

assigned to @amar

Author: Kinsey Moore 2024-07-26T20:16:35.043Z

Should we point people looking for this information to the locations where GitLab stores it?

Author: Amar Takhar 2024-07-26T20:16:35.043Z

It's funny you bring that up I was going to point it out but I deliberately left it out with the 3rd paragraph as an explanation. That list while it's there really doesn't tell anyone much. What if we're all busy?? Everyone on GitLab is invited to comment on MRs and issues not just a maintainer.

I don't think specifically targeting developers is the way to do it anymore. But..that's just my opinion if you think we should add it then we should have the caveat above. Either way it's going to be "open an MR/Issue" and maybe they can @ someone in the description?

Author: Kinsey Moore 2024-07-26T20:16:35.043Z

I was thinking more as a way to convert those that typically hunt for the MAINTAINERS file to the GitLab way of doing things.

Author: Amar Takhar 2024-07-26T20:16:35.043Z

Is there anywhere to put it other than in a MAINTAINERS file?

As devops tools have changed they're no longer relevant. Approvers aren't always maintainers just the person who knows the area / code the best the maintainer can be an entirely different person so who do you contact? Best way is to open an issue or MR. That's why I don't think it's worth it to have any mention of the concept anymore.

I think anyone seeking a MAINTAINERS file will be able to sort themselves out because not every project has had one, anyway.

Author: Joel Sherrill 2024-07-26T20:16:35.043Z

Like @opticron, I wonder if a pointer can go here. But OTOH, it seems like someone who got this far should be able to fend for themselves. We had this because GNU projects did this. It doesn't make much sense any longer.

I'd be ok removing it.

Summary

Remove INSTALL file.

All this does is points to the README. The README points to the docs website as it should.

INSTALL files are falling out of favour since sites show README.* by default over an INSTALL file.

Commit	84b56d69daab328b178de892b11ffa5793835f56

Summary

Remove Makefile.maint

This file has not been relevant in at least 8 years and even then only for texinfo? The file calls itself Experimental and relies on CVS. It was used for cutting old RTEMS releases.

assigned to @chris

Author: Gedare Bloom 2024-07-18T02:36:47.812Z

The name seems wrong/confusing, as there are several `rtems_libio_iop_xxx( *iop )` functions that manipulate iops. Perhaps `rtems_libio_count_open_iops` or `rtems_libio_count_open_descriptors`?

Author: Chris Johns 2024-07-18T02:36:47.812Z

Yeah sure, please choose one?

Author: Chris Johns 2024-07-18T02:36:47.812Z

I will change to `rtems_libio_count_open_iops`

Commit	cc034e7d2ffe330b2a45e5ca65254fea108960a8

Return task and idle time using `getrusage`. This has been tested with an updated `iocStats`.

Add support for `RUSAGE_THREAD` if the user builds with the `_GNU_SOURCE` macro defined.

Commit	174b69afd6f2e2220620ffd572025ca2291cf533

Summary

cpukit/shell: Account for tick rate in timeouts

On systems that don't provide a proper terminal or have broken window size detection, the RTEMS shell can take a long time execute commands if the kernel tick interval is longer than 1ms. This updates the shell window size retrieval timeout code to account for the kernel tick interval bringing the experienced timeout from 12.5ms to 1.25ms when using the default kernel tick interval (10ms).

Author: Kinsey Moore 2024-07-12T02:38:48.237Z

assigned to @opticron

Author: Chris Johns 2024-07-12T13:04:30.457Z

I would move this into a static function so the logic can be shared between here and below.

Does the time cal need a +1 if the time is less than the tick period?

Author: Kinsey Moore 2024-07-12T13:04:30.457Z

Sounds appropriate, I'll make sure the timeout is at minimum 1 tick.

Author: Kinsey Moore 2024-07-12T13:04:25.009Z

changed this line in version 2 of the diff

Author: Chris Johns 2024-07-12T19:42:13.646Z

I think adding `TERM_SIZE_DETECT` or something like that would be a good idea. If you do not want to do this I can add an MR after.

Author: Kinsey Moore 2024-07-12T19:42:13.646Z

It has been added in the second patch along with functionality to automatically disable window size retrieval on failure.

Summary

bsps/aarch64/a72: Avoid use of reserved INTIDs

Interrupt IDs 1020, 1021, 1022, and 1023 are reserved as special INTIDs and should be ignored for normal RTEMS operation as they signal internal changes in the interrupt controller that RTEMS itself is directly causing.

Summary

testsuites/libtest/dl12: add DL test for incrementally linked objects

This commit adds a test to validate the incremental linking functionality in RTL. The test is related to issue #3740.

Please limit your commit subject line to 50 characters. This might be a better formulation: testsuites/libtest: Add DL incremental link test

Author: Kinsey Moore 2024-06-13T12:34:43.775Z

This copyright is not accurate and needs to be replaced.

Author: Ranulfo Raphael 2024-06-13T12:34:43.775Z

The copyrights came from another dl test on which this test case was based. Would it be better to append a new copyright message or replace it?

Author: Kinsey Moore 2024-06-13T12:34:43.775Z

If the majority of the copied content is boilerplate that the project requires, then you should assert your own copyright. Otherwise, you should add your own since presumably it's not an exact copy. For exact copies, you could reference the original or leave the copyright intact in the copy.

Commit	c4c3e687903dccbb3679e3bd5babb87b95c507dc

Summary

bsps/arm: Fix L2C-310 cache disable

For the rtems_cache_disable_instruction(), just disable the L1 instruction cache and keep the L2 cache enabled. In SMP configurations, disable the L1 instruction cache on all online processors.

For the rtems_cache_disable_data(), disable the L1 data cache in assembly to make sure that no memory accesses are used in the procedure. In SMP configurations, disable the L1 data cache

on all online processors and make sure that the L2 cache is flushed and disabled by exactly one processor at the right time.

Author: Sebastian Huber 2024-05-22T15:56:45.726Z

added 2 commits

Compare with previous version

Author: Sebastian Huber 2024-05-23T10:03:08.831Z

This version still depends on code optimizations.

Author: Chris Johns 2024-05-23T22:22:50.967Z

One of the commit messages says:

> For the rtems_cache_disable_instruction(), just disable the L1 instruction cache and keep the L2 cache enabled. In SMP configurations, disable the L1 instruction cache on all online processors.
>
> Why does SMP need to disable L1? If there is a reason it would be good to explain this in the commit message and the code.

Author: Gedare Bloom 2024-06-24T16:37:44.049Z

mixing tabs and spaces

Author: Sebastian Huber 2024-06-24T06:32:56.856Z

changed this line in version 3 of the diff

Author: Gedare Bloom 2024-05-31T19:58:41.948Z

Somewhat of a historical question maybe, but should there be an `arm/shared/cache/cache-l2c-310.h` or similar?

Author: Sebastian Huber 2024-05-31T19:58:41.948Z

No, this is an internal function which needs to be implemented in assembly. In general, there is no reusable API here.

Author: Sebastian Huber 2024-06-24T06:32:57.640Z

changed this line in version 3 of the diff

Author: Gedare Bloom 2024-05-31T20:00:10.718Z

This belongs in its own MR first, with test case and documentation added. It is a new (internal) API. There should be an Issue to track it.

Author: Sebastian Huber 2024-05-31T20:00:10.718Z

This is an internal function, the Doxygen documentation is all what you get. I moved it to !46. There is no specific SMP barrier test, so adding a test case for this function exceeds my time budget for this work.

Author: Sebastian Huber 2024-06-24T06:32:58.409Z

changed this line in version 3 of the diff

Author: Gedare Bloom 2024-05-31T20:01:38.507Z

This is only “all_other” when `count` is equal to the online CPUs.

I might suggest `_SMP_barrier_Wait_for_count( ... unsigned int count)` and change `count - 1` below to `count`.

The function documentation and usage could be clarified. As a curiosity will it work with `x > 1` thread waiting here, if passing `count - x`?

Author: Sebastian Huber 2024-05-31T20:01:38.507Z

Yes, good idea. I changed it in !46.

Author: Sebastian Huber 2024-06-24T06:32:59.819Z

changed this line in version 3 of the diff

Author: Sebastian Huber 2024-06-05T06:26:22.247Z

marked this merge request as **draft**

Author: Sebastian Huber 2024-06-07T16:02:42.657Z

I managed to disable the L1 and L2 caches, however, afterwards I got not that far. On the Cortex-A cores it seems at least the L1 data cache is required to provide support for atomic operations:

https://stackoverflow.com/questions/76207164/disabled-dcache-will-prevent-atomic-flag-from-being-s

So, I suggest to do this for the cache manager implementation:

- Make the rtems_cache_disable_data() directive a nop.
- Issue a fatal error if someone calls rtems_cache_disable_data().

Author: Sebastian Huber 2024-06-24T16:37:56.583Z

A third option would be to return a status code in rtems_cache_disable_data().

Author: Gedare Bloom 2024-06-24T16:37:56.583Z

returning a failure code seems a bit nicer.

Commit	7ce6667e38408f5d56141dbf9e55e6a5005ce40e

Summary

Add a new API-level define `RTEMS_INTERRUPT_LOCK_NEEDS_OBJECT` to indicate if a lock object is needed. This can be used to reduce the size overhead of locks when no lock object is needed.

Simplify the score ISR locks API by using the new `ISR_LOCK_NEEDS_OBJECT` indicator.

See #4957 and #5038

Author: Chris Johns 2024-06-19T23:01:05.445Z

changed the description

Author: Chris Johns 2024-06-21T06:57:31.400Z

What is the default setting for `RTEMS_INTERRUPT_LOCK_NEEDS_OBJECT` ?

Why would you use tor not use this option and reduce the size?

Does this vary the API is defined and not defined? The comment would indicate you need a lock object and not need a lock object?

Author: Sebastian Huber 2024-06-21T06:57:31.400Z

The documentation of this define is:

```
1 /**
2 * @ingroup RTEMSAPIClassicIntr
3 *
4 * @brief If this define has a non-zero value, then the interrupt lock
5 *   operations require an object of type ::rtems_interrupt_lock,␣
  ↪otherwise no

The default value is 0, if RTEMS_SMP is defined, then it is 1.

Author: Sebastian Huber 2024-06-21T06:57:31.400Z

I added a code example using RTEMS_INTERRUPT_LOCK_NEEDS_OBJECT to the rtems_interrupt_lock notes.

Author: Chris Johns 2024-06-21T06:57:31.400Z

Thanks the documentation helps. I now get the connection and the reason for the MR. I will need to go and review the code in more detail to comment further. The last question in initial my list is outstanding?

Is the overhead of the `char` that was added in the non-SMP lock `struct` something you have seen as adding data? I am surprised if but willing to understand the nature of the problem you are resolving if you care to outline it?

Author: Sebastian Huber 2024-06-21T06:57:31.400Z

The lock operations API is always the same.

In C, the empty structures had a size of zero. It is not just a `char`. If you add the locks to a structure is is usually a 4 or 8 bytes overhead due to alignment.

Author: Chris Johns 2024-06-21T06:57:31.400Z

Yes field alignment is arch dependent and can be painful.

Can I summarize the change as moving from one point of difference in the `ISR_lock_Control` struct to explicitly handling the ISR lock control?

Can `ISR_LOCK_MEMBER` remain as empty? It seems the lock was already wrapped so I do not understand why that has been removed?

Author: Sebastian Huber 2024-06-21T06:57:31.400Z

The ISR_LOCK_* is an internal API, so we can break it. The patch set removes the `ISR_lock_Control` structure if it is not needed to make sure we don't use it internally. The problem with the `ISR_LOCK_MEMBER` member approach is that it confuses Doxygen. It adds the documentation of the removed member to the next one.

Author: Chris Johns 2024-06-21T06:59:02.323Z

Yes the API it is internal. Thanks for clarifying the change. It now makes sense to me.

This Xilinx ZynqMP specific or `aarch64` specific?

Author: Kinsey Moore 2024-06-20T16:45:27.875Z

This is specific to the implementation using A53 cores in the ZynqMP chip. The cache error reporting varies a bit by core and this could theoretically be reused for other A53 cores with interrupt number varying.

Author: Chris Johns 2024-06-20T16:45:19.957Z

Is this touching hardware?

Author: Kinsey Moore 2024-06-20T16:45:19.957Z

No, this is operating on pre-read registers and pointers are passed in since the values are needed in the calling function. They are intentionally non-volatile.

Author: Chris Johns 2024-06-20T13:25:07.526Z

Hardware?

Author: Kinsey Moore 2024-06-20T13:25:07.526Z

Yes, this should have been volatile. I'll get that fixed up.

The enum and structure naming is not really in line with the RTEMS-style. Should all this ECC stuff be in ecc.h?

Author: Kinsey Moore 2024-06-21T05:57:38.908Z

I was trying to keep BSP-internal interfaces separate from user-facing interfaces. I'll rename the existing ecc.h and move this into a new ecc.h.

Author: Kinsey Moore 2024-06-21T05:57:38.908Z

I'll also move the structs and enums to typedefs. As for the naming, would you prefer a **Zynqmp_** prefix? The naming rules for items in BSPs are listed as "TODO.".

Author: Sebastian Huber 2024-06-18T23:51:25.476Z

Did you check how much the data size increased due to this change? It caused a test failure in tc-intr-non-smp.c. Using the name in `_ISR_lock_Initialize()` may have side-effects.

Author: Chris Johns 2024-06-18T23:51:25.476Z

If the standard says the behavior with an empty struct is undefined and adding a `char` element results in test failures then I think the existing code and expected behavior is broken. I feel what GCC supports as an extension is a mute point.

An important lesson here is all warnings need to be carefully examined.

Author: Amar Takhar 2024-06-18T23:51:25.476Z

100% agreed also in general it's better to avoid extensions due to cross platform issues. The other problem is since it's undefined even if LLVM had an extension there is absolutely no way to know whether both are implemented in the same way or would stay the same way.

Author: Sebastian Huber 2024-06-18T23:51:25.476Z

There was no need to push this through within five hours. It would be nice if non-trivial changes stay open for at least a business day.

Author: Chris Johns 2024-06-18T23:51:25.476Z

Five hours is quick and different for RTEMS. My hope is any issues from a fast turn around are isolated so I think the benefits out weigh the process we had before.

We have avoided placing time limits on things because it quickly becomes complicated. A business day is not easy to define. With a world wide 24/7 community your business day and others in the community do not overlap and we would need to guard each side of the weekend which means we would have 3 effective review days per week and then there are public holidays, annual leave and more.

Author: Amar Takhar 2024-06-18T23:58:04.923Z

It's usually less than 3 effective review days because in order to give everyone a chance to see it around the world you really need to block it for 36-48 hours. With

the project having as few eyes as it does then MRs would sit around waiting for them to time out then you'd get a glut of MRs being accepted quickly to avoid the next "timeout window".

Eventually approvers will just wait once or twice a week to look at it so they can do several at once. Time limits don't work unless you have a large team and even then it's dubious.

We have been using the 'Reviewer' field and making an issue as Draft if someone absolutely must block something until an action is taken or they get a chance to review. I'm working on a bot to block MRs unless the reviewers have also approved this will mitigate some of these issues but for now I think it's OK.

Author: Kinsey Moore 2024-06-18T23:51:32.488Z

Discussion elsewhere suggested that this undefined behavior resulted in empty structs consuming 1 byte. That portion of the patch was tailored to replicate that behavior, so there should be minimal to no change. To answer the question, I didn't double-check the data size since it was claimed to be no actual change.

Existing users of _ISR_lock_Initialize() expect _name to be evaluated at least once in SMP mode and shouldn't have an issue with the same occurring in non-SMP mode. The vast majority pass in literals, function arguments, or struct members with the exception being the call in the testsuite that stringifies it to verify that it evaluates to a no-op which it still does, just not the same kind of no-op.

In any case, I broke the test so I need to fix it. If this macro evaluating to an empty string is specified behavior, then I can submit an alternative resolution to the warnings. If not, I can update the test.

Author: Gedare Bloom 2024-06-18T23:51:32.488Z

The 1 byte is how C++ handles it.

Author: Kinsey Moore 2024-06-15T13:57:41.476Z

I have created !74 with the test update fix.

Commit	644041626d3e83917309dae6a45e5696013eda63

Summary

testsuites: Update lock init validation test

This test was broken by b031cf2b19ef4be3a865d818e8d609011b04a3df since it expects the macros to evaluate to an empty string for non-SMP builds. This updates the check for the new content.

`tmp_buffer` is uninitialized, and `&tmp_buffer` is a pointer to this function's stack. This is going to be just writing into the stack space beyond the current stack frame.

Author: Kinsey Moore 2024-06-03T05:35:17.340Z

This is actually fine. This function is built weird and pastes its internal buffer pointer into the uint8_t** provided as the last argument.

Author: Kinsey Moore 2024-06-03T05:35:17.340Z

FYI, it uses its internal buffer because it must be properly aligned for the hardware to transfer data into it.

Author: Gedare Bloom 2024-06-03T05:35:17.340Z

ok, it's probably worth mentioning. It is still an uninitialized pointer** the first time it is called.

Author: Gedare Bloom 2024-06-03T05:35:22.194Z

do you need to adjust `MAX_READ_SIZE - startAlign`?

Author: Aaron Nyholm 2024-06-03T05:29:48.123Z

changed this line in version 4 of the diff

Author: Aaron Nyholm 2024-06-03T05:35:22.194Z

`startAlign` is used to correctly read when the offset is odd as `QspiPsu_NOR_Read` can only read at even addresses. We read the byte before the first requested byte to align the read and then throw out the unrequested byte. We still want to read the `MAX_READ_SIZE`.

any good reason to cast away the `const`?

Author: Kinsey Moore 2024-05-24T01:34:44.760Z

It's because the function doesn't take a const. Realistically, we own that function now and could constify that parameter.

Author: Gedare Bloom 2024-05-24T01:34:44.760Z

ok that's fine. We should keep the code close to the upstream?

Author: Kinsey Moore 2024-05-24T01:34:44.760Z

When I say we own that function, there is not a file that directly corresponds to the contents of xqspipsu-flash-helper.c in the embeddedsw repository. If we want to improve the interface, we can and should. The NOR driver layer on top of the QSPI interface was not well organized and upstream can only serve as vague direction at this point.

changed this line in version 4 of the diff

Author: Gedare Bloom 2024-05-24T01:37:42.706Z

this is not usual. what is the purpose?

Author: Kinsey Moore 2024-05-24T01:37:42.706Z

This is to generate a “versal” define that the Xilinx driver code has ifdefs for to alter behavior on Versal systems versus ZynqMP systems. It’s done this way so that it only gets defined for Versal BSPs.

Author: Gedare Bloom 2024-05-24T01:37:42.706Z

Thanks that is helpful.

changed this line in version 8 of the diff

Author: Kinsey Moore 2024-06-06T18:55:43.683Z

Why does the offset need to be aligned to a 2 byte boundary?

Author: Aaron Nyholm 2024-06-06T18:55:43.683Z

This is due to striping across multiple flash chips. Xilinx stores the even byte on one flash chip and odd on the other. This means you can't read one without also reading the other. The GQSPI driver does not handle this and instead always returns the lowest even byte regardless. I don't remember what happens at the end of the buffer of the top of my head but I think it might not return it as the buffer is full due to the extra byte read. Aligning to the two byte boundary ensures that we always get exactly what we ask for and can fix up the odd byte ourselves.

Author: Kinsey Moore 2024-06-06T18:55:43.683Z

Sounds like it only applies in parallel configurations, but it doesn't hurt single or stacked configurations so that's fine.

changed this line in version 8 of the diff

Author: Kinsey Moore 2024-06-06T06:39:21.012Z

Is there a reason to break this out?

Author: Aaron Nyholm 2024-06-06T06:39:21.012Z

Because it wasn't triggering for versal builds. I get errors around xilinx files not being included which are resolved by explicitly defining the bsps.

Author: Kinsey Moore 2024-06-06T06:43:42.132Z

Is there a reason to break this out?

Author: Aaron Nyholm 2024-06-06T06:43:42.132Z

This one doesn't need to be builds work either way. I'll revert it.

Author: Aaron Nyholm 2024-06-07T04:27:22.392Z

changed this line in version 8 of the diff

Author: Kinsey Moore 2024-06-07T13:53:52.251Z

It might be a good idea to move this functionality into the flash helper code, similar to how the write page code was merged in. It's generally useful.

Author: Aaron Nyholm 2024-06-07T13:53:52.251Z

If it was to be moved to `xqspipsu-flash-helper.c` what would header file look like? Move the logic into `QspiPsu_NOR_Read` and change the arguments and then put a new name to the existing `QspiPsu_NOR_Read` code?

Author: Kinsey Moore 2024-06-07T13:53:52.251Z

Yes, the existing function would be renamed QspiPsu_NOR_Read_Page and then the functionality here would be QspiPsu_NOR_Read. This is by no means a requirement for my approval of this patch set, just a suggestion if you feel like it.

Author: Aaron Nyholm 2024-06-07T13:53:52.251Z

I've moved the read into `xqspipsu-flash-helper.c`

For a fix see !67.

Author: Sebastian Huber 2024-06-11T11:44:43.429Z

Did this ever work? You call QspiPsu_NOR_Read() recursively here.

Author: Kinsey Moore 2024-06-11T13:11:29.063Z

This piece of code was formerly external to the flash helper and got moved here on my request because it's generic and useful functionality to have. It looks like it didn't get refactored or an old version of it slipped in.

Author: Sebastian Huber 2024-06-11T13:13:40.080Z

I got it to compile, but I really don't know if it is functionally all right, see !67.

Commit	e1be689980bacbdaca279783ba184a89c1bb0ee8

Summary

smpschedaffinity02: Fix sporadic test failures

Under rare timing conditions, the polled mutex obtain can favour one processor and starve the other. This can lead to test failures.

Commit	25ba67963aa23dff4fbe87a2e0c56b8c011cdf8a

Summary

score: Add _SMP_barrier_Wait_for_other()

This function may be used to ensure that a count of processors performed a set of actions and then wait on the barrier performing only memory loads (no memory stores).

Commit	d1a38c7749c7f4f9a84b7ccdc29ad38a780a4069

Summary

Corrected the header comment of aio_read.c

Fixes #5015

Author: Alessandro Nardin 2024-05-21T16:58:01.980Z

changed the description

Author: Joel Sherrill 2024-05-23T19:05:34.870Z

Can you convert the documentation in all aio*.c to Doxygen? This style of comments dates from the earliest days of RTEMS.

Author: Alessandro Nardin 2024-05-23T19:05:34.870Z

I was looking at the Doxygen Guidelines in the RTEMS documentation and it looks like every function declaration should be documented in the header. Right now the only documented function declaration is aio_cancel(). Should i move the documentation present in the various aio*.c files in aio.h ?

Commit	e74cea4172ee8564bef5f8500c5dd07512257d99

The _ARMV7M_Pendable_service_call() and _ARMV7M_Supervisor_call() work as a team. The –ef and ++ef is there to preserve the original exception frame across the jump to and from _ARMV7M_Thread_dispatch().

```
void _ARMV7M_Pendable_service_call( void )
{
Per_CPU_Control *cpu_self = _Per_CPU_Get();

/*
* We must check here if a thread dispatch is allowed.  Right after a
* "msr basepri_max, %[basepri]" instruction an interrupt service may
still
* take place.  However, pendable service calls that are activated during
* this interrupt service may be delayed until interrupts are enable
again.
*/
if (
( cpu_self->isr_nest_level |
cpu_self->thread_dispatch_disable_level ) == 0
) {
ARMV7M_Exception_frame *ef;

cpu_self->isr_nest_level = 1;

_ARMV7M_SCB->icsr = ARMV7M_SCB_ICSR_PENDSVCLR;
_ARMV7M_Trigger_lazy_floating_point_context_save();

At this point, the floating point context should be saved on the
exception frame.  The FPCCR.LSPACT bit should be 0, to indicate that lazy
```

(continues on next page)

(continued from previous page)

```
state preservation is no longer active.

ef = (ARMV7M_Exception_frame *) _ARMV7M_Get_PSP();
--ef;
_ARMV7M_Set_PSP( (uint32_t) ef );

This new exception frame is just there to jump to
_ARMV7M_Thread_dispatch(). Here was the problem, that FPCCR.LSPACT was
not set to 1.  This resulted in a floating-point context from
uninitialized memory which could corrupt the floating-point state.  See
also:

https://developer.arm.com/documentation/ddi0403/d/System-Level-Architecture/
↪System-Level-Programmers--Model/ARMv7-M-exception-model/Exception-return-
↪behavior?lang=en

/*
* According to "ARMv7-M Architecture Reference Manual" section B1.5.6
* "Exception entry behavior" the return address is half-word aligned.
*/
ef->register_pc = (void *)
((uintptr_t) _ARMV7M_Thread_dispatch & ~((uintptr_t) 1));

ef->register_xpsr = 0x01000000U;
}
}
```

Close #4923.

Commit	7eb3ef09b06ff19ecb32c932866f53ea21c8b12c

Summary

spec/xilinx-zynqmp-rpu: Calculate correct RAM area

There were some problems in the math calculating RAM length and NOCACHE origin location. These have been resolved in this patch allowing RTEMS RAM space to be relocated above 0xfe00000 to better accomodate other elements in the system.

Commit	ab8817ca03a2518679edccea7d1346764a27451c

Summary

Add directives to get and set the priority of an interrupt vector.

Implement the directives for the following BSP families:

- arm/lpc24xx
- arm/lpc32xx
- powerpc/mpc55xxevb
- powerpc/qoriq

Implement the directives for the following interrupt controllers:

- GICv2 and GICv3 (arm and aarch64)

- NVIC (arm)
- PLIC (riscv)

Update #5002.

The original implementations of these functions handle non-ARCH_V4 builds while the new versions do not. Was this functionality unused?

Author: Kinsey Moore 2024-05-07T20:20:30.374Z

Disregard, I see that the functionality mentioned was broken out into a separate implementation.

Author: Kinsey Moore 2024-05-07T20:20:30.391Z

resolved all threads

approved this merge request

Author: Chris Johns 2024-05-08T07:37:30.784Z

Is `priority` unused?

If there is no debug `bsp_interrupt_assert` becomes `((void) 0)` so does that mean `vector` is unused?

I will not comment on the other cases in this and the other files and assume this comment covers those cases as well.

Author: Sebastian Huber 2024-05-08T07:37:30.784Z

This is the version for BSPs which have no real implementation of this new API.

Author: Chris Johns 2024-05-08T07:37:30.784Z

Do we get warnings now? If not why not?

Author: Sebastian Huber 2024-05-08T07:37:30.784Z

Unused parameter warnings are not enabled as far as I know.

Author: Chris Johns 2024-05-08T07:37:30.784Z

Ah OK then turning it on would cause a lot of problems.

Author: Chris Johns 2024-05-08T07:35:54.055Z

Is this more a case of not supported on the BSP/arch? Would saying this help someone who sees the interface but does not know the BSP specifics understand what the error is?

Author: Sebastian Huber 2024-05-08T07:35:54.055Z

This error is returned if there is no real implementation or the interrupt controller doesn't support priorities. It is also associated with the can_get_priority attribute.

Author: Chris Johns 2024-05-08T07:35:54.055Z

Makes sense. Can this be added?

changed this line in version 4 of the diff

Author: Sebastian Huber 2024-05-08T07:35:54.055Z

Ok, I updated the documentation.

Author: Chris Johns 2024-05-08T07:25:36.056Z

Is <= OK or should it be <? The test as is means `MPC55XX_INTC_DISABLED_PRIORITY` is a valid priority?

If it is valid then I suggest this is noted in a comment.

Author: Sebastian Huber 2024-05-08T07:25:36.056Z

Yes, 15 is a valid priority value. The effect is that this interrupt is disabled.

Author: Sebastian Huber 2024-05-08T07:23:14.535Z

changed this line in version 3 of the diff

Author: Sebastian Huber 2024-05-08T07:25:36.056Z

I added a comment.

Author: Chris Johns 2024-05-08T07:25:51.695Z

Same comment as `MPC55XX`. Is this test valid or should it be <?

Author: Sebastian Huber 2024-05-08T07:23:15.328Z

changed this line in version 3 of the diff

Author: Sebastian Huber 2024-05-08T07:25:51.695Z

I added a comment.

Author: Chris Johns 2024-05-08T07:26:16.642Z

Am I to assume the `15` is related to the comment in the header file about the PIC value?

Should this be a define from that set so a check takes to those defines and so the comment?

Author: Sebastian Huber 2024-05-08T07:23:15.791Z

changed this line in version 3 of the diff

Author: Sebastian Huber 2024-05-08T07:26:16.642Z

I replaced the UINT32_C(15) with QORIQ_PIC_PRIORITY_DISABLED.

Author: Chris Johns 2024-05-06T04:01:20.193Z

I struggled with the name of this MR. I was looking for code optimizations for ARM BSPs and there are none.

Out of interest how are the changes build system optimizations?

Author: Sebastian Huber 2024-05-07T04:43:32.055Z

Build tasks are moved from shared items to BSP items which actually use them.

- dfc147fd - aarch64/xilinx-zynqmp: Enable errata workarounds

Compare with previous version

Author: Sebastian Huber 2024-05-08T10:20:53.455Z

This change is required to build the Cortex-A53 based BSPs with the latest tools.

Author: Kinsey Moore 2024-05-08T22:09:31.642Z

Thanks for adding the no-outline-atomics flags to the generic A53 BSPs. I didn't realize that A53 cores *can't* support FEAT_LSE as per documentation and I'm surprised outline atomics are enabled when the A53 core is selected by the CPU flag.

Author: Sebastian Huber 2024-05-08T22:09:31.642Z

I am not sure if the no-outline-atomics flag is actually redundant. I used it also for the multilib configuration.

Author: Kinsey Moore 2024-05-08T22:09:31.642Z

It was when I tested on zynqmp which is why it's there. GCC was generating instructions from FEAT_LSE and throwing undefined instruction errors. No idea if it's still necessary.

Author: Kinsey Moore 2024-05-08T22:09:36.470Z

If we're going to rearrange these, should we arrange them alphabetically? Applies to the other change as well.

Author: Sebastian Huber 2024-05-08T22:09:36.470Z

They are sorted from general to specific and match with the multilib configuration.

Commit	1f4e0c1036d7a814a7ce854436b5f7b82f92ef61

Summary

bsps/powerpc: Introduction of interrupt locks

Interrupt locks are introduced in shared vme device drivers to enable compilation in an SMP configuration of the qoriq BSP.

This merge request replicates the changes added in !11 that have been lost.

Author: Vincenzo Calabretta 2024-05-07T16:34:20.406Z

mentioned in merge request !11

Author: Chris Johns 2024-05-07T21:14:20.298Z

From !11 which was lost due to the history rewrite.

The changes had a review on the devel@ mailing list before we moved to GitLab. The important detail is:

> Hello Chris, it is tested on an MVME2500 which uses the powerpc/qoriq_e500 in an SMP configuration. Best regards Christian On 2024-04-18 04:04, Chris Johns wrote:

Commit	3fc3a4f8598a5e4a9d06410931fa654f718978f5

In preparation for moving to MarkDown.

Author: Amar Takhar 2024-04-24T22:30:12.665Z

added 5 commits

- bb7d37df...912d7572 - 3 commits from branch `rtems/rtos:main`
- ba8bcfeb - Rename README to README.md

- 710880c2 - Convert README to MarkDown.

Compare with previous version

Author: Chris Johns 2024-04-25T01:13:15.693Z

I like RTEMS in the title for those who may not pick up the what it stands for. What about:

> RTEMS - Real-Time Executive for Multiprocessing Systems
>
> ?

Author: Amar Takhar 2024-04-25T01:13:15.693Z

The very first sentence right after that says RTEMS I removed it because it was silly seeing it twice and it's hard to make the next sentence work without saying RTEMS.

Author: Chris Johns 2024-04-25T01:13:15.693Z

I have not viewed a rendered version and I have now by browsing the files under the commit (nice :smile:). It looks good.

Author: Chris Johns 2024-04-25T01:17:55.575Z

What about an update here while we make the change and say the license is permissive?

Author: Amar Takhar 2024-04-25T01:17:55.575Z

I'm converting to MarkDown right now I didn't even read the content really other than capitalising the first letters. We can make changes after it's converted?

Author: Chris Johns 2024-04-25T00:47:06.918Z

Looks good.

Do we want to add support is via RTEMS GitLab?

Author: Amar Takhar 2024-04-25T01:17:55.594Z

Commit	2f7d3c2bd5e59d01bc0e303172e9516588da4eaa

Summary

My attempt to fix bug #4923

The problem can be reproduced easily after applying the following patch to the paranoia.exe test for example:

https://devel.rtems.org/attachment/ticket/4923/bug-1-make-paranoia-test-fail.patch

The test fails after the added sleep(1) at the beginning of Init() and the CONFIGURE_STACK_CHECKER_ENABLED option which poisons the stack.

I've found two problems which are fixed here:

1. The FPSCR was not saved and restored during a user-generated context switches (sleep() call for example). The first patch fixes that.
2. The FPSCR (and half the FPU register file) was not initialised for new threads, it got its data from an unused/unitialised part of the thread stack. The second patch fixes that.

Note: If the stack was initialised with zeros, and if in the application there was never any change to the FPU registers (rounding mode for example), then everything could work by accident.

I'm marking that as a draft because this is my first attempt at a merge request here, and because I've not been able to recompile/test everything after the gitlab migration, but apart from that I believe the patches are correct.

Comments welcome!

Author: Joel Sherrill 2024-05-01T22:46:58.485Z

Is memset() guaranteed to be OK from an ISR?

Please use sizeof(ARMV7M_Exception_frame) so there is no doubt.

Author: Chris Johns 2024-05-02T07:13:02.600Z

We do not control `memset` and it changes so while reviewing the code is a good idea, how we know `memset` will always meet the requirements of code executing in this context? For example on some ARM `memset` needs the MMU to set up. I am not saying that is an issue here, it is an example.

Author: Amar Takhar 2024-05-02T07:21:29.019Z

Hey Cedric when you say 'next push' you mean another MR? We're trying to resolve comments within the MR you can modify this MR to solve the issues developers have brought up it can't be done in a separate request because it would make this (incorrect) one land.

If you mean you'll update this MR that's fine. We're trying to figure out our workflow and make sure everyone is aware.

Author: Cedric Berger 2024-05-02T07:23:27.844Z

Yes, update this MR, by either adding a new commit or force-pushing on the branch.

Author: Amar Takhar 2024-05-02T07:33:36.629Z

Okay thanks that's perfect just checking in. :)

Author: Amar Takhar 2024-05-02T06:16:55.095Z

Hi there Cedric I hope you don't mind but I'm going to be using this MR to test our CODEOWNERS file. You've hit something we didn't expect. So please ignore any churn in closing/opening it. :smile:

@gedare @chris

Author: Cedric Berger 2024-05-02T06:16:55.095Z

Fine with me :smile:

Author: Amar Takhar 2024-05-02T06:16:55.095Z

Great thank you. :)

Author: Sebastian Huber 2024-05-02T12:34:55.044Z

Hello Cedric, I packed out a board with a Cortex-M4 today (SAMRH71) and tested my suggested fix. It seems to work, please have a look at !12 . It has a slightly lower overhead compared to your fix since it only sets a bit in the FSCCR register.

Author: Cedric Berger 2024-05-02T12:34:55.012Z

Hello Sebastian, Is your patch supposed to replace just one or both of my fixes?

Author: Sebastian Huber 2024-05-02T12:45:35.848Z

It is supposed to replace the patch with the memset().

Saving and restoring the FPSCR during a context switch is another topic. According to the ABI, the FPSCR should have thread-storage duration, however, my off hand guess is that this is not required for RTEMS applications. See also #4027. I think we should just agree on the storage duration for FPSCR and FPEXC.

Author: Cedric Berger 2024-05-02T13:04:23.469Z

Ok, so how about I drop my memset() patch here in favour of yours, and we keep the other patch on this MR to fix the FPSCR not having thread-storage duration?

I mean functions like fesetround() change the FPSCR, so this should clearly be thread-local, otherwise these functions are useless.

Author: Sebastian Huber 2024-05-02T13:09:00.566Z

Yes, the fesetround() changes the FPSCR, but do you really need a thread-specific rounding mode? For me it is fine to make the FPSCR thread-specific if you really need it. What about the FPEXEC? It would be good to have a test case for this new feature.

Author: Cedric Berger 2024-05-02T13:23:08.762Z

Regarding FPEXEC I don't know, but I've never used FPU exceptions in my life. I can change my patch to save it as well if you want.

Author: Cedric Berger 2024-05-02T13:29:54.144Z

https://cplusplus.com/reference/cfenv/fesetround

> Each thread maintains a separate floating-point environment with its own state. Spawning a new thread copies the current state. [This applies to C11 and C++11 implementations]

Author: Sebastian Huber 2024-05-02T13:39:24.415Z

Yes, this is also referenced in #4027.. I am fine with making the FPSCR thread-specific. It seems the context creation needs to take the copy from the executing context into account. There should be also a test case where two threads with different rounding modes are involved.

Author: Cedric Berger 2024-05-02T13:43:07.487Z

So, do you want me to continue and write these test cases, or do you want to take over?

Author: Sebastian Huber 2024-05-02T13:45:17.333Z

It would be nice if you could continue with the FPSCR saving and restoring stuff.

Author: Cedric Berger 2024-05-02T13:52:14.399Z

Ok, will do.

Regarding your !12 patch, we can run some tests with it here, but I don't have a good enough understanding of the interactions between RTEMS and the lazy context save of the H7 to review your code properly. But it sure looks better and more efficient as it read/write less stuff.

Author: Sebastian Huber 2024-05-13T05:00:40.195Z

mentioned in merge request !12

Author: Kinsey Moore 2024-05-17T14:21:09.452Z

Commit	5e5214b786e327fa0639b45c181638ac174f1f97

Summary

Currently, the data produced by the 'cpuuse' shell command is output via a printer visitor which makes it hard to consume programmatically as it requires parsing the resulting string. This functionality could be recreated in an application, but it would be better to provide this directly to reduce copying.

closes #5105

test.txt

Author: Kinsey Moore 2024-09-09T18:51:48.331Z

Please change the name of the visitor callback back to "cpu_usage_visitor" as this is more descriptive than "callback".

This should be set in the calling function so that it can be changed out more easily. Once that is done, you'll need a way to pass it in. I'd recommend breaking out the core of the calling function (the section after the header is printed and before the footer is printed) into its own separate function so that usage_function_pointer can be provided.

Summary

bsps/stm32h7: make errata configurable

Closes 5110

Closes #5110

Author: Kinsey Moore 2024-08-12T12:44:06.421Z

approved this merge request

Author: Sebastian Huber 2024-08-14T03:19:56.293Z

You should avoid scripts if possible. You can use `enabled-by: STM32H7_ERRATA_ENABLE_FMC_282` and make it an option with these actions:

```
actions:
- get-string: null
- split: null
- env-append: ABI_FLAGS
```

You can also use a single `STM32H7_ERRATA_FMC_282_FLAGS` option which is `-mno-unaligned-access` by default and can be configured to be empty.

The libc, C++ library, etc. will not use this option. I am not sure if this is an issue.

Author: Karel Gardas 2024-08-14T05:11:39.146Z

Thanks for the review!

(1) yaml thing is something I'm lost in as I've not been able to find any documentation about it, any sensible doc documenting RTEMS macros/impls. Do you know if there is any available? But definitely agree that your suggestions are way better than using script. I've tried several times to find those, but failed, hence script was a way how to escape.

(2) the fact that -mno-unaligned-access is not used for libc/C++ etc from tools is indeed a showstopper which needs to be solved somehow. Probably the most easiest would be to add big warning to the stm32h7 BSP doc about a need to configure tools in a special way...

Author: Sebastian Huber 2024-08-14T13:15:33.871Z

(1) The build system documentation is here:

https://docs.rtems.org/branches/master/eng/build-system.html

The item format is also documented, for example:

https://docs.rtems.org/branches/master/eng/req/items.html#spectypebuildoptionaction

If you are unsure how something can be configured, then please ask on the mailing list. A key property of the build specification items is that they are processed in a defined order and each item is enabled according to the `enabled-by` attribute.

(2) I haven't looked at the errata, but if this option is really important, then we may need dedicated GCC multilibs for this. Also the memcpy() and memset() assembly implementations in Newlib assume that unaligned access works.

Author: Cedric Berger 2024-08-14T14:24:33.630Z

A few random comments here: * The errata looks scary “Read access with unaligned address, such as a half-word read access starting at odd address, is not supported” but I suppose that on the M7 side, for simple code+data access (no peripherals) it should probably not matter because all the access goes through the cache, and the cache will access the FMC one full cache line at a time, correct? * I’ve seen very weird things in that area, like writing stuff with the M4 and getting something slightly different on the M7 for the last bytes of every cache line, stuff like that. Never got to the bottom of it besides deciding to never share the FMC memory between M4 and M7. * We’ve got some data corruption when using the rtems-libbsd ethernet stm driver with data in SDRAM. I wonder if this is related in any way (I’m going to do some testing in this area today)

Author: Sebastian Huber 2024-08-16T00:13:31.571Z

That a certain memory doesn’t support unaligned access is not unusual. Normally, this is fixed by using a cache in the middle. You may have to configure it as write-back, write-allocate, and read-allocate.

If the Ethernet DMA performs an unaligned access, then you may have issues since it doesn’t use the cache.

Author: Karel Gardas 2024-08-16T06:11:10.725Z

changed this line in version 2 of the diff

Author: Cedric Berger 2024-08-16T06:25:25.773Z

Ok, so we’re on the same page here, which means the PR goes to the wrong direction and is trying to fix the wrong thing:

1. The M7 has a cache, it is used by RTEMS, so ‘fixing’ the compiler does not help anybody here. Things are fine without any fix as far as regular code is concerned. 1. The M4 used in a few variants (like the stm32h747 we use) has no cache, so a toolchain fix could help there in theory, but nobody in their right mind would configure the M4 to use the FMC for data, these chips have dedicated memories for the M4 (SRAM 1/2/3) 1. What would be hugely useful though for RTEMS and would help us here a lot would be some way to put any memory that is touched by peripheral DMAs into another section. In this case here, if there was an easy way to say: “I want all my data in SDRAM, but please allocate Ethernet mbuf clusters from AXIS or SRAM2”, then this would help a lot. the same goes of course for memory that is touched by the USB HOST stack. This is where we’re stuck right now.

Author: Karel Gardas 2024-08-16T06:38:50.447Z

I do not think that PR goes into wrong direction. IMHO it goes not enough deep

and this worries me a bit since it may create false assumptions in H7 RTEMS users, nothing more.

Author: Cedric Berger 2024-08-16T07:05:56.265Z

My assumption was I can develop some nice hardware using the stm32h7 and 64Megs of SDRAM, put RTEMS on it with libbsd, and release a beautiful and stable product with that combination. Was I right with that assumption? Mostly. The only issue I've at the moment is that for some reason, if_stmac.c is not working. My assumption was that if_stmac.c would be working. This PR does nothing to help that problem and is trying to "fix" something which is **not broken**.

Author: Karel Gardas 2024-08-16T07:20:38.869Z

@cedric there is clearly misunderstanding going here. ST thinks that FMC errata is important to mention in their errata document, hence RTEMS supporting H7 also needs to somehow react to that. And the discussion here is about that reaction. If your issue with RTEMS now is not working if_stmac in libbsd, then this is completely unrelated to that MR and #5110

Author: Cedric Berger 2024-08-16T07:45:28.153Z

@kgardas: Of course it important to know that the FMC cannot do unaligned access, hence the errata. I think the correct reaction for RTEMS would be: * A note in the stm32h7 ARM porting section. * Investigations of the consequences of this errata for peripheral access.

Author: Sebastian Huber 2024-08-29T00:18:31.735Z

I worked with other systems in the past where the memory controller had issues with misaligned access. The solution was to access the external memory through a properly configured cache and to make sure that DMA controllers don't use misaligned access. This worked quite well.

Forcing the compiler to not use misaligned access is a bit difficult since you also have to catch handwritten assembly files (memset(), memcpy(), etc.). Also you may have performance issues with packed structures (network stack).

Author: Karel Gardas 2024-08-15T22:25:31.609Z

Thanks for the review and suggestion, but even with this I'm still not able to make errata.yaml work as defined here:

```
SPDX-License-Identifier: CC-BY-SA-4.0 OR BSD-2-Clause
build-type: option
actions:
- get-string: null
```

(continues on next page)

(continued from previous page)

```
- split: null
- env-append: ABI_FLAGS
copyrights:
- Copyright (C) 2024 Karel Gardas
default:
- enabled-by: STM32H7_ERRATA_ENABLE_FMC_282
value: -mno-unaligned-access
- enabled-by: true
value: ""
enabled-by: true
links: []
name: STM32H7_ERRATA
format: '{}'
prepare-build: null
prepare-configure: null
type: build
```

during the configure stage it simply does nothing.

Due to this and due to the fact that this whole is half-baked solution I'm considering abandoning this and even reverting original:

```
commit d81bf04501cb83de4586f431ae91123e4965d86a (origin/main, origin/
↪HEAD, main)
Author: Karel Gardas <karel@functional.vision>
Date:   Fri Aug 9 15:39:11 2024 +0200

bsps/stm32h7: Workaround STM32 H7 errata by enforcing aligned access␣
↪only

The patch changes compiler ABI flags option and adds -mno-unaligned-
↪access
there. Usage of this option is also officially recommended way
by the errata document how to work around the issue. For more details
about the errata please see referenced issue number.

Closes #5110.
```

the thing is that this issue is quite complex to fix as a whole and currently I lack a time for that. What do you prefer? Half-baked solution or rather revert completely? – with perhaps some not to H7 BSP doc about a need to investigate erratas?

Author: Kinsey Moore 2024-08-15T22:27:42.540Z

Looking at other examples (tms570/optvariant.yml), you may need a set-value: in optenfmc282errata.yml. That example ends up getting used in tms570/optmemsramsize.yml

Author: Joel Sherrill 2024-08-15T22:21:42.797Z

@sebhub Can you point to an existing example in the source tree that does the equivalent of adding an extra GCC flag?

Alternatively, can you kindly post the file you want?

Thanks.

Author: Sebastian Huber 2024-08-16T00:23:54.981Z

With current list of actions, you:

1. Get a boolean option value from the configuration file or the default value.
2. You assign the option value to the build environment variable named `STM32H7_ERRATA_ENABLE_FMC_282`.
3. If the option value is true, then you define the define named `STM32H7_ERRATA_ENABLE_FMC_282`.

If you want to use `STM32H7_ERRATA_ENABLE_FMC_282` in `enabled-by` expressions, then you also have to add it to the enabled set. This is done by the

```
- env-enable: null
```

action.

Author: Chris Johns 2024-08-16T00:28:39.551Z

As @joel asked in https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/184#note_111112 would it be possible to provide an example file that shows this?

I am fine with the script version in the commit and think it is a rather clever solution.

Author: Sebastian Huber 2024-08-16T01:00:35.196Z

The problem is that there are two items involved. One item defines if a certain feature is enabled or disabled. Then another item does certain things if the feature is enabled. For this use case, we have the `enabled-by` expressions. This is a basic feature of the build system. If these mechanisms are not clear enough after reading the documentation, then we really have to fix this.

The scripts should be rarely used and definitely not be used for this purpose. If we decide to change the build system, then it is easy to convert all the non-script stuff, however, all the scripts would need manual work.

Author: Chris Johns 2024-08-16T01:21:02.928Z

Yes `enabled-by` is a well used expression however it can also be complex in how it can be used and the translation of that logic to the YAML format is not easy. I know from my recent PowerPC `libdebugger` experience I spent a number of hours guessing at the needed format to exclude specific BSPs and ended up adding a considerable number of prints to `wscript` to help. Then after all that I could see nothing

wrong with the YAML fragment so deleted the bits I needed and typed them back in. It worked and to this day I have no idea what the difference was and why it worked after typing the same text back in.

We have a bespoke solution as a build system and to me this means we need to lead users with a specific example and updated documentation if their offering is not acceptable. I cannot help because I do not know enough to provide valid input and I feel I would only make things more confusing.

The change presented here is clever because it uses `waf` in a `waf` way and that implies to me some effort has been expended. We have a few choices:

1. Accept this change and move on
2. Help provided what you see as needed
3. Not accept the MR.

My choice is option 1 because I cannot help with 2 and do not accept option 3 as a valid option.

Author: Sebastian Huber 2024-08-16T04:03:55.503Z

If nobody complains, nothing can get fixed. For example, it would easy to display a given enabled-by expression in C syntax (see `enabled_by_to_exp()` in https://gitlab.rtems.org/rtems/prequal/rtems-central/-/blob/main/rtemsspec/content.py?ref_type=heads#L1185). Spending hours to craft an enabled-by expression is definitely a big issue, because they are present in every item.

I think it makes more sense if someone else starts to work on documenting and improving the build system. I don't want to be the single point of failure.

For libdebugger, this would also work:

```

I am not complaining and I am sorry if that is the impression. I simply wanted to provide some feedback. I would like to help but I do not know the implementation and I have not spent enough time using it. I hope that changes however until then I depend on your support and advice.

The change above is a nice example, thanks. My problem was not finding examples, it was the lack of feedback, trace and debug output in the tool to guide and help me see what was wrong with my broken input. I read the documentation, looked for examples and attempted to be self sufficient but the lack of feedback from the tools made it hard.

I have no idea how C expressions would help and asking users to scan through rtems-central is not helpful.

What I did then and say now does not help progress this MR and we have headed away from it. If you are not prepared to offer a solution please say as we can move on?

Compare with previous version

Author: Karel Gardas 2024-08-16T06:11:30.303Z

reset approvals from @opticron by pushing to the branch

Author: Karel Gardas 2024-08-16T06:32:19.463Z

Guys, thanks to Sebastian's help, I was able to transit from script to option hence pushing a new version.

My original question if to fix this issue (FMC H7 errata) by half-baked solution still stays. Fixing it properly would require deep dive into newlibc with possibility of touching assembly and that is currently out of my reach for my spare time... I'm asking since I would not like to make an impression to the RTEMS H7 user that this issue is *properly* fixed. Comments welcome!

Author: Chris Johns 2024-08-16T06:32:45.288Z

I have not looked at the errata or details of what may be need as discussed but the RSB has the following options:

1. `--targetcflags`
2. `--targetcxxflags`

I have not used them in a long time and the options were added for MMS for Alan to test the performance of custom builds of libc and libm. Maybe it can help you see the effects of these options.

Author: Karel Gardas 2024-08-31T16:24:41.810Z

As originator of this MR I feel a need to close it as this is not the right way to tackle this issue. Since this whole issue was divided between two MRs I'm also pushing new !201 to remove part of the fix which was already merged. Sebastian & Cedric are right here that this can of worms needs to be solved by application programmer and not by the RTEMS itself...

Summary

libtests/dl12: Fix build error

Use standard link command to get all the required flags.

Update #3740. Close #5053.

Thanks for the fix allowing additional ldflags to the `link_cc`. But in this case the `link_cc` has additional arguments that invalidates the object creation for the dl12 test case, such as `-Wl,-gc-sections` and some rtems library linkage, resulting the following test output for `arm/xilinx_zynq_a9_qemu`:

```
$ qemu-system-arm -no-reboot -nographic -net none -serial null -serial␣
↪mon:stdio -M xilinx-zynq-a9 -m 256M -kernel build/arm/xilinx_zynq_a9_
↪qemu/testsuites/libtests/dl12.exe
qemu-system-arm: warning: nic cadence_gem.0 has no peer
qemu-system-arm: warning: nic cadence_gem.1 has no peer

```

Summary

In general, for test runs the system should reset once the test program terminated. The system reset implementation is BSP-specific. This makes _CPU_Fatal_halt() essentially a dead function since it is invoked after the BSP fatal extension which resets the system. To avoid this issue make the _CPU_Fatal_halt() implementation BSP-specific (similar to riscv and sparc).

Update #5010 and #5011.

Author: Sebastian Huber 2024-05-08T14:23:21.605Z

changed title from **aarch64: Make _CPU_Fatal_halt() BSP-specific** to **aarch64{+/arm+}: Make _CPU_Fatal_halt() BSP-specific**

Author: Sebastian Huber 2024-05-08T14:23:21.630Z

changed the description

Author: Chris Johns 2024-06-14T07:08:28.837Z

This reads as a change in functionality.

The `bsp_reset` call resets the board in a BSP specific manner. This may be common in a SoC or even on the same SoC overridden by a user to use an external watchdog

POR. You need this on a Zynq due to the way the resets work. The new name is `_CPU_Fatal_halt` that halts the CPU, shutting down the board requiring an external restart. This is normally something you see in a secure mode.

Author: Sebastian Huber 2024-06-14T07:08:28.837Z

I am not sure what you mean with the functional change. Applications should not call `_CPU_Fatal_halt()` directly. When applications do not want to use the BSP fatal error handler, then they should register their own fatal error handler through CONFIGURE_INITIAL_EXTENSIONS.

Author: Chris Johns 2024-06-14T07:08:28.837Z

The label `_CPU_Fatal_halt` reads

> Perform a CPU fatal error halt operation and that means halt the CPU because of a fatal issue in the CPU. An example is detecting tampering in a secure mode. It is unfortunate the scoping we have of `_CPU` and `Fatal` errors which ``halt``s RTEMS produces this naming. This is a comment on the naming we have.
>
> Does the fatal error path bypass `_exit` and other shutdown calls?

Author: Sebastian Huber 2024-06-14T07:08:28.837Z

All termination paths end up in _Terminate() which ultimately calls _CPU_Fatal_halt() provided all fatal user extensions return. However, a statically configured BSP or application fatal error extension should reset the system and not return to process the dynamic fatal error extensions.

Author: Chris Johns 2024-06-14T07:08:48.995Z

Ah I see this has been wrapped. Nice to see it is still present.

Author: Kinsey Moore 2024-06-14T07:08:48.995Z

This seems like a benign comment, can this thread be resolved?

Author: Chris Johns 2024-05-22T00:05:15.059Z

The comment for the first patch says:

```
In general, for test runs the system should reset once the test program
terminated.  The system reset implementation is BSP-specific. This makes
_CPU_Fatal_halt() essentially a dead function since it is invoked after␣
↪the BSP
```

(continues on next page)

(continued from previous page)

```
fatal extension which resets the system.  To avoid this issue make the
_CPU_Fatal_halt() implementation BSP-specific (similar to riscv and
↪sparc).
```

It is a requirement the kernel exits through the documented C API paths. A BSP gains control from those interfaces and then decide on the path taken. If testing is a special path should it be handled in the context of the existing interfaces or they should be updated?

I am as guiltily as anyone in by passing things and using `bsp_reset` so this is not a criticism of the change and more of a reality check to know if we are OK with this path and we are not digging a hole for ourselves?

Author: Sebastian Huber 2024-05-22T11:09:56.349Z

I think the interface to customize the fatal error handling (CONFIGURE_INITIAL_EXTENSIONS) is fine. The issue is that by default, the BSP resets the system. This makes a CPU port provided `_CPU_Fatal_halt()` a bit useless.

Author: Gedare Bloom 2024-05-23T20:31:19.128Z

I'm confused what problem this MR (and the related Issues) are solving. Is it to do with Testing / Coverage, that `_CPU_Fatal_halt` is dead code, or something else?

There is no requirement for BSPs to use the default fatal error handler. If they don't, they can also not provide `bsp_reset` or use the empty stub (like riscv and sparc).

Author: Sebastian Huber 2024-05-31T19:39:48.045Z

I do currently test runs with coverage enabled for arm and aarch64 BSPs. I noticed that the `_CPU_Fatal_halt()` is basically dead code, since the BSP fatal extension resets the system. So, I would like to make the implementation of `_CPU_Fatal_halt()` BSP-specific and let it do the system reset.

Author: Gedare Bloom 2024-05-31T19:39:48.013Z

If the problem is testing/application-specific, then why not configure with `BSP_RESET_BOARD_AT_EXIT = 0` and `BSP_PRESS_KEY_FOR_RESET = 0` to test the `CPU_Fatal_halt()` works as expected?

Making this change without modifying `_Terminate` also does not seem to be correct.

Author: Sebastian Huber 2024-06-04T08:56:02.025Z

Running the tests with different build options is an absolute no go from my side. You should run the tests exactly with the build options you use for your application.

The `_Terminate()` implementation is fine. It provides a safe fallback for badly configured applications.

This patch set fixes a minor code coverage issue by moving the `_CPU_Fatal_halt()` implementation from the CPU port to the BSP. I really don't understand why this causes such headaches on your side. A properly configured application should use the BSP fatal extension handler or provide its own. For these applications, there is no functional change.

Author: Sebastian Huber 2024-06-07T06:24:34.861Z

Yes, if you configure `BSP_FATAL_RESET` as disabled, then you would see a reset through `_CPU_Fatal_halt()`. Maybe we should remove this BSP option. The recommended approach to customize the termination process for applications is to install a static fatal error extension. Maybe this should be clarified in https://docs.rtems.org/branches/master/c-user/fatal-error/operations.html or the related sections.

The complexity of the BSP development is not increased. The BSP just has to provide a `_CPU_Fatal_halt()` function instead of `bsp_reset()`. Since the `_CPU_Fatal_halt()` sees the fatal source and code you could even pass this information to a boot monitor, hypervisor, or some reset safe storage to get better diagnostics.

Author: Sebastian Huber 2024-06-25T14:47:27.509Z

Any blocking issues left to resolve?

Author: Sebastian Huber 2024-07-09T09:29:11.971Z

This is a general change for aarch64 and arm BSPs. It is a blocking issue for my patch queue. It would be really nice if someone could have a look at it. From my point of view, I addressed all issues with the documentation update.

Author: Gedare Bloom 2024-07-10T05:59:34.045Z

I'm not that happy with the user experience that they can configure `BSP_FATAL_RESET` as disabled and still have the CPU port/BSP cause a reset. It would be a surprising bug.

A "Fatal_Halt" that results in a board reset by default is also surprising.

Overall, this change increases the number of surprises that a user will face. I understand that it is desirable to improve coverage, but I'm not convinced the cost is worth it here. Honestly, I don't see how to provide a "Fatal Halt" condition that is testable, while using a "Reset" to handle fatal errors. Maybe this patch should go the other way around, and `#ifdef` out the `_CPU_Fatal_halt()` functionality if a BSP reset is defined?

I am generally not in favor about the placement of `_CPU_Xxx` inside of BSP, but would be willing to overlook it. I do appreciate the documentation update.

Author: Sebastian Huber 2024-07-10T06:43:47.056Z

The system termination should always end in a statically configured fatal error handler. Everything else is a configuration bug.

Yes, the `BSP_FATAL_RESET` could lead to surprises, so I would remove this option.

In general, it seems that the current system termination procedure is too complicated.

I will address the code coverage issue differently. I will simplify the `_Termiante()` function and remove `_CPU_Fatal_halt()` in general and replace it with call to `_CPU_Thread_Idle_body()`.

this is not using the typical doxygen we use. also, I don't think we need to add doxygen for static/private functions.

You can update this MR to improve the comments on these internal functions, but they do not need to be in doxygen format. just use the existing `/* ... */`

Commit	8ffb84de13796add5fe561689e2f7a89304cdf6d

Modify the ‘exit’ coding style for libtests

Author: Sebastian Huber 2024-11-29T01:39:59.854Z

What is the reason for this change?

Author: 2024-11-29T01:39:59.854Z

“exit(0)” is more in line with coding standards. There are ‘exit(0)’ and ‘exit(0)’ in this directory. And I think they should be consistently written as exit(0).

Author: Sebastian Huber 2024-11-29T05:26:34.063Z

For RTEMS you can assume that each file has its own style. According to the RTEMS guidelines, it should be formatted like `exit( 0 )`:

https://docs.rtems.org/docs/main/eng/coding-formatting.html

I would not do any formatting changes by hand. This should be done by a tool. There are already two MRs open which do exactly this.

Author: 2024-11-29T09:34:56.684Z

I got it. Thank you!

Commit	71967a2f08a1b367929be67587b811f48b947dee

Summary

aarch64/raspberrypi: Add FDT support

Use rtems-bin2c to generate the FDT blob based on device-tree files from Linux 6.5.

Author: Ning Yang 2024-09-27T05:49:53.068Z

My test app is as follows, it works fine.

```
rtems_task Init(
rtems_task_argument ignored)
{
puts("hello");

const void *fdt;
int node;
int len;
```

(continues on next page)

(continued from previous page)

```
const uint32_t *val;

fdt = bsp_fdt_get();
node = fdt_node_offset_by_compatible(fdt, -1, "brcm,bcm2835-sdhci");

printf("%d\\n", node);

val = fdt_getprop(fdt, node, "reg", &len);

printf("%lX %lX\\n", fdt32_to_cpu(val[0]), len);

puts("end");

rtems_shutdown_executive(0);
}
```

output:

```
hello
20748
7E300000 8
end
```

Author: Christian Mauderer 2024-09-27T09:46:21.522Z

You pulled the FDT from Linux, right? Which license did they use?

Usually the FDTs from Linux are GPL. Therefor it's tricky to link them into RTEMS because the license is not compatible.

Author: Ning Yang 2024-09-27T09:46:21.522Z

https://github.com/freebsd/freebsd-src/blob/b0f9f970ec104e1df22ece7c7cdf12240e3c6713/sys/contrib/device-tree/src/arm/broadcom/bcm2711-rpi-4-b.dts

why freebsd can use it?

Author: Christian Mauderer 2024-09-27T09:46:21.522Z

FreeBSD has that in a separate "contrib" folder. I think they somewhere tell you that it has separate licenses. Additionally, FreeBSD distributes the device tree as separate files.

Your solution links it into a blob in the binary. You can find both opinions: Some people will tell you that a blob doesn't "infect" the remaining system with GPL. Other people will tell you that it will. Licenses are a legal topic and it's really hard to estimate how a court would decide. Especially because RTEMS is a worldwide

project and therefore you have to guess it in multiple legal systems. Therefore, it's usually something where an open source project just has to be careful.

Author: Ning Yang 2024-09-27T09:46:21.522Z

Understood. Thank you very much for your detailed reply.

Author: Joel Sherrill 2024-09-27T13:28:29.285Z

FWIW the Microblaze BSP has multiple ways to get the FDT and one is selected by config.ini.

1. There is a default FDT included 1. Have no FDT and use default values for properties BSP requires 1. User provide a path to one 1. Use one provided by U-Boot

The Microblaze is a highly configurable CPU and SoC and the user who sponsored this port needed those options. But for use on reference hardware, the no FDT option was OK.

Would some of these options being supported help? It at least can move a questionably licensed FDT out of our space.

Author: Ning Yang 2024-09-27T09:46:21.545Z

Commit	c3e75ca6f5fc9da8afea683381a519c72dd84f2b

Add new PL011 driver. I don't have a Raspberry Pi 3b hardware. `arm/raspberrypi`,``arm/xen``need to be test.

Author: Sebastian Huber 2024-05-29T12:06:26.010Z

Why do we need a new PL011 driver?

Author: Gedare Bloom 2024-05-29T12:06:26.010Z

Agreed, we should refactor the existing one to be extensible. I encountered a similar issue doing the Versal UART, as it is based on the PL011 but is not an identical register map at the end. @yangn0 :

A way to do this would be to define a `struct { ...} pl011_base;` that contains all the field definitions and `BSP_BIT` macros that exist in `struct { ... } pl011` up to (not including) `uint32_t uartdmacr;`

then, create

```
struct {
pl011_base PL011;
uint32_t uartdmacr;
#define PL011_UARTDMACR_DMAONERR BSP_BIT32(2)
...
uint32_t uartpcellid3;
} arm_pl011_uart;
```

and:

```
struct {
plo011_base PL011;
/* anything extra goes here */
} raspberrypi_uart;
```

and:

```
struct {
pl011_base PL011;
} versal_uart;
```

Author: Sebastian Huber 2024-05-29T12:06:26.010Z

Yes, this makes sense.

Author: Ning Yang 2024-05-29T12:06:26.010Z

Hi @gedare, Thanks for your help. `raspberrypi_uart` and `versal_uart`, Where should these BSP-specific structures be placed? `bsps` directory or `dev` shared directory?

Author: Ning Yang 2024-05-29T12:06:26.010Z

!47

Author: Kinsey Moore 2024-05-23T15:58:18.981Z

These commits are not organized in such a way that all of them build correctly. They either need to be squashed or the changes rearranged to produce functional builds after every commit.

I believe there is also a leftover arm-pl011.h that is now unused after applying these commits.

Author: Utkarsh Verma 2024-05-26T02:49:46.715Z

I have a suggestion for the `arm-pl011` driver. Since it's a base driver that other devices extend from. Wouldn't it be better to have `unsigned long regs_base` instead of `volatile pl011* regs`?

This way, we can avoid creating redundant structs for each child driver. For example,

```
// raspberrypi_pl011.h

bool some_device_specific_function(arm_pl011_context *ctx, ...);
```

instead of

```c
#include <arm-pl011-regs.h>

typedef struct {
pl011 base;

/* Any new registers that you have specific to RPi. */
} raspberrypi_pl011;

typedef struct {
rtems_termios_device_context base;
volatile raspberrypi_pl011 *const regs;
const rtems_vector_number irq;
const uint32_t initial_baud;
} raspberrypi_pl011_context;

bool some_device_specific_function(raspberrypi_pl011_context *ctx, ...);
```

Summary

add test empty and NULL usernames check

Author: Sebastian Huber 2024-09-13T01:47:37.159Z

Could you add this commit to !202 ?

Author: Amar Takhar 2024-09-13T01:47:37.159Z

Hi Sebastian I have made !202 as dependency to this one so it gets merged first the build won't break as it will ensure the other one gets added first is that OK for now?

Author: Sebastian Huber 2024-09-13T01:47:37.159Z

Thanks, this works also.

Commit	32d9ccd44ee654a191846a054748a8cc819be69b

Summary

bsps/aarch64/a72: Avoid use of reserved INTIDs

Interrupt IDs 1020, 1021, 1022, and 1023 are reserved as special INTIDs and should be ignored for normal RTEMS operation as they signal internal changes in the interrupt controller that RTEMS itself is directly causing.

Author: Kinsey Moore 2024-05-23T14:33:31.422Z

This test MR is no longer necessary

3.9.2.291 219 - shell/cat_file:Fix cat not outputting file with no newline at end (closed)

Commit	ad9e6d14e3ddf80db412c0313b8b2d8b52501567

Summary

The phenomenon is that when I create a file, such as 123.txt, in the root directory using the edit command, and type some content without pressing Enter to add a newline at the end, upon saving with F9, I can see the file 123.txt exists when using the ls command. However, when I try to view the content with the cat command, nothing is output.

Author: Kinsey Moore 2024-10-25T15:56:05.008Z

Instead of printing characters that are not part of the file, this should instead use fflush() to force a flush of the output buffer.

Author: shuhua hua 2024-10-25T15:56:05.008Z

I have tried using fflush, but it still couldn't output the data. Is it effective when you add fflush on your side?

Author: Joel Sherrill 2024-10-25T15:56:05.008Z

The fflush POSIX specification includes an example of using fflush() on stdout so it should work.

https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html

Trace the fflush() call down to see if what is actually happening. I think stdout is line buffered so this may be a factor.

@opticron Do you have any idea why this isn't working?

Author: Kinsey Moore 2024-10-25T15:56:05.008Z

It appears that cat is actually working just fine, even without this change. I'm not sure what @huangshuhua is using for the content of the file, but when I use "This

is a test string with no newline" and cat the file, the result I get is that the string prints and then the shell outputs a carriage return with no newline and so the shell prompt overwrites the beginning of the text yielding "SHLL [/] # est string with no newline".

If anything, the shell should be modified to not overwrite user output.

Author: Kinsey Moore 2024-10-25T15:56:05.008Z

The relevant line is cpukit/libmisc/shell/shell.c:332

Author: shuhua hua 2024-10-25T15:56:05.008Z

Yes, it seems you're right. When I created a text file with the content "123456789qwert" and used the `cat` command, it output "rt". However, when I changed the content of the text file to "123456789" and executed the `cat` command again, there was no output.

Author: Chris Johns 2024-09-20T22:42:55.554Z

Maybe we should change the command to https://github.com/freebsd/freebsd-src/blob/main/bin/cat/cat.c?

Author: Chris Johns 2024-10-18T00:29:09.667Z

requested review from @opticron and @joel

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/236
Commit	0e3d1e18c77bcd6b1407bc0da7a4bc1a0ded81bb

Summary

Fix a dependency problem in include ordering. The `optionsimpl.h` file uses types that are defined in `types.h`, but it only gets them included if something else was included before `optionsimpl.h` that pulls in `types.h`

Author: Amar Takhar 2024-09-23T22:25:43.515Z

Good catch adding ~"ci::possible" tag to this. There are plenty of SAST that will check for this also includes that are no longer required.

Author: Amar Takhar 2024-09-23T22:25:46.538Z

approved this merge request

Author: Sebastian Huber 2024-09-23T23:21:02.181Z

I would rather fix this by changing these expressions. The result type of `(option_set & RTEMS_NO_WAIT)` is an integer and not a bool. This should be `return (option_set & RTEMS_NO_WAIT) != 0;` and `return (option_set & RTEMS_EVENT_ANY) != 0;`.

Author: Sebastian Huber 2024-10-18T10:01:54.563Z

I changed the expressions in !261.

Author: Amar Takhar 2024-10-16T04:35:29.459Z

Author: Sebastian Huber 2024-09-20T04:24:10.999Z

changed title from **{-score: Use _Per_CPU_Get()-}** to **{+SMP: Minor system start improvements+}**

Author: Sebastian Huber 2024-09-20T04:24:11.027Z

changed the description

Author: Chris Johns 2024-09-20T22:28:53.849Z

Why return anything when it is always `true` given the commit changes functionality by removing the timeout?

Author: Sebastian Huber 2024-09-21T15:38:22.998Z

This allows a tail call optimization.

Author: Chris Johns 2024-09-20T22:34:33.633Z

This is an interface that accepts a `bool` result of the CPU starting but this change removes that logic from the arm BSPs. Do any of the SMP supported arch detect a CPU failing to start?

Author: Sebastian Huber 2024-09-21T15:39:31.844Z

None of the BSPs detect a CPU failing to start.

Author: Chris Johns 2024-09-20T22:28:55.888Z

The MR's title says minor improvements but this change removes timeouts on a CPU starting. This is a little confusing?

Author: Sebastian Huber 2024-09-21T15:41:00.834Z

Removing unused code is an improvement from my point of view. However, I will rework this further. This _Per_CPU_State_wait_for_non_initial_state() function is superfluous in general.

Compare with previous version

Author: Sebastian Huber 2024-08-31T03:42:12.041Z

The new objects and functions should be in a proper namespace, for example `_AArch64_` or `aarch64_`. The Doxygen documentation should be more detailed and explain the relationship between the functions and objects. It should also explain the initialization order and dependencies.

Author: Sebastian Huber 2024-09-18T00:24:48.844Z

The approach with this table is quite complicated and not necessary for most systems. Why can't you simply call a function which is provided by the BSP? For example:

```
#ifdef RTEMS_SMP
bl _AArch64_Get_current_processor
...
```

The default implementation is:

```
FUNCTION_ENTRY(_AArch64_Get_current_processor)
mrs x0, mpidr_el1
and x0, x0, #0xff
FUNCTION_END(_AArch64_Get_current_processor)
```

Author: xiaojun zheng 2024-09-18T00:40:11.813Z

The value of MPIDR could be 0x100,0x200 . . . , just as #5064 said.

Author: xiaojun zheng 2024-09-18T00:48:01.632Z

I learned this method from Zephyr. Linux set hwid in dts file, but not all RTEMS's bsp use dts file.

Author: Sebastian Huber 2024-09-18T01:24:23.858Z

Yes, this is fine, but I would like to keep the shared code simple. With this function call you can hide the BSP-specific details.

Author: xiaojun zheng 2024-09-18T01:48:44.324Z

Oh, I understand your point. I'll reconsider the implementation method.

Author: xiaojun zheng 2024-09-18T02:48:47.100Z

The map is still needed. When core 0 tries to start other cores, the PSCI command requires target core's MPIDR.

Author: Sebastian Huber 2024-09-18T03:15:34.886Z

You can abstract this with a function call as well.

Author: xiaojun zheng 2024-09-19T00:48:40.429Z

I think it can not simplify the implementation. The default implementation is simple. But if the hwid is 0x100 . . . , The map should be setup before `_el1_start:`. I think the setup may be complex(if I want ot load the hwid from dts, etc), because the runtime environment has not been established yet.

Author: Sebastian Huber 2024-09-19T01:07:45.822Z

Yes, it could be complex, so it is important to hide this complexity behind function calls. So, instead of accessing your map from everywhere, you should define a function call based API with currently two implementations: 1. the simple one we have right now which just uses the mpidr_el1, 2. the one with this map table. A third one could use a device tree or whatever in the future.

Author: Sebastian Huber 2024-09-19T02:07:28.535Z

Implementation 1. should be in a separate commit and not cause any regressions for existing BSPs. Implementation 2. should be in a follow up commit.

Author: xiaojun zheng 2024-09-19T04:01:20.443Z

`aarch64_cpu_boot_params` is not the map table, it is a global variable used to store the core index that core0 want to start, so the core can setup stack pointer correctly. If call `_AArch64_Get_current_processor` here, how to decide whether to call default implementation or the map implementation? And the function should be callable from assembly code, I think use a global variable here can reduce complexity.

The patch provided two functions aarch64_get/set_cpu_hwid() to visit the map table, in fact, only the get function is nessary for now, if the hwid is loaded from dts maybe set function is needed. And the map table can be static.

Author: Sebastian Huber 2024-09-19T04:10:07.152Z

The _AArch64_Get_current_processor() implementation is selected by the build configuration for a particular BSP. It needs to be implemented in assembly code. This single aarch64_cpu_boot_params object is very brittle. You may have a situation where the boot is done in parallel.

Author: xiaojun zheng 2024-09-19T05:47:04.798Z

Since the MR is quite diffrent from the method you mentioned, and I'm not familiar with assembly code. So I can not move on, should I closed it? I'm sorry to take up so much of your review time.

Author: Sebastian Huber 2024-09-19T05:55:29.131Z

Ok, no problem. Could you please move your first commit into a separate MR and address the review comments specific to this commit. I will work on a patch, which implements the _AArch64_Get_current_processor() approach with a default implementation.

Author: xiaojun zheng 2024-09-19T07:30:20.942Z

OK,done.

Author: Sebastian Huber 2024-09-18T00:27:45.247Z

This file is shared with the arm target. This needs to be done in the architecture-specific part.

Commit	e5e3ae1bd2bbb959dae444b7475cc413a75c43b1

Summary

objectinitializeinformation.c: Add Assert for API index too high

Coverity Scan spotted the possibility that the _Objects_Information_table could be over-indexed if the API value provided was too high. This function is only used during initialization and the input should be trusted. Adding a debug _Assert() emphasizes this trust.

Coverity CID 1512508

Closes #5084.

Author: Joel Sherrill 2024-08-02T16:18:14.578Z

Author: Chris Johns 2024-08-11T02:43:45.999Z

Hows does this resolve the Coverity issue if it is in an assert?

If this cannot be an error could it the assert be triggered for the same reason?

Author: Amar Takhar 2024-08-11T02:44:22.373Z

This should have been closed it was resolved elsewhere. Joel accidentally opened a 2nd MR

resolved all threads

Author: Joel Sherrill 2024-08-11T03:08:38.970Z

@chris Coverity sees assert as an indicator that we know the case cannot occur. Worst case, it indicates we know it should not happen because initialization is trusted arguments.

3.9.2.296 173 - ftpd.c: Do not use negative socket descriptor (closed)

assigned to @joel

Author: Amar Takhar 2024-08-09T19:09:34.208Z

Is it worth a comment as to why that's there? Seems pretty random in context.

Author: Joel Sherrill 2024-08-09T19:09:34.208Z

If I add a comment, Coverity will still think it is an issue. And I have to do a commit, cynically it is about the same work as adding the if. I can add a comment if you like but the if probably should stay.

Author: Amar Takhar 2024-08-09T19:09:34.208Z

No I mean keeping the code but adding a comment that it was added due to a Coverity highlight about -1 possibly being passed in. To me at least it seems like an out of place check I'd want to know why it's there.

Interesting the milestone is not setting itself from the default ticket template.

3.10 RTEMS / RTOS / Examples

Go to *Issues* (page 3291) or *Merge Requests* (page 3300)

Issues Summary

6 - Add Portable Hello World Example (page 3291)
5 - Update waf to 2.1.4 : rtems/rtos/rtems-examples (page 3292)
4 - Build fails on regulator test (page 3298)
1 - Update rtems_waf to gitlab (page 3299)

Merge Requests Summary

12 - waf: Update waf to waf-2.1.4 (page 3302)
11 - portable_hello: Add example of using standard portable POSIX source. (page 3302)
10 - regulator: Update for a change in attributes (page 3303)
9 - Fix warnings in other examples (page 3304)
8 - Fix regulator compile problem and warnings in other examples (page 3300)
3 - Convert LICENSE. to MarkDown* (page 3306)
2 - Convert README to MarkDown.* (page 3305)
1 - Update rtems_waf location (page 3307)

3.10.1 Issues

3.10.1.1 6 - Add Portable Hello World Example

Merges	0

Summary

Add an example hello world that shows how a “normal” POSIX program can be used with RTEMS. The pattern of putting RTEMS initialisation and configuration in a dedicated file (e.g. rtems_config.c) is done in some other examples but not in a simple one just to highlight this pattern.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
```

(continues on next page)

(continued from previous page)

```
./rtems-littlevgl/waf          waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf               waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf         waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf       waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf              waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                    waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T01:08:46.506Z

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

Summary

This currently fails to build when it gets to misc/regulator due to what appears to be a renamed struct member.

Steps to reproduce

3.10.1.3.2.1 Pre-set options

Author: Kinsey Moore 2024-11-15T20:45:18.298Z

assigned to @opticron

Author: Amar Takhar 2024-11-15T21:00:14.910Z

Doesn't this get included with the release are we okay not having this for %6.1 @chris ??

Author: Kinsey Moore 2024-11-15T21:00:14.876Z

I was going to ask. If it's included with the release it needs to get fixed.

Author: Kinsey Moore 2024-11-15T21:01:16.222Z

Yeah, it's part of RC4.

Author: Joel Sherrill 2024-11-15T21:32:47.780Z

I'm sorry. I think I had a branch with this fixed but between switching development OSes and removing and cloning after moving to Gitlab, I must have lost it.

It is just renaming from what I recall.

If @opticron doesn't fix it first you can assign it to me.

Summary

Convert README* to MarkDown.

Coalesce the three README files into one. Does not make sense to have them seperate especially with MarkDown.

This does not make any other changes.

Compare with previous version

Author: Amar Takhar 2024-07-08T08:17:40.938Z

Updated to fix two of the `shell` block markers. I looked at it online and saw it was still broken `grip` showed it as broken to me locally but I thought maybe it was a

rendering issue. It wasn't the issue was the level was off by 1 character needed to be indented further in the list.

3.11 RTEMS / RTOS / Release

Go to *Issues* (page 3309) or *Merge Requests* (page 3317)

Issues Summary

11 - rtems-net-services is missing from 6.1RC7 (page 3311)
10 - rtems-lwip is not listed under the source downloads in the main index for RC7 (page 3310)
9 - rc6 web list of documents includes broken links to network guide (page 3312)
8 - rc6 Broken Process of the VERSION file (page 3313)
7 - Disable singlehtml for releases until fixed (page 3309)
6 - Add rtems-lwip to release packages (page 3314)
4 - Add NIOS V to release notes once BSP is merged (page 3316)
2 - Add config.ini option to release script (page 3316)

Merge Requests Summary

22 - Fixes to make 6.1-rc8 (page 3318)
18 - Release process fixes (page 3319)
17 - rtems-notes-6.1: update for issue rtems/rtos/rtems#5118 (page 3320)
14 - rtems-notes-6.1.md: Add NIOS-V to added BSPs (page 3323)
13 - rtems-notes-6.1.md: Update Versal BSP naming (page 3324)
12 - rtems-notes-6.1: Update for recent pre-release BSP churn (page 3324)
11 - note: added a note for the new stack checker reporter configuration macro (page 3325)
9 - Added GDB pretty-printing feature to 6.1 release notes (page 3321)
8 - rtems-notes-6.1.md: Add missing BSPs to added and removed lists (page 3326)
7 - rtems-notes-6.1.md: Added 14 m68k BSPs for Deprecation (page 3327)
6 - Update Deprecation of BSPs and Architectures (page 3328)
4 - Update RTEMS 6.1 release notes (page 3317)
3 - Add merge requests to Release Notes (page 3331)
2 - Update URLs to GitLab (page 3330)
1 - Update the release notes to GitLab (page 3334)

Merges	2

Summary

The single HTML documentation is not working on all machines including the one to create the release. This issue covers not building with `--singlehtml` for releases until the issue can be resolved.

Steps to reproduce

The failing environment is:

1. FreeBSD 14.1
2. Python 3.9 or 3.22
3. Package install `npm-node18`, `npm-node20` or `npm-node22`. All fail.
4. NPM install `inliner` using `npm install -g inliner`

The failure is the generated HTML file is empty. If the commands are run manually a suitable HTML is created.

Summary

Every invocation of waf from the rtems source tree out of the rc6 tarball fails. @opticron says the VERSION file is using the wrong section names and key names.

This will have to be fixed on main as well.

3.11.1.5.2.1 Pre-set options

Author: Joel Sherrill 2024-12-18T16:34:16.359Z

assigned to @opticron

Author: Joel Sherrill 2024-12-18T16:34:16.743Z

Author: Kinsey Moore 2024-12-18T16:37:10.333Z

The release process created a VERSION file with the old format for the 6 RC6 release instead of the new version with section [version] and key "revision". This new expectation was introduced by commit 3d782180eae14... in RTEMS. The current file for RC6 contains RTEMS_VERSION and RTEMS_VERSION_CONTROL_KEY.

The release note generator uses the Gitlab API and this requires an API key. Update the release scripts to:

1. Require a `config.ini` file be supplied or
2. A JSON file of the milestone issues data used by the release generator

@chris given how comprehensive the new release notes are based off of GitLab do manual release notes make sense anymore? I don't think it's worth it and we should focus on having better MR, Issue and commit titles.

Author: Sebastian Huber 2024-08-17T06:46:11.600Z

We should definitely have some high level release notes which are structured in the usual way.

Author: Joel Sherrill 2024-08-02T16:59:59.357Z

rtems.org/logos/... was intended to be a set of permanent URLs for logos. Are we breaking that for the more complex ones?

Author: Amar Takhar 2024-08-02T16:59:59.357Z

First I've heard of that! Yes it's going to be broken according to the web logs nobody is using it so I didn't think it was important? It is not typical for someone to link to your logo but copy the file and use it that way because you can never guarantee the link will work. I do not know why `devel.rtems.org` was taken here you'd have to ask @chris

The URL I put in is much worse but I wanted something that would work for now because the old one is 100% dead, anyway.

Author: Chris Johns 2024-07-28T07:00:11.107Z

You can view the HTML with Issues and Merge Requests here https://ftp.rtems.org/pub/rtems/people/chrisj/releases/test/html

Author: Amar Takhar 2024-08-02T04:25:36.850Z

Looks good but the HTML code when people are set to the rich text editor is coming through. I'm guessing it's delimiting the HTML tags.

Scroll a bit down from here:

- https://ftp.rtems.org/pub/rtems/people/chrisj/releases/test/html/r-6-1-rtems-rtos-rtems.html#rn-14-66402033

Author: Chris Johns 2024-08-02T04:25:36.850Z

This is not nice. The exported data has embedded HTML in it. Escaping the HTML is easy for HTML output but that does not work for PDF output.

Author: Amar Takhar 2024-08-02T04:25:36.850Z

It will have it based on whether the user is using the rich editor or not this is actually the normal way it works. The API probably has a way to know which editor the user used so you can base it off of that.

Author: Chris Johns 2024-08-02T04:25:36.850Z

It does not seem to be so in this case. It is from the rebasing of merge requests.

Author: Amar Takhar 2024-08-02T04:25:36.850Z

What do you mean? There is no way to tell if it's rich or not? There are python libraries to strip HTML I would just do that then for non-html versions like PDF.

Author: Chris Johns 2024-08-02T04:25:36.850Z

The HTML is in automatically added notes as a result of rebasing the MR. No one entered it.

Author: Amar Takhar 2024-08-02T04:25:36.850Z

Ahh I see what you mean. It must use MarkDown or otherwise for the rich comments. Well that's easily stripped you can convert it to monospace text using a python library to convert it and keep formatting.

Author: Chris Johns 2024-08-02T04:25:36.850Z

I have added support to handle the HTML and convert it to sphinx.

The change also fixes links and adds support for references. Replies have been fixed.

Author: Kinsey Moore 2024-08-02T04:26:59.663Z

Was this change intentional? It seems like something that might have been changed during development for testing purposes.

Author: Chris Johns 2024-08-02T04:26:46.268Z

3.12 RTEMS / Tools / RTEMS Deployment

Go to *Issues* (page 3336) or *Merge Requests* (page 3344)

Issues Summary

4 - Backport wscript: fix text for help (page 3336)
3 - Update waf to 2.1.4 : rtems/tools/rtems-deployment (page 3338)
2 - Add option to pass the RSB options (page 3344)

Merge Requests Summary

17 - waf: Update waf to waf-2.1.4 (page 3344)
16 - wscript: fix text for help (page 3345)
12 - config/amd/k26: Rename to the correct K26 SOM name (page 3347)
10 - amd: Add civetweb package to the package stack (page 3348)
9 - amd: Add yaml-cpp package to the package stack (page 3349)
8 - amd/kr26: Name the BSP kr26 (page 3349)
7 - beagle: Add Beaglebone Black (page 3350)
6 - amd/kr26: Set the console to UART1 (page 3351)
5 - Enable SMP for kria/kr26 and microzed BSPs (page 3351)
4 - AMD updates (page 3352)
3 - Add KR60 (KR260) (page 3353)
2 - waf: Fix pandoc check (page 3353)
1 - Support RSB options (page 3355)

11 - Amd add yaml cpp (closed) (page 3356)

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

marked this issue as blocking rtems/docs/rtems-docs#54

Author: Amar Takhar 2024-11-16T20:21:31.439Z

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T01:08:46.506Z

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

Summary

Provide a deployment option to specify options to pass to the RSB. For example the RSB `--url` option to specify an alternative cache of sources for the RSB to use.

mentioned in commit ae9d645739d264395274db67902fc1573656ce61

Author: Amar Takhar 2024-06-12T04:56:14.124Z

FYI for some reason this created a merge commit which I deleted manually. Still not sure why it happened.

Author: Kinsey Moore 2024-06-12T13:35:48.384Z

The default merge method for this repo is set to “merge commit”.

Author: Kinsey Moore 2024-06-12T13:36:46.372Z

I have updated that setting for this repo. I suppose we need to do an audit of all our current repos to make sure we don’t have any others with that setting.

Author: Kinsey Moore 2024-06-12T13:40:19.365Z

I fixed a few others as well. Hopefully they're all set to FF now.

Commit	9957963b631bc15227399934472480df0c5ae6e1

Summary

Add build files to .gitignore

This doesn't deal with the fact that we have pre-built files in the repository when you build some files will get modified like the documentation.

If you regen configure and it's friends will get modified, too.

Author: Amar Takhar 2024-07-19T21:28:27.533Z

assigned to @amar

Author: Chris Johns 2024-07-20T06:43:33.708Z

These are to be added to you local ignore as they are editor specific

Author: Amar Takhar 2024-07-20T06:43:25.164Z

changed this line in version 2 of the diff

Author: Amar Takhar 2024-07-20T06:43:33.708Z

That's weird I have no idea where that ~ file came from I have no editors that create files like this. I went through all the steps I did before and it's not showing up again how strange.

I have removed them.

Author: Chris Johns 2024-07-20T07:12:54.164Z

I suspect you see this because you have configured in the source. I normal avoid this.

The only change needed is the editor specific files which we do not add to pre repo ignores.

Author: Amar Takhar 2024-07-20T07:12:54.164Z

Yes, there are other in-source files in .gitignore so why not add the rest? I've never configured out of source I don't see the harm in adding them as it makes for easier development.

Author: Chris Johns 2024-07-20T07:12:54.164Z

I am fine with them being added.

RTEMS had a policy of not configuring in source to avoid generated files being added as it became a problem over time.

3.14 RTEMS / Tools / RTEMS Source Builder

Go to *Issues* (page 302) or *Merge Requests* (page 319)

Issues Summary

76 - Release builds of rtems-net-legacy references rtems_waf (page 3381)
74 - simhost is broken with build errors (page 3387)
72 - NTP is now in net-services, remove as a 3rd pary package (page 3385)
70 - The –with-rtems-tests flag does not cause tests to be installed appropriately (page 3383)
69 - GCC does not build on FreeBSD on arm64 systems (page 3384)
68 - Version's _top() call does not find the top (page 3382)
66 - Non-simhost builds fail with force_package_build error (page 3386)
62 - RSB: All toolset builds fail on 6.1rc4 looking for texinfo (page 3401)
61 - RSB: All toolset builds fail on 6.1rc5 looking for texinfo (page 3391)
60 - RSB: All toolset builds fail on 6.1rc4 looking for texinfo (page 3392)
57 - Add rtems-lwip build set (page 3388)
55 - Remove upstream lwIP from build configurations in favor of using rtems-lwip (page 3394)
53 - RSB: clean unused buildsets and configurations (page 3395)
52 - 6: Add –release-branch option to use on release branches (page 3390)
46 - Add std::filesystem chdir and mkdir support to libstdc++v3 (page 3402)
44 - expat picking up dockbook2man and erroring when XML support is not enabled. (page 3410)
42 - gaisler.se qemu patch download fails (page 3397)
40 - Adding a hash in a release build generates an error (page 3416)
38 - Windows only code in common area in path.py (page 3417)
36 - dtc build failure on msys2 - all rtems6 target tools fail to build on Windows 10 (page 3411)
35 - x86_64 breaks on MacOS M machines (page 3407)
32 - Can't build everything with all locales (page 3418)
29 - cannot create /opt/rtems/6/share/gdb/python/rtems/stdcxx.py: Directory nonexistent (page 3375)
28 - Update to binutils 2.34 for rtems 6 (page 3421)
27 - GDB builds fail on MSYS2 for RTEMS 6 (page 3363)
26 - gsed,texinfo builds fail on MSYS2 for RTEMS 6 (page 3365)
25 - dtc builds fail on MSYS2 for RTEMS 6 (page 3415)
24 - Update newlib hash for RUSAGE_PTHREAD and remove sys/tree.h (page 3420)
23 - Microblaze Tools Fails to Build (page 3422)
22 - All Builds Fail on Cygwin From chmod Returning an Error (page 3424)
19 - RTEMS source builder is not compiling GCC correctly (Failed to obtain rtems-tools from previous repository) (page 3367)
17 - newLib fails to build with shellcmd cmd failed error (page 3370)
13 - sb-rtems-pkg does not update rtems-tools checksum (page 3419)
12 - GIT links to gitlab.rtems.org need to use protocol=https (page 3426)
11 - Source downloads fail (page 3429)
10 - Provide an RTEMS STD C++ script in Python (page 3374)
9 - GDB 14.2 fails to build on MacOS (page 3431)
8 - Change GDB back to 13 (page 3435)

continues on next page

Table 5 – continued from previous page

7 - GDB requires GMP 4.2+, and MPFR 3.1.0+ (page 3433)
6 - CI to update file cache on ftp.rtems.org (page 3379)
5 - The –url command line option does not dowload all paths (page 3399)
4 - Move devel.rtems.org patches to gitlab.rtems.org (page 3436)
3 - Move git.rtems.org configurations to gitlab.rtems.org (page 3437)
2 - QEMU failed to build on FreeBSD 14 (page 3439)
1 - Migrate commits from master to main after gitlab transition (page 3396)

Merge Requests Summary

116 - rtems/net-legacy: Do not reference rtems_waf when released (page 3464)
113 - sb: Fix version finding the top when invoked with VERSION externally (page 3464)
109 - rtems/net: Remove NTP as a 3rd party package (page 3466)
107 - sb: A build does not accumulate errors, remove assignment (page 3467)
105 - rtems/config/rtems-kernel-common: Parse –with-rtems-tests correctly (page 3462)
102 - config/gcc-13: Add support in ISL for FreeBSD on arm64 systems (page 3465)
99 - source-builder: Set default for force_package_build (page 3467)
98 - source-builder: Set default for force_package_build (page 3468)
97 - sb/simhost: Fix bset parsing in simhost and improve error handling (page 3469)
93 - bare/texinfo: Add back texinfo-1.cfg which was removed by sb-track (page 3471)

```

" should be added before '$i' and '*' in gdb-common-1.cfg:line131-132

when fixed this, there is another error.

3.14.1.1.1.2 no usable python found at /usr/bin/python3

rsb-report-arm-rtems6-gdb-14.2-x86_64-w64-mingw32-1.txt

But python3 is there.

```
MINGW64 ~/rtems-source-builder/rtems$ whereis python3
python3: /usr/bin/python3.11-config /usr/bin/python3.exe /usr/lib/python3.11 /usr/
↪include/python3.11 /usr/share/man/man1/python3.1.gz
```

Author: Frank Kuehndel 2024-07-29T00:49:44.971Z

Hi Xiaojun Zheng,

> when fixed this, there is another error. no usable python found at /usr/bin/python3
>
> This is most likely a follow up error from the awk command failing or not working correctly. The lines where the awk command fails, look like the source builder tries to figure out which Python library to use. If the awk command does not understand the syntax, may be you do not use GNU awk. If not, it may be worth trying to install GNU awk and make sure its the one actually used by the source builder.
>
> My recommendation would be to first follow the instructions in the *Quick Start* section strictly and if these work, change to your needs:
>
> https://docs.rtems.org/branches/master/user/start/index.html#quick-start

On my machine (OpenSUSE 15.5), git commit 892e966e4331f977cca8c83fc3bc22c8fa9d2754 builds without trouble:

../source-builder/sb-set-builder –log=/tmp/l-arm.txt –prefix=/tmp/build-sb/rtems/6 6/rtems-arm

Greetings, Frank

Author: xiaojun zheng 2024-07-29T00:49:44.937Z

Thanks, The awk is GNU awk

```
~$ awk -V
GNU Awk 5.3.0, API 4.0, PMA Avon 8-g1, (GNU MPFR 4.2.1, GNU MP 6.3.0)
Copyright (C) 1989, 1991-2023 Free Software Foundation.
```

Building in windows is not as easy as in Linux.

Summary

I have an issue trying to prepare a Docker environment for RTEMS development.

For what I can see the rtems-source-builder is failing to download the following file: https://git.rtems.org/rtems-tools/snapshot/rtems-tools-04d6aa3ada572c1fd7352e3a95775824679c0aa0.tar.bz2

Im using repository https://gitlab.rtems.org/rtems/tools/rtems-source-builder.git with branch 5.3, here is the log of the process that's giving me the error

Log

Steps to reproduce

Follow the RTEMS build procedure for RTEMS 5.3. The error is generated when running

```
../source-builder/sb-set-builder --prefix=/opt/rtems/5 5/rtems-arm
```

`

Author: Kinsey Moore 2024-06-28T13:54:23.559Z

Hello, 5.3 is a tag that was released before the gitlab transition. If you look on the 5 branch, the latest commit resolves this issue. Please verify that you can build with that patch.

Author: Brais Solla 2024-07-01T06:50:25.691Z

Hello @opticron, I'm trying to build using the branch 5 of rsb, but now I have a new issue, the patches are not getting downloaded and applied correctly.

Merges	0

Summary

I am trying to build newLib with rtems source builder in cygwin64 and Linux, but in both situations the build fails. I use the `rtems-gcc-13.3-newlib-head.cfg` file and I get the error:

```
Makefile:1040: recipe for target 'all' failed
make: \\*\\*\\* \\[all\\] Error 2 make: Leaving directory '/home/jenkins/agent/workspace/\\_RiscV_Tools_Update-to-gcc-to-13/riscvtools/rtems/build/riscv-rtems6-gcc-13.3.0-newlib-1ed1516-x86_64-linux-gnu-1/build'
shell cmd failed: /bin/sh -ex /home/jenkins/agent/workspace/\\_RiscV_Tools_Update-to-gcc-to-13/riscvtools/rtems/build/riscv-rtems6-gcc-13.3.0-newlib-1ed1516-x86_64-linux-gnu-1/do-build
error: building riscv-rtems6-gcc-13.3.0-newlib-1ed1516-x86_64-linux-gnu-1
See error report: rsb-report-riscv-rtems6-gcc-13.3.0-newlib-1ed1516-x86_64-linux-gnu-1.txt
Note: In some cases the error appears only in the complete build log (see --log option)
```

I've noticed in the Makefile created there is an extra '+' character. The previous Makefile was created after rtems-gcc-9.3.0-newlib-7947581.cfg and doesn't have that '+' character. !`image <https://gitlab.rtems.org/-/project/uploads/35afeadfb4b1fc95ba1260b76996980b/image.png>`_

Steps to reproduce

Author: Chris Johns 2024-06-27T22:09:38.616Z

changed the description

Author: Joel Sherrill 2024-06-28T13:57:26.651Z

I've started builds to attempt to duplicate this failure but have a few questions:

- First, why is this marked confidential?
- What Linux distribution?
- What directory is this Makefile with the "+ sign in?

Author: Joel Sherrill 2024-06-28T16:43:40.014Z

I grep'ed to find that the top level Makefile has the "+". It is legal per the GNU make manual. I found this:

"As a special feature, using the variable MAKE in the recipe of a rule alters the effects of the '-t' ('–touch'), '-n' ('–just-print'), or '-q' ('–question') option. Using the MAKE variable has the same effect as using a '+' character at the beginning of the recipe line. See Instead of Executing the Recipes. This special feature is only enabled if the MAKE variable appears directly in the recipe: it does not apply if the MAKE variable is referenced through expansion of another variable. In the latter case you must use the '+' token to get these special effects."

What make are you using?

I still have the various builds going and will follow up.

Author: Joel Sherrill 2024-06-28T21:27:27.945Z

The build of riscv-rtems6 tools successfully completed on Cygwin and CentOS 7 for me. On CentOS 7, I have the Software Collections to get a Python 3 and GCC 11. The build time on Cygwin isn't going to win awards (7:17:00.959216) but was only 38m0.527s on the Linux machine. Cygwin builds have a history of being unstable using more than -j1.

At this point, this is "works for me." Any other variables?

Author: Gheorghiu Cristiana Andreea 2024-07-01T07:38:32.008Z

Hi! Could you change confidentiality level to public?

Author: Gheorghiu Cristiana Andreea 2024-07-01T07:49:57.113Z

The Makefile file is from "rtemsbuildriscv-rtems6-gcc-13.3.0-newlib-1ed1516-x86_64-pc-cygwin-1buildMakefile"

Author: Gheorghiu Cristiana Andreea 2024-07-01T11:03:01.651Z

Actually I am not building riscv-rtems6 tools, I am building tools/rtems-gcc-13.3-newlib-head and I get the same error on Cygwin and Linux

Author: Gheorghiu Cristiana Andreea 2024-07-01T11:06:19.508Z

The make version I am using on cygwin is 4.4.1.

Author: Amar Takhar 2024-07-01T23:36:55.531Z

Author: Amar Takhar 2024-07-02T07:22:00.987Z

Hello, Confidentiality has been disabled for this issue thanks.

Author: Amar Takhar 2024-07-02T01:51:01.176Z

Which version/distrubtion of Linux and Cygwin? Thank you.

Author: Chris Johns 2024-07-02T01:51:01.147Z

Cygwin is a rolling release so there is none you can reference.

Author: Amar Takhar 2024-07-02T01:54:41.512Z

Yes this is true for packages I should have specified the kernel as some are running ancient kernels which can restrict you to older packages. There is a FAQ entry about this:

- https://www.cygwin.com/faq.html#faq.what.version

Author: Gheorghiu Cristiana Andreea 2024-07-02T18:32:09.964Z

Hello everybody!

The same issue appear:

- on Cygwin64 terminal (3.5.3-1.x86_64 version) which is installed on a windows 11 enterprise machine
- on a dockerImage with openSuse 12 which is running on jenkins

I think, this potential issue, is not operating system dependent. On Cygwin, I run this command from `rtems` folder:

```
../source-builder/sb-set-builder                          --log=l-riscv32.txt
--prefix=StagingArea/linux64/riscv-rtems6-13.3.0 6/rtems-gcc-newlib
```

The file``[rtems-gcc-newlib.bset](/uploads/fdaaf2066cecb2cf6df8591ada18b18e/rtems-gcc-newlib.bset) attached is placed in the ``rtemsconfig6` folder

Can you try it on your machine to see if you manage to reproduce it? Thanks.

Author: Joel Sherrill 2024-07-02T18:32:09.931Z

I think the –prefix has to be a fully qualified path. This is the behavior of the gcc, binutils, etc. configure/build setup. Try something like ${HOME}/... or /opt/...

You can also build a tarball and/or not install with the RSB.

Author: Gheorghiu Cristiana Andreea 2024-07-02T18:19:39.481Z

I've found out the gmp is needed, but the download it is not working

download: https://gmplib.org/download/gmp/gmp-6.3.0.tar.bz2 -> sources/gmp-6.3.0.tar.bz2 download: https://gmplib.org/download/gmp/gmp-6.3.0.tar.bz2: error: <urlopen error [Errno 116] Connection timed out> error: downloading https://gmplib.org/download/gmp/gmp-6.3.0.tar.bz2: all paths have failed, giving up

Author: Amar Takhar 2024-07-02T18:19:39.440Z

The site appears to be down you can fetch it from our FTP or the gnu mirror:

- https://ftp.rtems.org/pub/rtems/cache/rsb/main/
- https://ftp.gnu.org/pub/gnu/gmp/

Place it in the sources directory once done

Author: Gheorghiu Cristiana Andreea 2024-07-04T07:41:13.613Z

Hi! Finally I've managed to build the rtems-gcc-13.3-newlib-head with success. There were gmp and mpfr packages missing, after adding them every thing was good. Thanks for your help!

I am going to close this issue too.

Author: Amar Takhar 2024-07-05T08:14:29.997Z

No problem it's great you were able to get it sorted thanks for the report.

Author: Joel Sherrill 2024-07-08T06:55:38.440Z

Thanks for closing this when it worked for you. I just wanted to follow up and ask if the only issue was the relative path on the configure line and gmplib.org being down.

FYI: gmplib.org has a news item on what happened. It's an interesting example of unintended consequences.

3.14.1.5 10 - Provide an RTEMS STD C++ script in Python

Id	10
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns

Merges	0

Summary

This issue is for the development of a python script called `stdcxx.py` that lives under the installed prefix of the RTEMS built tools. The script is to load the GCC libstdc++ pretty printers.

3.14.1.5.1.1 Script Requirements

1. The script is called by the `.debug_gdb_scripts` python text when the executable loads
2. Determine the path to the GCC libstdc++ pretty printer scripts. These will installed and available however they are under the version of GCC built for the `$prefix`
3. There is only ever be one version of GCC installed under a `$prefix`
4. Inspect the GCC pretty printer scripts and determine what they require

Author: Chris Johns 2024-06-11T06:07:09.335Z

Author: Chris Johns 2024-06-11T06:07:26.158Z

assigned to @chris

Author: Chris Johns 2024-06-11T06:12:57.056Z

changed the description

Author: Suraj Kumar 2024-06-11T06:17:16.533Z

@chris Question: the GCC path and and GDB path would both live under the `share` directory in the installed `$prefix`, so the GCC path would be relatively the same always from the path provided by `gdb.PYTHONDIR`. Could that be a possible solution to finding the location of the installed pretty-printer scripts?

Author: Chris Johns 2024-06-11T06:17:49.762Z

moved to rtems-tools#5

Build Set: Time 0:03:13.027483
Build FAILED
```

The last successful run of this CI job was on 2024-08-15T02:33:07+02:00. I assume the error is triggered by the merge yesterday of https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/35

Steps to reproduce

The CI job I mentioned in https://gitlab.rtems.org/rtems/docs/rtems-docs/-/merge_requests/9#note_110876 found this issue. It carries out the exact instructions you can find in section Bare Metal Rust with RTEMS. It actually extracts the instructions from the source code of the page in the `rtems-docs` repository.

Author: Amar Takhar 2024-08-19T18:34:16.297Z

@the.m3chanic this is something you will need to look at, thank you!

Author: Suraj Kumar 2024-08-19T18:34:16.265Z

I am on it

Author: Amar Takhar 2024-08-19T18:41:38.825Z

Great thanks!

Author: Suraj Kumar 2024-08-19T20:38:50.079Z

I think the issue is that on fresh builds, it does not seem to be able to run `sparc-rtems6-gcc`, hence the odd string that `sed` is trying to replace with. That seems to be the one causing the issue here. Also, the script install location does not exist yet, since the RSB only writes at the end of the build - I have fixed this issue.

@chris For cases like this (where `sparc-rtems6-gcc` is not yet built), can a fall back option be to use the `gcc_version` macro defined in the corresponding `newlib` file for that build? Please let me know, thanks

@amar After I had moved files around, I had only re-built current toolchains I already had built, I had forgotten to re-test for this case. That is my bad and this will be fixed ASAP

Author: Suraj Kumar 2024-08-19T21:19:13.617Z

I have created a merge request to patch this: https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/48

Author: Joel Sherrill 2024-08-19T21:19:21.701Z

Now that I have written it, it feels a bit rambling. There may not be a real solution in here. It is just background which might help figure out a workable solution.

@the.m3chanic GDB is built relatively early in the set of tools because it often fails to build because the python development package isn't installed (e.g. Python.h). At some point, Chris/I moved gdb up from last to near first so if this failure occurred, it wouldn't waste as much of the user's time.

It is possible to move gdb back toward the end of the list. This may fix this problem if the cross gcc is visible while building. This may work but it doesn't address the small elephant left in the room which is why we moved the order of gdb back then...

We wanted gdb to be early because the sb-check tool only checks for installed program executables. It does not check for needed libraries/headers. You can run sb-check and get an "ok" but fail because you are missing python-devel. Enhancing sb-check to check for libraries/headers would help users avoid starting a build they don't have all the dependencies to finish.

2024-08-23: Retested with RSB commit fc5ad5930421d28d0c3c3861def4fec6a62f5300 “sb: Fix config file directive processing in includes”. Bug persists.

Author: Suraj Kumar 2024-08-23T13:37:20.636Z

@frank_k Could you please tell me what error you are getting? And the command that you ran

Author: Frank Kuehndel 2024-08-23T13:37:20.636Z

@the.m3chanic The exact same command and error noted in the summary of this bug. The CI creates a new docker container and then runs in the container:

```
git clone https://gitlab.rtems.org/rtems/tools/rtems-source-builder.git␣
↪rsb
cd rsb/rtems
../source-builder/sb-set-builder --prefix /opt/rtems/6 6/rtems-sparc 6/
↪rtems-riscv
```

The error is:

```
error: shell macro failed: cat "/home/ferris/rsb/rtems/config/stdcxx-
↪template.py" | sed "s/@RSB_GCC_VERSION@//bin/sh: 1: /opt/rtems/6/bin/
↪sparc-rtems6-gcc: not found/g" > "/opt/rtems/6/share/gdb/python/rtems/
↪stdcxx.py": 2: /bin/sh: 1: cannot create /opt/rtems/6/share/gdb/
↪python/rtems/stdcxx.py: Directory nonexistent
```

Note: The CI run does not apply the patch from @chris https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/48#note_111355 . With that patch the RSB builds successfully.

Author: Suraj Kumar 2024-08-23T13:37:20.636Z

If I’m not wrong I applied those patches to this MR !48 . Could you please check out the changes on this branch and try again? Please let me know if I am mistaken but when I tested with these exact conditions it worked for me

Author: Frank Kuehndel 2024-08-23T13:37:20.636Z

@the.m3chanic Please, give me some time to do it. The continuous integration job cannot do this. (It may be an idea for another day to try to improve the CI job in this regard.) Note that !48 is not yet merged.

Author: Frank Kuehndel 2024-08-23T13:37:20.636Z

@the.m3chanic Yes, that RSB builds without producing #29 . To be sure, I tested this RSB:

```
$ git -C rsb status
On branch rtems-source-builder-the-m3chanic
nothing to commit, working tree clean

$ git -C rsb log -1
commit 80ea5fa58e58ab94692bf8ca458a5b8cf1edcfcb (HEAD -> rtems-source-
↪builder-the-m3chanic)
Author: the-m3chanic <hisurajkumar2004@gmail.com>
Date:   Wed Aug 21 18:39:20 2024 +0530

Added install directive
```

3.14.1.7 6 - CI to update file cache on ftp.rtems.org

Id	6
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Amar Takhar
Closed by	Amar Takhar
Created	2024-05-24T06:35:32.626Z

Milestone	6.1
Labels	tool::rtems-source-builder
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/6
Merges	0

Summary

This issue is to add a CI that runs after a merge is pushed to the repo. It runs the RSB's source download. There is a file cache per active branch in the RSB.

The URL is https://ftp.rtems.org/pub/rtems/cache/rsb and branches are subdirectories under this. For example the `main` branch is https://ftp.rtems.org/pub/rtems/cache/rsb/main

Reason for the Cache

The cache is provided for user sites that are locked down. The RSB will not work because it fetches source from a number of hosts and IT support staff tend to not want to add the list of places the RSB references. The cache provides a single machine which is can be made accessible allowing the RSB to build tools.

Command

The command to run is:

```
cd rtems-source-builder/rtems
../source-builder/sb-get-sources
```

The command will check all buildsets and configuration files for all support hosts.

The files can be found in `sources` and `patches` and the contents of both can be copied to the cache directory.

Merges	1

Summary

The `version.py` function does not find the top of the RSB when calling an RSB command because the commands are in `source-builder`. This means a released RSB does not find the released `VERSION` file. It has worked with the release because invoking `../source-builder/sb-set-builder` from the `rtems` directory caused `_top()` to return `..` which happened to work. Calling the RSB externally like `rtems-deployment` does breaks this.

Steps to reproduce

1. Run a released `rtems-deployment` and then grep the log with `grep '^download:' out/out/amd/amd-kria-k26.txt` and check the download paths.

Running deployment on a release do

```
wget https://ftp.rtems.org/pub/rtems/releases/6/rc/6.1-rc8/sources/rtems-source-builder-6.1-rc8.tar.xz
wget https://ftp.rtems.org/pub/rtems/releases/6/rc/6.1-rc8/sources/rtems-deployment-6.1-rc8.tar.xz
tar jxf rtems-source-builder-6.1-rc8.tar.xz
```

(continues on next page)

(continued from previous page)

```
tar jxf rtems-deployment-6.1-rc8.tar.xz
cd rtems-deployment-6.1-rc8
./waf configure --rsb ../rtems-source-builder-6.1-rc8
./waf --targets=amd/amd-kria-k26,amd/avnet-microzed
```

Merges	1

Summary

This is due to the changes made for RC6.

Steps to reproduce

Try to build tools on 6 or main outside of simhost.

3.14.1.13.2.1 Pre-set options

Milestone	6.1
Labels	tool::rtems-source-builder
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/42
Merges	1

Summary

During the build process of the QEMU source builder, a patch fails to apply due to an unresolved link to a non-RTEMS resource. Specifically, the `gaisler.se` URL times out and returns a 404 error. This prevents the completion of the cross-compiler emulator tool suite installation.

```
Config: devel/qemu-5.2.0-1.cfg
package: qemu-5.2.0-rc1-x86_64-linux-gnu-1
download:
https://gaisler.se/qemu/qemu-5.2.0-leon3.patch
-> patches/qemu-5.2.0-leon3.patch
download:
https://gaisler.se/qemu/qemu-5.2.0-leon3.patch:
error: HTTP Error 404: Not Found
error: downloading
https://gaisler.se/qemu/qemu-5.2.0-leon3.patch:
all paths have failed, giving up
Build FAILED
See error report: rsb-report-qemu-5.2.0-rc1-x86_64-linux-gnu-1.txt
Note: In some cases the error appears only in
the complete build log (see --log option)
error: downloading
https://gaisler.se/qemu/qemu-5.2.0-leon3.patch:
all paths have failed, giving up
Build Set: Time 0:02:22.412941
Build FAILED
```

Steps to reproduce

1. Run `sudo ../source-builder/sb-set-builder --prefix=/opt/rtems/6 devel/qemu`
2. Encounter failure on download of the following qemu patch https://gaisler.se/qemu/qemu-5.2.0-leon3.patch

Workaround

1. Navigate to `https://ftp.rtems.org/pub/rtems/releases/5/5.2/sources/`
2. Download the relevant patch (qemu-5.2.0-leon3.patch)
3. Place it inside the patches directory under `patches/qemu-5.2.0-leon3.patch`
4. re-run install

Author: Amar Takhar 2024-10-23T21:29:41.290Z

Thank you for the report

Author: Joel Sherrill 2024-10-24T14:41:55.142Z

We have the perception that content on the Internet is forever but things disappear or move. :disappointed:

You seem to be in a good position to fix and test this. The solution should be to just change the line in the RSB Qemu configuration file with the URL to point to the RTEMS release directory. The hash should not change.

I don't think using the patch from an RTEMS release directory is an issue. Those are intended to be very permanent.

If it works, just create a merge request and submit the fix.

Please and thank you.

Author: CHARLES TAYLOR 2024-10-24T14:41:41.147Z

@joel I updated the suggested file and posted the MR here: https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/72 let me know if I did anything out of style.

Merges	1

The `libstc++-v3` configure uses links tests to check for the calls `chdir` and `mkdir`. These checks fail because the calls are in `rtems/rtos/rtems.git` and we need a compiler to built RTEMS.

Author: Chris Johns 2024-11-13T10:29:38.018Z

assigned to @chris

Author: Chris Johns 2024-11-13T10:34:29.051Z

This patch sets the defines for RTEMS so `std::filesystem` directory management works.

commit e0466d32eb3422e6d206a16845e4e594d3a0f2b2
Author: Sebastian Huber <sebastian.huber@embedded-brains.de>
Date:   Wed Jun 8 08:44:36 2022 +0200

Enable some features for RTEMS in libstdc++

Remove RTEMS support from crossconfig.m4 since this code is not used␣
↪due to
"with_newlib" being "yes".

libstdc++-v3/ChangeLog:

* configure: Regnerate.
* configure.ac (newlib, *-rtems*): Enable TLS support for all RTEMS
targets except bfin, lm32, mips, moxie, or1k, and v850.
For all RTEMS targets, define HAVE_ALIGNED_ALLOC, HAVE_AT_QUICK_EXIT,
HAVE_LINK, HAVE_POLL, HAVE_QUICK_EXIT, HAVE_READLINK, HAVE_SETENV,
```

(continues on next page)

(continued from previous page)

```
HAVE_SLEEP, HAVE_SOCKATMARK, HAVE_STRERROR_L, HAVE_SYMLINK,
HAVE_TRUNCATE, and HAVE_USLEEP.
* crossconfig.m4 (*-rtems*): Remove.
```

Author: Chris Johns 2024-11-13T20:47:26.243Z

That would also work. The header file was easier to sort out because I did not need to regenerate configure

Would the change be as simple as bringing across the defines I have in the header file?

Author: Kinsey Moore 2024-11-14T23:24:55.412Z

changed title from **Add std::filesystem c{-d-}dir and mkdir support to libstdc++v3** to **Add std::filesystem c{+h+}dir and mkdir support to libstdc++v3**

Author: Sebastian Huber 2024-11-16T23:38:37.048Z

There is already this change in GCC:

```
commit 5955c18dfb970740d55d432aeee5cb5a6f51cf65
Author: Alexandre Oliva <oliva@adacore.com>
Date:   Thu May 30 04:01:15 2024 -0300

[libstdc++-v3] [rtems] enable filesystem support

mkdir, chdir and chmod functions are defined in librtemscpu, that
doesn't get linked in during libstdc++-v3 configure, but applications
use -qrtems for linking, which brings those symbols in, so it makes
sense to mark them as available so that the C++ filesystem APIs are
enabled.

for  libstdc++-v3/ChangeLog

* configure.ac [*-*-rtems*]: Set chdir, chmod and mkdir as
available.
* configure: Rebuilt.
```

Author: Chris Johns 2024-11-16T23:38:37.048Z

I searched https://gcc.gnu.org/git/?p=gcc and could not find that commit?

Author: Chris Johns 2024-11-16T23:38:37.048Z

Found the patch on `master`. I have commented below.

Author: Sebastian Huber 2024-11-16T23:42:57.171Z

Proposal for GCC trunk:

0001-libstdc-v3-Enable-features-for-RTEMS.patch

Author: Chris Johns 2024-11-16T23:42:57.171Z

This looks great. I will test it and then make a MR for the RSB to use it.

Author: Chris Johns 2024-11-16T23:42:57.171Z

The patch does not work.

Author: Chris Johns 2024-11-16T23:00:01.176Z

It does not fix the directory management because the tests fail. The configure test results I can see are:

```
checking for chmod... no
checking for mkdir... no
checking for chdir... no
checking for getcwd... yes
checking for realpath... no
checking for utimensat... no
checking for utime... no
checking for lstat... yes
checking for struct stat.st_mtim.tv_nsec... yes
checking for fchmod... yes
checking for fchmodat... no
checking for sendfile that can copy files... no
checking for link... no
checking for readlink... no
checking for symlink... no
checking for truncate... no
checking for fdopendir... yes
checking for dirfd... yes
checking for openat... no
checking for unlinkat... no
```

In `acinclude.m4` the `mkdir` change says:

```
AC_DEFINE(_GLIBCXX_USE_MKDIR, 1, [Define if usable mkdir is available␣
↪in <sys/stat.h>.])
```

I will test defining this by manually hacking the patch to add the `_GLIBCXX_USE_*` defines.

Author: Chris Johns 2024-11-16T23:39:55.930Z

This patch works vCJ-0001-libstdc-v3-Enable-features-for-RTEMS.patch. Manually hacked!

I found the patch from Alexandre on GCC's `master` branch and I could not find it on `release/gcc-13` branch.

I prefer the approach I have taken because it is the method detailed in the check's help. I am concerned directly tweaking the configure vars depends on the implementation which would need to be kept in sync.

Author: Chris Johns 2024-11-23T06:10:10.686Z

@sebhub any update on this change?

Author: Sebastian Huber 2024-11-23T06:10:10.686Z

Sorry, I am busy with other things right now.

Author: Chris Johns 2024-11-23T06:10:10.686Z

Thanks and I am only asking because of branching this week.

Author: Chris Johns 2024-11-23T06:11:05.126Z

I have created a v2 patch and regenerated `configure`.

```
the problem report is attached.

Joel adds: dtc does not build on msys2. It requires fnmatch.h which is not present. Alternative fixes include finding an alternative for fnmatch on msys2, providing an implementation to be used on msys2, or adding gnulib which is a portability package to our RSB packages on msys2.

Also there may be other tickets for the same issue.

Releases provide the release tar file hash in the `VERSION` file. This is read and loaded when the RSB starts a set build. If the package being built has a development hash in its configuration file the addition of that hash to the hash table results in an error because the hash is present and the value is different.

If the RSB is in release mode (`%{release} == 1`) do not raise an error. This lets the error happen during development if there is a duplicate and lets us ship untouched config files with the release versions of the tar files and hashes defined in `VERSION`.

The change to detect Windows 11 in !63 is in the common area and should have been guarded with a check of `nt`. It has broken non-Windows builds:

```
windows11 = sys.getwindowsversion().build >= 22000
^^^^^^^^^^^^^^^^^^^^^
AttributeError: module 'sys' has no attribute 'getwindowsversion'
```

Summary

I wanted to build the `qemu-xilinx` on an Archlinux System with a German language setting. With that, downloading the sources for qemu-xilinx-v2023.2-1 failed. It seems that the `source-builder/sb/git.py` module tries to parse some language specific strings. My problem is at that line:

https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/blob/8488d28da6bfa233a90c2e80898696fd8de15534/source-builder/sb/git.py#L241

With a LANG='C' or LANG='en_US' setting, the output of `git remote show origin` has a line

HEAD branch: main

that is parsed by that module. With a LANG='de_DE', I instead get a

Hauptbranch: main

With that output, no default branch can be found and the source builder crashes at `source-builder/sb/download.py` in line 511:

repo.checkout(default_branch)

I'm not sure whether that's the only place where a language specific string is parsed.

Steps to reproduce

On a system with a German locale, try

../source-builder/sb-set-builder –source-only-download devel/qemu-xilinx

Possible solutions

I can think of multiple solutions:

- Setting the locale to 'C' for all RSB applications using the python `locale.setlocale(...)`. Problem is: I'm not sure whether that works on Windows. I didn't find any clear cross-platform solution.

- Replacing the current git.py with the python git module. Most likely difficult due to dependencies.
- Handle strings of all languages.

Any better ideas?

Author: Christian Mauderer 2024-09-07T14:16:44.287Z

assigned to @c-mauderer

Author: Christian Mauderer 2024-09-07T16:07:56.823Z

I did not analyze the problem enough. It was a problem with a broken clone of the repo in the sources directory. Sorry for creating the issue without analyzing enough.

3.14.1.33 13 - sb-rtems-pkg does not update rtems-tools checksum

```

The microblaze target is using a specific version of binutils and gcc with patches extracted from the Xilinx repo. Updating to FSF versions is not possible. There is an effort underway to submit work but the person who reached out to the binutils and gcc communities says it may take a year. So we are stuck needing to get the Microblaze target back to its state before this patch.

The contrib/download_prerequisites script with the Xilinx gcc version cites these:

```
1 gmp-6.1.0.tar.bz2
2 mpfr-3.1.6.tar.bz2
3 mpc-1.0.3.tar.gz
4 isl-0.18.tar.bz2
```

Steps to reproduce

```
1 cd
2 rtems
3 ../source-builder/sb-set-builder --prefix=${HOME}/rtems-work/tools/6 --log=l-
   ↪microblaze.txt  6/rtems-microblaze
```

Merges	1

Summary

For some unknown reason, the _chmod_ has begun to fail on Cygwin. This is done after untaring the source files and results in all Cygwin RSB builds failing.

Steps to reproduce

Build any target on Cygwin. The generated do-build script is run with “sh -ex” which will exit on any command returning non-zero. The following shows the results of manually “sh -ex do-build ; echo $?”

```
+ tar_exit=0
+ cd sourceware-mirror-newlib-cygwin-7947581
+ chmod -R a+rX,g-w,o-w .
1
```

marked this issue as related to #21

Author: Amar Takhar 2024-07-08T17:08:22.824Z

If it’s Windows 10+ chmod isn’t going to be needed and those flags will cause issues for sure especially the group perms. If we want to just say “You need at least Windows 10” then deleting all of them would be fine.

Merges	1

Summary

Moving to Gitlab has changed the git repo path from `git://git.rtems.org` to `https://gitlab.rtems.org` for read-only access. The RSB code `download.py` assumes anything with `http/` `https` is a file download. The URLs should use `protocol=https`.

Steps to reproduce

```
../source-builder/sb-rtems-pkg
```

Solution

Change the URLs back to `git://gitlab.rtems.org`

> ```
> https://gitlab.rtems.org/rtems/rtos/rtems.git?fetch?checkout=main
> ```
>
> So I will make sure only the supported list of `git` commands are supported. Anything else is a file download

Author: Chris Johns 2024-06-13T07:00:44.135Z

Oh hang on, it is already covered in the code here https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/blob/main/source-builder/sb/download.py?ref_type=heads#L490 :

```
if _as[0] == 'protocol':
if len(_as) != 2:
raise error.general('invalid git protocol option: %s' % (_as))
if _as[1] == 'none':
# remove the rest of the protocol header leaving nothing.
us[0] = url_base[len('://'):]
else:
if _as[1] not in [
'ssh', 'git', 'http', 'https', 'ftp', 'ftps', 'rsync'
]:
raise error.general('unknown git protocol: %s' % (_as[1]))
us[0] = _as[1] + url_base
```

This issue is now about updating the `git` URLs

Author: Amar Takhar 2024-06-13T07:00:44.135Z

Well, since we're the ones controlling it can't we state that anything ending in `.git` is a repository? Also Python has urlparse which can easily get the base URL.

Author: Amar Takhar 2024-06-13T07:00:44.135Z

hmm okay should be using urlparse though instead of hacking the URL directly

Author: Chris Johns 2024-06-13T07:00:44.135Z

Yeah, old code and not related to this issue.

I will find the URLs that got changed and change them back.

Author: Amar Takhar 2024-06-13T07:00:44.135Z

What do you mean? `git://` is not a supported protocol on GitLab.

Author: Chris Johns 2024-06-13T07:00:44.135Z

Yes I know `git://` is not supported. The URL is internal to the RSB and how it works and not related to gitlab. A URL of:

```
git://gitlab.rtems.org/rtems/tools/rtems-tools.git?protocol=https
```

Will be turned into something like:

```
url: get: git://gitlab.rtems.org/rtems/tools/rtems-tools.git?protocol=https?fetch?checkout=main -> /Users/chris/development/rtems/rsb/rtems-source-builder.git/rtems/sources/rtems-tools.git

Fix Python 3.12 PEP-701

Escapes are no longer allowed in strings.

Fixes #3
```

Author: Amar Takhar 2024-06-13T07:00:44.135Z

Oh, yeah I see how it works now that is a strange way to do it but I guess if it works. The nice thing of just checking for .git at the ending is you can just cut and paste any urls in there without worrying about switching protocols in the url arguments. Also url.parse will get the argument of a URL even if it's encoded.

Author: Chris Johns 2024-06-13T07:07:33.181Z

The change was made a while ago to support other sites. It is a way of fitting in a solution into something existing.

Author: Amar Takhar 2024-06-13T07:00:44.135Z

Fair enough.

Milestone	6.1
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/11
Merges	1

Summary

Running `sb-get-sources` fails because of incorrect logic in:

1. `config/tools/rtems-kernel-common.cfg`
2. `source-builder/config/glib-2-meson.cfg`

The changes are:

```
-%if %{_dry_run} && %{defined with_download}
+%if %{_dry_run} || %{defined with_download}
```

GNU GCC git upgrades has broken building `gcc-4.9` compilers as the common support contains patches from git. Remove the GCC 4.9 builds from `bare`.

Changes to fix #9 in !21 breaks building RTEMS 7. The MPFR define is not present.

Steps to reproduce

```
cd rtems
../source-builder/sb-get-sources --stop-on-error
```

Author: Chris Johns 2024-06-11T23:29:31.261Z

assigned to @chris

Author: Chris Johns 2024-06-11T23:34:32.748Z

changed the description

Author: Chris Johns 2024-06-12T00:29:28.446Z

Reviewing the comments in `config/tools/rtems-kernel-common.cfg` it says:

```
# If a dry-run and with download ignore errors and correct setting for␣
↪tools
# and BSPs. Only after the source to download.
```

and this means `--dry-run` and `--with-download` should be set. Reviewing the `sb-get-sources` command it is only providing `--with-download` as a default option:

```
opts = simhost.load_options(args, argopts, extras=['--with-download'])
```

Add `--dry-run` is a better solution.

Further review of `source-builder/sb/getsources.py` dry run returns `True` and the `%{_dry_run}` macro is `0`. I will add a set of extra defaults to `simhost.py` to match the option defaults.

The change to `gdb-14` has changed the dependencies it has when building when a host does not have packages installed. The change is:

1. GMP 4.2+
2. MPDR 3.1.0+

We should check the change worked on MacOS with M2 processors

Author: Chris Johns 2024-06-06T20:49:21.618Z

changed due date to June 09, 2024

Author: Chris Johns 2024-06-06T20:49:21.668Z

assigned to @joel

Author: Chris Johns 2024-06-07T05:18:39.764Z

The RTEMS defaults tools for 6 builds GMP 6.3.0 so that is ok. The error must be MPFR.

The RSB `bare` has support for MPFR 4.2.0. This will be added to the defaults tools build.

Author: Chris Johns 2024-06-07T05:21:49.779Z

GCC 13 is building MPFR 4.2.1. The `bare` package should be moved to 4.2.1 and support in GCC 13 removed.

Author: Chris Johns 2024-06-08T04:44:19.340Z

@joel it seems MPFR and GDB use `libtool` and this is the error:

```
libtool: link: warning: library `/opt/work/chris/rtems/deploy/rtems-
↪deployment.git/build/tmp/sb-500/tools/rtems-default-tools/opt/rtems/
↪deploy/lib/libmpfr.la' was moved.
libtool: link: cannot find the library `/opt/rtems/deploy/lib/libgmp.la
↪' or unhandled argument `/opt/rtems/deploy/lib/libgmp.la'
make[2]: *** [Makefile:2173: gdb] Error 1
```

It seems `libtool` does not like using staged libraries in a build and wants the library in the final location.

Author: Chris Johns 2024-06-08T04:44:19.340Z

If you have an existing install under the build prefix the build may work as `libgmp.a` etc are found. If you use:

```
--prefix=/never-exist --no-install
```

you will see the problem. This is a simple RSB set of options for the command line tests the RSB build works for a clean install.

The issue is the `.la` files `libtool` uses being installed into the `_tmproot` path used to stage internally used libraries. If they are deleted before the GDB build runs with:

```
rm -f $(find %{_tmproot} -name \\*.la)
```

before `make` runs in the `gdb-common-1.cfg` the build and GDB and GCC build.

I think the solution is to make GPM and MPFR internal packages so the prefix they have is internal and `libtool` should not see a problem.

Author: Chris Johns 2024-06-08T04:44:19.340Z

I have made the changes to build Expat, GMP and MPFR as internal packages. The build installs static libraries into a temporary internal path in the RSB's build area and GDB and GCC link against these. The packages are not installed which I think is a good thing.

The MR !16 has the changes.

Change the 6 version of GDB back to 13 until #7 is resolved.

Author: Chris Johns 2024-06-07T23:30:44.394Z

assigned to @chris

Author: Chris Johns 2024-06-07T23:53:49.093Z

Changing GDB to 13.2 lets it build however GCC fails with:

```
libtool: warning: library '/opt/work/chris/rtems/deploy/rtems-deployment.git/build/tmp/sb-500/tools/rtems-default-tools/opt/rtems/deploy/lib/libmpfr.la' was moved.
/usr/bin/grep: /opt/rtems/deploy/lib/libgmp.la: No such file or directory
/usr/bin/sed: can't read /opt/rtems/deploy/lib/libgmp.la: No such file or directory
libtool:   error: '/opt/rtems/deploy/lib/libgmp.la' is not a valid libtool archive
```

Another but similar error to the GDB MPFR one reported in #7

This is on Rocky 9

Author: Chris Johns 2024-06-08T01:12:11.875Z

I am closing this. It looks like the problem in #7 is related to deployment builds in `rpmbuild` to make an RPM. The updates from @joel build cleanly on FreeBSD 14 and Rocky 9 from the RSB command line.

3.14.1.43 4 - Move devel.rtems.org patches to gitlab.rtems.org

Summary

There are approx. 73 references to devel.rtems.org in RSB and most of them appear to be linking to patches. The patch attachment links appear to be mechanically fixable by replacing:

`https://devel.rtems.org/raw-attachment/ticket/####/FILENAME` with `https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/assets/tracmigration/ticket_attachments/FILENAME.patch`

Steps to reproduce

Author: Gedare Bloom 2024-05-16T18:06:25.054Z

assigned to @chris

Author: Amar Takhar 2024-05-16T18:23:13.241Z

This won't work. The directory structure was flattened so there are no more subdirectories I did this to future-proof in the hopes that they can actually be imported into GitLab in the future. So if there were previously 5 patch.diff files they will now be patch.diff, patch-1.diff, patch-2.diff etc.

I'll see if I can generate a log so we can easily replace these not sure though due to how tracboat is written.

Pixman and GLib fail to build on FreeBSD 14

Pixman update to 0.42.2 build however GLib 2.69.3 requires `meson` and `ninja` to build. This is a major changed.

Steps to reproduce

```
cd bare
../source-builder/sb-set-builder --prefix=/opt/rtems/qemu --log=qemu.txt devel/
↪qemu
```

Author: Chris Johns 2024-05-13T07:21:48.106Z

assigned to @chris

Author: Chris Johns 2024-05-14T04:16:16.059Z

Glib uses `pkg-config` via `meson` and `meson` checks for `--version` to determine if `pkg-config` is usable. I have added `--version` to the RSB `pkg-config` and `meson` seems happier:

```
Found pkg-config: YES (/opt/work/chris/rtems/rsb/rtems-source-builder.
↪git/source-builder/pkg-config) version: 1.2.3
```

The Glib build now fails due to:

```
Run-time dependency libpcre found: NO (tried pkgconfig and cmake)
Run-time dependency libpcre found: NO (tried pkgconfig and cmake)
Looking for a fallback subproject for the dependency libpcre
Downloading libpcre source from https://ftp.pcre.org/pub/pcre/pcre-8.37.
↪tar.bz2
```

(continues on next page)

meson.build:2002:9: ERROR: could not get https://ftp.pcre.org/pub/pcre/
↪pcre-8.37.tar.bz2 is the internet available?
```

Oh hmm

Author: Chris Johns 2024-05-14T04:16:16.059Z

FreeBSD has `pcre2-10.43` installed and the following is present:

```
$ pkg which /usr/local/lib/libpcre2-16.a
/usr/local/lib/libpcre2-16.a was installed by package pcre2-10.43
```

and:

```
$ find /usr/local/libdata/ -name \\*.pc | grep pcre
/usr/local/libdata/pkgconfig/libpcre2-32.pc
/usr/local/libdata/pkgconfig/libpcre2-posix.pc
/usr/local/libdata/pkgconfig/libpcre2-16.pc
/usr/local/libdata/pkgconfig/libpcre2-8.pc
```

The RSB's `pkg-config` has `meson` reporting:

```
Pkg-config binary missing from cross or native file, or env var␣
↪undefined.
Trying a default Pkg-config fallback at pkg-config
```

(continues on next page)

(continued from previous page)

```
Found pkg-config: YES (/opt/work/chris/rtems/rsb/rtems-source-builder.
↪git/source-builder/pkg-config) version: 1.2.3
Determining dependency 'libpcre' with pkg-config executable '/opt/work/
↪chris/rtems/rsb/rtems-source-builder.git/source-builder/pkg-config'
env[PKG_CONFIG_BUILD_TOP_DIR]: /opt/work/chris/rtems/rsb/rtems-source-
↪builder.git/bare/build/tmp/sb-1001/devel/qemu
env[PKG_CONFIG_PATH]: /opt/work/chris/rtems/rsb/rtems-source-builder.
↪git/bare/build/tmp/sb-1001/devel/qemu/opt/work/rtems/qemu/lib/
↪pkgconfig
env[PKG_CONFIG]: /opt/work/chris/rtems/rsb/rtems-source-builder.git/
↪source-builder/pkg-config
-----------
Called: `/opt/work/chris/rtems/rsb/rtems-source-builder.git/source-
↪builder/pkg-config --modversion libpcre` -> 1
```

Using the FreeBSD `pkg` installed `pkg-config` gives:

```
Pkg-config binary missing from cross or native file, or env var␣
↪undefined.
Trying a default Pkg-config fallback at pkg-config
Found pkg-config: YES (/usr/local/bin/pkg-config) 2.0.3
Determining dependency 'libpcre' with pkg-config executable '/usr/local/
↪bin/pkg-config'
env[PKG_CONFIG_BUILD_TOP_DIR]: /opt/work/chris/rtems/rsb/rtems-source-
↪builder.git/bare/build/tmp/sb-1001/devel/qemu
env[PKG_CONFIG_PATH]: /opt/work/chris/rtems/rsb/rtems-source-builder.
↪git/bare/build/tmp/sb-1001/devel/qemu/opt/work/rtems/qemu/lib/
↪pkgconfig
env[PKG_CONFIG]: /usr/local/bin/pkg-config
-----------
Called: `/usr/local/bin/pkg-config --modversion libpcre` -> 1
```

Both report no `pcre` present. The RSB `pkg-config` is not the issue. The question is why `glib` and/or `meson` does not find `pcre`?

The `glib` support in `meson.build` is:

```
pcre = dependency('libpcre', version: '>= 8.31', required : false) #␣
↪Should check for Unicode support, too. FIXME
if not pcre.found()
if cc.get_id() == 'msvc' or cc.get_id() == 'clang-cl'
# MSVC: Search for the PCRE library by the configuration, which␣
↪corresponds
# to the output of CMake builds of PCRE.  Note that debugoptimized
# is really a Release build with .PDB files.
if vs_crt == 'debug'
pcre = cc.find_library('pcred', required : false)
else
pcre = cc.find_library('pcre', required : false)
endif
```

(continues on next page)

(continued from previous page)

```
endif
endif

# Try again with the fallback
if not pcre.found()
pcre = dependency('libpcre', required : true, fallback : ['libpcre',
↪'pcre_dep'])
use_pcre_static_flag = true
elif host_system == 'windows'
pcre_static = cc.links('''#define PCRE_STATIC
#include <pcre.h>
int main() {
void *p = NULL;
pcre_free(p);
return 0;
}''',
dependencies: pcre,
name : 'Windows system PCRE is a static build')
use_pcre_static_flag = pcre_static
else
use_pcre_static_flag = false
endif
```

Author: Chris Johns 2024-05-14T04:16:16.059Z

Updating to 2.80.2 as @amar kindly pointed out has resolved the PCRE issue

Author: Amar Takhar 2024-05-14T02:18:37.043Z

http://pcre.org/:

- Note that the former ftp.pcre.org FTP site is no longer available. You will need to update any scripts that download PCRE source code to download via HTTPS, Git, or Subversion from the new home on GitHub instead.

Author: Amar Takhar 2024-05-14T04:17:22.081Z

https://github.com/PCRE2Project/pcre2/releases

Author: Chris Johns 2024-05-14T04:17:22.081Z

It is not yet clear what the issue is to trigger `meson` to take the path it has. And I would discourage letting `glib` build a package like this. Too easy to be manipulated.

Author: Amar Takhar 2024-05-14T04:17:22.081Z

You mean why glib can't find libpcre or why it's trying to download it?

Author: Amar Takhar 2024-05-14T04:17:22.081Z

What version of glib is this?

Author: Chris Johns 2024-05-14T04:17:22.081Z

Attempting to build glib-2.69.3

Author: Chris Johns 2024-05-14T04:17:22.081Z

I wonder if `glib` wants PCRE, ie 8.45 (or something), and not PCRE2?

Author: Amar Takhar 2024-05-14T04:17:22.081Z

glib stable is at 2.80 any reason to build an old version like that? Might be why it's failing certainly why it's looking for an old ftp.

Author: Chris Johns 2024-05-14T04:17:22.081Z

Ah thanks and no reason other than scanning the list of files and getting the wrong one. I will take a look.

Author: Chris Johns 2024-05-14T04:17:22.081Z

@amar The `glib` site says 2.81.0 (https://docs.gtk.org/glib/) but I cannot find it in the Releases on their gitlab site. I have paged through a lot of dot releases and got bored?

Author: Amar Takhar 2024-05-14T04:17:22.081Z

I think that is the version of the documentation which is probably HEAD. 2.81 isn't released yet:

- https://gitlab.gnome.org/GNOME/glib/-/releases

Author: Chris Johns 2024-05-14T04:17:22.081Z

Using 2.80.2 has sorted this issue. Thanks.

Author: Chris Johns 2024-05-14T04:42:02.723Z

Fixed the RSB `pkg-config` to support `--modversion` so `meson` is happy however there is a new issue with `glib`:

```
Found pkg-config: YES (/opt/work/chris/rtems/rsb/rtems-source-builder.
↪git/source-builder/pkg-config) version: 1.2.3
Run-time dependency libpcre2-8 found: YES 10.43

meson.build:2214:0: ERROR: Subproject exists but has no meson.build␣
↪file.
```

Author: Amar Takhar 2024-05-14T04:42:02.723Z

Do you have any build artifacts around? That error can happen from previous builds/downloads that have failed.

Author: Amar Takhar 2024-05-14T04:42:02.723Z

Are you using the 'source code' or 'release tarball'?? Make sure you're using the release tarball it has all the submodules already.

- This: https://download.gnome.org/sources/glib/2.80/glib-2.80.2.tar.xz

Author: Chris Johns 2024-05-14T04:42:02.723Z

Ah OK. I took the source tarball.

Author: Amar Takhar 2024-05-14T04:42:02.723Z

Okay probably source of the error then they don't do a good job of making it clear you want the release tarball and not source.

Author: Chris Johns 2024-05-14T04:42:02.723Z

The released sources has resolved that issue

Author: Chris Johns 2024-05-14T04:52:24.733Z

The `glib` build has now moved onto fail with:

```
Dependency gvdb found: YES 0.0 (overridden)
Library m found: YES
Run-time dependency libffi found: YES 3.0.13
Run-time dependency zlib found: YES 1.3
Run-time dependency intl found: YES
Checking for function "ngettext" with dependency intl: YES
Checking for function "bind_textdomain_codeset" with dependency intl:␣
```

(continues on next page)

(continued from previous page)

```
↪YES
Checking for function "getxattr" : NO
Header "attr/xattr.h" has symbol "getxattr" : NO

meson.build:2318:4: ERROR: Problem encountered: No getxattr␣
↪implementation found in C library or libxattr
```

Author: Chris Johns 2024-05-14T04:52:24.733Z

I do not have:

```
pxattr-2.1.0                    Portable utility to work with file␣
↪extended attributes
```

installed. I do not like adding further dependencies into what we need.

Author: Amar Takhar 2024-05-14T04:52:24.733Z

You can pass `-Dxattr=false` To meson.

Author: Amar Takhar 2024-05-14T04:52:24.733Z

Actually the FreeBSD port may give you some ideas:

- https://github.com/freebsd/freebsd-ports/blob/main/devel/glib20/Makefile#L27

Author: Chris Johns 2024-05-14T04:52:24.733Z

Thanks, happy to borrow those options.

Author: Chris Johns 2024-05-15T02:47:29.135Z

Glib's `meson` support does not like the staging used by the RSB. The RSB builds and installs packages into an internal temporary work space (using `DESTDIR`) and those packages are referenced using `LDFLAGS` etc when building on top of earlier packages. This is mostly working expect when running `gio/glib-compile-resources`. This tool does a compile and link as it does not include the `LDFLAGS` or `LD`. The `LDFLAGS` are used else where by `meson` without an issue so it seems this is specific to this type of build target. In this case `iconv` is built however there is:

```
[986/1597] /opt/work/chris/rtems/rsb/rtems-source-builder.git/bare/
↪build/glib-2.80.2-x86_64-freebsd14.0-1/glib-2.80.2/_build/gio/glib-
↪compile-resources --compiler=clang --target=gio/tests/plugin-
↪resources.c --sourcedir=/opt/work/chris/rtems/rsb/rtems-source-
```

(continues on next page)

(continued from previous page)

```
↪builder.git/bare/build/glib-2.80.2-x86_64-freebsd14.0-1/glib-2.80.2/
↪gio/tests --internal --generate-source --c-name _g_plugin ../gio/
↪tests/test4.gresource.xml
FAILED: gio/tests/plugin-resources.c
/opt/work/chris/rtems/rsb/rtems-source-builder.git/bare/build/glib-2.80.
↪2-x86_64-freebsd14.0-1/glib-2.80.2/_build/gio/glib-compile-resources -
↪-compiler=clang --target=gio/tests/plugin-resources.c --sourcedir=/
↪opt/work/chris/rtems/rsb/rtems-source-builder.git/bare/build/glib-2.
↪80.2-x86_64-freebsd14.0-1/glib-2.80.2/gio/tests --internal --generate-

↪libglib-2.0.so.0: Undefined symbol "libiconv_open"
```

Author: Amar Takhar 2024-05-15T02:47:29.135Z

There's probably a different environment variable that's used to avoid pulling in the system libraries and use the internal ones. Not sure why it isn't adding the directories it may not be detecting them. Did you look at the FreeBSD Makefile to see what it does?

Author: Chris Johns 2024-05-15T02:47:29.135Z

It is a custom command so env handling would have to be in compiler as a child process.

While looking into the issue I notice the name `gio/tests/test4.gresource.xml` is a test so I checked `meson_options.txt` and found I could disable the tests. The build completes and `qemu` is now building.

Author: Chris Johns 2024-05-16T04:51:20.683Z

QEMU has built and install however the `iconv` shared library is not being installed:

```
$ /opt/work/rtems/qemu/bin/qemu-system-aarch64 --version
ld-elf.so.1: Shared object "libintl.so.9" not found, required by
↪"libgio-2.0.so.0"
```

The installed shared libraries are:

```
$ find /opt/work/rtems/qemu -name \\*.so
/opt/work/rtems/qemu/lib/libgirepository-2.0.so
/opt/work/rtems/qemu/lib/libgettextsrc.so
/opt/work/rtems/qemu/lib/libpixman-1.so
/opt/work/rtems/qemu/lib/libgthread-2.0.so
/opt/work/rtems/qemu/lib/libffi.so
/opt/work/rtems/qemu/lib/libasprintf.so
```

(continues on next page)

(continued from previous page)

```
/opt/work/rtems/qemu/lib/libintl.so
/opt/work/rtems/qemu/lib/libgettextsrc-0.18.3.so
/opt/work/rtems/qemu/lib/libgio-2.0.so
/opt/work/rtems/qemu/lib/libgettextlib-0.18.3.so
/opt/work/rtems/qemu/lib/libgettextlib.so
/opt/work/rtems/qemu/lib/libglib-2.0.so
/opt/work/rtems/qemu/lib/libgmodule-2.0.so
/opt/work/rtems/qemu/lib/libgobject-2.0.so
/opt/work/rtems/qemu/lib/libgettextpo.so
```

Author: Amar Takhar 2024-05-16T04:51:20.683Z

Is `libintl.so.9` actually there? What is the link pointing to?

Author: Chris Johns 2024-05-16T04:51:20.683Z

It is built as part of the vertical stack if not present. I am looking into where the problem could be. I think this is an RSB issue.

Author: Chris Johns 2024-05-16T04:51:20.683Z

Hmm is is not being built:

```
config: devel/libiconv-1.14-1.cfg
config: devel/gettext-0.18.3.1-1.cfg
package: gettext-0.18.3.1-x86_64-freebsd14.0-1
building: gettext-0.18.3.1-x86_64-freebsd14.0-1
```

The package is in the stack but not built. It is only built on Windows.

Author: Amar Takhar 2024-05-16T04:51:20.683Z

If it's not built how is there a `libintl.so`?? Is that being created somewhere else?

Author: Chris Johns 2024-05-16T04:51:20.683Z

I cleaned the build and install `${prefix}` path and it is now failing with:

```
ld-elf.so.1: Shared object "libpixman-1.so.0" not found, required by
↪"qemu-system-aarch64"
```

I cannot build pixman as static and adding `--static` to the qemu build gave me an error looking for `libxml2` which I have not looked into. The shared library `libpixman-1.so.0` is installed into `${prefix}/lib` however qemu does not know to search there.

Author: Chris Johns 2024-05-16T04:51:20.683Z

The RSB configures qemu with:

```
--extra-ldflags="-Wl,-rpath -Wl,/$SB_PREFIX_CLEAN/lib -L$SYSROOT/lib $
↪{VDE_LDFLAGS}"
```

to set the search path in the executable. I am not sure why this has broken?

Author: Amar Takhar 2024-05-16T04:51:20.683Z

How come `-rpath` is empty? That might be your problem.

Author: Chris Johns 2024-05-16T04:51:20.683Z

It should not be empty as `$SB_PREFIX_CLEAN` is a clean version of the `$prefix` which is `/opt/work/rtems/qemu`? These options are (should be?) passed to `cc` which calls the `ld` with `-rpath /opt/work/rtems/qemu/lib`. The build system is `meson` and a `make` wraper which is calling ninja. I am not yet sure how to get a verbose option into that path.

Building with the path hard coded to the prefix:

```
--extra-ldflags="-Wl,-rpath -Wl,/opt/work/rtems/qemu/lib"
```

results in:

```
$ readelf -d /opt/work/rtems/qemu/bin/qemu-system-aarch64 | grep RUNPATH
$
```

If I change the path to something else:

```
--extra-ldflags="-Wl,-rpath -Wl,/chris/lib"
```

I get:

```
$ readelf -d /opt/work/rtems/qemu/bin/qemu-system-aarch64 | grep RUNPATH
0x000000000000001d RUNPATH              Library runpath: [/chris/lib]
$
```

Something must be touching these options if the path is based on the `$prefix` is not being set. The linker does not know about prefixing.

Author: Chris Johns 2024-05-16T04:51:20.683Z

And to prove there must be a simple pattern match I have made the path `/$SB_PREFIX_CLEAN/lib/../lib` and it works:

```
$ readelf -d /opt/work/rtems/qemu/bin/qemu-system-aarch64 | grep RUNPATH
0x000000000000001d RUNPATH              Library runpath: [/opt/work/
↪rtems/qemu/lib/../lib]
```

Weird

Author: Chris Johns 2024-05-16T04:51:20.683Z

I think reason `libintl.so.9` was not found by `libgio-2.0.so.0` is `gio` is not built with a suitable `-rpath` option. I guess the `rpath` needs to be set for all packages in the vertical stack?

Author: Amar Takhar 2024-05-16T04:51:20.683Z

Oh sorry I was confused by the separate use of -Wl I usually use -Wl,-rpath=<path>

Yes it might need to be set for all of them but your find only showed the *.so files was libintl.so.9 actually there or another version?

Author: Chris Johns 2024-05-16T04:51:20.683Z

I am reluctant to change `-rpath /a/b` to `-rpath=/a/b` given it has been working for years.

Yes that library is installed but it is not found by `gpio`.

Also using `/$SB_PREFIX_CLEAN/lib/` works as an `-rpath`.

Author: Chris Johns 2024-05-16T04:51:20.683Z

I have added `-rpath` to the packages in the stack and it works:

```
$ /opt/work/rtems/qemu/bin/qemu-system-aarch64  --version
QEMU emulator version 5.1.91
Copyright (c) 2003-2020 Fabrice Bellard and the QEMU Project developers
```

@amar thanks for your help and feedback, it has saved my sanity.

Author: Amar Takhar 2024-05-16T04:51:20.683Z

hah no problem I deal with this sort of thing a _lot_.

Also the only reason I use rpath=<path> is to make sure the path always sticks with the argument. I've had that not be the case but that was a long time ago.

Author: Chris Johns 2024-05-16T04:51:20.683Z

I agree on using = but I think the GNU doco was separate at the time but I cannot remember.

Author: Amar Takhar 2024-05-16T04:51:20.683Z

I think it was a bug in automake this was a really long time ago I'm sure it's not an issue anymore but who knows..

Commit	f279f357e61e2e4ab56eef4c718d45c0f7cdd652

Summary

As noted in issue rtems/tools/rtems-source-builder#29, the build fails when run on a fresh toolchain. This occurs for 2 reasons:

1. The directory to which the script is to be installed does not exist (this only happens if this is the _first_ toolchain being built to that prefix).
2. `arch-rtems6-gcc` has not yet been installed, due to which one of the macros is left defined wrong. This is a result of not testing on a completely fresh toolchain after altering the order of some files in !35

To circumvent these errors, two checks have been added:

1. A check to see if the install path exists first, which if not, will be created and the script (`stdcxx.py`) will be placed there.
2. The `gcc_version` macro is used as backup if the toolchain's GCC is not yet built (in the case of fresh builds)

mentioned in issue #29

Author: Amar Takhar 2024-08-20T17:18:04.172Z

Can you add "Closes #29" to your commit message body without the quotes this way it will close and reference the ticket when merged thanks.

Chris is the best person to review this MR.

Author: Suraj Kumar 2024-08-20T17:18:04.172Z

Done, and agreed

Author: Amar Takhar 2024-08-20T17:18:04.172Z

This needs to be done in the commit message via git not the MR. Also please remove the [PATCH] as it is not needed thank you.

Author: Suraj Kumar 2024-08-20T17:18:04.172Z

@amar Do you mean something like that? I always added it to the MR body since it would mention "Closes #29 " in the `Merge details` section as well

Author: Amar Takhar 2024-08-20T17:18:04.172Z

Yes that's correct thanks. The Merge details only takes the commit message when first created but it doesn't run any of the commit triggers those only get activated via the commit message since there are other ways to put code into the repository.

Author: Suraj Kumar 2024-08-20T17:18:04.172Z

Ohh wow, I will keep this in mind, thank you. Git is beautiful

resolved all threads

Author: Suraj Kumar 2024-08-20T03:09:53.479Z

Another (messier) but working alternative might be to still place everything inside `gcc-common-1.cfg` but with the added check from `rtems-gcc-13.3-newlib-head.cfg`, without any includes to other files (which seems to be causing some kind of ordering issue?)

Author: Suraj Kumar 2024-08-20T04:12:39.482Z

I think `rtems-install-stdcxx.cfg` is being run by the RSB before it has a chance to get included at the right time (via `gcc-common-1.cfg`). I tried to circumvent this by defining a variable like

```
%define gcc_installed %(if [ -x %{_bindir}/%{_target}-gcc ]; then echo 1; else echo 0; fi)
```

and then placing the rest of the script under this condition, i.e, the first time being run by the RSB it would not run, and we can define it inside the check within

`gcc-common-1.cfg` (`gcc_pre_install`) before including `rtems-install-stdcxx.cfg` and it should have worked but didn't. Please let me know if this can be an approach as well

Author: Suraj Kumar 2024-08-20T04:26:26.125Z

Another method could be to place something like this instead:

```
- %define rsb_rtems_gcc_version %( %{_bindir}/%{_target}-gcc --version␣
↪| head -1 | awk '{print $3}' )
+ %define rsb_rtems_gcc_version %( \\
+  if [ -x %{_bindir}/%{_target}-gcc ]; then \\
+    %{_bindir}/%{_target}-gcc --version | head -1 | awk '{print $3}'; \
↪\
+  else \\
+    echo "'@RSB_GCC_VERSION@'"; \\
+  fi \\
+)
```

This way, even if things go wrong (which they should not, since by the 2nd time this script is included from `gcc-common-1.cfg`, GCC will have been built), we can add a check within `stdcxx-template.py` like such:

```
if gcc_version == "@RSB_GCC_VERSION@":
# something went wrong when building with GCC
gdb.execute("return")
```

This way, we need not refer to the `gcc_version` macro and can safely proceed with our own defined one.

I think this might be a clean approach. Please let me know your thoughts

Author: Frank Kuehndel 2024-08-23T21:43:10.519Z

I am a bit unsure about the approach with checking the GCC version by calling `sparc-rtems6-gcc`. What do you really know about the `sparc-rtems6-gcc` you are calling? Is it an old gcc from a different run of a different RSB? Is it installed by the current RSB? Is the current RSB run going to overwrite the gcc you called (by a one being of a different version)?

Moreover, in bug report #29 it called an installed gcc:

```
/opt/rtems/6/bin/sparc-rtems6-gcc
```

but RSB has options to for example build only packages and to install nothing at all.

Author: Chris Johns 2024-08-23T21:43:10.519Z

We need the internal gcc version and not the RSB version. To do this we need to ask the newly built gcc (`xgcc`). The file should be placed into the staging area. The staging area is tar'ed or copied to the prefix. I hope this helps explain the task.

Author: Suraj Kumar 2024-08-23T21:43:10.519Z

It calls the GCC specific to the architecture currently being built. I have also added a check now such that if GCC is not built as part of the toolchain, it will add a specific string which will be checked for in `stdcxx.py`, which lets it know GCC was not available during building hence GCC features (such as pretty-printing) would not be available.

And to answer your question on which GCC it will use, the script is now such that it will build the current GCC first (if build is enabled), then run it to find out the version

Author: Chris Johns 2024-08-23T21:43:10.519Z

Please install into the `DESTDIR`. That should clean up the writing on no install builds

Author: Frank Kuehndel 2024-08-23T14:58:08.056Z

1. You do not need to check whether the directory exist. `mkdir -p` will not fail if it exist.
2. RSB has options not to install anything (e.g. to only build packages). Does `mkdir -p %{stdcxx_script_path}` create something on the users machine even if RSB is told to install nothing?

Author: Suraj Kumar 2024-08-23T14:58:08.056Z

Hmm, I don't suppose that option is enabled. I am not sure about that but I suppose it might need to be added as another check? @chris What do you think?

Author: Chris Johns 2024-08-23T14:58:08.056Z

If ``-p``is portable it is a nice solution.

Author: Chris Johns 2024-08-23T14:58:08.056Z

The path should be prefixed with `$DESTDIR`

Author: Frank Kuehndel 2024-08-23T14:58:08.056Z

Oh, it did not consider whether `-p` is portable. Good point. Its part of POSIX.1-2008 at least.

Author: Chris Johns 2024-08-23T14:58:08.056Z

@frank_k thanks for checking

Author: Suraj Kumar 2024-08-21T12:49:55.150Z

changed this line in version 3 of the diff

Author: Chris Johns 2024-08-23T21:43:27.651Z

I have taken a closer look and the RSB config parse needs a change to support what we want. The issue is the `%install` directive is not passed into the include file processing so the context of the included file is lost which causes the command we want to not be in the right spot in the include processing.

Author: Chris Johns 2024-08-23T21:43:27.651Z

With !49 and the following patch I can build a tool chain for `aarch64` with `--no-install` and `--bet-tar-file`. The patch is:

Commit	1842d15b60141cccdbbc08c6d80d261ab48a87e8

Summary

source-builder: Set default for force_package_build

This variable is missing outside of simhost builds. This adds a default to prevent failures outside that environment.

Closes #66

Commit	e52d2288c8a0df64466010839ca1eb40c6d243ed

Summary

expat: disable docbook to avoid man page generation error

The error occurs when building with the `docbook-utils` package installed on Ubuntu. Disabling docbook prevents the man page for `xmlwf` from being created.

Fixes #44.

3.14.2.27 32 - rsb(rtems-build-dep): handle multiple library paths

Id	32
State	merged
Merged by	Kinsey Moore

Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/32
Commit	eda555d1d75f24fd816090e352f77f668ef02437

Summary

The script `rtems-build-dep` might fail to find a library if multiple `-L path` arguments are passed.

The argument parser only keeps the last library path provided:

```
# source-builder/sb/rtems-build-dep
libraries="$2"; shift;
shift;;
```

Take the following example. We are trying to find `libpython3.so`, which can be found on /usr/lib:

```
$ rtems-build-dep -c gcc -L /usr/lib -l libpython3.so # this works because we only pass -L once

  found

  $ rtems-build-dep -c gcc -L /tmp/ -L /usr/lib -l libpython3.so # this also works because /usr/lib is the last path provided

    found

    $ rtems-build-dep -c gcc -L /usr/lib -L /tmp/ -l libpython3.so # this fails because /usr/lib is discarded

      not-found

  I've made a change to handle multiple library paths in the same fashion multiple include directories are handled.

  --

  I don't know the implications of this change. So far, I've managed to build the ``6/rtems-arm`` bset successfully using this changes.
```

3.14.2.28 50 - Use 4.11 branch for rtems-tools automake patch URL

Id	50
State	merged
Merged by	Chris Johns

Commit	6b76c4c7baa6557a068f2082a15bf5cdf410671a

Summary

Use 4.11 branch for rtems-tools automake patch URL

The automake-1.12.6-bugzilla.redhat.com-1239379.diff patch used for the 4.11 toolchain does not exist in the “5” branch in the rtems-tools repository, but does exist in the “4.11” branch, so change the URL used to get rtems-tools files to use the “4.11” branch instead.

This should resolve errors like this in the build:

```

changed the description

Author: Chris Johns 2024-10-25T21:07:14.390Z

Why use the bare/config/devel/automake-1.12.6-1.cfg from the [5](https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/tree/5?ref_type=heads) branch of the RSB?

Author: Martin Werner 2024-10-25T21:07:14.390Z

I'm assuming there's a "not" missing in that question? Since at the moment it does not use a copy of that file.

The diff between them contains quite a bit more, of which I assume quite a bit is rtems-specific and cannot be replaced wholesale:

```
$ git diff origin/4.11:rtems/config/tools/rtems-automake-1.12.6-1.cfg␣
↪origin/5:bare/config/devel/automake-1.12.6-1.cfg

```

But I guess it might make sense to use the same tracmigration url (and the nicer sh256 checksum) from that file into the 4.11 branch, if that's what you mean?: https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/assets/tracmigration/ticket_attachments/automake-1.12.6-bugzilla.redhat.com-1239379.diff

Using the tracmigration url solves the build issue similarly for me as far as I can tell.

Would it still make sense to update %{rtems_git_tools} to point at 4.11 instead of 5?

Author: Kinsey Moore 2024-10-25T21:07:14.390Z

@chris I've updated the patch set to resolve related issues. Could you could give this a once-over to see if this thread is now resolvable?

Author: Kinsey Moore 2024-10-25T21:07:14.390Z

Just FYI, I ran through all of the toolchain builds and QEMU and this patchset now resolves all download errors, but several toolchains were not compilable because my native toolchain was too new and threw errors about certain syntax no longer being allowed in C++17.

I have fixed `sb-rtems-pkg` to handle submodules so `rtems-net-services``will pick up the updated ``rtems_waf`. I have tested it with the `rtems-deployment` change got AMD K26.

Commit	8fc070bc4a6b4382e4fefbe5872aebb009f976e9

Summary

On Windows there is a workaround to handle the drive letter in the prefix that needs to be picked up when installing rtems-tools.

Commit	4cf0f0c6fa7e33e9fed6961ccc27e2d8fc051e7d

Summary

dtc: do not attempt to build on windows

fixes #25, #36

Author: Gedare Bloom 2024-10-10T04:44:12.823Z

assigned to @chris

Author: Gedare Bloom 2024-10-10T04:48:53.453Z

I confirmed the build still runs on linux (ubuntu).

Author: Chris Johns 2024-10-18T21:09:10.626Z

This should be indented but I get why you have not.

Would it be nicer and simpler to have the RSB **_finish_** the config processing?

Author: Gedare Bloom 2024-10-18T21:09:10.626Z

“nicer and simpler” in what way?

I’m not sure what action has to be taken to close out a partial configuration.

Author: Chris Johns 2024-10-18T21:09:10.626Z

Would adding a new command to the config processing to %``finish`` be cleaner for this type of solution?

Author: Gedare Bloom 2024-10-18T21:09:10.626Z

Having a generic way to terminate a config would be cleaner, but, we don’t have that functionality at the moment unless I’m missing something. It would be some work to add a new feature if that is what you are suggesting.

Currently this dtc config blocks building on Windows.

Commit	d2f00ca6c06f0f5c78eab1128121e9c58fba0443

Add support to build `civetweb` as a package.

Note:

1. The thread type and thread stack size is currently hard coded and not part of the configuration.
2. I have created Github PR rtems: Add support for RTEMS for the patch in my repo.
3. Only tested with libbsd.

Commit	7aec6d55b060f89a35608cc8d9dbb374f333f7b3

Summary

Issue #5101

The NIOS V/g processor with FPU enabled needs the rv32imf risc-v architecture. This patch adds that support.

Author: Joel Sherrill 2024-08-15T00:39:26.925Z

It is probably not well documented but the patch should be somewhere other than the RSB. They usually are just attached to the RTEMS issue and the URL referenced here.

Even better would be to submit it upstream and we get it out of their mailing list or git history.

In this case, attach the patch to this issue.

Author: Kevin Kirspel 2024-08-15T00:39:26.925Z

The patch was emailed to gcc-patches. When incorporated, RSB could be updated to use that gcc version.

Author: Kevin Kirspel 2024-08-15T00:36:49.151Z

changed this line in version 3 of the diff

Author: Kevin Kirspel 2024-08-15T00:39:26.925Z

patch has been moved to an attachment in Issue #5101 and referenced from there for downloading to RSB.

Author: Joel Sherrill 2024-08-15T00:40:11.164Z

Please email this to gcc-patches@gcc.gnu.org and cc me. I will then be able to shepherd it to getting merged.

Author: Kevin Kirspel 2024-08-15T00:40:11.164Z

Any special subject and wording in the email?

Author: Kevin Kirspel 2024-08-15T00:40:11.164Z

I plan on putting this in the subject:

[PATCH] t-rtems: add rv32imf architecture to the RTEMS multilib for RISC-V

Author: Kevin Kirspel 2024-08-15T00:40:11.164Z

I sent the email. I will see what happens.

Author: Kevin Kirspel 2024-08-15T00:40:11.164Z

Patch is visible on the gcc-patches mailing list (Aug 7th). No comments so far.

Author: Joel Sherrill 2024-08-15T00:40:11.164Z

Thank you.

Author: Chris Johns 2024-08-15T00:40:11.164Z

This directory is not allowed in the repo.

Author: Amar Takhar 2024-08-15T00:40:11.164Z

@chris then should he create an issue to attach the patch for now?

Author: Amar Takhar 2024-08-15T00:40:11.164Z

Nevermind I see you have answered this.

Author: Chris Johns 2024-08-15T00:40:11.164Z

Only to reference the patch.

Author: Kevin Kirspel 2024-08-15T00:40:11.164Z

Just for my knowledge, patch files do not go in the repo (i.e. source-builder/patches)? What is the purpose of the "source-builder/patches" repo directory?

Secondly, if I have a patch file locally, how should I reference the patch file? My initial assumption was that I would reference it in "rtems/config/tools/rtems-gcc-13.3-newlib-head.cfg" but apparently that is not correct.

Author: Kevin Kirspel 2024-08-15T00:36:51.244Z

changed this line in version 3 of the diff

Author: Kevin Kirspel 2024-08-15T00:40:11.164Z

patch has been moved to an attachment in Issue #5101 and removed from this directory.

Author: Joel Sherrill 2024-08-12T14:34:39.692Z

resolved all threads

Author: Chris Johns 2024-08-23T14:08:13.790Z

The patch handling is not right. The source and patch directories should be added to the repo.

Please attach the patch to an issue or reference and get the RSB to download it. A further change can be made once merged into GCC we.

Author: Kevin Kirspel 2024-08-23T14:08:13.790Z

I attached the patch file to the issue I created for all the merge requests related to the NIOS V BSP. Issue #5101.

Author: Kevin Kirspel 2024-08-23T14:08:13.790Z

The patch I sent to gcc-patches is now merged on the trunk.

Author: Chris Johns 2024-08-14T06:04:04.897Z

marked this merge request as **draft**

Author: Chris Johns 2024-08-14T06:04:31.778Z

Marked as draft until the patch location is resolved.

Author: Chris Johns 2024-08-14T06:05:04.215Z

Commit	632ccda714fdba59c39bb126cf417f2b101c8929

Summary

The current implementation of auto-loading pretty-printers in GDB depends on a script, `stdcxx.py` to register the pretty-printers provided by GCC. The path to these scripts changes with every evolving version of GCC, and hence the `gcc_version` variable used in `stdcxx.py` would need updating with every new build.

3.14.2.47.1.1 Solution

Modify the `gcc-common-1.cfg` script in `source-builder/config` to:

1. Find the current GCC version according to the target being built
2. Add some instructions to resolve paths to the template script present in `rtems/config`
3. Use that to install `stdcxx.py` with the correct GCC version in `gdb/python/rtems` in the build target directory

Closes rtems/tools/rtems-tools#5

Author: Suraj Kumar 2024-07-10T18:44:26.288Z

changed the description

(Commented, of course)

Author: Christian Mauderer 2024-07-12T06:31:47.164Z

Yes. But with your copyright instead of Chris Johns'.

Author: Suraj Kumar 2024-07-12T06:31:47.164Z

Okay, I have added the license header. Please let me know if that is fine.

Author: Christian Mauderer 2024-07-12T06:31:47.164Z

Looks good. Thanks.

Author: Christian Mauderer 2024-07-11T05:20:27.849Z

Just to understand these lines:

- `gdb_path` is something like `${PREFIX}/share/gdb/python`, right?
- Then your `gcc_python_path` is something like `${PREFIX}/share/gcc-13.2.1/python`, right?

Author: Suraj Kumar 2024-07-11T05:20:27.849Z

Bingo. Is it clear enough from the name or could the file use some comments?

Author: Christian Mauderer 2024-07-11T05:20:27.849Z

That's OK. I just wanted to make sure that I understand it correctly.

Author: Christian Mauderer 2024-07-11T05:19:23.952Z

Shouldn't we have a %{gcc_version} already? @chris: You know the source builder a lot better.

Author: Suraj Kumar 2024-07-11T05:19:23.952Z

I had talked about this with Chris here, please check out this thread when you find the time: https://gitlab.rtems.org/rtems/tools/rtems-tools/-/issues/5#note_108895

Chris had said:

> Would it end up being confusing? How would know which value the variable holds? Remember the gcc version internal to gcc may not match the version in the macro `gcc_version`. For example we could have a git hash build of the gcc 13 branch. This work needs to know the internal value to find the path gcc will look.
>
> So, I resorted to finding the actual version from the target's GCC compiler itself. Hope that it clear.

Author: Christian Mauderer 2024-07-11T05:19:23.952Z

OK. Thanks for the explanation.

Author: Suraj Kumar 2024-08-13T14:13:55.893Z

resolved all threads

Author: Chris Johns 2024-08-18T06:24:14.862Z

This is looking good.

I think the next step is see if we can find a suitable trick to move this out here and into the RTEMS area. It may not be possible, I am not sure how to do this.

The issue is this file is used in `bare` configs and they do not depend on RTEMS.

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

@chris I had pinged you about this on Discord, but I am not sure what you meant by:

> I think the next step is see if we can find a suitable trick to move this out here and into the RTEMS area. It may not be possible, I am not sure how to do this. The issue is this file is used in `bare` configs and they do not depend on RTEMS.
>
> Are you referring to the modifications or the `stdcxx.py` being installed or ... ? I was not too sure. Please clarify this whenever you find the time. Thank you.

Author: Chris Johns 2024-08-18T06:24:14.862Z

The change is specific to building `gcc` for RTEMS and `gcc-common-1.cfg` is used by the `bare` builds which include `gcc`. This change needs to somehow be moved to just the `rtems` configurations.

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

Okay, I see. So would that mean having some kind of check in here to see if the target is a `bare` GCC or moving it out to some other file itself?

Author: Chris Johns 2024-08-18T06:24:14.862Z

That is a solution. Another is to place a macro label there such a `%{gcc-pre-install}` and that is defined in a file in `config/rtems/tools` and included is included in an RTEMS tools gcc config?

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

Yeah sure, that would work too. I assume that including files will have the variables/macros from the file including it too (?) so that would make for a more modular approach.

I think we can have a file, say `rtems-gcc-preinstall.cfg`, under `rtems/config/tools`, which can have the same changes as my commit, and then have a check like so:

```
%if %{_target} =~ ".*-rtems.*"
%include %{_configdir}/rtems/tools/gcc-pre-install.cfg
%endif
```

How does that sound?

Author: Chris Johns 2024-08-18T06:24:14.862Z

Would a simpler approach work? In `gcc-common-1.cfg` have:

```
%if %(defined gcc-pre-installer}
%{gcc-pre-installer}
%endif
```

Where you want it to execute the include. Then add in the RTEMS configs something like:

```
%define gcc-pre-installer %include %{_configdir}/rtems/tools/gcc-pre-
↪install.cfg
```

I think should work but if not let me know.

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

Okay I got what you meant, I will check out this solution and get back to you. Thanks

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

@chris I had pinged you on Discord regarding this, but I take it you are buried with a lot of work

I think I have a working solution, but I am just not sure which file I can add this definition to such that it would be defined before this script is called? I tried looking at the trace output when dry running building the RSB to see which files are executed

in which order but that did not give me much direction. Could you help me out with this please?

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

@chris I am not sure if this what you had in mind, but here's something:

in `rtems-base.bset` (`{prefix}/rsb/rtems/config`), we can add the following line:

```
%define rtems_build 1
```

The extra code I initially added to `gcc-common-1.cfg` can be moved over to `{prefix}/rtems/tools/gcc-pre-install.cfg` , and this line can be added to `gcc-common-1.cfg`:

```
%define gcc_pre_installer %include %{_configdir}/rtems/tools/gcc-pre-
↪install.cfg
```

Then, in `gcc-common-1.cfg`, we can add:

```
%if %{defined rtems_build}
%{gcc_pre_installer}
%endif
```

How does this sound? Please let me know

Author: Chris Johns 2024-08-18T06:24:14.862Z

Where does ``gcc-pre-install.cfg``get included?

I would include it in rtems/config/tools/rtems-gcc-13.3-newlib-head.cfg and then you should not need `rtems_build` because it is an RTEMS build. The define check in `gcc-common-1.cfg` can be macro name.

Also the name of the file can be what it does and not the name of macro if that helps make things clearer?

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

`gcc_pre_installer` is defined as `%include %{_configdir}/rtems/tools/gcc-pre-install.cfg`, which would handle the include after the check.

I thought about adding it in `rtems-gcc-13.3-newlib-head.cfg` as well, but wouldn't that make it version dependent? (Or at least I think so)

Yep sure, I'll change the filename to reflect what it does, I was just wondering about the version update part fo the change. If that is not an issue then we can consider this issue as solved. :)

Author: Chris Johns 2024-08-18T06:24:14.862Z

It will only work on that version and later which will be based on the 13.3 version as a copy and change.

Author: Suraj Kumar 2024-08-18T06:24:14.862Z

Oh I see, so it acts as a copy + paste + edits from the older versions?

Alright, I will modify my environment as such and test. Will keep you posted on the progress. Thank you

Fixed

Author: Chris Johns 2024-08-18T06:23:33.899Z

This will not work. You should not assume any order in that path or even need to parse it.

Why explicitly provide the path? The `%include` directive should search `%_confdir`?

I would have thought something like:

```
%define gcc_pre_install %include tools/rtems-install-stdcxx.cfg
```

should work?

Author: Suraj Kumar 2024-08-18T06:23:33.899Z

The thing is, I need a path specifically to `rsb/rtems/config/stdcxx-template.py`, in order to be able to cat it and filter it through `sed`.

If I try doing the following:

```
%define stdcxx_template %{_configdir}/stdcxx-template.py
```

It appends `stdcxx-template.py` to each path in the macro, and it is not in a form which I can `cat` (since it is 4 paths). This is why I decided to define a separate macro for it. I hope I was able to convey the problem clearly enough?

Your solution will work for the rest of the issues I think, since it is only a matter of including the files - but it is not working for the case of running `cat` on `stdcxx-template.py`. Would another approach be to grep the pattern of `rtems/config` instead of assuming a specific ordering within `_configdir`? Please do let me know.

Commit	337ba081e74d8f5d57608af9178f74ec4f4796d3

Summary

Migrate devel links to gitlab

I did the best I could, but there were still some issues on my local machine. This needs to be thoroughly checked by someone familiar with it, especially since sb-get-sources in this version does not have the error flag.

Commit	05179d3cc8a26975f9b5e3d95797117069faeab1

This MR fixes:

1. Fix `_dry_run` macro support
2. Fix the default version in `bare/devel/expat-internal`
3. Add MPFR support for RTEMS 7

4. Remove support for `gcc-4.9` because the default build config contains GCC git patches and these break everytime GNU GCC upgrades their version of git

The issue #11 details the work.

Commit	571791cfe50c74ff306b2aa9aa9cd36972800864

Summary

windows.py: Disable chmod on Cygwin

The command chmod as invoked by the RSB has begun to fail on Cygwin. It was determined that doing a chmod is not necessary. This disabling it was seen as a solution.

Closes #22.

Author: Chris Johns 2024-07-09T20:49:01.571Z

The macro is __setup_post so I am confused how this change helps?

Author: Joel Sherrill 2024-07-09T20:49:01.571Z

Summary

rtems-gcc-13.3-newlib-head.cfg: Update hash to 1339af4

This picked up the following patches of interest to RTEMS:

- sys/tree.h: Remove from rtems includes
- sys/resource.h: Add RUSAGE_THREAD

Closes #24.

Author: Amar Takhar 2024-07-15T19:21:45.453Z

Question .. What was the point of opening #24?

The MR has more detail and the issue is just a title and the summary says to read the title. I went and looked over the issue expecting more details but it was just a waste of time since the details are here.

You can skip opening the issue if there aren't going to be more details there it saves everyone time and it's easier to search as you don't have to look in 2 places.

Author: Joel Sherrill 2024-07-15T20:46:54.390Z

To have an issue for the MR. No more. No less.

Author: Amar Takhar 2024-07-15T20:46:54.390Z

Okay.

Summary

rtems/6: Update MicroBlaze GCC to 12

GCC 10 fails to build.

Closes #23.

Author: Chris Johns 2024-07-16T22:30:30.957Z

approved this merge request

Author: Sebastian Huber 2024-07-19T06:33:32.248Z

I get build errors on microblaze:

```
1 /home/EB/sebastian_h/src/rtems/cpukit/libcsupport/src/getrusage.c: In␣
  ↪function 'getrusage':
2 /home/EB/sebastian_h/src/rtems/cpukit/libcsupport/src/getrusage.
  ↪c:113:8: error: 'RUSAGE_THREAD' undeclared (first use in this␣
  ↪function); did you mean 'SIGEV_THREAD'?
```

(continues on next page)

(continued from previous page)

```
113 |   case RUSAGE_THREAD:
|        ^~~~~~~~~~~~~
|        SIGEV_THREAD
```

Maybe the Newlib version is not the right one.

Commit	d282a1723359dc689ca49fe6a7241423d0f10e97

Fix the handling of the hash in `sb-rtems-pkg`. The logic was confused of the tar file name was in another macro. Expand the macros and check for the package name.

Close #13

The final patch also addresses #4

Author: Kinsey Moore 2024-06-06T14:22:12.671Z

Also of note, I don't have a lot of the platforms that these patches affect, so I can't verify the download of patches for things like darwin.

Author: Chris Johns 2024-06-06T14:22:12.671Z

The `sb-get-source --stop-on-error` is your friend here. It will make sure all build sets and so all configurations are run through all possible host types. The `--stop-on-error` option is needed or you miss issues.

Note, delete the `sources` and `patches` directories before running or the RSB will see the cached files and assume they are all OK.

Author: Kinsey Moore 2024-06-06T14:22:12.671Z

I have updated the one hash that threw an error.

Author: Chris Johns 2024-06-06T00:50:46.658Z

marked this merge request as **draft**

Author: Chris Johns 2024-06-06T14:24:41.075Z

I suspect this change in this `.bset` file is not accessible in `.cfg` files so I wonder if this file is copied to `rtems-urls.cfg` and `rtems-urls.bset` includes the `.cfg` file? We may not need a `.bset` version if no extension is added to the include but I would need to check this to be certain.

Over time references to our git repos have been added to a number of config files. I am fine with the changes in this MR staying as they are and then a separate issue

added to clean up the build set and config files to have a single reference if that is too much for this change?

Author: Kinsey Moore 2024-06-06T14:24:41.075Z

I'd prefer the cleanup to happen in a different MR/issue. I definitely noticed that the defined URLs were not consistently used or available and were often redefined instead of pulling in the global set.

Author: Chris Johns 2024-06-06T01:07:05.678Z

@opticron awesome set of changes, thank you. I have made the MR draft until the `sb-get-sources` command has been run and completes. The https://gitlab.rtems.org/administration/integration/-/issues/6 issue will use this command to update the cache on ftp.rtems.org so it will be checked once we have the CI running.

Commit	484c7a4095fe8cebba0320b58bf9477f2f40b1b6

Update QEMU

This update allows QEMU to build on FreeBSD. The updates are:

- `sb/pkg-config`:
- Support `--version`. Meson uses `--version` to determine if `pkg-config` is valid.
- Supoort `--modversion`. Meson uses `--modversion` to determine the version of a library.
- Update `pixman` because it did not build
- Update `glib` because it did not build. This meant adding support for `meson`.
- Update `qemu` build to resolve shared libraries. For some reason `qemu` does not accept an `-rpath` that is `$prefix/lib`. The option seems to be removed. Add a trailing `/` to the path lets `qemu` keep the `-rpath` option and the executable can find the installed shared libraries.
- Add `-rpath` to all the packages in the vertical stack so any shared libraries loaded can find other shared libraries they depend on

Closes #2

Commit	5faa46ce70702afcef65afe180676a7d580f1243

Summary

Keep RTEMS up to date with the upstream development.

Author: Chris Johns 2024-05-07T07:35:46.183Z

Is the NIOS2 going to be 7?

Author: Sebastian Huber 2024-05-07T07:35:46.183Z

The nios2 target is still supported in GCC 14. If we ship RTEMS 7 with GCC 14, then I would say yes, with a later GCC no.

Author: Chris Johns 2024-05-07T07:35:46.183Z

We need to announce removal of an arch in 7 when we release 6. If we do not ship GCC 14 with 7 we could let the nios2 stay on GCC 14 for 7 and we announce it's removal?

Author: Sebastian Huber 2024-05-07T07:35:46.183Z

I am not sure why you rush for the nios2 removal. Currently it builds fine.

Author: Chris Johns 2024-05-07T07:35:46.183Z

We track GCC and this merge request **enables obsolete** architectures. That raises a warning to me.

We cannot just remove the BSP as we have a policy of tagging it for removal in one release for removal in the next. If we are not proactive in managing this we end up carrying dead architectures. We have a few now.

Author: Sebastian Huber 2024-05-07T07:35:46.183Z

The nios2 target is definitely not recommended for new designs. We can still support it on a best effort basis. Right now the tools are fine.

Commit	e7a135eff47226c0af01c429727c07129060ce67

Summary

Fix ncpu on FreeBSD so default jobs works.

We can use os.cpu_count() safely since we're on Python 3.

Author: Amar Takhar 2024-06-08T19:43:29.472Z

This actually works already for some reason and I'm unsure why as it was late GCC hung while building. Quickly using truss and ktrace didn't show anything this was on a FreeBSD 14 machine I've since upgraded to 14.1 and it works fine. If it happens again I will make a stronger effort in debugging.

Summary

Create a python script for updating the ACPICA code in the RTEMS codebase. The script will convert commits from the ACPICA tree to a patch that can be applied to the RTEMS codebase (as long as the ACPICA commit actually changes a file we have imported). This means the process of updating the ACPICA code would be as such:

- Check git log on the RTEMS source tree for the last ACPICA commit (All ACPICA commits should contain "ACPICA commit {hash}" in their message);
- Use the script to generate patches for the missing commits;
- Apply the commits to the RTEMS source tree;

Summary

This issue is for the development of a python script called `stdcxx.py` that lives under the installed prefix of the RTEMS built tools. The script is to load the GCC libstdc++ pretty printers.

3.15.1.2.1.1 Script Requirements

1. The script is called by the `.debug_gdb_scripts` python text when the executable loads
2. Determine the path to the GCC libstdc++ pretty printer scripts. These will installed and available however they are under the version of GCC built for the `$prefix`
3. There is only ever be one version of GCC installed under a `$prefix`
4. Inspect the GCC pretty printer scripts and determine what they require

3.15.1.2.1.2 Setting GCC Version

The installed `stdcxx.py` script is for one version of GCC that is installed then the script is installed. A `$prefix` for a build of tools is only for a single version. You should not mix versions under the same prefix. This includes versions of GCC for different architectures. As a result the last installed version of tools is the one we consider **_current_** or **_active_** and `stdcxx.py` so reference that version explicitly.

The GCC build uses the common configuration script and I recommend adding the support there in install section. The version however may not be the same version GCC considers itself. For example the version the RSB has could be a git hash while GCC will have a dot version number such as `1.2.3`. A suitable solution to this needs to be found. One possible method is to locate the architecture specific GCC command in the staging area such as `arm-rtems6-gcc` and to run the command with the `--version` option to get the version. For example:

```
$ arm-rtems6-gcc --version | grep arm-rtems6-gcc
arm-rtems6-gcc (GCC) 13.3.0 20240521 (RTEMS 6, RSB␣
↪d282a1723359dc689ca49fe6a7241423d0f10e97, Newlib 1ed1516)
```

This line could need to be split and the `13.3.0` extracted.

The RSB could contain a temple `stdcxx.py` script with the version set to `@RSB_GCC_VERSION@` and the script could be filter with the version tag being replaced by the detected GCC version and placed in the staging area. Once in the staging area the RSB will install it when the build successfully completes.

The RSB has the option `--keep` so the staging area can be keep and inspected and the `--dry-run` option is useful when debugging RSB configuration scripts. Another consideration is the RSB will preprocess the macros and external commands (`%()`) before the build starts while the `install:` section of the script will be added to the `do-build` script and that is run when the script runs.

changed the description

Author: Suraj Kumar 2024-06-11T06:25:09.834Z

@chris Question: the GCC path and and GDB path would both live under the `share` directory in the installed `$prefix`, so the GCC path would be relatively the same always from the path provided by `gdb.PYTHONDIR`. Could that be a possible solution to finding the location of the installed pretty-printer scripts?

Author: Chris Johns 2024-06-11T06:25:09.802Z

Yes but the version changes and that is independent of the RTEMS Tools repo (this repo). How do we find the right path and set it? We do not want to add a dependency that need to change each time we change the version of the tools.

Author: Suraj Kumar 2024-06-12T23:03:56.408Z

Does this work? @chris

```
import os
import subprocess
import sys
import re
import gdb

# get the objfile name
filename = gdb.objfiles()[0].filename

# get the arch of the objfile
output = subprocess.check_output(['file', filename]).strip().decode(
↪'utf-8')
arch = output.split(',')[1].lower().strip()
gcc = arch + "-rtems6-gcc"

# get path to GCC
gcc_path = subprocess.check_output(f"which {gcc}", shell=True).strip().
↪decode('utf-8')
gcc_path = gcc_path.split('/')[:-1]
gcc_path = '/'.join(gcc_path)

# get version of GCC
output = subprocess.check_output([gcc, '--version']).strip().decode(
↪'utf-8')

regex = r'gcc \\(GCC\\) ([\\d.]+)'
match = re.search(regex, output)
if match:
gcc_version = match.group(1)
else:
print(f"Could not find GCC version for {gcc}.")
exit()

gcc_full_path = gcc_path + "/../share/gcc-" + gcc_version

print(gcc_full_path)
```

Sourcing this from inside GDB seems to work well for me, though I would like to find a more reliable way to find the architecture perhaps... I was thinking of a way to do that for a while before "hacking" it like this. Let me know if this would be suitable

This is just POC script to confirm with you whether the design is fine or not, after

this importing would be pretty easy.

Author: Chris Johns 2024-06-12T23:39:57.255Z

Thanks for this. The scripts contains lots and maybe lots more than we need. Something to consider is the script will be installed when the tools are built by the RSB and the RSB should know the version of gcc or it can find it out and it also have all the files to be installed including the libstdcxx pretty printer scripts.

For now we know the gcc version is 13.3.0 so may just have this:

```
gcc_version = '13.3.0'
```

and then concentrate on figuring out how to load the C++ pretty printers and have them print a `std::vector`.

Author: Amar Takhar 2024-06-12T23:46:26.587Z

```
gcc_path.split('/')[:-1]
gcc_path = '/'.join(gcc_path)
```

Please use os.path.basename() for this so it works on all operating systems. Also use os.path.join() later on so we don't have to worry about path deliminators.

Author: Chris Johns 2024-06-11T06:17:49.731Z

moved from rtems-source-builder#10

Author: Chris Johns 2024-06-14T04:10:15.573Z

The existing python scripts installed by `rtems-tools` may need to be clean up for a `stdcxx.py` script to load. Please track those changes so we can update the `rtems-tools` repo

Author: Suraj Kumar 2024-06-14T04:10:15.573Z

The only modification I needed to make was commenting out this line from `__init__.py`:

```
_cmds = rtems.create()
```

which was causing the following error:

```
Traceback (most recent call last):
File "<string>", line 6, in <module>
File "/home/the.m3chanic/quick-start/rtems/6/share/gdb/python/rtems/__
↪init__.py", line 38, in <module>
```

(continues on next page)

(continued from previous page)

```
_cmds = rtems.create()
^^^^^^^^^^^^
AttributeError: partially initialized module 'rtems' has no attribute
↪'create' (most likely due to a circular import)
```

I created a new file called `stdcxx.py` as you had said, and added the following content to it:

```
import sys
import traceback
import gdb
import os

gdb_path = gdb.PYTHONDIR
gcc_version = "13.2.0"

gcc_path = os.path.dirname(os.path.dirname(gdb_path))
gcc_path = os.path.join(gcc_path, "gcc-" + gcc_version)
gcc_python_path = os.path.join(gcc_path, "python")

sys.path.insert(0, gcc_python_path)

try:
from libstdcxx.v6.printers import register_libstdcxx_printers
register_libstdcxx_printers(None)
print("Script executed successfully")
except Exception as e:
print(f"Exception during execution: {e}")
traceback.print_exc()
```

This script strangely gives 3 warnings (which do not affect pretty-printing output) from the `printers.py` file present in `{prefix}/share/gcc-13.2.0/python/libstdcxx/v6/printers.py`, where some regex patterns were not `r` prefixed, so I fixed those up.

Here is the program I tested this with:

```
#include <iostream>
#include <cstdlib>
#include <vector>

#define DEFINE_GDB_PY() \\
asm( \\
".pushsection \\".debug_gdb_scripts\\", \\"MS\\",@progbits,1\\n" \\
".byte 4\\n" \\
".ascii \\"gdb.inlined-script\\\\n\\"\\n" \\
".ascii \\"import sys\\\\n\\"\\n" \\
".ascii \\"import os.path\\\\n\\"\\n" \\
```

(continues on next page)

(continued from previous page)

```
".ascii \\"sys.path.append(os.path.join(gdb.PYTHONDIR, 'rtems'))\\\\n\\
↪"\\n" \\
".ascii \\"print(sys.path)\\\\n\\"\\n" \\
".ascii \\"print(gdb.PYTHONDIR)\\\\n\\"\\n" \\
".ascii \\"import rtems.stdcxx as stdcxx\\\\n\\"\\n" \\
".byte 0\\n" \\
".popsection\\n" \\
)

int main() {
DEFINE_GDB_PY();
std::cout << "Hello World" << std::endl;

auto v = std::vector<int>({1, 2, 3, 5, 7, 8});
for (auto i: v) {
std::cout << i << ' ';
}
std::cout << std::endl;

return 0;
}
```

Running with this configuration, and debugging in GDB gives me:

```
0x001046ac      67        for (auto i: v) {
(gdb) p v
$1 = std::vector of length 6, capacity 6 = {1, 2, 3, 5, 7, 8}
```

Please let me know if this is okay. We can find another way to find the GCC Path if the relative approach I am currently using might be unstable long-term.

Author: Chris Johns 2024-06-14T04:10:15.573Z

This looks good and on the right track. I will close this issue as done.

Author: Chris Johns 2024-06-14T04:10:59.686Z

The work for this issue is now complete.

@chris

Here are the modifications I have in mind for making this change. Please let me know if they are in line with what you have in mind as well

```
- gcc_version = "13.3.0"
+ gcc_version = "@RSB_GCC_VERSION@"
```

```
%define gcc_version %{_target}-%{rtems_version}-gcc --version | grep %{_
↪target}-%{rtems_version}-gcc | awk '{print $3}'

%define stdcxx_script stdcxx.py
%define gcc_install_dir lib/gcc/%{_target}/%{gcc_version}/python
```

```
sed "s/@RSB_GCC_VERSION@/${gcc_version}/g" %{stdcxx_script} > ${DESTDIR}
↪/%{gcc_install_dir}/%{stdcxx_script}
```

I am not very familiar with config script editing, so there might be silly mistakes. I just wanted to make sure we were both thinking the same thing(s) when it came to RSB modifications.

Author: Chris Johns 2024-07-07T22:19:41.022Z

This looks close to what is need. I am sure you will discover further detail that will need resolving. Some points aret:

1. Where is the location of `stdcxx.py` in the RSB?
2. The label `gcc_version` is being used so another macro name is needed
3. To execute a shell command in a config file wrap it in `%()`. The output to `stdout` is returned and assigned to the macro
4. You will need to locate the staged gcc executable. It will be under `%{build_dir}/$SB_BIULD_ROOT <https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/blob/main/source-builder/config/gcc-common-1.cfg?ref_type=heads#L220>`_ path after being installed
5. I always `cat a_file | sed -e 's/xxx/yyy/g' > ${build_dir}/$SB_BUILD_ROOT/share/gdb/what-ever/stdcxx.py` which using `sed` to filter a file
6. The `%{name}` macros are expanded when the config is processed by the RSB. The shell variables are only valid when the build is running in the shell

Author: Suraj Kumar 2024-07-08T22:20:46.054Z

@chris Thank you, I have gotten a better understanding of things from your comments.

1. I was thinking of having it in the `src/rsb/source-builder/sb` directory along with where the other Python files seem to be situated. I was wondering if something like `../sb/stdcxx.py` would work or if there is an OS-independent form of resolving this relative path?
2. Sure, fixed (Although, if it is already defined, is there anything stopping us from using that macro instead?)
3. Fixed
4. Okay, this made the idea a lot clearer to me, I have implemented it in my code.
5. Noted, fixed
6. Noted, thanks

Here are my updated modifications to `gcc-common-1.cfg`:

```
%define stdcxx_script stdcxx-template.py
%define gcc_install_dir %{build_dir}/$SB_BUILD_ROOT/bin
%define rtems_gcc_version %(%{gcc_install_dir}/%{_target}-%{rtems_
↪version}-gcc --version | head -1 | awk '{print $3}')
%define stdcxx_template_path ${build_top}/../sb/%{stdcxx_script}
```

```
cat %{stdcxx_template_path} | sed "s/@RSB_GCC_VERSION@/%{rtems_gcc_
↪version}/g" > %{build_dir}/$SB_BUILD_ROOT/share/gdb/python/rtems/
↪stdcxx.py
```

I hope this resolves the standing issues with the original version

Author: Chris Johns 2024-07-09T01:15:34.255Z

1. The support for gdb pretty printing is RTEMS specific so I think that should be under the `rtems/config` tree. The `gcc-common-1.cfg` is in the common area so I think the support eventually end up in the RTEMS side of things. I think we will have to progress to this point
2. Would it end up being confusing? How would know which value the variable holds? Remember the gcc version internal to gcc may not match the version in the macro `gcc_version`. For example we could have a git hash build of the gcc 13 branch. This work needs to know the internal value to find the path gcc will look.
3. The path `${build_top}` is not in the RSB source tree and you cannot assume the `build` is always in the RSB source. The `rtems-deployment` repo is example of extending the RSB configs. I think we need to find a way to get the path. I suggest using `--trace` and `--dry-run` and then reviewing the log and macro variables that are printed to see what is suitable

Author: Suraj Kumar 2024-07-09T17:16:51.067Z

@chris Thanks, I have made the required changes and debugged them with `--dry-run` and `--log` and see that they are the outputs that I would like. Here are the final set of changes:

```
%define rtems_configdir %(echo %{_configdir} | cut -d':' -f1)
%define stdcxx_template %{rtems_configdir}/stdcxx-template.py
%define rsb_rtems_gcc_version %(%{_bindir}/%{_target}-gcc --version |␣
↪head -1 | awk '{print $3}')
%define stdcxx_script %{_prefix}/share/gdb/python/rtems/stdcxx.py

cat %{stdcxx_template} | sed "s/@RSB_GCC_VERSION@/%{rsb_rtems_gcc_
↪version}/g" > %{stdcxx_script}
```

I found that `_configdir` was the directory pointing to `rtems/config`, but was 4 copies of the same path separated by ":", so `rtems_configdir` is a singular copy of that path.

For reference, the macros expand to the following on my system:

```
1. rtems_configdir - /home/the.m3chanic/quick-start/src/rsb/rtems/config
2. stdcxx_template - /home/the.m3chanic/quick-start/src/rsb/rtems/
↪config/stdcxx-template.py
3. stdcxx_script - /home/suslaptop/quick-start/rtems/6/share/gdb/python/
↪rtems/stdcxx.py
```

I think these would work well, I will do a test build in the meantime and verify everything works as it is supposed to.

[Edit: Just did a build on ARM, no build issues and the updated `stdcxx.py` script got placed there.]

3.15.1.3 4 - rtems-bin2c: Allow adding a license header

Id	4
State	closed
Type	ISSUE
Author	Christian Mauderer
Closed by	Chris Johns
Created	2024-06-03T13:50:56.532Z
Closed	2025-04-03T22:55:11.952Z
Updated	2025-09-19T01:03:40.476Z
Milestone	6.1
Labels	feature::request
Link	https://gitlab.rtems.org/rtems/tools/rtems-tools/-/work_items/4
Merges	2

Summary

3.15.1.3.1.1 Purpose

If files generated by rtems-bin2c are committed into a repository, there is no license information. It would be great if the tool would provide some options to add a license.

For an example, the device tree file in the i.MXRT BSP is processed with bin2c and the [resulting source file](https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/7141afbb0ea41675ef8cf7e60f398aaf900defd9/bsps/arm/imxrt/dts/imxrt1050-evkb.c) has been added as a C file to avoid the necessity for a working dtc on all platforms to build RTEMS. The C file is missing a license.

3.15.1.3.1.2 Result

There are multiple possible directions for a feature like that:

- Take an extra file that is prepended to the resulting file as a license header.
- Read the license comments from a file (same or different one to the file that is processed) and use that as a header.
- Provide only some RTEMS-relevant default license headers.

Author: Christian Mauderer 2024-06-03T13:54:47.066Z

mentioned in merge request rtems/rtos/rtems!35

Author: Joel Sherrill 2024-06-04T05:43:12.168Z

I would suggest that the default behavior is 2-BSD with an option to include another license file verbatim.

Author: Christian Mauderer 2024-06-04T05:43:12.132Z

That's the right one for RTEMS, yes.

Usually there is a copyright line with a name and year right before the license text. Would we just skip that in the default case?

I would also suggest to not make it default but use an option flag instead. There are most likely lots of use cases where rtems-bin2c is used already and where a different license applies. So something like:

```
-l <file> - Add the specified file as license header.
-B - Add a default BSD-2-clause license header. Can't be combined with -
↪l.
```

Author: Joel Sherrill 2024-06-04T21:59:41.864Z

Will not adding any arguments result in the current behavior? If so, then I am happy.

Author: Christian Mauderer 2024-06-05T05:54:48.493Z

I would strongly suggest that the default behavior (without an argument) should be the same as the current default behavior, yes.

Author: Gedare Bloom 2024-06-20T19:32:38.954Z

If the input has spdx, that should be simple enough to support?

Author: Joel Sherrill 2024-06-20T20:44:59.088Z

If the goal is to only pass through the SPDX annotation line. But that doesn't include author info.

It still may be a good option if not too much trouble to implement.

Merges	1

Summary

@chris I am testing my updated Rust documentation. When running the `rtems-tester`, I am getting a warning:

```
ferris@0fa931a464ca:~/example-rust$ rtems-run --rtems-bsp=rv64imafdc hello_rtems_
↪riscv.exe
/opt/rtems/6/share/rtems/tester/rt/pygdb/spark.py:122: SyntaxWarning: invalid␣
↪escape sequence '\\e'
_NULLABLE = '\\e_'
[...]
```

This happens in a newly build container with freshly cloned source-builder.git and rtems.git.

```
Ubuntu 24.04 LTS
Python 3.12.3
RTEMS version: 6.0.0.e74cea4172ee8564bef5f8500c5dd07512257d99
RTEMS tools: 13.2.1 20240502 (RTEMS 6, RSB␣
↪484c7a4095fe8cebba0320b58bf9477f2f40b1b6, Newlib 730703b)
```

The file seems to be in `rtems-tool.git`: `tester/rt/pygdb/spark.py`

Author: Frank Kuehndel 2024-05-22T17:55:50.868Z

The warning appears only when run for the first time. That is, one must delete the cache to re-produce it:

```
rm -rf /opt/rtems/6/share/rtems/tester/rt/pygdb/__pycache__/
```

Author: Amar Takhar 2024-05-22T18:38:58.428Z

Does adding an extra before e work? So it should look like `\e_.'`

Python 3.12 no longer allows as an escape sequence in strings

- https://docs.python.org/3/whatsnew/3.12.html#pep-701-syntactic-formalization-of-f-strings
- https://peps.python.org/pep-0701/

Author: Amar Takhar 2024-05-26T19:30:05.625Z

@frank_k did this suggested change fix the issue? I don't have rtems-tools running currently let me know thanks.

Author: Frank Kuehndel 2024-05-27T12:51:14.092Z

@amar When I manually changing this, I do not get any warning message anymore and `rtems-run` works as expected. Yet, I did not check the use of `_NULLABLE`.

```
$ diff /opt/rtems/6/share/rtems/tester/rt/pygdb/spark.py.ori /opt/rtems/
↪6/share/rtems/tester/rt/pygdb/spark.py
122c122
<       _NULLABLE = '\\e_'
---

  _NULLABLE = '\\\\e_'
```

Author: Amar Takhar 2024-05-27T20:23:10.862Z

Thanks.

@chris how would we test this to make sure this change works?

Author: Frank Kuehndel 2024-05-28T07:38:07.341Z

Python supports only known backslash escape sequences. Citing that page:

> Unlike Standard C, all unrecognized escape sequences are left in the string unchanged, i.e., _the backslash is left in the *result* (page 3573).
>
> From my point of view making the change suggested by @amar is safe as it will not change the behavior (a single backslash appears before and after the change in the string). Only the warning – and the error planed in future Python versions – goes away.

Milestone	6.1
Labels	tool::rtems-tools
Link	https://gitlab.rtems.org/rtems/tools/rtems-tools/-/work_items/17
Merges	1

Summary

There is a module missing from the RTEMS GDB C++ Pretty Printer support. Starting gdb results in:

```
Find the GDB manual and other documentation resources online at:
<http://www.gnu.org/software/gdb/documentation/>.

For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from build/arm-rtems6-xilinx_zynq_microzed/app/spu/spu...
RTEMS GDB Support
Python Exception <class 'ModuleNotFoundError'>: No module named 'rtems.pprinter'
(gdb)
```

This issue is set to the %6.1 milestone because it is fixing the support being documented by https://gitlab.rtems.org/rtems/rtos/rtems-release/-/merge_requests/9.

Steps to reproduce

Start an RTEMS gdb with an RTEMS executable.

Author: Chris Johns 2024-11-15T05:29:13.073Z

assigned to @chris

Author: Chris Johns 2024-11-15T06:14:00.357Z

The problem is the some files where added in https://gitlab.rtems.org/rtems/tools/rtems-tools/-/merge_requests/26 the MR did not update the `waf` script to install them.

I have also fixed the case of the RSB failing to install the version specific GCC support. A warning is now printed:

```
Type "apropos word" to search for commands related to "word"...
Reading symbols from build/arm-rtems6-xilinx_zynq_microzed/app/spu/spu..
↪.
RTEMS GDB Support
warning: no C++ pretty printers; invalid install
(gdb)
```

Merges	1

Summary

rtems-tools do not build on Cygwin. Multiple files fail to compile and report this:

```
[ 15/270] Compiling rtemstoolkit/elftoolchain/libelf/gelf_cap.c
../rtemstoolkit/elftoolchain/libelf/gelf_cap.c:36:13: error: expected declaration␣
↪specifiers or \ |md_0_8216|\ ...\ |md_0_8217|\  before string constant
36 | ELFTC_VCSID("$Id: gelf_cap.c 3977 2022-05-01 06:45:34Z jkoshy $");
|             ^~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
|
Waf: Leaving directory `/home/jrs007/rtems-work/rtems-tools/build'
```

Steps to reproduce

Simple to reproduce – just build on Cygwin.

Author: Joel Sherrill 2024-06-27T19:05:28.458Z

assigned to @joel

Merges	1

Summary

The python tests in RTEMS Tools check the state of the git repo and raise an error if there are untracked files or changes not staged and committed. This complicates using the tests for development because an error is raise.

A release is a tarball of files and there is no GIT repo associated to the tarball. The tests should pass for a release.

A release is created by using git to export the repo and adding a `VERSION` file to top. The `version.py` code knows to check and load the `VERSION` file set the various version values based on the contents.

Commit	db3a6e34d816a77885a27a2d7948bab5b748b736

Summary

Remove import of host

This avoids a circular dependency in execute.py since other modules that will also use host import it as well.

This uses os.name to detect if we're on Windows which is "nt"

Author: Amar Takhar 2024-10-28T03:36:27.643Z

requested review from @chris

requested review from @gedare

Author: Amar Takhar 2024-10-28T03:36:54.949Z

This executes but I'm not on a Windows machine to test if this works OK until @gedare tests it.

Author: Chris Johns 2024-10-28T04:03:05.190Z

Does this work on Cygwin?

Author: Amar Takhar 2024-10-28T04:03:05.190Z

No it won't it'll return posix. Native Python will return 'nt' and mingw python will return 'nt'. Does it need to? I guess I should have asked didn't think about it since it didn't come up in conversation.

Author: Amar Takhar 2024-10-28T04:03:05.190Z

I could change it to use sys.platform and check for `win32`, `cygwin` and `msys` that would cover those 3.

Author: Chris Johns 2024-10-28T04:03:05.190Z

Great. The Cyginw vs MSYS2 verses native Windows can become tricky.

Author: Amar Takhar 2024-10-28T03:49:10.728Z

added 1 commit

Compare with previous version

Author: Gedare Bloom 2024-10-28T03:57:39.942Z

This MR works for me on MSYS2 and on Ubuntu. The os.name == 'nt' should only pick up MSYS2, not pick up Cygwin, so this should be non-functional change for Cygwin.

Commit	a56eff6358763820847930668188d7f3c7eb4ab9

Summary

This merge request fixes the open() and read() calls for tty devices on rtems tester and run.

Opening a device in 'rw' mode causes:

`error: opening tty dev: /dev/ttyACM0: must have exactly one of create/read/write/append mode`

Reading from device:

```
Exception in thread tty[/dev/ttyACM0]:
[...]
File "/usr/lib/python3.10/codecs.py", line 321, in decode
data = self.buffer + input
TypeError: can't concat NoneType to bytes
```

Commit	18e38d5dfdbbca5a2c187e95f764b9f0ea309e0c

Summary

Added niosvc10lp BSP support for Issue #5101 1. Add niosvc10lp bsp and tier 2. Added support for Intel's juart_terminal.exe JTAG UART application as a console device 3. Changed the way GDB shuts down after closing to work with ash-riscv-gdb-server.exe GDB Server a. Ashling ash-riscv-gdb-server.exe GDB Server doesn't shut down properly when killing it through SIGTERM. b. When closing gdb.py, call stop() instead of kill() to allow graceful shutdown. c. Ashling ash-riscv-gdb-server.exe GDB Server doesn't respond to the -exec-interrupt command. d. Send SIGINT signal to break active GDB session e. Added disconnect before quiting GDB session f. commented out print() when sending signals to keep output clean with these changes 4. When opening and closing the console, added the current test index and total test value to allow console to perform actions on first and last test case. Important for opening and closing the juart_terminal.exe only once since to lower the chance of a failed initialization when it runs over the JTAG cable.

Commit	24475571e6455e851d0a8cbe12d61219ba24a4ad

Summary

This MR also contains changes in rtemstoolkit:

- Adding a missing import in path.py which was needed for the “removeall” method
- Adding methods to git.py which are used by the script

I tested the script on Gentoo Linux, FreeBSD and Windows with Cygwin. I don’t have any means to test it on macOS.

Commit	8138b87f0b9e5b95d7abd991f335701d01b8564d

Summary

Add tester configurations for both amd64 (using the FreeBSD bootloader) and amd64efi (using GRUB).

Additionally fix a typo causing @FEXE@ to not expand to the correct value and add an option to qemu.cfg allowing the image path to be specified by the BSP config.

Commit	9ca988052b2a4c525649d43e24e1038113e1df48

Summary

This merge request fixes the `--jobs` option in `--help` output.

```
$ rtems-test --help | grep jobs
--jobs=[0..n,none,half,full] : Run with specified number of jobs, default: num␣
↪CPUs.

```

(continues on next page)

(continued from previous page)

```
$ rtems-test --jobs=full
error: invalid jobs option: full
```

The valid jobs option is `max`.

Commit	3a639da113534dc12cbd99e9f5790e045bb49e94

Summary

Add test suite for rtemstoolkit.

This was written in 2020.

To run do:

Author: Amar Takhar 2024-06-17T03:47:15.530Z

assigned to @amar

Author: Chris Johns 2024-06-18T03:42:42.996Z

This looks great and thanks for doing it. I some questions:

1. Would `rtemstoolkit/tests` be a better place for the code? It would be nice to add `doctest` support to the C++ code at some point.
2. There is test code at the end of each module which could be migrated over and deleted. It is run with `./waf test`. Will these tests take over from those tests?

Author: Amar Takhar 2024-06-18T03:42:42.996Z

I was planning to eventually write tests for other components of `rtems-tools` eventually which is why it's toplevel. Also other directories that have required files like `config/` it made sense to have it toplevel. Though nothing stops us from having lots of different `test` directories the tools aren't all insular.

Oh yes sorry I completely forgot to delete those! Yes this replaces all of them should I delete it in this commit or should I do it in another? I think it may be cleaner to do it in another so there is at least one commit where they live side-by-side makes for easier testing if required.

In my defense I wrote this 4 years ago and I just copied the test files but forgot there were source changes.

Author: Chris Johns 2024-06-18T03:42:42.996Z

The `rtemstoolkit` is isolated so `tests` is fine but should it be `tests/rtemstoolkit` or even `tests` and that references `rtemstoolkit/tests`. This way we can add tests to things that are not related to the `rtemstoolkit`?

The current tests should be migrated before being deleted or we will forget what those tests did.

Author: Amar Takhar 2024-06-18T03:42:42.996Z

I have renamed them to `test_rt_*` .. subdirs won't work because it messes with the python import it's easier to just have them all in the same directory anyway.

I think all the tests have been migrated but if any haven't been in the next commit I'll leave them behind and then migrate the rest. I'm pretty sure I did all of them unless more have been added.

Author: Amar Takhar 2024-06-18T03:42:42.996Z

Hold on something screwed up in my merge.

Author: Amar Takhar 2024-06-18T03:42:42.996Z

Interesting it seems the file rename didn't carry through on my squash so it just deleted the files that's not good.

Author: Amar Takhar 2024-06-18T03:42:42.996Z

haha I forgot to add the files after I renamed them so they got deleted I didn't notice when I squashed so the files I renamed got left behind while the moved files got deleted. I've never done that before, funny.

Author: Chris Johns 2024-06-18T03:42:42.996Z

Yes I agree a sub-directory will not work. This is good.

I think we want to explicitly `return None`

Author: Amar Takhar 2024-06-18T03:40:48.484Z

The default behavior or Python is to return None. A return statement is useful if you want to let others know you didn't forget anything but it will always be None.

Author: Chris Johns 2024-06-18T03:40:48.484Z

We will move to typing and return type interfaces once 3.10 (I think) and later is widely adopted. Before that version typing in python is not great to use. I have this in the release notes generator and after working on 3.12 and then testing on FreeBSD 3.9 I had to unwind a bunch of things.

Could `pytest -v` be linked to `./waf test`? This way you could do `./waf configure test`?

I like `waf` handling the interface so we can add C++ tests and not break or add anything new for users.

Author: Amar Takhar 2024-07-30T02:51:05.608Z

pytest doesn't like being run inside anything. I wouldn't recommend running tests inside of another program like that. I think it's OK as with python it's really common for the test command to be something separate.

Commit	d46ab8375de5ded8de18dd56bc0776a0cbd43a8d

Summary

Add API documentation using pdoc

https://pdoc.dev/

A lot of documentation is missing but it's a start. If we need more complicated features in the future we can move to Sphinx but pdoc is great and a very small dependency.

Remove unused import

This also checks for the existence of a 'python' binary. It assumes it's Python 2.7 if found and uses it. If it's not found it skips building the documentation instead of erroring out.

Once we drop Python 2.7 support we can set this up properly using Wafs internal Python detection. It's non-trivial to pickup and support two versions at the same time.

Testing MR comments.

Author: Gedare Bloom 2024-07-02T04:43:02.949Z

Please edit the commit message (and MR title) to make the scope more clear (What API? I think it is `rtemstoolkit:`)

Is this something for using with the 6.1 release?

Author: Amar Takhar 2024-07-02T04:43:02.949Z

It's not strictly limited to rtemstoolkit no but the only directory it scans right now is rtemstoolkit so I left it off. I wanted it in the repo first before I modified it to include other areas.

I don't see why it can't be in 6.1 it's an innocuous change it can also be useful for anyone wanting to use rtemstoolkit as it does make useful documentation even though it is sparse.

Author: Chris Johns 2024-07-02T04:43:02.949Z

I think @gedare is discussing this commit which is why it would be good to have in the history which part is being covers?

Is there an example of the generated docs I can look at? Yes I am being lazy not running the change :smile:

Author: Amar Takhar 2024-07-02T04:43:02.949Z

I can add it but do we really split hairs on things like this? This commit adds the framework which is in the docs/ directory which coincidentally adds rtemstoolkit first but it's mostly for the framework. I left it off because it's not really fully part of either.. I can add it but I'm starting to feel these rules are kind of fuzzy

There is no example pdoc is a single dependency just install it, `waf configure build`, that's it! If it finds it then it will install the docs are in `build/`

Author: Amar Takhar 2024-07-02T04:43:02.949Z

I added a `doc:` identifier.

Author: Amar Takhar 2024-07-02T04:43:02.949Z

You can look at some example docs online look under submodules on the left:

- https://pdoc.dev/docs/pdoc.html

Author: Chris Johns 2024-07-02T04:43:02.949Z

We are only attempting to understand what is happening and nothing more.

The commit and MR title say "Add API documentation using pdoc" and it is not actually adding any documentation it is allowing us to support API generation hence the confusion (for me that is).

What about `waf: Add pdoc support for generating API documentation`?

Author: Amar Takhar 2024-07-02T04:43:02.949Z

That is what my title says though.. Add API documentation using pdoc .. I can add the word generating for you.

Author: Amar Takhar 2024-07-02T04:43:02.949Z

I have changed the title to:

- `doc: Add API documentation generation using pdoc`

I did not add waf because it's in the ``doc/`` directory and relates to docs more than the build system.

Author: Chris Johns 2024-07-02T04:43:02.949Z

Commit	71cf2428e0f61876a7ea84904cf151217b532e9a

Summary

Use the user-provided symbol map file name as is. This simplifies the use in build systems by having clearly defined input and output names without some magic inbetween (adding a suffix).

Update #rtems/rtos/rtems/4941.

Please rename this one or something, it's a bit confusing atm.

I will not review this one, until the other one is more complete. It is extra work to review the same code in two places. Maybe rebase this MR on top of the other, and link it as a dependency

Author: Amar Takhar 2024-06-18T03:06:33.120Z

One thing that is annoying about GitLab is it's easy to forget to edit the MR titles/description after fixing an incorrect initial push to the MR. It's fixed now.

It was decided to keep these two separate. One adds the new test suite this one deletes it.

@chris would you like to establish any commit message rules for this repo?

To be consistent, at a minimum, I would put the `rtemstoolkit:` at the start of the commit message.

Author: Chris Johns 2024-06-18T23:22:25.742Z

Yes, I think prefixing on the first line is a good idea. The top level directory would be a good place to start.

Author: Chris Johns 2024-06-18T23:24:22.032Z

Moving the test code into pytest is a fantastic improvement. Thank you.

The only thing we should discuss now is the moving of some modules between the RSB and `rtemstoolkit`. Some modules, not all, are manually kept in sync and removing the tests from here means updating is a little harder. I do not care for the tests at the end of the files if there are tests somewhere to fill that role. I am also happy if we establish this repo as the master copy and if a problem in for example `execute.py` is raised in the RSB we update this copy and run the tests before merging the commit into the RSB.

I have considered in the past unifying the code in a single repo however in the end I felt the work required, the overheads to keep updated verses the time it takes to sync the small number of common files was not worth it. An example of the work to unify is `config.py` in `rtemstoolkit` is a better version and an improvement on the RSB but it would need changes deep in the RSB that are stable.

Author: Amar Takhar 2024-06-18T23:24:22.032Z

Yes I agree moving as much of our Python code to rtemstoolkit as possible makes the most sense so we can have a central way to manage everything even if other

tools end up being mostly a frontend that's fine. There's certainly a lot of duplicated code.

Author: Chris Johns 2024-06-18T23:27:20.195Z

Should we have an issue to list the common files in the RSB and the ones we need to keep updated with `rtemstoolkit`. At this point in time I think manual managment is fine.

Author: Amar Takhar 2024-06-18T23:33:05.693Z

Yes that sounds like a good idea but we also have to figure out how we want it to work if the RSB will now require rtemstoolkit to be installed.

Author: Chris Johns 2024-06-19T00:49:38.522Z

I am seeing failures. Are there any expected failures? My host is FreeBSD 14.0 and python is 3.9.18

Author: Amar Takhar 2024-06-19T00:49:38.522Z

Hmm what's the error?

Author: Chris Johns 2024-06-19T00:49:38.522Z

The first is no `svn` installed. I suggest that check can be removed.

The second is the repo has an untracked and a change. I think having to have all files committed makes using the tests for development hard.

Author: Chris Johns 2024-06-19T00:49:38.522Z

Releases have a top level `VERSION` and no git repo. What would happen in a release?

Author: Amar Takhar 2024-06-19T00:49:38.522Z

Ohh yes I forgot about the svn error! We can remove that but this merge request is about deleting the old tests did the other one with the testsuite work?

I don't understand the second part.

Author: Amar Takhar 2024-06-19T00:49:38.522Z

I don't know but an issue may be a better place to talk about this since this ticket doesn't have anything to do with the new test suite.

Author: Chris Johns 2024-06-19T00:49:38.522Z

I am fine to see the `svn` test go.

Sure, is there an issue to use to following up with?

Author: Amar Takhar 2024-06-19T00:49:38.522Z

Can you open one? A release will break for sure since some tests use Git.

Author: Chris Johns 2024-06-19T00:49:38.522Z

Yes and thanks.

Author: Amar Takhar 2024-06-19T00:49:38.522Z

Commit	93908c08a2bcaf037e76720129874d73cfbf10c3

Summary

Simplify usage of patch_argv fixture.

This moves the fixture to conftest and adds it as an argument

Version tests are still broken but this cleanup is required.

Also some whitespace fix.

Commit	38bbbe52bf2a2636aa6c0c4efba40ec896c30a4a

Summary

Revert “linker/rap: Ignore relocation records with no section”

This reverts commit 0ad4aaafc20afcb5aacb7a82b0b3a8150b638975

The latest rtems-tools generated wrong RAP file, the object file become too small(elf,2184bytes==>rap,736bytes) and the RAP file loaded failed, error message like this:

```
load app.out error:offset past end of file: offset=736 size=736 error.
```

I reverted the rtl-rap.cpp commit (rtems-tools@0ad4aaafc20afcb5aacb7a82b0b3a8150b638975), the rap file can be loaded. At Chris’s suggestion, I found get_relocations(s) return all the count of relocation and write to rap file, but actual count is less, because the reloc with section=0 is ignored.

I tried to make the length fit the relocs write to rap file, but the file can not be loaded, it crashed. So the relocs(reloc.symsect == 0) can not be ignored.

The command line I used to create RAP file is:

```
rtems-ld -n -e appmain -s -O rap --base rtems.elf app.elf -o app.out
```

Close #4952 https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/4952

Author: Chris Johns 2024-05-06T05:12:42.122Z

changed the description

Author: Chris Johns 2024-05-08T08:07:29.648Z

I think the change is right but I think there is a spot somewhere else in the RAP code that is not adjusting things and so the size is out.

Author: xiaojun zheng 2024-05-08T08:07:29.617Z

Is there a document about the RAP file format?

Author: Chris Johns 2024-05-08T08:09:18.077Z

Sorry there is not. It would be good to have.

Commit	0514213bb398cb7e14197dcc9ef60376f38150b5

Summary

Adds `stdcxx.py` as mentioned in rtems/tools/rtems-tools#5

Author: Suraj Kumar 2024-06-27T16:41:51.005Z

Note: The version number for GCC is still hardcoded until I figure out a way to use the RSB to get the version number. It is on my to-do for this week.

Author: Suraj Kumar 2024-06-27T19:48:22.234Z

Author: Chris Johns 2024-07-02T23:45:33.702Z

I am closing this MR because the script needs to be generated and installed when GCC is built as discussed in #5. This is part of GCC and not GDB.

Commit	3228f15579e3e98e534ba7a112edb01e97d735fb

Summary

This MR adds a new file, `pprinter.py` to act as a layer that we can modify to add RTEMS pretty-printers as well as load the existing GCC printers. The `stdcxx.py` script it references is installed by the RSB at build time.

Loading the `VERSION` file in a release references bad path code. It looks like the code from taken from the RSB which has special host management.

1. Copy CFLAGS into separate CXXFLAGS and ASFLAGS
2. Python was sharing the same flags which meant any C++ flags were seen in the CFLAGS
3. Add a configure option group incase there is not one.
4. Do not force a `config.inc` when configuring libbsd
5. Do not overwrite the compiler flags in BSD's configure

Commit	d85551e1d1e575bd722a2a0654b8f358fbbf392c

Summary

Spellcheck.

Fix some spelling.

Author: Amar Takhar 2024-07-05T19:24:40.655Z

I know this includes the commit from !1 GitLab should resolve it after that is merged and the rebase happens as they are the same commit. I wonder if it'll resolve automatically it might.

created #2 to continue this discussion

Author: Joel Sherrill 2024-07-06T23:07:50.273Z

That's a lot of changes for a "Spellcheck". :)

Author: Amar Takhar 2024-07-06T23:07:50.273Z

You missed my comment in the MR this is a sequential set of MRs. Look at !1 this MR includes the changes from !1 which will go away from this MR when that is merged.

Author: Amar Takhar 2024-07-06T23:07:50.273Z

If you go into the list of commits you'll see the changes in this MR:

- https://gitlab.rtems.org/rtems/tools/rtems_waf/-/merge_requests/2/diffs?commit_id=d85551e1d1e575bd722a2a0654b8f358fbbf392c

Author: Amar Takhar 2024-07-06T23:07:50.273Z

It's not possible for me to create this MR without that commit in it but it should go away I did this as a test to see if it would on it's own or if a 'rebase' would need to be done.

Commit	3e35a87cb2da66bdacd49c6aca5aa7e2aa56b2fb

Summary

I didn't do any formatting or changing this is just a conversion.

Should the content be updated to gitlab in this MR?

Author: Amar Takhar 2024-07-06T23:08:26.463Z

No not in this I don't use `rtems_waf` I was just trying to convert it to MarkDown Im not comfortable making those changes.
