CHAPTER

ONE

RTEMS 6.3

1.1 RTEMS / Documentation / Documentation

Go to *Issues* (page 346) or *Merge Requests* (page 351)

Issues Summary

163 - The mdump example output is broken (page 8)
160 - Build warnings on 6 branch with Python 3.14 (page 5)
158 - Update waf on 6 branch (page 6)
157 - Docs version.py on 6 needs updating (page 2)
151 - Backport to 6 branch "user: Update remaining references to autotools" (page 10)

143 - hexdump formats disks (opened) (page 11)
93 - rtems-ver-minor set wrong in release? (opened) (page 12)

Merge Requests Summary

262 - shell/memory_commands.rst: Correct mdump example (page 13)
260 - shell/file_and_directory.rst: Correct wrong summary for hexdump (page 14)
258 - build: Fix python warnings (page 15)
257 - version: Fix building a release with Python 3.14 (page 17)
255 - waf: Update to 2.1.9 (page 18)
253 - user/start/sources: Make release examples consistent (page 19)
250 - user: Update remaining references to autotools (page 20)

1.1.1 Issues

1.1.1.1 157 - Docs version.py on 6 needs updating

```

I guess pulling `version.py` from `main` would help if that version is also OK?

Merges	1

Summary

This work item is the same problem as #142 but for the 6 branch.

The mdump example output is broken. There are spaces missing between the address and the first byte.

```
SHLL [/] $ mdump 0x10000 32
0x0001000000 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00 ................
0x0001001000 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00 ................
SHLL [/] $ mdump 0x02000000 32
0x02000000A1 48 00 00 29 00 80 33-81 C5 22 BC A6 10 21 00 .H..)..3.."...!.
0x02000010A1 48 00 00 29 00 80 33-81 C5 22 BC A6 10 21 01 .H..)..3.."...!.
SHLL [/] $ mdump 0x02001000 32
0x0200100003 00 80 00 82 10 60 00-81 98 40 00 83 48 00 00 ......`.....H..
0x0200101084 00 60 01 84 08 A0 07-86 10 20 01 87 28 C0 02 ..`....... ..(..
```

Note the ten hex digits after each 0x (there should be only 8, followed by a SPACE character).

Steps to reproduce

1. Surf to https://docs.rtems.org/docs/main/shell.html
2. Scroll to mdump example

Merges	0

Summary

The docs erroneously (I hope) state that hexdump formats disks.

Steps to reproduce

Surf to https://docs.rtems.org/docs/main/shell.html section 4.1 Introduction, where is says "[hexdump] - format disks"

Author: Jens Schweikhardt 2026-03-26T19:22:26.212Z

set status to **To do**

Summary

The minor number is `0` in the released docs for RTEMS `6.1`

I'm not sure if this belongs to docs or release.

See for example https://docs.rtems.org/docs/6.1/user/start/sources.html#releases

@chris

Commit	ef5ddcc15e41435a32e530709135e99e46c92592

Summary

user/start/sources: Make release examples consistent

When version numbers were updated to replaceable references, this section was made confusing due to only part of the example getting updated. This makes the example self-consistent again.

Commit	0d1ca3a8897c41a47682a921a10ab873352efbd3

Summary

rtemslwip: Add gethostbyname wrapper

Applications and libraries compiled without the benefit of the lwIP headers may require gethostbyname() instead of lwip_gethostbyname(). This wrapper allows those applicationns and libraries to link properly.

Commit	6be6b4664e04cfa200462fd51371f75211dfb19d

Summary

embeddedsw/xadapter: Start link detect thread after init

This moves the start of the link detection thread after the initialization of the interface to remove the race condition where the link detection thread might start running before initialization of the netif structures has been completed.

Closes #14

Commit	9a5ca00781f933eadfc7ed7cd9d29954ad9588e9

Summary

embeddedsw/xemacps: Expand protection to BD ring

This expands the locking protection of pbufs to encompass calls to the BD Ring API. Testing has shown that this descriptor ring is also succeptible to the same issues as the pbuf arrays under heavy load.

Updates #12

rtemslwip/zynqmp/netstart: Drop core-zero locking of threads

This removes the locking of emacps servicing thread to core 0 as it is no longer necessary given the added locking around the BD ring manipulations.

Closes #12

Commit	96e17bdbf19e485ece80bc391478b68b26184306

Summary

embeddedsw/emacps: Backport iteration limit fix

Prevent iterating beyond the buffer descriptor ring tail node. Iterating over the tail node can cause unexpected behavior such as failure to send and receive further packets.

Closes #11

Commit	ceb0657332349f5d32493373957bad87b5e06367

Summary

leon3: Use sreload instead of scaler_reload for GPTIMER scaler value

LEON3_Timer_Regs->scaler_reload does not access the Scaler Reload Value Register as intended. The correct field is LEON3_Timer_Regs->sreload, which retrieves the GPTIMER core's scaler reload value.

(cherry picked from commit ea84592c823b606f44e652e9a05c01e58a69c20e)

Summary

Beagle Bone Black networking is broken on `7-freebsd-14`. A number of drivers are missing and the FDT is broken.

The FDT sources I have tested with are:

am335x-boneblack.dts

This file is derived from the FreeBSD FDT some of which are GPL 2 so please check and consider the license. I have not regenerated the DTB from the original sources as I think there are some mistakes in it.

Summary

Running `netstat -i` on an SMP LibBSD build of RTEMS just after booting results in:

```
xcon [/] # netstat -i
Name    Mtu Network       Address              Ipkts  Ierrs  Idrop     Opkts
↪Oerrs   Coll
cgem0  1500 <Link#1>      72:44:fa:b0:29:da    153687      0      0     86831
↪  0      0
cgem0      - 10.10.5.0/24   10.10.5.70           86733      -      -     48516
↪  -      -
lo0   16384 <Link#2>      lo0                    128      0      0  26324640
↪13999735  26384
lo0        - ::1/128        ::1                     64      -      -        64
↪  -      -
lo0        - fe80::%lo0/64  fe80::1%lo0              0      -      -         0
↪  -      -
lo0        - 127.0.0.0/8    127.0.0.1               48      -      -        48
↪  -      -
```

It looks like something is not aligned correctly. These calls are used by LibBSD in `if.c` to manage the 64bit counters in a safe way on SMP.

Steps to reproduce

Run `netstat -i` on a Zynq or ZynqMP SMP system. Verified on Zynq and ZynqMP hardware.

Summary

Provide support to generate `/rtc/rc.conf` from environment variables. A BSP can define environment variables based on boot loader settings and these can then be used as the settings to initialize LibBSD using `rc.conf`.

Add:

1. The ability to build with `KDTRACE_HOOKS`
2. Add FreebSD `KDTRACE` support files.
3. Provide a simple probe and an `ltrace` command to access the probe data

The support to trace the probes. It does not attempt to do anything close to what `dtrace` can do. A full `dtrace` needs CTF format support and specific target back end support and that is a massive task. The purpose of this support is to get at the runtime probe support built into FreeBSD.

Commit	a5a18251301a8aa7daa16f7e62a052ac6f5137e1

Summary

Issue #112: counter_u64 is broken on SMP archs

This is the backport of !165 to 6-freebsd-14. The commit applies without a change.

The update to FreeBSD 14 dropped the processor offset from `zpcpu_get()`. All processors added to the slot of processor 0 without an atomic operation.

The new `keg_layout()` places the items of a per-CPU slab in its first page and the copy of each processor in a page of its own. The RTEMS value of `UMA_PCPU_ALLOC_SIZE` was `PAGE_SIZE / 32`. `counter_u64_fetch()` therefore added the values of unrelated counters, and an `M_ZERO` allocation cleared them. This gave the `netstat -i` output of the issue.

Use `PAGE_SIZE` for `UMA_PCPU_ALLOC_SIZE` and restore the processor offset in `zpcpu_get()`, as FreeBSD does. Give the size of the early counter in `uint64_t` elements. On a target with 32 processors, the early counter takes 128 KiB.

The new test `counter01` checks the sum of each counter and the slot of each processor. It fails without the fix. With the fix, `counter01`, `epoch01`, `smp01`, `loopback01` and `init01` pass against RTEMS 6.

The branch does not build for sparc/gr740 without a local change. `freebsd/sys/arm/ti/am335x/am335x_scm.c` uses `phandle_t`, but no header of an RTEMS 6 build provides `<dev/ofw/openfirm.h>` to it. The tests ran with this include added. This defect predates the merge request.

BSP sparc/gr740 with RTEMS_SMP · **Simulator** sis -gr740 -m 4

AI Details

1.6.2.1.2.1 Prompt used

None as a single prompt. The work was done in an interactive Claude Code session on the rtems-libbsd tree. The task was to fix issue #112 and to backport the fix. Each change was directed and reviewed.

1.6.2.1.2.2 AI model used

Claude Opus 5.5 (claude-opus-5-5), through Claude Code.

1.6.2.1.2.3 How AI was used for the contribution

- ( ) Formatting
- (x) Test creation.
- (x) Code comments.
- ( ) The entire contribution was generated using AI
- ( ) AI code completion such as Copilot in VSCode.

The diagnosis, the implementation and the test were produced in that session under my direction, and the commit message was drafted there.

1.6.2.1.2.4 Access

I have not used a product which claims copyright in its output, and I have legitimate access to the one I used.

Commit	d8a187bc2e54deb31e319e63d6e12ec531fed209

The 6-freebsd-14 version of !153: dup() of a socket returns a broken descriptor (#101), a kqueue-registered descriptor can never be closed (#102), pipe() is not connected to the libbsd implementation (#39), select/poll drop the hold of the wrong descriptor after a dup2 (#103), and getdirentries() reads a vnode out of a descriptor that has none (#104). Each commit carries its testsuite case; filed on the 6-freebsd-14 tracking issue #100 alongside !152.

Commit	b53ff40126329139129b54148f210fae43bb25b3

Summary

- Support generic interrupts on the beatnik
- Support legacy bus scans for more than PCI bus 0 for the MVME5500
- Add e1000 driver to the beatnik

Closes #90

The User Manual has undergone several iterations in the last few years, and the current state is much better than [in the past](https://docs.rtems.org/all.html), but we are still not sure that the flow and accessibility of the sections within the manual are appropriate for on-boarding new RTEMS users and developers. This project will focus on improving the organization and presentation of the User Manual to improve the reader's experience in approaching RTEMS.

Improving accessibility of other manuals, or providing other improvements to the User Manual, could also be considered within the scope of this project.

Go to *Issues* (page 998) or *Merge Requests* (page 2535)

Issues Summary

5803 - Backport to 6 branch: "bsps/shared/nandpsu: Invalidate page cache on erase" (page 74)
5794 - counter_u64 is broken on SMP archs (page 80)
5735 - Backport Fxp fix to 6-freebsd-14 (page 85)
5734 - Backport page table-base vme window initializations for MVME5100 (page 79)
5681 - Add libbsd support for MVME5100 (page 87)
5679 - Fix mvme2100 bspreset (page 78)
5678 - MVME3100 libi2c support (page 76)
5677 - Backport MVME5100 support (page 75)
5676 - Remove 6-freebsd-12 from 6 releases (page 74)
5666 - Set environment variables from PPCBug GEV data on MVME2700 (page 180)
5665 - Backport powerpc/beatnik converting MOTLoad GEV variables into env variables (page 182)
5664 - Print all environment variables with the shell getenv command (page 181)
5662 - Libdebugger register block corruption (page 185)
5661 - Backport PowerPC ASM warning fixes (page 184)
5652 - Backport to 6 branch "cpukit/flashdev: Clarify interface and update consumers" (page 183)
5640 - Add TCB pointer to libdebugger's extra thread info (page 179)
5638 - Fix thread names in top to show classic and POSIX names (page 178)
5589 - Move powerpc/beatnik BSP to generic interrupts (page 189)
5580 - Backport to 6 branch: "bsps/zynq-uart: fix parity configuration handling" (page 191)
5490 - Backport "cpukit/libio: Fix race condition in iop free" (page 216)
5488 - Complete the u-boot support for qoriq_e500 (page 220)
5481 - Backport to 6 branch: "Complete the u-boot support for qoriq BSP" (page 93)
5435 - Add -D_LDBL_EQ_DBL=1 workaround to ABI_FLAGS on Coldfires (page 212)
5422 - Follow-up from "bsps/aarch64: Add isb instruction after write to sctlr_el1 in aarch64_mmu_enable" (page 224)
5411 - Follow-up from "cpukit/libio: Support close with IOP references held" (page 217)
5410 - Follow-up from "cpukit/sapi/src/interrtext.c: Add missing definition" (page 223)
5403 - Backport to 6 branch: "bsps/shared/dev/flash: Add a flashdev simulation backend" (page 225)
5386 - Initializing network (libbsd) issue on 6-freebsd-12 powerpc beatnik (page 94)
5382 - Back port fix for flashdev JFFS2 double free of mount_data and instance to 6 (page 211)
5375 - Backport to 6 branch "bsps/qspi: Make flashdev control structure private" (page 210)
5367 - Remove Mongoose Web Server (page 205)
5310 - Remove Mongoose Web Server from RTEMS 6.3 (page 177)

continues on next page

Table 1 – continued from previous page

5269 - 6.1 GR740 SMP Driver Manager build fail (page 83)

Table 1 – continued from previous page

4091 - tester: BlockingIOError: [Errno 11] write could not complete without blocking (page 137)
4087 - libbsd: sh architecture build is broken (page 166)
4085 - libbsd: x86_64 architecture build is broken (page 167)
3963 - Add build specification item verification (page 164)
3923 - Add traceability information to the application configuration options (page 90)
3738 - Refactor the Software Engineering Manual (page 168)
3597 - Variable tmp_dirent not initialized CID 1440356 (page 169)
3431 - Eliminate use of __ppc_generic and other PowerPC model defines in BSP configure.ac (page 196)
3230 - RSB does not report –rsb-file for patches correctly. (page 172)
2960 - RSB: Reports modified Git version in case RSB is a Git submodule (page 173)
2780 - Capture engine accesses 'capture_per_cpu' without first checking. (page 176)

5771 - Complete the u-boot support for qoriq_e500 (opened) (page 227)
5663 - Follow-up from "spintrcritical0[1-5, 20, 23]: Fix sporadic test failures" (opened) (page 247)
4903 - TMS570 console driver, SCI frame error (baudrate calculation error) (opened) (page 228)
4364 - rtems-test Fails to list failed tests to user (opened) (page 247)
3701 - RTEMS Pre-Qualification (ECSS) for SMP (opened) (page 231)

Merge Requests Summary

1523 - bsps/shared/nandpsu: Invalidate page cache on erase (page 253)
1510 - powerpc/shared/console: Fix uart build for beatnik (page 255)
1497 - cpukit/libmisc/shell/main_mdump.c: Use uintptr_t to print address (page 256)
1476 - Fix mvme2100 reset (page 260)
1475 - Use page tables for MVME5100 VME window Init (page 257)
1474 - motorola_powerpc: Add support for MVME5100 (page 262)
1473 - Backport Libi2c support for mvme3100 (page 264)
1439 - libfs/pipe: Add pipe and pipe2 indirect handler calls (page 265)
1380 - powerpc/motorola_powerpc: Convert PPCBug NVRAM vars into env vars (page 272)
1379 - powerpc/beatnik: Convert MOTLoad GEV variables into env variables (page 273)
1378 - libmisc/shell: Add -a to print all vars in the shell getenv command (page 271)
1376 - Backport libdebugger to add TCB to extra thread info (page 279)
1375 - Backport libdebugger fix for corruption of thread registers with 32 or more threads (page 276)
1374 - Backport cpuuse fix of thread names in top (page 278)
1372 - Remove MGHTTP (Mongoose) Web server (page 280)
1371 - Backport PowerPC assembler warnings fixes (page 282)
1354 - cpukit/flashdev: Clarify interface and update consumers (page 274)
1262 - 6 - powerpc/beatnik: Support generic IRQ (page 283)
1252 - bsps/zynq-uart: fix parity configuration handling (page 284)
1060 - cpukit/libio: Fix race condition in iop free (page 285)
976 - Complete the u-boot support for qoriq BSP (page 266)
951 - bsps/m68k: Add -D_LDBL_EQ_DBL=1 workaround to ABI_FLAGS (page 286)
916 - bsps/aarch64: Add missing ISB after SCTLR write (page 289)
884 - Fix failing tests (page 287)
863 - bsps/shared/dev/flash: Add a flashdev simulation backend (page 290)
806 - bsps/qspi: Make flashdev control structure private (page 293)
763 - bsps/noelv: Align instruction in bsp_reset() (page 290)
697 - bbb bsp: add modified gpio handling and adc section (page 248)

1373 - Backport of Flashdev fix to clarify interface and update consumers (closed) (page 297)
424 - build: Provide LDFLAGS for pkg-config (closed) (page 294)

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5794
Merges	0

Summary

Running `netstat -i` on an SMP LibBSD build of RTEMS just after booting results in:

```
xcon [/] # netstat -i
Name    Mtu Network       Address              Ipkts  Ierrs  Idrop     Opkts␣
↪Oerrs   Coll
cgem0  1500 <Link#1>      72:44:fa:b0:29:da    153687      0      0     86831␣
↪  0      0
cgem0     - 10.10.5.0/24  10.10.5.70            86733      -      -     48516␣
↪  -      -
lo0   16384 <Link#2>      lo0                     128      0      0  26324640␣
↪13999735  26384
lo0       - ::1/128       ::1                      64      -      -        64␣
↪  -      -
lo0       - fe80::%lo0/64 fe80::1%lo0               0      -      -         0␣
↪  -      -
lo0       - 127.0.0.0/8   127.0.0.1                48      -      -        48␣
↪  -      -
```

It looks like something is not aligned correctly. These calls are used by LibBSD in `if.c` to manage the 64bit counters in a safe way on SMP.

Steps to reproduce

Run `netstat -i` on a Zynq or ZynqMP SMP system. Verified on Zynq and ZynqMP hardware.

1.8.1.8 5235 - RTEMS GPIO Clear bug

Id	5235

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5235
Merges	1

Summary

This bug has been produced on the Beagleboneblack (AM335 chip). When the RTEMS API is used to clear a GPIO pin, all pins which are set, are cleared. I am using the released version of RTEMS 6.1.

Steps to reproduce

Environment: Ubuntu 22.04.5 (LTS) Using the released RTEMS source builder 6.1, I built the toolchain and the BSP for the beagleboneblack (following the user guide).

Expected behaviour

BSP - beagleboneblack RTEMS 6.1 When the function, rtems_gpio_bsp_clear is called, any GPIO that is currently set, is cleared. This is because mmio_set is being used, when in fact mmio_write is sufficient. mmio_set does a read of the register first and OR's with your wanted pin and writes again. The AM335X_GPIO_CLEARDATAOUT does not work this way, when it is read, it returns the register value of GPIO_DATAOUT (In the datasheet), so it clears all set GPIO pins at that time.

Author: Heinz Junkes 2025-09-25T23:07:05.154Z

Hi Ryan, I'm currently working on this BSP and especially the GPIO.

https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5198

Here is my current status, but it is not reviewed and may still contain some errors.
It would be nice if you could take a look at it. Thanks Heinz patch_2

Author: Chris Johns 2025-09-25T23:07:05.105Z

@junkes is the patch an MR? If not would you please be able to create one?

Author: Chris Johns 2026-07-31T00:20:00.314Z

@junkes Any update on making the patch an merge request?

Author: Chris Johns 2025-09-25T23:06:25.618Z

Milestone	6.3
Labels	arch:sparc, smp
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5269
Merges	0

Summary

Building the GR740 BSP with `RTEMS_SMP` and `RTEMS_DRVMGR_STARTUP` set to True will fail in multiple ways.

The issues appear in `bsps/shared/grlib/btimer/tlib_ckinit.c` .

1.8.1.9.1.1 First issue

Excerpt from the build log:

```
../../../bsps/shared/grlib/btimer/tlib_ckinit.c: In function 'irqamp_get_timecount
↪':
../../../bsps/shared/grlib/btimer/tlib_ckinit.c:373:28: error: 'irqamp' has no␣
↪member named 'timestamp'
373 |   return LEON3_IrqCtrl_Regs->timestamp[0].counter;
|                            ^~
```

The first issue appears in every instance of `LEON3_IrqCtrl_Regs->timestamp[0]` such as:

```
irqmp_ts = &LEON3_IrqCtrl_Regs->timestamp[0];
```

This stems from an earlier change where the type of the IRQ(A)MP timestamp register block was changed from `irqmp_timestamp_regs` to `irqamp_timestamp`. These two types represent the same thing but have different names for their members.

1.8.1.9.1.2 Possible fix

This can be fixed by using `&LEON3_IrqCtrl_Regs->itstmp[0];` instead.

1.8.1.9.1.3 Second issue

Excerpt from the build log:

```
/opt/rtems/rtems-7-sparc/bin/../lib/gcc/sparc-rtems7/13.4.0/../../../../sparc-
↪rtems7/bin/ld: ./librtemsbsp.a(tlib_ckinit.c.9.o): in function `tlib_clock_find_
↪timer':
/home/matteo/dev/rtems-gaisler/build/sparc/gr740_smp/../../../bsps/shared/grlib/
↪btimer/tlib_ckinit.c:141:(.text._Clock_Initialize+0x30): undefined reference to␣
↪`leon3_up_counter_is_available'
collect2: error: ld returned 1 exit status
```

The second issue appears when linking the object files, the `tlib_clock_find_timer()` function calls `leon3_up_counter_is_available()` (declared and defined in `bsps/sparc/leon3/include/bsp/leon3.h`) but this function is only available when the BSP is defined as not having the SPARC ASR22 and ASR23 registers. This is not the case for the GR740 BSP:

```
LEON3_HAS_ASR_22_23_UP_COUNTER = True
```

From the output of `./waf bspdefaults --rtems-bsp=sparc/gr740` .

1.8.1.9.1.4 Possible fix

I am not sure why `leon3_up_counter_is_available()` is not always defined like the rest of the up_counter functions in the file. Removing the define guards fixes the issue.

1.8.1.9.1.5 Steps to reproduce

Create a `gr740.ini` file with the following contents:

```
[sparc/gr740_smp]
INHERIT=gr740
RTEMS_SMP=True
RTEMS_DRVMGR_STARTUP=True
```

Run `./waf configure --prefix=$RTEMS_PREFIX --rtems-config=gr740.ini` and then `./waf .`

1.8.1.9.1.6 Expected behaviour

The build should complete successfully.

/bsp sparc/gr740

I searched for “enable-” in rtems-docs and it looks like there are multiple places where the autoconf build system is referenced. I got over 50 hits on that phrase but some do appear to ok as they are for rtems-tools. All need to be reviewed.

Searching for bootstrap turned up 39 hits.

Searching for the word configure is probably too hard. We need to have a few key phrases to search for to find documentation that needs to change.

The same list of search terms needs to be done to the wiki but that’s a separate ticket.

Author: Trac Migrate 2020-10-10T13:20:23.000Z

From my point of view this is not a waf blocker. Once the old build system is removed from the tree and the user interface of the new build system is stable, we should start cleaning up the documentation.

Original author: sebastian.huber

There exists a specification of the application configuration options here:

https://git.rtems.org/rtems-central/tree/spec/acfg

For the RTEMS Qualification project we need traceability from the specification to the source code and vice versa. Methods and tools for this needs to be agreed on, documented, and implemented:

https://lists.rtems.org/pipermail/devel/2020-March/058744.html

https://lists.rtems.org/pipermail/devel/2020-March/058745.html

Document the configuration related specification items in the RTEMS Software Engineering manual along with the traceability approach.

Author: Trac Migrate 2022-07-21T07:55:34.000Z

Original author: sebastian.huber

The application configuration options (defines) are evaluated by header files in `cpukit/include/rtems/confdefs*`. Traceability from the specification to the source code and vice versa can be done via a Doxygen map file. However, this doesn’t work for the application configuration since the evaluation of defines cannot be documented through Doxygen. We would need the ability to reference source code blocks in the specification.

Summary

I noticed a strange issue with pkg-config for a BSP with special linker flags:

https://github.com/pkgconf/pkgconf/issues/371

I think we should provide the linker flags also through an `LDFLAGS` variable.

This change breaks libbsd and I suspect more. See https://gitlab.rtems.org/rtems/pkg/rtems-libbsd/-/issues/38 for details.

Author: Chris Johns 2025-02-11T05:36:33.803Z

The MR needs to be revert it.

Author: Sebastian Huber 2025-02-11T05:38:22.683Z

mentioned in commit e36ba91110724b5cc8a9e07659d98d0bcb96e4d4

Author: Sebastian Huber 2025-02-11T05:38:56.744Z

I would first like to investigate why this change causes something to break. The LDFLAGS were previously not visible by pkg-config.

Author: Sebastian Huber 2025-02-11T06:26:22.134Z

It seems the removal of the `Ldflags:` is the issue here. This part of the patch needs to be reverted. The `rtems_waf` package uses the option `--ldflags` which is not documented by `pkg-config --help`.

Author: Chris Johns 2025-02-11T06:26:22.134Z

I suggest this change is reverted and then a new change can created, review and merged. Any change has to build `rtems_waf` base packages such as `libbsd` to be approved.

Author: Sebastian Huber 2025-02-11T06:26:22.134Z

Why don't you give people a business day to fix this?

Author: Chris Johns 2025-02-11T06:26:22.134Z

That depends on the fix and how long it takes to be reviewed and merged. A revert works, I have tested it so it lets LibBSD build which is important. I am a little unsure what the problem is with a revert?

Author: Sebastian Huber 2025-02-11T06:26:22.134Z

I am already working on a patch.

Author: Chris Johns 2025-02-11T06:26:22.134Z

Sure and thanks. I am only providing a way to solve this breakage. It would helpful if you could please explain your position of no reverts? Gitlab has a Revert button because it is useful and used so if a change breaks something it is helpful.

Author: Sebastian Huber 2025-02-11T06:26:22.134Z

In the past, patches were not reverted this quickly.

Author: Amar Takhar 2025-02-11T06:27:01.628Z

These should be reverted because it caused the breakage it's a good way to record the issue in GitLab. New MRs should come with the alternate change.

The reason we moved to GitLab is to make these processes easy we're not in a race I appreciate you wanting more time but the policy should always be to revert ASAP when we see breakage and have a new change in come via a new MR this is an easier way to track changes. This also means that any future changes can be properly considered without being under pressure due to current breakage.

Author: Sebastian Huber 2025-02-11T06:26:22.134Z

Please go ahead, I will have a look at it in a couple of days.

Original author: blofeld80

Hi, Aaron Nyholm has added a nice flashdev API this year. I wanted to put LittleFS on top of this API and encountered some difficulties / found some bugs / have some open questions / would like to make some breaking API changes. Therefore, I hope that Aaron can comment.

1. C++ include guards are missing in flashdev.h
2. The switch case in flashdev.c => rtems_flashdev_ioctl is missing a default case
3. Is there a guideline for naming IOCTLs? There are several defines and functions which, I feel, could have a more descriptive name. For example, there is the define RTEMS_FLASHDEV_IOCTL_PAGE_COUNT which is used to get the number of pages within the flash. Could we have it called RTEMS_FLASHDEV_IOCTL_GET_PAGE_COUNT so that it is immediately clear what is good for? Basically, I would like to add "_GET" / "_get" at all appropriate places (i.e. refactor the corresponding function names, too). I guess there will be an issue with the 80 char per line limit, but I'd provide a proposal for handling them at a final stage when all other issues have been addressed.

4. I need to be able to create more than one flashdev. Therefore, the mutex initializer in rtems_flashdev_do_init is a bit of a roadblocker as it would use the same name for the mutex inside each flashdev instance. From my point of view, the easiest way to deal with this is to have the mutex name as an argument to the initializer. However, I'd prefer to a. shorten the

name - like FDEV_MTX_${Number} b. loop over ${Number} until we can create the mutex Is there an rtems_get_id_by_name? I've only found a function to get the name of an id.

5. Some thoughts on the "regions". Regions behave much like paritions, except that not every region / partition gets its own file handle, right? a. Why not calling the regions partitions? b. Do we really need to set them up "dynamically", or could we pass a partition table to the flashdev initialisation? c. There are the IOCTLs RTEMS_FLASHDEV_IOCTL_REGION_SET and RTEMS_FLASHDEV_IOCTL_REGION_UNSET. Looking at the implementation I feel they do more than I'd expect. For example, RTEMS_FLASHDEV_IOCTL_REGION_SET creates the region, or even redefines a region if one has not called unset, and then it activates the region. I'd like to refactor this into four IOCTLs: * **RTEMS_FLASHDEV_IOCTL_** REGION or PARTITION _CREATE * **RTEMS_FLASHDEV_IOCTL_** REGION or PARTITION _DELETE * **RTEMS_FLASHDEV_IOCTL_** REGION or PARTITION _ACTIVATE * **RTEMS_FLASHDEV_IOCTL_** REGION or PARTITION _DEACTIVATE

For my use case, setting up a static partition table would be good enough. We could spare the _CREATE, _DELETE, check the partitions more thoroughly during initalisation (for example that they do not overlap), and would not have to provide a mechanism to be able to resize them during runtime.

Flashdev shall work for NAND flashes, too. I am not an expert when it comes to NAND flashes. Therefore, I would like to outline my basic understanding and hope someone tells me if I am completely off.

Some parts I find often in designs:

NOR - MT25Q https://www.micron.com/-/media/client/global/documents/products/data-sheet/nor-flash/serial-nor/mt25q/die-rev-b/mt25q_qlkt_u_01g_bbb_0.pdf

NAND - W25N01 https://www.mouser.de/datasheet/2/949/w25n01gv_revl_050918_unsecured-1489588.pdf

Memory layout: bytes form pages, pages form sectors and sectors form blocks. There is always some confusion as some vendors omit the term sector

Read operations: can start at every address and have arbitrary length

Write / Program operations: work on single pages. Therefore, at max. PAGE_SIZE Bytes can be written in one go. There is a wrap around in case the configured address was not byte 0 in the current page. Usually, the minimum write size is 1 byte. However, setting a minimum write size to a different value might allow using additional features (such as ECC for the s25fl when using 16 Byte writes to 16 byte aligned addresses).

Erase operations: work on sectors and they always erase the complete sector. If an address is passed which points right in the middle of the sector, also the sector memory before the address is erased.

6. Wrt. the write operations. I think RTEMS_FLASHDEV_IOCTL_WRITE_BLOCK_SIZE is misleading as the term "block" is already defined in the context of flash memories. The implementation / comments / unit tests show that we are looking at the minimum write size. a. Could we refactor this to RTEMS_FLASHDEV_IOCTL_GET_MIN_WRITE_SIZE? b. Especially regarding the ECC features of some flashes. The addresses need to be aligned to

RTEMS_FLASHDEV_IOCTL_GET_MIN_WRITE_SIZE. I think we should test the adress alignment on writes.

7. Wrt. the erase operations. The erase operations work on sectors! a. I need an API extension to get the erase size b. We should test that the address passed to the erase function is aligned to the erase size. c. The erase size puts constraints on the regions / partions. Their addresses need to be aligned with the erase size and their length must be a multiple of the erase size

8. Some unit tests (testsuite flashdev01) fail as expected, but not due to expected reason. Take for example line 148 in testsuites/libtests/flashdev01/init.c and change

read_data = fgets(buff, 2048, file);

to

read_data = fgets(buff, 1, file);

Actually, the test case is expected to fail as the sector size is only 512 bytes and we try to read 2048 bytes. Unfortunatelly, reading a single byte doesnt work either. This is due to the fact that by default buffered IO is used. On my side, each fgets translates to one or more read operations of 1024 bytes length. I.e. this testcase will always succeed as we expect the test to fail. a. I like to propose that we initialise flashdev to operate in buffered mode using RTEMS_FLASHDEV_IOCTL_GET_MIN_WRITE_SIZE. b. I think we should add a raw_read and raw_write to be able to transfer larger junks of data.

I can work on this and start providing patches for review.

1.8.1.19 4883 - GDB cannot see TLS variables

Id	4883
State	closed
Type	ISSUE

GDB does not know how to handle TLS variables on RTEMS. This make debugging newlib hard because newlib now uses TLS for it's reent data.

Author: Chris Johns 2024-02-16T00:36:24.000Z

- **Milestone** changed from %"6.1" to %"Indefinite"
- **Version** changed from ~"6" to ~"7"

We need to understand what GDB needs to have done to it support TLS variables. At the moment it is not possible to determine the scale of effort needed.

We will move this to 7 and when solved we can make a dot release for 6 and release a working GDB.

Author: Kinsey Moore 2025-06-18T18:59:43.193Z

mentioned in merge request !518

Author: Kinsey Moore 2025-06-18T18:59:57.611Z

mentioned in merge request !517

Author: Kinsey Moore 2025-06-19T20:34:52.499Z

The base functionality in RTEMS is added by !517 and !518. There is a piece to this puzzle that still needs to be added to GDB.

Author: Kinsey Moore 2025-06-19T20:34:51.922Z

Attached is the GDB patch that I used to test the TLS functionality.`gdb-tls.patch <https://gitlab.rtems.org/-/project/uploads/2f72fc89002e9a1652c3c943e10be8b0/gdb-tls.patch>`_

While this patch is obviously not suitable for upstream consumption, it does work. It could theoretically be pulled in to the GDB build by RSB in the short term and used to enable TLS functionality for RTEMS until a more polished version of the patch can be incorporated upstream.

Author: Chris Johns 2025-06-19T20:47:35.889Z

Does this mean GDB needs RTEMS support per arch?

Author: Kinsey Moore 2025-06-19T20:50:08.129Z

Unfortunately, I think the answer is yes.

Author: Kinsey Moore 2025-06-19T20:50:47.456Z

And that patch only adds it for AArch64 because that's what I was testing.

Author: Kinsey Moore 2025-06-19T21:41:04.600Z

~~There *is* a section that provides a place to hook in OS-targeted objects instead of architecture-targeted objects, so I'll look into that to see if that can be made to work.~~

This still needs a per-arch stub to point at it, but it will be good for sharing RTEMS details that apply to all architectures.

Author: Kinsey Moore 2025-06-20T20:43:39.076Z

Attached is a more polished version of the GDB patch which should be far more acceptable upstream.`0001-gdb-Add-support-for-TLS-under-RTEMS.patch <https://gitlab.rtems.org/-/project/uploads/ac8467cb05964de8569d62798681d5fd/0001-gdb-Add-support-for-TLS-under-RTEMS.patch>`_

I managed to get all the RTEMS-related support in one place so we don't have to proliferate files throughout GDB just to support RTEMS. This was built by adding it to the 15.2 GDB recipe in RSB on 6 branch and it was tested with libbsd 6-freebsd-12 with the patch support the vGetTLSAddr query. The version of libbsd should be irrelevant. This is the patch for RSB main GDB recipe (16.2) which has also been tested against the 6-freebsd-12 build: 0001-gdb-Add-support-for-TLS-under-RTEMSv16.2.patch

Author: Kinsey Moore 2026-05-08T19:37:15.226Z

Attached is an even more polished version with feedback from the GDB mailing list that targets 17.1/main.`0001-gdb-Add-support-for-TLS-under-RTEMSv17.1.patch <https://gitlab.rtems.org/-/project/uploads/f4a37404615b82ab9cb8400ecc64e500/0001-gdb-Add-support-for-TLS-under-RTEMSv17.1.patch>`_

Original author: dppinto

It is stated in the comments that these functions are deprecated: * cpukitincludertemsfatal.h: RTEMS_NO_RETURN void rtems_fatal_error_occurred(uint32_t fatal_code); * cpukitincludertemsscorethread.h: void rtems_iterate_over_all_threads( );

Can these be removed now or are there still portability reasons to still keep these?

Original author: dppinto

For the current pre-qualified feature set of RTEMS, one wants to use rtems_timer_initiate_server(), then it has to provide a custom stack allocator. This makes it inconvenient to use. One option would be to provide a new directive to construct the timer server, for example rtems_timer_server_construct().

Additional Notes: This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-VAL-001.

Original author: kgardas

Hi,

using recent (as of 2021-12-11) rsb source code from git, I'm not able to build devel/qemu on Mac OS X. It fails on glib compilation which fails on configure step in two ways: missing `__int64` type and missing gettext library – looks like `DYLD_LIBRARY_PATH=$SYSROOT/lib` is not working as expected.

Steps to reproduce:

```
cd bare
../source-builder/sb-set-builder --prefix=/tmp devel/qemu
```

anyway, I'm attaching both report and glib's config.log here which contain all the clues.

- config-3.log
- rsb-report-glib-2.48.2-x86_64-apple-darwin19.6.0-1.txt.xz

changed the description

Author: Kinsey Moore 2026-05-15T16:32:35.716Z

Looks like there is currently an error during build likely due to a newer GCC version: https://lists.rtems.org/pipermail/build/2026-May/073276.html

Author: Joel Sherrill 2026-05-15T16:32:35.667Z

@chris' addition of std=support should make it easy to fix. Whatever package that is will likely be fixed with gnu17 for C and gnu++17 for C++.

If this is on the 6 branch, the milestone shouldn't have been removed. It should have been moved to 6.5 if we aren't fixing it for 6.4. but we should fix it.

Author: Kinsey Moore 2026-05-15T16:36:43.602Z

%6.3 hasn't even been released yet and it still has that milestone on it.

This looks like gdb on msys2 is not being linked against a random number library.

https://docs.microsoft.com/en-us/windows/win32/api/bcrypt/nf-bcrypt-bcryptgenrandom

Also looks like that may be deprecated.

I found this thread which I read as you might be missing a DLL:

http://sourceware-org.1504.n7.nabble.com/Unable-to-build-GDB-on-Windows-td649748.html

It is also possible based on that thread that gdb is missing some configure magic still.

When I run the automated build sweep on the CentOS server, I see some qemu hang but only on arm. I thought it might be the qemu BSP but I noticed this time it is xilinx_zynq_zc706 which might be a clue.

Anyway, I login and check on things and this only happens on this machine. The same script should be running on FreeBSD and Ubuntu but I don't see this behavior on those servers.

```
[joel@devel ~]$ ps -ef | grep " qemu-system"
joel      6457  6408 91 Apr02 ?        18:29:20 qemu-system-arm -no-reboot -

Author: Chris Johns 2021-04-08T01:36:29.000Z

- **Summary** changed from *rtems-test: qemu-system-arm hangs during cron'ed test runs* to *qemu: qemu-system-arm hangs during cron'ed test runs with rtems-test*

I am sorry but you are going to have to debug this to resolve it because it is not been seen else where and/or we do not have a suitable set up to duplicate it.

At the core of the bug is qemu stopping and it should not unless our test code or the BSP has a problem you have exposed. I agree there is a secondary bug where `rtems-test` is not killing the process but I am reluctant to look at that until the reason qemu hangs is found. A fixed `rtems-test` only results in more tests being (maybe) incorrectly tag as `indeterminate` and I prefer we look to get better qemu test results.

A few suggestions...

1. Is console output still being generated?
2. See if you can find out where in an RTEMS test executable things are hanging. This means adding the gdb server flag to each qemu however I am not sure if this breaks when a number of qemu sessions are run in parallel, ie port binding.
3. Can you connect a python debugger to an active process based on pid? If you could debug what is happening that would help the `rtems-test` of things but as stated IMO that is secondary to the real issue.
4. Hack `rtems-test` to add some trace around the job handling. Again only `rtems-test` related.

Author: Joel Sherrill 2021-12-17T20:35:44.000Z

- **Milestone** changed from %"6.1" to %"Indefinite"

Changing the milestone because this is hard to reproduce and could randomly go away with a different qemu version.

Author: Chris Johns 2026-07-30T23:42:15.690Z

The fix is project input from `/dev/null` to QEMU or it hangs.

Coverity Scan spotted this in rtems-rfs-bitmaps.c as CID 1399749). On the face of it, Scan appears to be correct but this issue should be reviewed by the original author of this code.

```
}
623     else
624     {
625       bits      = *map;
626       available = rtems_rfs_bitmap_element_bits ();
627     }
628
629     if (rtems_rfs_bitmap_match (bits, RTEMS_RFS_BITMAP_ELEMENT_SET))

CID 1399749 (#1 of 1): Useless call (USELESS_CALL)
side_effect_free: Calling rtems_rfs_bitmap_set(*search_map, bit) is only useful
↪for its return value, which is ignored. [show details]
630       rtems_rfs_bitmap_set (*search_map, bit);
631     else
632     {
```

Original author: rmueller

I had issues with a Cxc cross-compiled toolchain (ARM) on Windows so I tried to recompile it natively (there were some updates, GMP is built now).

However, there are issues building newlib related to GMP. The build is configured with the following options:

configure: summary of build options:

Version: GNU MP 6.1.0 Host type: none-w64-mingw32 ABI: standard Install prefix: /c/Users/Robin/Documents/RTEMS/rtems-tools/rtems/6 Compiler: x86_64-w64-mingw32-gcc -O2 -g -pipe -I/c/Users/Robin/Documents/RTEMS/rtems-tools/src/rsb/rtems/build/tmp/sb-197609/6a/c/Users/Robin/Documents/RTEMS/rtems-tools/rtems/6/include Static libraries: yes Shared libraries: no

And the build fails with the following error:

In file included from ../../../gnu-mirror-gcc-03e2d83/gmp/gmp-impl.h:146,

from fib_table.c:4:

../fib_table.h:4:1: warning: data definition has no type or storage class

4 | Error, error, this data is for 32 bits

^~~~~

../fib_table.h:4:1: warning: type defaults to ‘int’ in declaration of ‘Error’ [-Wimplicit-int]

I tried to compile GMP separately, using the following commands:

./configure –prefix=/c/Users/Robin/Documents/RTEMS/rtems-tools/rtems/6 –disable-shared –enable-static make make install

And this appeared to work.

configure: summary of build options:

Version: GNU MP 6.1.0 Host type: x86_64-w64-mingw32 ABI: 64 Install prefix: /c/Users/Robin/Documents/RTEMS/rtems-tools/rtems/6 Compiler: gcc Static libraries: yes Shared libraries: no

Maybe ABI is not set properly? Also, GMP was alreay (successfully) built so I am confused that it is built again as part of the newlib build with these settings.

I am also a bit confused that Host was set to none-w64-mingw32 because the sb program recognized that the systemis a x86_64 system as well (I printed out the value which is assigned to _build to test this in the sb program).

I attached the error report as well

Kind Regards Robin

Original author: rmueller

- **Summary** changed from *GMP not configured correctly in MSYS in newlib build step* to *RSB: GMP not configured correctly in MSYS in newlib build step*

Author: Trac Migrate 2021-01-01T14:41:37.000Z

Original author: rmueller

Could not attach file. Find it here: https://drive.google.com/file/d/1zKp7IWn9hW_5QvE92UA2oNz24TKs6uMc/view?usp=sharing

To reproduce the issue, run the following RSB set-builder command on Windows 10 on a x86_64 system:

../source-builder/sb-set-builder –prefix=$RTEMS_TOOLS 6/rtems-arm

Author: Trac Migrate 2022-05-17T05:41:02.000Z

Original author: rmueller

edit the Makefile.in in gcc source directory, change GMP configure line “–host=none-${host_vendor}-${host_os} –target=none-${host_vendor}-${host_os}” to “–host=${host_alias} –target=${host_alias}”, the build will be success.

Just reporting this with the hope that I am not the only one with the issue when building the tool suite on Windows with MSYS2

I had another issues where the the building the tool suite failed when configuring expat. That issue went away (although I can’t reasonably explain why and how, maybe it was an update), but now the build process appears to be problematic somewhere else.

When building the newlib, the process appears to be stuck. This is the output from the command line:

downloading: sources/mpc-1.0.3.tar.gz - 654.2kB of 654.2kB (100%) download: https://ftp.gnu.org/gnu/gmp/gmp-6.1.0.tar.bz2 -> sources/gmp-6.1.0.tar.bz2 downloading: sources/gmp-6.1.0.tar.bz2 - 2.3MB of 2.3MB (100%) building: sparc-rtems5-gcc-7.5.0-newlib-7947581-x86_64-w64-mingw32-1

And this is the last output in the log file:

x86_64-w64-mingw32-g++ -O2 -g -pipe -I/c/Users/Robin/Documents/RTEMS/rtems-demo/toolchain/src/rsb/rtems/build/tmp/sb-197609/5s/c/Users/Robin/Documents/RTEMS/rtems-demo/toolchain/rtems/5/include -I../../gcc-7.5.0/libcpp -I. -I../../gcc-7.5.0/libcpp/../include -I../../gcc-7.5.0/libcpp/include -g -O2 -W -Wall -Wno-narrowing -Wwrite-strings -Wmissing-format-attribute -pedantic -Wno-long-long -fno-exceptions -fno-rtti -I../../gcc-7.5.0/libcpp -I. -I../../gcc-7.5.0/libcpp/../include -I../../gcc-7.5.0/libcpp/include -c -o init.o -MT init.o -MMD -MP -MF .deps/init.Tpo ../../gcc-7.5.0/libcpp/init.c

I built with the git clone of the RTEMS Source builder. This happens for master as well as branch RTEMS version 5. The build command for RTEMS5:

../source-builder/sb-set-builder –prefix=$RTEMS_INST 5/rtems-sparc

and for RTEMS6:

../source-builder/sb-set-builder –prefix=$RTEMS_INST 6/rtems-sparc

Original author: rmueller

Hi,

I followed the quick start guide to install the RSB ([https://docs.rtems.org/branches/master/user/start/tools.html]) and encountered following error:

```
$ ../source-builder/sb-set-builder --prefix=/c/Users/Robin/Documents/RTEMS/quick-start/rtems/5 5/rtems-sparc
RTEMS Source Builder - Set Builder, 5.1
Build Set: 5/rtems-sparc
Build Set: Time 0:00:00.009008
Traceback (most recent call last):
File "../source-builder/sb/cmd-set-builder.py", line 26, in <module>
setbuilder.run()
File "../source-builder/sb/setbuilder.py", line 736, in run
b.build(deps, mail = mail)
File "../source-builder/sb/setbuilder.py", line 452, in build
bs.build(deps, nesting_count, mail)
File "../source-builder/sb/setbuilder.py", line 390, in build
log.notice('Build Set: %s' % (self.bset))
File "../source-builder/sb/log.py", line 88, in notice
print(l)
LookupError: unknown encoding: cp65001
```

I solved this by typing in the command line:

```
export PYTHONIOENCODING=UTF-8
```

I just though I report this, maybe it helps other people who have the same issue or maybe this is a problem related to more recent python installations.

The RTEMS Tester seems to have an issue with tests that produce a lot of output. This seems to be a sporadic error which depends also on the system load. For example (BSP: arm/realview_pbx_a9_qemu):

```
[628/628] p:602 f:5   u:6   e:0   I:0   B:3   t:0   L:0   i:0   W:0   | arm/realview_pbx_a9_qemu: ts-validation-0.exe

Is `ts-validation-0.exe` available on `master`?

Author: Trac Migrate 2020-09-24T04:41:12.000Z

Original author: sebastian.huber

Yes, it is available on the master, however, with a bit less output. You can increase the output with:

```
diff --git a/testsuites/validation/ts-validation-0.c b/testsuites/
↪validation/ts-validation-0.c
index 3e60fb6ab8..5c10ca6d71 100644
--- a/testsuites/validation/ts-validation-0.c
+++ b/testsuites/validation/ts-validation-0.c
@@ -102,7 +102,9 @@ static void runner_task( rtems_task_argument arg )

rtems_test_begin( rtems_test_name, TEST_STATE );
T_register();
+  for (int i = 0; i < 100; ++i) {
exit_code = T_main( &test_config );
+  }

if ( exit_code == 0 ) {
rtems_test_end( rtems_test_name );
```

It is a sporadic error. I can't reproduce it reliably, but I observed this BlockingIOError error on several machines.

Author: Chris Johns 2020-09-24T05:45:53.000Z

Original author: sebastian.huber

Thanks. Which host OS?

Author: Trac Migrate 2020-09-24T08:23:48.000Z

Original author: sebastian.huber

Yes, on Linux (OpenSUSE).

I found this:

https://github.com/travis-ci/travis-ci/issues/8920

They suggest to add something like this:

```
python -c "import fcntl; fcntl.fcntl(1, fcntl.F_SETFL, 0)"
```

Author: Trac Migrate 2020-09-24T09:16:28.000Z

Original author: sebastian.huber

I added some debug output to log.py. Someone sets f = 0 which is fhs = <_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'> to non-blocking. In log.__init__ stdout is set to blocking.

Author: Trac Migrate 2020-09-24T12:47:16.000Z

Original author: sebastian.huber

It is a bit weird. The stdout suddenly changes to non-blocking.

So, stdout is blocking for a while and then changes to non-blocking.

Author: Chris Johns 2020-09-26T01:30:23.000Z

Original author: sebastian.huber

I suggest you print the id of the thread being checked? The original trace shows the exception in the original thread for the process and this last exception is in the

worker thread for the test. Are the thread's picking up the original state and not the modified state?

Also I wonder if `print(l)` should be `sys.stdout.write(l)`? That is, maybe the low level layer of `log.py` should work at the handle level only and not mix things up.

Author: Joel Sherrill 2021-12-17T17:01:20.000Z

Apparently you have to have RTEMS tools in your PATH before running the bsp builder. I just finished a run that took 2 hours to basically tell me to add RTEMS tools to my PATH. Could this be error checked and bail out early?

Original author: sebastian.huber

The new build system uses build specification items to define what is built and how it is built. Add a ./waf –rtems-verify-spec option to verify that the build specification items are sane. For

example, check that there are no cycles in the graph, all required attributes are present, the attribute values have the proper type, no additional attributes are present, all UIDs are resolvable, etc.

Author: Trac Migrate 2020-05-28T11:03:17.000Z

Original author: sebastian.huber

The basic functionality for a verification of build items is implemented in the RTEMS Qualification Tools repository:

https://git.rtems.org/sebh/rtems-qual.git/tree/specverify.py

To make use of it, one option would be to install the RTEMS Qualification Tools Python modules under ${prefix}/share/rtems parallel to the rtemstoolkit modules. Only if the wscript should do the verification, then the module is loaded.

Missing features are:

- verify that the directed graph of specification items has no cycles (depending on the link role)
- specify and verify required links, roles, and target types for item types
- detect isolated items
- add warning conditions
- improve the output of failed assertions

The newest RTEMS Manual is the [Software Engineering (SwE)](https://docs.rtems.org/branches/master/eng/index.html) Manual, which is intended to document the software engineering practices of RTEMS development. This project will improve the completeness and consistency of the SwE Manual with respect to primary sources and our intentions for this manual's use.

One of the main sources of content for the SwE book is our wiki. We would like to have the content of the SwE manual cross-checked with the respective wiki pages, and have those wiki pages be replaced with a link to the SwE book as the authoritative source for the information moving forward. This check should ensure the content is correctly reproduced, and identify any re-formatting that should be done in the manual to improve typesetting etc.

- The primary remaining task is to review sections taken from the wiki, ensure the conversion looks correct, delete the wiki page, and correct all references from the web to the delete page.

In addition, the flow and organization of the SwE Manual likely could be greatly improved. We created the manual by filling in an outline with large dumps of text. A balanced and thoughtful approach to the manual's organization would likely provide great benefits to its usability and maintenance.

Original author: zehata

From rtems root directory, cd cpukit/libfs/src/dosfs/msdos_dir.c tmp.dirent was used 18 times but isn't initialized anywhere in the file. In line 325, memcpy was used, with the second parameter, a constant, being tmp_dirent, however, before this, it was not initialized at all, leading to the usage of an uninitialized variable (in memcpy)

```
64 msdos_dir_read(rtems_libio_t *iop, void *buffer, size_t count)
65 {

...

73 struct dirent tmp_dirent;

...

154 if ((*MSDOS_DIR_ATTR(entry) & MSDOS_ATTR_LFN_MASK) == MSDOS_ATTR_LFN)
155 {

...

324 if ( cmpltd >= 0 ) {
```

Uninitialized scalar variable (UNINIT) uninit_use_in_call: Using uninitialized value tmp_dirent. Field tmp_dirent.d_type is uninitialized when calling memcpy.

```
325 memcpy(buffer + cmpltd, &tmp_dirent, sizeof(struct dirent));
326
327 iop->offset = iop->offset + sizeof(struct dirent);
328 cmpltd += (sizeof(struct dirent));
329 count -= (sizeof(struct dirent));
330
331 /* inode number extracted, close fat-file */
332 rc = fat_file_close(&fs_info->fat, tmp_fat_fd);
333 if (rc != RC_OK)
334 {
335 msdos_fs_unlock(fs_info);
336 return rc;
337 }
338 }
339 }

...

349 }
```

Original author: sebastian.huber

In case the RSB is used as a Git submodules the git status yields

```
git status
# HEAD detached at b64b38e
nothing to commit, working directory clean
```

leading to

```
RTEMS Source Builder - Set Builder, 4.12 (b64b38ef076c modified)
```

Author: Chris Johns 2017-03-30T20:44:03.000Z

Original author: sebastian.huber

Is the bug you would like fixed the `modified` being added to the git hash?

Author: Trac Migrate 2017-03-31T04:55:34.000Z

Original author: sebastian.huber

Replying to Chris Johns:

> Is the bug you would like fixed the `modified` being added to the git hash?
>
> Yes I think so, nothing is modified. I had some problems to understand the git.status() function in git.py.

Author: Chris Johns 2017-03-31T04:59:40.000Z

Original author: sebastian.huber

The status function should return a dict of discovered states. I wonder if the last `elif` should be an `if`?

Author: Trac Migrate 2017-06-08T09:09:54.000Z

Original author: sebastian.huber

I tried to fix this, but I have no idea what repo.status() is supposed to do (especially the last elif part).

Author: Chris Johns 2017-09-22T01:27:03.000Z

Original author: sebastian.huber

Replying to Sebastian Huber:

> I have no idea what repo.status() is supposed to do (especially the last elif part).

The last `elif` part when there is a valid state picks of the content of a section of the `status` output. For example:

```
Untracked files:
(use "git add <file>..." to include in what will be committed)

x
```

The `_state` is selected and then the contents of the state are parsed and added to the state or a new state is selected.

Author: Chris Johns 2017-09-22T01:45:26.000Z

Original author: sebastian.huber

I can ignore a detached HEAD as condition for being dirty. That seems reasonable.

I will also ignore untracked files. They should be ignored in a build if nothing is modified. It does assume the build is not modified by untracked files. Untracked cannot be easily handled as I cannot look into the files or make assumptions. This is a change to the initial implementation but I am seeing tool builds with up to date repos that have untracked files like logs, or patches and that is not a true indication of the state. Needing a completely clean directory does seem a little onerous.

Is a modified submodule considered dirty? I think so. For example:

```
$ git st
On branch master
Your branch is up-to-date with 'origin/master'.
Changes not staged for commit:
(use "git add <file>..." to update what will be committed)
(use "git checkout -- <file>..." to discard changes in working␣
↪directory)
(commit or discard the untracked or modified content in submodules)

modified:   freebsd-org (new commits, untracked content)
```

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5310
Merges	0

Summary

The Mongoose webserver (mghttpd) in RTEMS is old and pre-dates the change to GPL. The project forked and the permissive licensed code lives on as Civitweb. The mghttpd code in RTEMS is from before the split and is unmaintained upstream.

Civitweb can be built using the RSB. It is an active project.

It is recommended that users migrate to Civitweb.

The mghttd code is deprecated in RTEMS 6 and will be removed before RTEMS 7 branches.

It is being removed from 6 as of 6.3 because it is not actively maintained and have CVEs which are addressed in Civitweb.

Related ticket is #5303 for 7

Milestone	6.3
Labels	cpukit::debugger
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5640
Merges	0

Summary

Print the TCB or `Thread_Control` pointer in the thread extra info query output. This is shown when you enter `info thread` at a GDB prompt.

The TCB is useful then inspecting objects that contain the TCB pointer. For example:

```
(gdb) p *__mutex
$4 = {
_Queue = {
_Lock = {
_next_ticket = 7632,
_now_serving = 7632
},
_heads = 0x7f49308,
_owner = 0x7f44668,
_name = 0x0
}
}
(gdb) p __mutex->_Queue._owner
$5 = (_Thread_Control *) 0x7f44668
```

The `__mutex->_Queue._owner` field is the TCB and if the `info thread` command shows the TCB for a thread you can see which it is without the need to dump other thread specific details.

Merges	0

Summary

Set environment variables using the MOTLoad Global Environment Variables (GEV) the boot loader maintains. GEV variables are available on some PowerPC BSPs.

This work is part of the `EPICS RTEMS Support Project <https://github.com/epics-base/epics-base/discussions/851>`_to improve the RTEMS initialization in EPCIS. Currently EPICS has very specific code to extract these GEV variables and to use them to initialize the network. Moving the code to RTEMS and using environment variables expands the number of BSPs EPICS could support.

The initial work is for the `power/motorola_powerpc` BSP.

Summary

If more than 32 threads are active the `thread->register` pointer may end up referencing an old block pointer depending on the value returned by a `realloc` call. This has not been a problem on ARM or AARCH64 builds but is a problem on PowerPC although it is a definite issue on all architectures.

I suspect a key difference is PowerPC has a 412 byte register buffer per thread, significantly more than ARM and AARCH64, so a block resize using `realloc` is more likely to results in the pointer returned having a different address. The corruption is each thread has taken a pointer to the registers from the original block for each thread and it is not re-based after the `realloc` moves the pointer.

Solution

Add a rebase handler to the block code that is called if the base pointer of a block moves so the pointer can be remapped.

Note, only the `registers` is effected as all other blocks do not have references taken.

Steps to reproduce

Run a simple EPICS IOC application on PowerPC, connect then list the threads and then print thread's registers. The values are garbage.

1.8.1.59 4922 - QEMU delivers back-to-back timer ticks after task switches

Id	4922
State	closed
Type	ISSUE
Author	Kinsey Moore
Assignee(s)	Trac Migrate
Closed by	Gedare Bloom

Merges	0

A selection of tests in the RTEMS testsuite will fail consistently or intermittently when running under QEMU while they pass consistently on real hardware or more accurate simulators. This is due to QEMU getting context-switched out on the host system and when it gets more run time it delivers all outstanding clock ticks as quickly as possible according to the wall clock. Naturally, this is more severe on heavily loaded systems. The tests that fail in this manner are heavily dependent on timing and inter-tick processing to verify their correct operation.

The tests known to fail in this manner on ARM and AArch64 BSPs are at least: psx12 psxclock psxtimes01 psxualarm rtmonuse rtmonusxtimes01 smpclock01 smpfatal01 smpfatal03 smpmrsp01 smpmutex01 smppsxmutex01 smpschedaffinity01 smpschedaffinity02 smpschededf01 smpschededf03 smpscheduler04 smpthreadpin01 sp04 sp20 sp68 sp69 sp71 spcpucounter01 spedfsched02 spedfsched04 spintrcritical01 spintrcritical02 spintrcritical03 spintrcritical04 spintrcritical05 spintrcritical06 spintrcritical07 spintrcritical08 spintrcritical09 spintrcritical10 spintrcritical11 spintrcritical12 spintrcritical13 spintrcritical14 spintrcritical15 spintrcritical16 spintrcritical17 spintrcritical18 spintrcritical19 spintrcritical20 spintrcritical21 spintrcritical22 spintrcritical23 spintrcritical24 sprmsched01 sptimecounter01 sptimecounter02 sptimecounter04 ttest02

This issue does not exist to rectify the situation with QEMU so much as to document the issue so that it can be referenced from non-pass expected test outcomes for those affected BSPs that are dedicated to the QEMU platform.

Author: Kinsey Moore 2023-07-06T17:22:16.000Z

I mistakenly left out these tests: validation-0 validation-smp-only-0

Author: Joel Sherrill 2023-07-06T17:46:25.000Z

One of the challenges we have had on issues like this where a BSP runs fine on hardware but not on the simulator is that if the same variant name is used in both cases, there is no way to distinguish HW vs simulator expectation. On the aarch64, I don't think this applies but at least for sparc and i386, the same BSP variant runs on HW and simulator. Our test annotations apply to a BSP – not BSP plus "hw/sim".

Intermittent failures are worse because you can't mark them as expected failures either.

Author: Kinsey Moore 2023-07-06T18:14:00.000Z

Yes, those reasons and differing peripheral support are exactly why I've made sure to have separate QEMU BSPs for all the work I've done. I suspect that sparc and i386 should really have separate BSPs for at least QEMU and maybe also for other simulators that have similar problems.

Author: Trac Migrate 2023-07-10T13:49:21.000Z

In [changeset:"f46c15fd76a4c1904760360cd220a061d74edad4/rtems" f46c15f/rtems]:

```
spec: Add QEMU test annotations

QEMU is known to fail certain tests intermittently due to clock tick
delivery issues. This defines those tests as intermittent for BSPs
intended to run on QEMU alone.

Updates #4922
Updates #4072

Original author: dppinto

Within function bsp_interrupt_raise ther is code active despite described as being dangerous and only to be used for test purposes. It would be a good idea to insert a pragma in the code to present a warning when this is included/used. -> “#pragma GCC warning message”

Additional Notes: To raise an IRQ# from 0-15 there is a proper register that permits that, but to raise IRQ# from 31-16 it is needed to write on top of the pending associated IRQ bit, which can override an already IRQ pending in that line. That is why that code may be dangerous and in the case of forcing IRQ# from 31-16 can only be used for testing.

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). Original ISVV reference for this issue is RTEMS-SMP-CODE-VER-044.

File list: bspssparcleon3starteirq.c (function bsp_interrupt_raise) (line 154-158)

- **Milestone** set to %”6.1”
- **Resolution** set to ~”wontfix”
- **Status** changed from *new* to *closed*

This warning is pretty useless since it is invisible to the user. The hardware limitations are documented in the hardware manuals. We could introduce some sort of a test mode which guards this feature. To keep it simple I tend to not fix it.

Author: Trac Migrate 2023-02-13T08:23:31.000Z

Original author: dppinto

- **Milestone** changed from %”6.1” to %”Indefinite”

- **Resolution** ~"wontfix" deleted
- **Status** changed from *closed* to *reopened*

One option is to remove the raise implementation for extended interrupts and test the extended interrupts through BSP-specific code.

Reduce use of PowerPC CPU model defines now in various PowerPC BSP configure.ac required bsps/powerpc/include/rtems/powerpc/powerpc.h. Some may indicate that the set of predefined CPP macros set as a side-effect of -mcpu=XXX are incomplete.

Original author: rmueller

The chapter to test the test the built BSP is not working for me in its current form. I had to use the following command to perform the tests:

rtems-test –rtems-bsp=erc32-sis ../../rtems/6/sparc-rtems6/erc32/tests

But maybe I also did something wrong? I took care to follow the guide exactly and the BSP was not installed in the src path like recommended. Maybe it would be a good idea to update the command specified in 2.6.

Also, some of the tests failed apparently:

Passed: 577 Failed: 3 User Input: 6 Expected Fail: 1 Indeterminate: 0 Benchmark: 3 Timeout: 0 Test too long: 0 Invalid: 0 Wrong Version: 0 Wrong Build: 0 Wrong Tools: 0 ———— Total: 590 Failures: User Input: capture.exe dl10.exe fileio.exe monitor.exe termios.exe top.exe Expected Fail: psxfenv01.exe Benchmark: dhrystone.exe linpack.exe whetstone.exe Average test time: 0:00:00.264940 Testing time : 0:02:36.314482

Original author: rmueller

When installing the tool suite for a git clone, the build set 5/rtems-sparc does not appear to be available anymore.

It would be a good idea to update to Quick Start guide accordingly.

Running ../source-builder/sb-set-builder –list-bsets yields the list of build sets and 5/rtems-sparc is not among them.

So installing 5/rtems-sparc is not possible.

Kind Regards Robin

Original author: novium.kyle

I have been trying to build the BSP for the ATSAM architecture following the Quick Start Guide and the RSB BSP Build. However, the build keeps failing.

RSB seems to be set up properly:

```
$ ../source-builder/sb-check
RTEMS Source Builder - Check, 6 (65f83cf973d6)
Environment is ok
```

And I can see the bset:

```
$ ../source-builder/sb-set-builder --list-bsets
RTEMS Source Builder - Set Builder, 6 (65f83cf973d6)
Examining: config
Examining: ../source-builder/config
Examining: ../bare/config
Examining: config
...
7/rtems-x86_64.bset
bsps/atsamv.bset
bsps/beagleboneblack.bset
...
```

This is the command I'm trying to use:

```
$ ../source-builder/sb-set-builder --prefix=$HOME/qs/rtems/6 --target=arm-rtems6 -
↪-with-rtems-bsp=atsamv --with-rtems-tests=yes 6/rtems-kernel
RTEMS Source Builder - Set Builder, 6 (65f83cf973d6)
Build Set: 6/rtems-kernel
config: tools/rtems-kernel-6.cfg
package: rtems-kernel-bsps-1
building: rtems-kernel-bsps-1
error: building rtems-kernel-bsps-1
```

(continues on next page)

(continued from previous page)

```
Build FAILED
See error report: rsb-report-rtems-kernel-bsps-1.txt
error: building rtems-kernel-bsps-1
Build Set: Time 0:00:00.301361
Build FAILED
```

I have also tried:

```
--with-rtems-bsp=atsam
```

and:

```
--with-rtems-bsp=arm
```

This is the error from the log file mentioned:

```
building: rtems-kernel-bsps-1

What am I doing wrong here? And where in the manual is this explained?

Author: Joel Sherrill 2022-12-14T23:38:10.000Z

Original author: novium.kyle

- **Owner** set to @chrisj
- **Status** changed from *new* to *assigned*

I normally just use the RSB to build the tools and then waf to build the BSP. This procedure is covered in the Users Manual. This works well so I am not sure what happened here unless the kernel RSB bset has an issue.

In fact, today I posted results from the rtems-bsp-builder tool which builds every BSP in multiple configurations and there were no failures. The atsamv built fine per https://lists.rtems.org/pipermail/build/2022-December/038438.html.

My guess at this point is that your $PATH has a space in it based on this output from your post:

```
/home/kyle/qs/src/rsb/rtems/build/rtems-kernel-bsps-1/do-build: 4:␣
↪export: (x86)/NVIDIA: bad variable name
```

Beyond that, is there something in a log or rsb-* file which might indicate what went wrong?

Author: Trac Migrate 2022-12-21T03:17:30.000Z

Original author: novium.kyle

That $PATH problem was my mistake. I had started a new shell when I went to reproduce the problem and copy the output for this ticket. I forgot to do the export on my $PATH which typically is this:

```
/usr/lib/lightdm/lightdm:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/
↪bin:/sbin:/bin:/usr/games:/usr/local/games:/home/kyle/qs/rtems/6/bin
```

In which case the error is this:

```
+ ./waf configure --prefix=/home/kyle/qs/rtems/6 --rtems-config=config.
↪ini
Setting top to                           : /home/kyle/qs/src/rsb/rtems/
↪build/rtems-kernel-bsps-1/rtems-kernel-bsps-1-
↪d0b92735b0dfd509e1edb82c7145042b67714f43/rtems-
↪d0b92735b0dfd509e1edb82c7145042b67714f43
Setting out to                           : /home/kyle/qs/src/rsb/rtems/
↪build/rtems-kernel-bsps-1/rtems-kernel-bsps-1-
↪d0b92735b0dfd509e1edb82c7145042b67714f43/rtems-
↪d0b92735b0dfd509e1edb82c7145042b67714f43/build
Regenerate build specification cache (needs a couple of seconds)...
Section name 'atsamv' is a malformed 'arch/bsp' tuple
(complete log in /home/kyle/qs/src/rsb/rtems/build/rtems-kernel-bsps-1/
↪rtems-kernel-bsps-1-d0b92735b0dfd509e1edb82c7145042b67714f43/rtems-
↪d0b92735b0dfd509e1edb82c7145042b67714f43/build/config.log)
shell cmd failed: /bin/sh -ex  /home/kyle/qs/src/rsb/rtems/build/rtems-
↪kernel-bsps-1/do-build
error: building rtems-kernel-bsps-1
```

The line:

```
Section name 'atsamv' is a malformed 'arch/bsp' tuple
```

gave me a clue. So I used:

```
../source-builder/sb-set-builder --prefix=$HOME/qs/rtems/6 --target=arm-
↪rtems6 --with-rtems-bsp=arm/atsamv --with-rtems-tests=yes 6/rtems-
↪kernel
```

Which begs the question, why does the Quick Start Guide use:

```
--with-rtems-bsp=erc32
```

in Section 2.5.1 if its supposed to be 'arch/bsp'?

But that command seems to complete successfully:

```
$ ../source-builder/sb-set-builder --prefix=$HOME/qs/rtems/6 --
↪target=arm-rtems6 --with-rtems-bsp=arm/atsamv --with-rtems-tests=yes␣
↪6/rtems-kernel
RTEMS Source Builder - Set Builder, 6 (65f83cf973d6)
Build Set: 6/rtems-kernel
config: tools/rtems-kernel-6.cfg
package: rtems-kernel-bsps-1
building: rtems-kernel-bsps-1
sizes: rtems-kernel-bsps-1: 225.306MB (installed: 33.319MB)
cleaning: rtems-kernel-bsps-1
reporting: tools/rtems-kernel-6.cfg -> rtems-kernel-bsps-1.txt
reporting: tools/rtems-kernel-6.cfg -> rtems-kernel-bsps-1.xml
staging: rtems-kernel-bsps-1 -> /home/kyle/qs/src/rsb/rtems/build/tmp/
↪sb-1000-staging
installing: rtems-kernel-bsps-1 -> /home/kyle/qs/rtems/6
cleaning: rtems-kernel-bsps-1
installing: 6/rtems-kernel -> /home/kyle/qs/rtems/6
clean staging: 6/rtems-kernel
Staging Size: 33.323MB
Build Set: Time 0:00:15.271741
```

But then the test fails:

```
$ rtems-test --rtems-bsp=arm/atsamv build/arm/atsamv
RTEMS Testing - Tester, 6.0.not_released
Command Line: /home/kyle/qs/rtems/6/bin/rtems-test --rtems-bsp=arm/
↪atsamv build/arm/atsamv
Host: Linux DESKTOP-U0P8IUP 5.10.16.3-microsoft-standard-WSL2 #1 SMP␣
↪Fri Apr 2 22:23:49 UTC 2021 x86_64
Python: 3.10.6 (main, Nov 14 2022, 16:10:14) [GCC 11.3.0]
Host: Linux-5.10.16.3-microsoft-standard-WSL2-x86_64-with-glibc2.35␣
↪(Linux DESKTOP-U0P8IUP 5.10.16.3-microsoft-standard-WSL2 #1 SMP Fri␣
↪Apr 2 22:23:49 UTC 2021 x86_64 x86_64)
error: cannot find bsp configuration file: arm/atsamv.ini
```

Where am I going wrong? Am I malforming the command parameters again? Are the proper forms documented anywhere? I haven't seen anything in the manual yet.

Author: Trac Migrate 2023-05-19T04:04:25.000Z

Original author: novium.kyle

I can confirm this is an error in the documentation - it should be made with a *slash*, that is `../rsb/source-builder/sb-set-builder --prefix=$HOME/rtems/6/ --host=sparc-rtems6 --with-rtems-bsp=sparc/erc32 6/rtems-libbsd`, or `../rsb/source-builder/sb-set-builder --prefix=$HOME/rtems/6/ --target=aarch64-rtems6 --with-rtems-bsp=aarch64/raspberrypi4b --with-rtems-test=yes 6/rtems-kernel`

Summary

The Mongoose webserver (mghttpd) in RTEMS is old and pre-dates the change to GPL. The project forked and the permissive licensed code lives on as Civitweb. The mghttpd code in RTEMS is from before the split and is unmaintained upstream.

Civitweb can be built using the RSB. It is an active project.

It is recommended that users migrate to Civitweb.

The mghttd code is deprecated in RTEMS 6 and will be removed before RTEMS 7 branches.

Summary

Steps to reproduce

https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/libcsupport/src/termios_baudtable.c?ref_type=heads https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/libcsupport/src/termios_setbestbaud.c?ref_type=heads#L43

The algorithm in `rtems_termios_set_best_baud()` successively iterates over the elements of the `rtems_termios_baud_table` and searches for a fitting baud rate (checking by "is element lower than the `baud` parameter, then checks the next element, ...).

The table of baud rates is not sorted correctly from a certain point on, therefore the algorithm for choosing the optimal baud rate does not work for every baud rate.

e.g. if the input is `7200` (which is in the table) the search terminates at `9600` as that is larger, the last entry was `4800`, so in the check it sets it to either of those, but not the `7200`.

We observed it when we entered `38401` (due to measurement errors on the hardware was a bit larger). We identified the search ending at `57600` and it ended using the `last = 28800`.

Summary

Run time symbol loading from an object file is broken. The change to track dependencies added support to check the origin of a symbol to track dependencies. Runtime loading of symbols requires the symbol `rtems_rtl_base_sym_global_add` be in the symbol table. Loading an symbol object file causes a constrictor attribute function to be run and that calls `rtems_rtl_base_sym_global_add` adding the base image global symbols. Currently attempting to load a symbol object file results in an unresolved external to `rtems_rtl_base_sym_global_add` because the symbols is inserted into the global symbol table and not added to the base image's global symbols.

Also `rtems-syms` does not correctly export the needed TLS data.

The `machine/_kernel_time.h` header has:

```
#define         getboottime(_tvp) _Timecounter_Getboottime(_tvp)
#define         getboottimebin(_bt) _Timecounter_Getboottimebin(_bt)
```

however `machine/_timecounter.h` does not have a prototype for `_Timecounter_Getboottime` and GCC 14 now generates an error.

Original author: lsilistr

When running SMP with CONFIGURE_MAXIMUM_PROCESSORS < total number of harts, the unused harts that start will allocate interrupt stacks from the sections following .rtemsstack. 16 bytes are used (written) while parking the core in _CPU_Thread_Idle_body.

Unallocated _Per_CPU_Information is also used but only for pointer math - this seems to work out fine.

It does seem like practically, with the default linkcmds, unless the cores are held/delayed by a debugger, they would never end up writing in memory before that memory is used -.rtemsstack is followed by .work.

Is this intended/known behaviour?

Author: Trac Migrate	2022-10-07T05:06:16.000Z

  Author: Allan Hessenflow 2026-01-16T03:54:44.833Z

  I’m testing in main, not a 6.x branch, but newlib01 is also broken for the efm32gg11 bsp and it runs okay if I revert the referenced IOP changes. It seems likely to be the same issue seen with the zynqmp_qemu. Here’s what I’ve found and a possible fix:

  This call chain occurs (omitting some irrelevant stuff) exit() -> fatal_extension() -> fstat() -> rtems_libio_get_iop().

  That calls rtems_libio_iop_hold() followed by rtems_libio_iop_drop() because the descriptor is closed.

  Then rtems_libio_iop_drop() -> rtems_libio_free() -> rtems_libio_free_iop(). However the referenced iop is already on the free list. So I added an additional check below before calling rtems_libio_free_iop(), which appears to fix the problem. However I don’t feel I have a good understanding of how all this IOP stuff is intended to work so hopefully someone who does will evaluate and comment.

I'll also note that spintrcritical24 was failing as well on the efm32gg11 and it also appears to be fixed with this change. It had been ending up in an infinite loop trying to count free iops because rtems_libio_iop_free_head->data1 == rtems_libio_iop_free_head. That state is consistent with an iop being appended to the free list twice.

```

Author: Allan Hessenflow 2026-01-16T17:27:01.435Z

On further reflection the possible fix above is certainly incorrect. A better fix would be the one below, replace the test !rtems_ibio_iop_is_free() inside rtems_libio_free_iop() with an atomic test and set of LIBIO_FLAGS_FREE prior to the rtems_libio_lock(). I'm fairly confident this correctly addresses the newlib01 case. I don't know about spintrcritical24 (it does pass with the efm32gg11 bsp with either patch but I can't explain why; it is very sensitive to timing).

With additional testing I can now explain the spintrcritical24 failures I've seen and the patch above that adds the atomic test and set of LIBIO_FLAGS_FREE in rtems_libio_free_iop outside the semaphore protected section is a correct fix for that as well as for newlib01.

In spintrcritical24 fcntl() is called from inside an interrupt on a file descriptor that is being closed from a normal task at approximately the same time. The close() results in rtems_libio_free_iop() being called. If the interrupt occurs inside that function after the test for LIBIO_FLAGS_FREE and before that flag is set then the free occurs twice on the same descriptor, messing up the free list.

The newlib01() test is similar in that it causes rtems_libio_free_iop() to be called at a point in the exit() process when semaphores can no longer be taken.

After this patch I'm not certain there isn't still a window for spintrcritical24 to cause a problem. If the interrupt were to occur earlier, but still after LIBIO_FLAGS_OPEN has been cleared and the hold close() had on the descriptor has been dropped, then the rtems_libio_free_iop() would actually occur during the interrupt context. Assuming this scenario is possible, one solution would be to check for interrupt context prior to the test+set of LIBIO_FLAGS_FREE and not proceed in that case.

Finally, I think it would also be acceptable to just declare spintrcritical24 as invalid since I don't think fcntl() is ever guaranteed to be safe from an interrupt context. If it was my decision I'd still fix it on the off chance there is or will someday be a function that takes a file descriptor and that's specified as interrupt safe, by using either of the above patches combined with an ISR_Is_in_progress() check. In the case of newlib01, in general calling fstat() on an already closed file isn't safe since the descriptor could have been reused, but when newlib01 does it that isn't posslbe and either of the two above patches would allow newlib01 to do so.

Merges	0

Summary

The u-boot support for powerpc/qoriq is not complete. Under bsps/powerpc/qoriq/include/bsp.h, bsp_uboot_getenv is declared if HAS_UBOOT is defined. However, in HAS_UBOOT is not configurable through waf and variables needed by bsp_uboot_getenv are not defined for qoriq.

Steps to reproduce

- Add the .yml file under spec so that HAS_UBOOT can be defined in config.ini
- Add uboot_support.c to define the u-boot environment base address and size

Expected behaviour

User can have “HAS_UBOOT = True” in config.ini when building RTEMS, and then use bsp_uboot_getenv in applications to access the u-boot environment variables.

powerpc, qoriq

Summary

The psxaio05 test fails on both hardware and QEMU BSPs with:

```
../../../testsuites/psxtests/psxaio05/init.c: 142 status == 0
```

Steps to reproduce

Run the psxaio05 test under QEMU with:

```
qemu-system-aarch64 -no-reboot -nographic -serial mon:stdio -machine xlnx-zcu102 -
↪m 4096 -kernel build/aarch64/zynqmp_qemu/testsuites/psxtests/psxaio05.exe
```

1.8.1.80.2.1 Pre-set options

Author: Kinsey Moore 2025-03-11T20:34:44.479Z

assigned to @opticron

Author: yang zhang 2025-03-20T06:32:27.762Z

I also find this issue, i think the reason maybe below: In toolchain, <limits.h> also define AIO_LISTIO_MAX /* * Definitions of the following may be omitted if the value is >= stated * minimum but is indeterminate. */

So AIO_LISTIO_MAX in <aio_misc.h> won't be defined again.

Author: Amar Takhar 2025-10-12T18:25:20.534Z

Does this need fixing for 7.1? If not please bump.

Author: Kinsey Moore 2025-10-12T18:25:20.494Z

Moved.

Author: Kinsey Moore 2025-12-26T18:16:05.074Z

As Yang noted, this appears to be an issue with conflicting definitions and this is no longer present on main/7. I will submit a fix for the 6 branch that overrides the toolchain value.

https://git.rtems.org/rtems-tools/tree/doc

Still exists.

Author: Joel Sherrill 2023-02-09T16:04:32.000Z

I think that much of the content in rtems-tools/doc is NOT in the Users Guide. The discussion of the RTEMS Tester in the Users Guide takes a different view and appears to never show how to use it which is the focus of much of this documentation. I don't think this is a simple remove some files.

Merges	0

Summary

The u-boot support for powerpc/qoriq is not complete. Under bsps/powerpc/qoriq/include/bsp.h, bsp_uboot_getenv is declared if HAS_UBOOT is defined. However, in HAS_UBOOT is not configurable through waf and variables needed by bsp_uboot_getenv are not defined for qoriq.

Steps to reproduce

- Add the .yml file under spec so that HAS_UBOOT can be defined in config.ini
- Add uboot_support.c to define the u-boot environment base address and size

Expected behaviour

User can have “HAS_UBOOT = True” in config.ini when building RTEMS, and then use bsp_uboot_getenv in applications to access the u-boot environment variables.

powerpc, qoriq

Comment to the next patch proposal

```
--- a/bsps/arm/tms570/console/tms570-sci.c
+++ b/bsps/arm/tms570/console/tms570-sci.c
@@ -311,7 +311,7 @@ bool tms570_sci_set_attributes(
/* Apply baudrate to the hardware */
baudrate *= 2 * 16;
bauddiv = (BSP_PLL_OUT_CLOCK + baudrate / 2) / baudrate;
-  ctx->regs->BRS = bauddiv? bauddiv - 1: 0;
+  ctx->regs->BRS = bauddiv? bauddiv - 2: 0;
```

I think that change is not correct. The actual used values for BSP_PLL_OUT_CLOCK and baudrate should be provided to analyze the case. The code can result in some rounding error and can be enhanced if fractional divider is used or even super fine-grained fractional divider. But these options are available only for for SCI/LIN peripheral case.

According to

TMS570LS31x/21x 16/32-Bit RISC Flash Microcontroller Technical Reference Manual Literature Number: SPNU499B

26.2.3 SCI Baud Rate

SCICLK Frequency = VCLK Frequency / (P + 1 + M / 16)

Asynchronous baud value = SCICLK Frequency / 16

So the subtraction of one corresponds to the manual.

Actual code does not use M part. It would be problem if it is leftover from some boot/monitor but it is part of BRS 32-bit register which is overwritten in the whole, so such problem should not appear either.

So I vote against the proposed change for now and suggest to do analysis what happens in the computation and what are input values and output. Change would/could affect negatively large number of combinations of the baudrate and clocks.

I would consider to discuss if the rounding formula could/should be updated, but I think that it is the best which cane be achieved for rations which do not result in exact ratio.

```
(BSP_PLL_OUT_CLOCK + baudrate / 2) / baudrate;
```

If there is interrest then code can be enhanced by fraction dividers for SCI/LIN peripheral case. The field with variant should be added into tms570_sci_context and in this case the alternative formula can be used

```
long long bauddiv;
bauddiv = (BSP_PLL_OUT_CLOCK * 16ll + baudrate / 2) / baudrate;
ctx->regs->BRS = ((bauddiv >> 4) & 0xffffff) | ((bauddiv & 0xf) << 24);
```

which should be rewritten after header for SCI/LIN update to

```
ctx->regs->BRS = TMS570_LIN_BRS_P(bauddiv >> 4) | TMS570_LIN_BRS_
↪M(bauddiv & 0xf);
```

Original author: sebastian.huber

This ticket summarises activities carried out by a 24 month project sponsored by the European Space Agency (ESA). The project start was February 2019.

The main goal of the project is to enable European space missions to use RTEMS as a software product in criticality category C (this is basically category B without independent software verification and validation, ISVV). Criticality category C means according to ECSS-Q-ST-80C:

“Software that if not executed, or if not correctly executed, or whose anomalous behaviour can cause or contribute to a system failure resulting in: Major consequences”

In ECSS-Q-ST-40C major consequences are characterized in Table 6-1 as a major mission degradation without effects to the outside world of the system. A future activity may perform ISVV to enable a use in category B settings.

The qualification will be done according to ECSS standards (ECSS-E-ST-40C and ECSS-Q-ST-80C). The standards are available at

http://ecss.nl/

free of charge after registration.

The project consists of four major tasks.

1. Qualification toolchain

This task aims to produce a tool chain so that qualification related work can be carried out efficiently. For example: document generation, test suite runs (including code coverage), test reporting, test result archiving, code metrics, static code analysis, traceability (e.g. requirements to tests), etc.

2. RTEMS SMP qualification data package

This task covers the main RTEMS components (source code, tests, documentation; new: requirements document, ECSS standard tailoring) so that a data package for space mission consumers can be generated.

-

3702: Space profile for RTEMS SMP

-

3703: Technical Specification (TS) for space profile

-

3715: Add Requirements Engineering chapter to RTEMS Software Engineering Handbook

-

3726: Select a requirements engineering tool

-

3705: Software Design Document (SDD) for space profile

-

3704: Review and update Doxygen recommendations

-

3706: Create a hierarchy of RTEMS software components using Doxygen groups

-

3707: Assign each code file to a Doxygen group

-

3708: Remove Doxygen comments from confdefs.h

-

3716: Unit, integration and validation tests for space profile

-

3717: Add test guidelines chapter to RTEMS Software Engineering Handbook

-

3718: Add support for test plans

-

3199: New test framework

3. RTEMS SMP formal verification

This is a research project. The aim is to apply formal methods for the verification of a subset of the RTEMS SMP algorithms.

4. RTEMS SMP application porting

The goal of this task is to port an existing uniprocessor space software from RTEMS 4.8 (RTEMS Improvement by Edisoft) to RTEMS SMP. The algorithms used by the software needs to be parallelized.

The project partners are:

- Edisoft (prime) and [CISTER](http://www.cister.isep.ipp.pt/) from Portugal
- Lero with Lero researchers from Trinity College Dublin and University of Limerick from Ireland
- Jena-Optronik GmbH and [embedded brains GmbH](https://embedded-brains.de/) from Germany

The results of this activity should be open source and available to the RTEMS community.

* #3703: Technical Specification (TS) for space profile
* #3705: Software Design Document (SDD) for space profile
* #3704: Review and update Doxygen recommendations
* #3706: Create a hierarchy of RTEMS software components using Doxygen␣
↪groups
* #3707: Assign each code file to a Doxygen group
```

(continues on next page)

(continued from previous page)

```
+       * #3708: Remove Doxygen comments from confdefs.h

3. RTEMS SMP formal verification

This is a research project. The aim is to apply formal methods for the verification of a subset of the RTEMS SMP algorithms.

4. RTEMS SMP application porting

The goal of this task is to port an existing uniprocessor space software from RTEMS 4.8 (RTEMS Improvement by Edisoft) to RTEMS SMP. The algorithms used by the software needs to be parallelized.

The project partners are:

* [Edisoft](http://www.edisoft.pt/) (prime) and [CISTER](http://www.cister.isep.ipp.pt/) from Portugal

* [Lero](https://www.lero.ie/) with Lero researchers from Trinity College Dublin and University of Limerick from Ireland

* [Jena-Optronik GmbH](https://www.jena-optronik.de/) and [embedded brains GmbH](https://embedded-brains.de/) from Germany

The results of this activity should be open source and available to the RTEMS community.

- **Description** changed

```
This ticket summarises activities carried out by a 24 month project sponsored by the European Space Agency (ESA). The project start was February 2019.

The main goal of the project is to enable European space missions to use RTEMS as a software product in criticality category C (this is basically category B without independent software verification and validation, ISVV). Criticality category C means according to [ECSS-Q-ST-80C](http://ecss.nl/standard/ecss-q-st-80c-rev-1-software-product-assurance-15-february-2017/):

"Software that if not executed, or if not correctly executed, or whose
```

(continues on next page)

(continued from previous page)

```
↪anomalous behaviour can cause or contribute to a system failure␣
↪resulting in: Major consequences"

In [ECSS-Q-ST-40C](https://ecss.nl/standard/ecss-e-st-40c-software-
↪general-requirements/) major consequences are characterized in Table␣
↪6-1 as a major mission degradation without effects to the outside␣
↪world of the system. A future activity may perform ISVV to enable a␣
↪use in category B settings.

The qualification will be done according to ECSS standards (ECSS-E-ST-
↪40C and ECSS-Q-ST-80C). The standards are available at

http://ecss.nl/

free of charge after registration.

The project consists of four major tasks.

1. Qualification toolchain

This task aims to produce a tool chain so that qualification related␣
↪work can be carried out efficiently. For example: document generation,
↪ test suite runs (including code coverage), test reporting, test␣
↪result archiving, code metrics, static code analysis, traceability (e.
↪g. requirements to tests), etc.

2. RTEMS SMP qualification data package

This task covers the main RTEMS components (source code, tests,␣
↪documentation; new: requirements document, ECSS standard tailoring)␣
↪so that a data package for space mission consumers can be generated.

* #3702: Space profile for RTEMS SMP
* #3703: Technical Specification (TS) for space profile
+       * #3715: Add Requirements Engineering chaper to RTEMS Software␣
↪Engineering Handbook
* #3705: Software Design Document (SDD) for space profile
* #3704: Review and update Doxygen recommendations
* #3706: Create a hierarchy of RTEMS software components using Doxygen␣
↪groups
* #3707: Assign each code file to a Doxygen group
* #3708: Remove Doxygen comments from confdefs.h
+    * #3716: Unit, integration and validation tests for space profile
+       * #3717: Add test guidelines chapter to RTEMS Software␣
↪Engineering Handbook
+       * #3718: Add support for test plans
```

(continues on next page)

(continued from previous page)

```
+       * #3199: New test framework

3. RTEMS SMP formal verification

This is a research project. The aim is to apply formal methods for the verification of a subset of the RTEMS SMP algorithms.

4. RTEMS SMP application porting

The goal of this task is to port an existing uniprocessor space software from RTEMS 4.8 (RTEMS Improvement by Edisoft) to RTEMS SMP. The algorithms used by the software needs to be parallelized.

rtems-test does not report the set of failed tests to the user at the conclusion of its run. It only gives a summary by category. They ARE in the log file. I assume this is a minor issue now that I have spotted the pattern.

I assume this also applies to 5 but I spotted it on 6 during the recent heavy round of manual testing.

Author: Amar Takhar 2024-05-17T02:02:50.798Z

Joel are you OK with this being moved to %6.2 Since there is already a solution this is more of an ease-of-use feature.

Author: Joel Sherrill 2024-05-17T13:46:01.611Z

It is not an ease of use feature. If interactive, you do not get the list of failures unless you enable logging.

I don't mind moving the milestone though. This has been sitting here for 3 years already.

Commit	de23ff5960decc2db58e75188a0ca28f4c6864d8

Summary

add modified gpio handling and adc section to BBB

could close #5198

This is based on the work of ketul93 (https://gist.github.com/ketul93/d717555951174a74c8b4)

All gpio I/O pins can be used (Mode7). Extension of the adc-section to be able to use optional channels.

I am unsure whether I meet the requirements for RTEMS code development ;-) However, I was able to put the BBB into production with these changes.

Author: Amar Takhar 2025-09-03T14:12:24.808Z

changed target branch from `main` to `6`

Author: Amar Takhar 2025-09-03T14:14:00.020Z

Couple of issues in the commit messages see: https://gitlab.rtems.org/rtems/rtos/rtems/-/jobs/14290

Author: Heinz Junkes 2026-09-10T22:31:50.591Z

Sorry, I wanted to delete the fork and do everything from scratch with 6.1 fork. Unfortunately I can't manage it :-(I can't delete my fork and the merge request. And I can't create a new fork of 6.1 either. And customizing the commit message is not clear to me either. Unfortunately, I've probably gone off the rails here. Can you give me a tip on how to proceed? I would like to try again.

Author: Kinsey Moore 2026-09-10T22:31:50.591Z

First off, I would recommend against working directly on upstream branches going forward (once we've sorted all this out). When starting a new feature branch for 6, I tend to check out 6 branch, update it, and then create a new branch of the form br6-short-description. However, this advice does no good for you at the moment.

You need to edit your existing commit and push that updated commit with the -f flag to overwrite the content on your fork which will update this MR. Which step are you getting stuck on?

Author: Heinz Junkes 2026-09-10T22:31:50.591Z

I have now managed to change my commit message in the gilab gui and this time it went through. I am curious what will happen now ;-) Thank you

Author: Kinsey Moore 2026-09-10T22:31:50.591Z

Changing the title of the MR is not sufficient. You need to change the subject line of the commit which can still be seen as the original text under the “Commits” tab.

Author: Wayne Thornton 2026-09-10T22:31:50.591Z

@junkes The best way is to run a git commit –amend in your terminal and update the commit message to comply with what is being requested. Then run a git push -f (which forces the push to the repo). The MR will automatically update with the changed commit messages.

Author: Kinsey Moore 2026-09-10T22:31:50.591Z

@junkes I suggest you hop on discord so we can work out your workflow.

Author: Heinz Junkes 2025-09-03T15:26:46.113Z

Commit	8b5a6cb7d64dcecc6b6c6f2377ddecdb860098d5

Summary

bsps/shared/nandpsu: Invalidate page cache on erase

When the opportunistic page cache was added, invalidation was only added for writes. This could result in bad behavior under certain access patterns where a read is used to verify an erase. This change ensures that the page cache is invalidated on block erasure.

Updates #5803

The second patch reduces the invalidation footprint to what is actually necessary instead of being overbroad.

Commit	4a76fe06008c70dc40f01bce76071bdca612a52c

Summary

cpukit/libmisc/shell/main_mdump.c: Use uintptr_t to print address

The behavior of the %p printf() specifier is implementation dependent. The behavior varies on RTEMS between printf() and printk(). This change prints an address as a uintptr_t to ensure formatting is consistent. It also adjusts the output width based on target architecture pointer size.

Author: Christian Mauderer 2026-09-18T06:39:51.729Z

Are really both IRQs on the same number? I have seen controllers like that but it could be also a copy and paste bug.

Author: Vijay Banerjee 2026-09-18T06:39:51.729Z

Hi Christian. Thanks for the review!

Yes. According to the board's manual they are both same.

Author: Christian Mauderer 2026-09-18T06:40:20.154Z

You defined the `BSP_UART_IOBASE_COM1` in BSP.h. Why don't you use a `BSP_UART_IOBASE_COM1 + 0xa0` here instead of the magic number so that it is obvious that it's an access to the COM1?

Author: Vijay Banerjee 2026-09-18T06:40:20.154Z

This is not a COM access. `0xfef88000` is the base of the Hawk ASIC's external register sets. The UART happens to sit at the base of the register set and it occupies offsets `00` to `70`. `80` is the STATUS register and at `a0` is the reset register (MODRST). This call is setting the reset register that triggers a board reset. I have tested this on hardware.

Author: Christian Mauderer 2026-09-18T06:40:20.154Z

OK.

Author: Christian Mauderer 2026-09-18T06:40:38.666Z

That is in the same range as the `BSP_UART_IOBASE_COM1`. Is that correct?

Author: Vijay Banerjee 2026-09-18T06:40:38.666Z

Also outside UART, the `$c8` is the NVRAM base

Author: Christian Mauderer 2026-09-18T06:40:38.666Z

OK.

Commit	2be19a2a0a6b35604f4bc55e714d854bcbfe32ef

Summary

The u-boot support for powerpc/qoriq is not complete. Under bsps/powerpc/qoriq/include/bsp.h, bsp_uboot_getenv is declared if HAS_UBOOT is defined. However, in HAS_UBOOT is not configurable through waf and variables needed by bsp_uboot_getenv are not defined for qoriq.

- Added the .yml files under spec so that HAS_UBOOT can be defined in config.ini
- Updated .yml files for the added build dependencies
- Added uboot_support.c to define the u-boot environment base address and size

I didn't use Generative AI at all, so I left it blank as instructed in the comment from the template. Should I write anything there instead?

Author: Joel Sherrill 2026-02-06T18:31:18.325Z

Where did this address come from? It needs a reference.

Author: Ran Hong 2026-02-06T18:13:04.282Z

changed this line in version 2 of the diff

Author: Ran Hong 2026-02-06T18:31:18.325Z

This address is actually configurable by users. I am developing this feature for a specific board (mvme2500) that can run with the qoriq_e500 BSP. For mvme2500, it has a 512k MRAM (a type of nonvolatile memory) starting from address 0xfff00000, which can be configured to hold the u-boot environment, and it can be access using the same functions in bsps/powerpc/shared/u-boot. I updated the address and mentioned that this can be referenced to the mvme2500 manual.

Author: Joel Sherrill 2026-02-06T18:31:04.303Z

The comment blocks at the top of this file need to follow the RTEMS standard. There are plenty of examples beyond what's documented.

sure. Changed.

Author: Gedare Bloom 2026-02-09T22:19:57.900Z

Is there a reason this targets `6` and not going into `main`?

Author: Ran Hong 2026-02-09T22:19:57.900Z

Since most of my current development work is based on branch 6, so I would like to have it updated first. Then I will create a similar merge request for main.

Author: Gedare Bloom 2026-02-09T22:19:57.900Z

Please have a look at https://docs.rtems.org/docs/main/eng/release-maintenance.html#release-backports to see the process for MRs on release branch. You'll need to create an issue for this, and might need some help to link it to the epic and set the issue metadata.

We will want to have the merge request available for `main` before we merge into `6` most likely.

Author: Ran Hong 2026-02-09T22:19:57.900Z

I do have a issue for this, but I am not so sure how to link the issue (https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5439) with this merge request. I will work on the merge request on main and link it to the issue. After reading Joel's comment, I think I can make the uboot environment base address configurable via waf configure.

Author: Ran Hong 2026-02-09T22:19:57.900Z

I just created another merge request !1046. I modified the code according to the comments Joel gave. The related issue is #5439, but I am not sure how to link them together. Could anyone help? Thanks!

Author: Kinsey Moore 2026-02-06T18:48:00.346Z

This needs a backport issue and the issue should be referenced from the commit message with: `Closes #issuenumberhere`

Author: Kinsey Moore 2026-02-05T22:12:32.227Z

created #5481 to continue this discussion

Author: Kinsey Moore 2026-02-06T18:48:00.346Z

I have created #5481 for this purpose.

Commit	e2859cf1c5dbfde7dc2ddb5e2e0aaa3c0dbda822

Summary

libdebugger: Fix corruption of thread registers with 32 or more threads

The block logic uses realloc to resize memory used by libdebugger when creating a snapshot of threads. Thread registers take a reference to the block and if a realloc changes the base address any references are invalid. Add rebase handler support to blocks that is called when the block base changes and add a handler to thread register blocks to rebase a thread's registers.

Exclude threads using both types of names they can have. This lets all names be reported in extra thread info packets.

Commit	c4553bbd2d35d61adc6e8f5d0b1ca034a0e587d4

Summary

bsps/zynq-uart: fix parity configuration handling

Fix parity handling in zynq_uart_set_attributes() by clearing existing parity bits before setting a new mode instead of always ORing PAR_NONE, which caused incorrect or ignored parity; also fix inverted PARODD logic and add ZYNQ_UART_MODE_PAR_MASK to manage the parity field correctly.

Commit	7f064c49bdea4c0e7c4d6502e0500c4098f01786

Summary

bsps/aarch64: Add missing ISB after SCTLR write

A write to the sctlr_el1 register is a ‘context-changing operation’ and thus requires a pipeline flush for the change to actually take effect on subsequent instructions.

The isb instruction gurantees this, and ensures mmu is enabled immediately.

Commit	be446b02d091a2a745e03405eaab4de078571532

Summary

bsps/shared/dev/flash: Add a flashdev simulation backend

This adds a backend for flashdev that simulates a flash device with adjustable delays to simulate real flash devices and offers configurable flash parameters. This also migrates the JFFS2 filesystem tests to the flashdev framework and eliminates the purpose-built simulated flash in the testsuite in favor of a more generic and widely usable solution.

For all the methods, there is no error checking of parameters. Can they always be trusted? Should there be debug assertions?

Author: Kinsey Moore 2025-12-04T23:42:11.446Z

As far as I'm aware, all the other flashdev backends trust the passed parameters. I suppose debug assertions wouldn't hurt, but those might be better placed in the flashdev framework itself to avoid duplication.

Author: Joel Sherrill 2025-12-04T20:13:47.266Z

Having this second half in an else is unnecessary and makes it look like the function can fall out the bottom.

Commit	571dc6fb3168293f94439fc864e9d05c0c3da490

Summary

Some pkg-config variants perform transformations on the –libs options. This may lead to completely broken linker options:

https://github.com/pkgconf/pkgconf/issues/371

Provide the LDFLAGS as a variable. Do not add the ABI_FLAGS to LDFLAGS since they are already contained in the CFLAGS. The linker command line should include the compiler flags so that link-time optimization works properly.

Update #5165.

changed target branch from `main` to `6`

Author: Sebastian Huber 2025-02-15T05:48:57.400Z

I created the MR with the wrong target branch. Now the pipeline is confused.

Author: Amar Takhar 2025-02-15T05:59:03.534Z

Yes, we actually enacted a new policy and adding to gitlab that branches targeted towards branches need to start with `5-*` or `6-*` gitlab will then automatically set the branch.

This just happened no doc updating the old way is still fine but this way this CI issue won't happen. Let me try and see if restarting the pipeline manually fixes it.

Author: Amar Takhar 2025-02-15T06:00:16.820Z

Nope that didn't fix it let me see how to properly handle this situation it may be how I have the CI setup

Author: Amar Takhar 2025-02-16T09:50:17.653Z

I think we're stuck unless you do an update the source or we have to rebase on it. GitLab will snapshot the state when an MR comes in and use that. I have seen complaints about this exact issue but no solutions anywhere so we'll wait until there is a chance to rebase.

cpukit/flashdev: Clarify interface and update consumers

This clarifies the flashdev out of band read and write interfaces and updates any consumers of those interfaces. This was partially refactored at one point and the refactoring didn't extend to the consumers as it should have.

Closes #5652

This is a duplicate of !1354

Author: Chris Johns 2026-07-27T02:47:33.070Z

Sorry I did not see the linked MR.

Author: Kinsey Moore 2026-07-27T03:32:55.527Z

It is unfortunate that gitlab only appears to link the MRs one direction and does not show “MRs that depend on this one” for a given MR.

Summary

FATAL (assert exception) - output shows wrong version string.

```
*** FATAL ***
fatal source: 7 (RTEMS_FATAL_SOURCE_ASSERT)
fatal code: 2156335792 (0x808712b0)
RTEMS version: 6.1.0.not-released
RTEMS tools: 13.3.0 20240521 (RTEMS 6, RSB no-repo, Newlib 1b3dcfd)
executing thread ID: 0x0b010001
executing thread name: _main_
U-Boot SPL 2018.09-00002-g0b54a51eee (Sep 10 2018 - 19:41:39 -0500)
...
```

Steps to reproduce

In a 'normal' programme 'assert()'

```
assertion "sc == RTEMS_SUCCESSFUL" failed: file "../pyroArrayIOCGpio.c", line 139,
↪ function: testingGpio
```

rtems_get_version_string() shows:

```
rtems-6.1.0 (ARM/ARMv4/beagleboneblack)
```

1.10 RTEMS / Tools / RTEMS Source Builder

Go to *Issues* (page 302) or *Merge Requests* (page 319)

Issues Summary

216 - Microblaze tools do not build for RTEMS 6 (page 303)
214 - Qemu build relies on libslirp.so (backport to 6) (page 304)
213 - Remove libbsd 6-freebsd-12 from the RSB (page 302)
212 - Released LibBSD branches so not build (page 305)
206 - Add a source and hash check to the get sources command (page 306)
197 - Building GDB fails for RTEMS 6 on MacOS (page 314)
188 - spike does not compile and needs C version set (backport to 6 branch) (page 307)
184 - Back port main source-builder to the 6 branch (page 316)
133 - Backport to 6 branch: "config: Update expat to 2.7.3" (page 317)
87 - Unable to build the BSP with Python 3.12 (page 309)
59 - rtems6: spike fails to link on arm64-apple-darwin23.2.0 (page 318)
39 - User manual RSB BSP build examples need updating (page 313)

Merge Requests Summary

303 - qemu-common-2.cfg: Add ${prefix}/lib64 to rpath (page 319)
300 - rtems/libbsd: Handle releases of 6-freebsd-fb14 correctly (page 320)
297 - sb/getsources: Apply missing fixes to the hash checker (page 321)
294 - Fix backport issues and update RTEMS versions and hashes (page 323)
292 - sb/getsources: Check sources all have a valid hash (page 321)
282 - Adjust GDB versions after general move to gdb 17.2 (page 324)
281 - 6/rtems-default.bset: Update to gdb 17.2 (page 326)
263 - sb/defaults: Add C and C++ standard option support for packages (page 331)
260 - rtems/c++: Patch to support C++17 filesystem namespace calls (page 332)
254 - sb: Back port main to the 6 branch (page 327)
248 - sis-2-1.cfg: Define host_c_std as GNU17 (page 333)

1.10.1 Issues

1.10.1.1 213 - Remove libbsd 6-freebsd-12 from the RSB

Id	213

Labels	libbsd, libbsd::freebsd-12, tool::rtems-source-builder
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/213
Merges	0

Summary

Remove RSB support to build LibBSD `6-freebsd-12` as this is only and has known problems. Users need to upgrade to `6-freebsd-14`.

Author: Chris Johns 2026-09-02T00:16:26.863Z

added rtems#15 as parent item

Author: Chris Johns 2026-09-02T00:16:26.956Z

set status to **In progress**

Author: Chris Johns 2026-09-02T00:16:27.060Z

assigned to @chris

Author: Chris Johns 2026-10-31T16:44:55.460Z

set status to **Done**

Author: Chris Johns 2026-10-31T16:44:56.590Z

Fixed. A test release build for 6.3 has:

```
$ ls 6.3/sources/ | grep libbsd
rtems-libbsd-fb14-6.3.tar.xz
```

1.10.1.2 216 - Microblaze tools do not build for RTEMS 6

1.10.1.3 214 - Qemu build relies on libslirp.so (backport to 6)

Id	214
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Closed by	Chris Johns
Created	2026-09-02T12:50:54.775Z
Closed	2026-09-03T01:37:40.560Z
Updated	2026-09-03T01:37:40.565Z
Milestone	6.3
Labels	tool::qemu
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/214
Merges	0

Summary

Backport of #210 with changes in !301

Qemu built by the RSB relies on _libslirp.so_. Unfortunately, the one we build is not used by default so on Rocky 9, it results in a failure:

```
$ ~/rtems-work/tools/next/qemu/bin/qemu-system-arm
/home/joel/rtems-work/tools/next/qemu/bin/qemu-system-arm: /lib64/libslirp.so.0:␣
↪version `SLIRP_4.9' not found (required by /home/joel/rtems-work/tools/next/
↪qemu/bin/qemu-system-arm)
/home/joel/rtems-work/tools/next/qemu/bin/qemu-system-arm: /lib64/libslirp.so.0:␣
↪version `SLIRP_4.7' not found (required by /home/joel/rtems-work/tools/next/
↪qemu/bin/qemu-system-arm)
/home/joel/rtems-work/tools/next/qemu/bin/qemu-system-arm: /lib64/libslirp.so.0:␣
↪version `SLIRP_4.5' not found (required by /home/joel/rtems-work/tools/next/
↪qemu/bin/qemu-system-arm)
```

This can be resolved by setting _LD_LIBRARY_PATH_ to point to the _libslirp.so_ installed by the RSB. The following command or just exporting LD_LIBRARY_PATH works.

```
LD_LIBRARY_PATH=/home/joel/rtems-work/tools/next/qemu/lib64      /tmp/rttools/bin/
rtems-test --rtems-bsp=malta_qemu ``find build -name hello.exe``
```

Depending on the host operating systems this is happening on, it could be negatively impacting the cron sweeper.

Steps to reproduce

This is a normal RSB build of qemu. I think all you need is to be on a host without the _libslirp.so_ version used to build qemu.

Milestone	6.3
Labels	libbsd::freebsd-14
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/212
Merges	0

Summary

The build scripts so not handle releases and default to the standard package name. For LibBSD is `*-freebsd-12` branch that has been removed from releases. The branch `6-freebsd-14` package is `rtems-libbsd-fb14-6.3.tar.xz`.

Fix the support.

Summary

Add a check of the sources and hashes when getting sources to make sure all files have a valid hash reference.

This is important when generating the catalog for use with the download cache.

Summary

The same version of spike is used on the 5, 6, and 7 branches. With recent host OS and compilers, it does not compile because it needs to explicitly include .

This patch spike-1.1.0-add-cstdint.h.diff addresses the issue.

Related to #186

Steps to reproduce

Build with recent host and gcc.

I believe that the versioning function could be replaced by setuptools_scm e.g. as used here https://github.com/DiamondLightSource/python-copier-template/blob/9c6f34d60a138f72fe01aed8f9639773d1ce635d/pyproject.toml#L1-L3

This should be backward compatible to python3.8.

I would be interested in submitting a PR this if it is likely to be of use.

  Disregard this issue. It appears that gdb 15.2 in 6 branch builds fine with a mismatched expat. 16.x must have introduced a new dependency.

Author: Kinsey Moore 2025-10-20T19:10:06.613Z

Summary

This was reported by the OAR Build Sweeper. Full output is at this build list entry. The pertinent output is:

```
g++ -L. -L/lib64  -Wl,-rpath,/Users/tester/rtems-cron-6/tools/6/lib  -o termios-xspike termios-xspike.o  libspike_main.a  libriscv.a  libdisasm.a  libsoftfloat.a  libfesvr.a  libfdt.a -lpthread -lpthread
ld: warning: directory not found for option '-L/lib64'ld: warning:
ld: warning: directory not found for option '-L/lib64'
directory not found for option '-L/lib64'
ld: warning: directory not found for option '-L/lib64'
ld: warning: directory not found for option '-L/lib64'
ld: in libspike_main.a(libriscv.a), archive member 'libriscv.a' with length 448440448 is not mach-o or llvm bitcode file 'libspike_main.a' for architecture arm64
clang: error: linker command failed with exit code 1 (use -v to see invocation)
ld: in libspike_main.a(libriscv.a), archive member 'libriscv.a' with length 448440448 is not mach-o or llvm bitcode file 'libspike_main.a' for architecture arm64
clang: error: linker command failed with exit code 1 (use -v to see invocation)
make: *** [xspike] Error 1
make: *** Waiting for unfinished jobs....
make: *** [libcustomext.so] Error 1
```

This appears to indicate that this version of spike does not have build awareness of arm Macs. Perhaps an update will fix this.

Commit	84b3f5660ebaa96e1e405ca12f67b538b48636d6

Summary

qemu-common-2.cfg: Add ${prefix}/lib64 to rpath

On some hosts, libslirp.so is installed into ${prefix}/lib64 and may be a different version from the host's. This ensures the RSB built qemu uses the intended shared library.

Closes #214.

Summary

rtems/config/tools: Update RTEMS versions and hashes

Update RTEMS repositories to pull in the telnetlib fix in rtems-tools.

This MR also fixes some issues that were brought in with the large backport from main.

This does not have a backport issue. Is this really intended for 6 branch?

Author: Joel Sherrill 2026-07-09T23:08:51.251Z

Yes. It was missed whenever the other targets were moved to gdb 17.2. Using gdb 17.2 isn't as much a backport as a way to build on mac and this one was missed by https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/281.

Author: Kinsey Moore 2026-07-09T23:08:51.251Z

That should not have been merged without referencing a backport issue.

Author: Joel Sherrill 2026-07-09T23:08:51.251Z

This is the original issue. It did not impact 7 at all so it isn't really a backport.

Author: Kinsey Moore 2026-07-09T23:08:51.251Z

I have set the parent on that issue appropriately. Please reference it in the commit message. All commits/MRs to released branches need an associated issue with the appropriate parent (even if they're not technically backports).

The python and defaults updates look fine and some of the package updates make sense, but this also pulls in many .cfg files that aren't referenced at all. This likely results from the 6 branch having already had its unused files pruned and those still existing on main. This likely needs the prune operation applied again and squashed with this commit.

Author: Chris Johns 2026-05-28T22:35:59.858Z

Thanks for review. The only configurations files pulled in are the common base ones and they cannot be used without a version level build set or configuration file. The nice things about the approach used is a single simple `git` command run in the top directory of:

```
git checkout main -- source-builder
```

Pruning means we would have to remove the unused files and a further back pork would add them again. We can:

1. Leave the files
2. Back port from `main`, commit, prune and a further commit
3. Back port from `main` and prune with a single commit

Note, other configuration files maybe needed if we need to use more recent configuration files. This complicates the build and testing if pruning.

Summary

When attempting to run the RTEMS tester with Python 3.13 an error about no `telnetlib` support appears.

Steps to reproduce

1.11.1.2.2.1 Pre-set options

Author: Kinsey Moore	2025-03-02T02:21:55.776Z

assigned to @opticron

Author: Kinsey Moore	2025-02-28T22:39:31.957Z

assigned to @opticron

Author: Kinsey Moore 2025-02-28T22:39:32.416Z

Author: Kinsey Moore 2026-07-31T16:28:04.497Z

On further investigation, this is 2 separate issues. The escapes need to be fixed to resolve the warnings and the actual exit is caused by missing telnetlib since it was deprecated in 3.11 and removed in 3.13.

Author: Kinsey Moore 2026-07-31T16:28:04.497Z

On debian systems, there is currently a workaround for the actual exit issue by installing `python3-zombie-telnetlib`.

Author: Amar Takhar 2026-07-31T16:28:04.497Z

The current state of telnetlib isn't great I don't think there are any maintained ones. This one is its own project but no activity from the maintainer in years: https://github.com/jquast/telnetlib3

The Python one was just removed there is nobody touching the code anymore which is why they called it 'zombie' .. apt name.

`telnetlib3` is at least installable via pypi. I'm not sure if it's a drop in replacement does it work can you try it out?

FreeBSD for example has no telnet library for python available and I'm sure that's true for most OS the Python project itself recommends either telnetlib3 or Exscript which is even more out of maintainership

Author: Kinsey Moore 2026-07-31T16:28:04.497Z

`telnetlib3` *appears* to be a mostly drop-in replacement (s/telnetlib/telnetlib3/g), but I don't have an example of a tester configuration that actually uses it, so I can't verify that functionality completely.

Author: Chris Johns 2026-07-31T16:28:04.497Z

https://docs.rtems.org/docs/main/user/testing/configuration.html#console and look for:

```
%define bsp_tty_dev      1.2.3.4:8989
```

Author: Kinsey Moore 2026-07-31T16:28:04.497Z

Ah, I *do* actually have a test configuration that I can verify this on. It'll probably have to wait until Monday.

Commit	214a3eeca7967808fa1afd2e4a97257ad998cf61

tester/rt/tftp.py: Prevent infinite hang

When tester setups are not ideal, conditions can occur where the tftp tester can hang indefinitely on a given test. This has been demonstrated both with corrupted output from the ZynqMP platform and with a hanging test on the versal platform. This condition also causes a loss of test data since the report is never written.

The solution is to set self.opened = False after the loop in open() to allow processing to proceed.

Closes #23

Summary

If a list of BSPs is provided during configure and not all of that list is actually installed at the target prefix directory, two different outcomes can occur depending on the set of BSPs.

- If all BSPs are of the same architecture and one of them is installed in the prefix directory, configuration succeeds.
- If the BSPs are of two or more architectures and any of the architectures does not have a valid BSP (even if others do), then configuration fails.

This is caused by the `found` check in the first loop in `_check_arch_bsps` in rtems.py.

Steps to reproduce

Install the aarch64/zynqmp_apu BSP in the prefix directory. Configure rtems-lwip (or any other project that uses rtems_waf) with aarch64/zynqmp_apu,aarch64/zynqmp_qemu. The configuration attempt will succeed even though the aarch64/zynqmp_qemu BSP is not installed.

Now, configure rtems-lwip with aarch64/zynqmp_apu,arm/zynqmp_rpu_split_0 without performing additional BSP installations. The configuration attempt will fail.

Summary

Please highlight the value of Rtems in the architecture page:

1. All links point to a blank page `We are working on content this page is intentionally left blank` with an additional link to the source code. Please point to the pages in the reference documentation such as https://docs.rtems.org/branches/master/cpu-supplement/arm.html, or to the source code directly if that's the intention. Right now there is no point in consulting this architectures page.
2. Why mention "obsoleted ports" at all on this page? Can that information be moved to a page specific to a particular release, for example https://docs.rtems.org/branches/master/cpu-supplement/preface.html ?
3. What is the process for having new supported architectures and what are the future plans for the RTEMS project?

Summary

The FTP link to the RTEMS Source Builder (RSB) under the Quick Start section in the documentation is outdated and results in a 404 error. Currently, it points to:`https://ftp.rtems.org/pub/rtems/releases/6/6.0/sources/rtems-source-builder-6.0.tar.xz`

This link is broken and needs to be updated to the latest release, such as:`https://ftp.rtems.org/pub/rtems/releases/6/rc/6.1-rc7/sources/rtems-source-builder-6.1-rc7.tar.xz`

Link to the documentation page with the issue:RTEMS Quick Start - Sources Section

Author: Vidhu Sarwal 2024-12-31T11:38:35.368Z

Will start working on a fix.

Author: Gedare Bloom 2025-01-16T14:48:57.351Z

The problem here is that 6 hasn't finished being released. This is a transition issue during the release. I'm not sure what we should do about it. Maybe link to the parent directory instead?

https://ftp.rtems.org/pub/rtems/releases/6/

Summary

The approver flow in this repo requires 1 general approver and does not require 1 maintainer approver.

See also https://gitlab.rtems.org/administration/gitlab/-/issues/6

Steps to reproduce

Author: Gedare Bloom 2024-05-02T03:44:41.109Z

assigned to @gedare

Author: Amar Takhar 2024-05-02T03:57:25.218Z

marked this issue as related to administration/gitlab#6

Author: Amar Takhar 2024-05-02T03:57:54.881Z

FYI the 'linked items' section is handy keeps things more organised and will combine certain things

Author: Gedare Bloom 2024-05-02T04:07:03.082Z

created branch 6-merge-request-approval-process-is-broken to address this issue

Author: Gedare Bloom 2024-05-02T04:07:34.064Z

mentioned in merge request !6

Author: Gedare Bloom 2024-05-02T04:51:03.785Z

mentioned in merge request !7

Author: Gedare Bloom 2024-05-02T05:18:58.469Z

See https://gitlab.rtems.org/gedare/rtems-docs/-/commit/e59b13dd40f52a3d831967795b70a1681acbb84b for a proof-of-concept patch.

The basic logic is to make the General Approvers section optional, and to require at least 1 approval from the Maintainer Approvers section.

Now, since only 1 approval is required in the repo settings, this means the General Approvers approval is purely optional/advisory, as at least 1 Maintainer would still need to approve an MR.

Add `ntpd` sys var query and sync status calls to return the system level state of NTP. This call accesses the state directly and avoids the overhead or performing an `ntpq` query on the `127.0.0.1` address.

Provide calls to initialize the files for a client pool configuration. This is the most common RTEMS use case.

Summary

netservices.py: Ensure that ttcp.h is installed

This header was missing from the install.

Closes #18

Author: Kinsey Moore 2025-08-26T18:49:13.350Z

assigned to @opticron

Author: Chris Johns 2025-09-19T23:58:00.649Z

@opticron would nuttcp work on lwIP?

Author: Kinsey Moore 2025-09-19T23:58:00.649Z

I would assume so, but I haven't tested it. If it doesn't work, rtems-lwip needs to be fixed up for it to operate properly.

Commit	6182e638dae87017c9a2a9f97e393747de92b7e2

Add `ntpd` sys var query and sync status calls

- Provide calls to get the NTP status without using ntpq. The data returned is the same.

- Add a command `ntpsv` to print the status without using `ntpq`.

Update #17

Commit	13f7dc2b3879b1dd5a83010894e2fb9974ac52cd

Summary

ntp: Avoid including broken (on Coldfire) ieeefp.h header

The LDBL_EQ_DBL define in newlib.h is determined at GCC/newlib configure time and is shared between all 68k targets. The default 68k target for GCC supports long double (12 bytes), while the Coldfire ISA does not. This results in LDBL_EQ_DBL being undefined for Coldfire targets, even though double and long double are indeed equal. ieeefp.h has sanity checks that fail if LDBL_EQ_DBL is not defined when sizeof(long double) == sizeof(double).

A workaround is to avoid including this header. In this case, it doesn't seem to be a necessary include anyway.

Closes #15

Commit	7fc097ecd8ada44d33386f33d6b5d193c4021456

Summary

gitlab: Add link to CI

This runs only the commit message and merge request checker.

Required so we can have 'all pipelines must pass' enabled due to a bug in GitLab.

2.6 RTEMS / Packages / LibBSD

Go to *Issues* (page 870) or *Merge Requests* (page 888)

Issues Summary

65 - dc net driver crashses on powerpc/mvme2700 (page 379)
63 - Support for DC_DEVICEID_21140A (0x0009) missing (page 380)
60 - powerpc/beatnik does not build on 6-freebsd-14 (page 384)
56 - Backport to 6-freebsd-14: MMCSD reads and writes are inconsistant (page 383)
51 - Backport update to releng/14.3 to 6-freebsd-14 (page 388)
49 - Media server is required to attach mmcsd on 6-freebsd-14 (page 391)
43 - Socket close fails when using kqueue (page 381)
35 - sendmsg() is not POSIX compliant (page 387)
28 - Install OFW driver headers (page 394)
24 - freebsd-to-rtems.py may need fixing (page 386)
23 - testsuite: Restore BSP-selected values and increase mbufs for ZynqMP for 6-freebsd-13 (page 392)
20 - testsuite: Restore BSP-selected values and increase mbufs for ZynqMP for 6-freebsd-14 (page 393)
18 - [zone: mbuf_cluster] kern.ipc.nmbclusters limit reached (page 389)
17 - Follow-up from "Misc 6-freebsd-12 fixes" (page 381)

Merge Requests Summary

113 - freebsd/dev/dc: Fix dc driver crash (page 395)
109 - bsp/motorola_powerpc: Add dc and ukphy support (page 395)
107 - freebsd/sys/sys/libkern.h: Disable conflicting macros (page 396)
103 - rtemsbsd/libio: Atomic set LIBIO_FLAGS_CLOSE_BUSY (page 397)
92 - Update 6-freebsd-14 to releng/14.3 (page 404)
91 - rtemsbsd/mmcsd: Fix inconsistent multi block read and writes (page 402)
89 - rtemsbsd/syscall: LibBSD files set CLOSE_BUSY (page 401)
85 - dev/mmc/mmcsd: Remove media server requirement for mmcsd (page 401)
82 - Update libbsd 6-freebsd-14 for GCC 15 (page 406)
77 - 6-freebsd-14: Beatnik BSP fixes (page 399)
69 - sys/kern/kern_event.c: Fix kqueue double hold (page 398)
67 - freebsd/sys_generic: Prevent multiple FD mappings (page 399)
64 - gitlab: Add link to CI (page 410)
63 - gitlab: Add link to CI (page 409)
62 - gitlab: Add link to CI (page 409)
54 - rtems/syscall: Return the data sent when calling sendmsg (page 411)
53 - rtems/syscall: Return the data sent when calling sendmsg (page 411)
49 - libbsd.py: Install dev/ofw header files (page 408)
31 - testsuite: Restore BSP-selected values and increase mbufs for ZynqMP (page 412)
30 - testsuite: Restore BSP-selected values and increase mbufs for ZynqMP (page 413)

97 - Draft: Use LIBIO_FLAGS_CLOSE_BUSY (opened) (page 422)
52 - rtems/syscall: Return the data sent when calling sendmsg (closed) (page 420)
51 - rtems/syscall: Return the data sent when calling sendmsg (closed) (page 421)
15 - Draft: Raspberrypi4b: Add Genet Ethernet driver (closed) (page 414)

The dc net driver in FreeBSD crashes on the `powerpc/mvme2700` BSP due to a bug in the upstream FreeBSD driver.

I have raised a bug report .. https://bugs.freebsd.org/bugzilla/show_bug.cgi?id=290314

The `6-freebsd-12` branch has support for `DC_DEVICEID_21140A`. The commit is f5c405ec05f58033cf2d74da4e989104423bf218. It is missing from `6-freebsd-14` and needs to be added back.

Summary

In `6-freebsd-14` due to the `block_count` not always being zeroed the SDHCI driver would not set the auto stop bit causing the first read or write to never complete causing later commands to fail. This explicitly zeros the block count (used for CMD53 only). Brought across from `7-freebsd-14`

Steps to reproduce

2.6.1.5.2.1 Pre-set options

Summary

The branch I'm using is 6-freebsd-14.

I followd the CONTRIBUTING.md to run:

```
./freebsd-to-rtems.py -R
./freebsd-to-rtems.py
```

The working directory is no longer clean, some files were changed.

The code `#include <machine/rtems-bsd-user-space.h>` is included twice in these files. !`image <https://gitlab.rtems.org/-/project/uploads/678794d818b67b4ae8454a08f5b376f5/image.png>`_

I found a POSIX compliance bug. In file `rtems-bsd-syscall-api.c`,line 644.

https://pubs.opengroup.org/onlinepubs/009604599/functions/sendmsg.html Upon `successful completion, sendmsg() shall return the number of bytes sent.`

But in RTEMS `sendmsg()` only returns an errno.

This problem exists in `6-freebsd-12`

We should be using stable releases for our LibBSD development branches instead of checked out commits on `stable/14` which is not ensured to be stable. We should move to the latest minor release of Freebsd 14 on `6-freebsd-14`. This ensures that our stable branch is using both a stable version of RTEMS and FreeBSD.

Summary

When I tested the genet driver !15 , I encountered this issue.

1. I use the following command on my PC to test `tx`. It works very well.

```
yangn0@yangning-PC:~$ sudo curl -o /dev/null ftp://192.168.1.100/dev/zero
[sudo] password for yangn0:
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
Dload  Upload   Total   Spent    Left  Speed
0     0    0  987M    0     0  50.6M      0 --:--:--  0:00:19 --:--:-- 50.6M
```

2. I use the following command on my PC to test `rx`. After transmitting a small amount of data, the Current Speed drops to 0. And rtems shell printed `[zone: mbuf_cluster] kern.ipc.nmbclusters limit reached`.

```
yangn0@yangning-PC:~$ sudo curl -T /dev/zero ftp://192.168.1.100/dev/null
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
Dload  Upload   Total   Spent    Left  Speed
100 10.6M    0     0    0 10.6M      0   448k --:--:--  0:00:24 --:--:--     0
```

I just committed a change to 6-freebsd-12 to fix this issue for ZynqMP. It's likely the fix needs to be pulled forward into the other branches. I'll create MRs for those so you can add a configuration setting for RPi4/genet.

Author: Kinsey Moore 2024-11-23T08:19:44.799Z

Which branch of libbsd was this against?

Author: Ning Yang 2024-11-23T08:19:44.799Z

6-freebsd-14

Author: Kinsey Moore 2024-11-23T08:19:44.799Z

I have created a MR to cherry-pick this change: !31

Author: Kinsey Moore 2024-11-23T08:19:44.799Z

You'll have to update for the RPi4 platform once that goes in, but you should be able to test increasing the memory buffers.

Author: Ning Yang 2024-11-23T08:19:44.799Z

!`image <https://gitlab.rtems.org/-/project/uploads/dff3a04098942485d3bebd38b909759d/image.png>`_

It works good!

Thank you very much.

Summary

The RTEMS media server is required to attach mmcsd devices. We should remove this requirement and attach the devices by default but keep the option to be able to use the media server if chosen.

This is relevant to `6-freebsd-14`

Steps to reproduce

2.6.1.11.2.1 Pre-set options

Author: Aaron Nyholm 2025-08-27T00:52:25.804Z

Commit	0ac188a5cab1d48029265d07721be4a45edebb40

Summary

When the `selscan()` and `selrescan()` functions were modified for use with RTEMS, the already-mapped FD was stored in `selfd->sf_cookie` by `selscan()` contrary to the modified behavior of `pollscan()` which stores an unmapped FD (wrapped inside a struct) in `sf_cookie`. This stored mapped FD was then mapped again into libbsd FD space in `selrescan()` which resulted in `EBADF` since there was no open FD in the lower range that libbsd FD space FDs typically occupy compared to RTEMS FD space.

The fix is to only store unmapped FDs into `selfd->sf_cookie` by passing the unmapped FD into `selfdalloc()` instead of the already-mapped FD.

Closes #40

Commit	254b7174e264e29acf04ca7b1d5631717dc1d72d

Summary

dev/mmc/mmcsd: Remove media server requirement for mmcsd

Media server is not required to attach MMCSD device by default. To use the media server call rtems_mmcsd_use_media_server() before the device attaches.

Closes #49.

Commit	bd6ee145074d906eb266e2eee9fcb878cf80ea6b

Summary

Due to the `block_count` not always being zeroed the SDHCI driver would not set the auto stop bit causing the first read or write to never complete causing later commands to fail. This explicitly zeros the block count (used for CMD53 only). Brought across from `7-freebsd-14`

Closes #56

Commit	8e22db4a259e9de392a4ed8db4bc5b5b5a1d76cd

Summary

This updates 6-freebsd-14 with the GCC 15 fixes to make future backports easier where necessary.

Closes #46

changed the description

Author: Chris Johns 2025-07-27T01:58:51.197Z

The RSB does not build gcc-14 any more as `head` was moved to gcc-15. Please update this MR after testing with gcc-15. Also please reference https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/issues/116 to track what builds and testing as been done.

Thanks

Author: Kinsey Moore 2025-07-27T01:58:51.197Z

This has been tested with GCC 15 with no additional errors.

Commit	42cd064a76c12e21ae5028ed3eb336b64c718ae3

Summary

testsuite: Restore BSP-selected values and increase mbufs for ZynqMP

In cases where DHCP is selected, network-config.h is not used which is what provides the bsp.h include when static network configuraton is used. Adding the bsp.h include to default-network-init.h directly allows selection of default values based on BSP regardless of whether DHCP is in use.

Author: Amar Takhar 2025-07-03T18:40:03.671Z

This is for 6-freebsd-14 is there any plan to forward port this to 7? Or does it already exist there?

Author: Ning Yang 2025-07-03T18:40:03.671Z

When I ported genet, there was no 7-libbsd.

It will probably be easy to port genet to 7. I will port it later.

Author: Kinsey Moore 2025-07-03T18:29:44.665Z

Is this change intentional?

Author: Ning Yang 2025-07-03T18:29:44.665Z

No. It is an mistake. I have deleted it.

Author: Kinsey Moore 2025-07-03T18:25:48.632Z

64MB seems excessive given that ZynqMP with 4 interfaces only requires 16MB. Is 64MB the minimum required to run the LibBSD tests?

Author: Ning Yang 2025-07-03T18:42:18.761Z

I don't have a raspberrypi4 right now. I will test it tomorrow

Author: Kinsey Moore 2025-07-03T18:33:31.556Z

Please use lowercase hexadecimal to be consistent with the other constants here.

rtems6 does not support the genet FDT, so the 6-freebsd-14 branch genet driver is useless. I will close this MR and submit a new one for 7-libbsd.

Author: Amar Takhar 2025-07-09T16:40:08.727Z

Okay, thank you!

[Contents, inline)]

Introduction

The current test suite is a combination of different methods and techniques which makes it difficult to maintain. It also relies on screen ouput to determine valid tests.

This project involves converting the current test suite to the new format which has already been setup and prepared.

You will learn about software and hardware testing in embedded computing. The abilities learned during this project will be transferable to any area within software engineering.

Requirements

Knowledge of testing is not required. The ideal candidate should have a firm grasp of the C language and enjoys the occasional challenge. Each test conversion has varied levels of difficulty ranging from 1-10. Some tests will require refactoring of code. Light knowledge of the Python programming language is an asset.

Preparation

It would also be beneficial for anyone applying to briefly familiarise themselves with the following topics:

- Unit tests.
- Mock tests.
- Temporal tests.
- Continuous Integration

2.7.1.1.3.1 New Build System

A new build system has been written for RTEMS using the Waf build system. In order to familiarise yourself with this please see the following email thread:

https://lists.rtems.org/pipermail/devel/2015-February/009837.html

2.7.1.1.3.2 Waf

Waf is a build system written in Python. Please read over the documents to get a rough idea of how it works. It is not necessary to learn it completely just get an idea of how it is put together.

Apologies for the delay, bad timing with work I will have time now for the next few weeks to answer questions.

Author: Amar Takhar 2017-03-23T15:00:07.000Z

Please also refer to this email posted to the users list. I will add the content here for ease:

https://lists.rtems.org/pipermail/users/2017-March/031107.html

This project involves a near ground-up rewrite of the current testsuite harness. Most tests are trivial to convert but many will need refactoring. The new testsuite moves away from the 'screen' based testing we do currently to an internal, C-based approach. That is a very general and broad overview it's not as simple as it sounds.

I do have this working already and the tests have all been renamed.

All the tests have been renamed to use a more intuitive naming scheme no more hidden and random file names. The web portal to the test suite is up temporarily here:

https://test.rtems.org/

This project also involves going into the database to ensure they have been properly renamed and fixing any that need changing.

Feel free to drill down the site. I'm working on better documentation for this project by the 20th I was hoping for sooner but things have gotten in the way.

Anyone working on this project is not expected to convert the entire testsuite, just as much as possible the rest of the work will involve identifying what may be required to complete the rest which can involve refactoring of RTEMS itself.

Author: Trac Migrate 2017-03-29T06:11:00.000Z

The Unity testing framework is by no means good enough for the RTEMS testsuite. It lacks some important features like thread-safety at a basic level.

See also:

https://lists.rtems.org/pipermail/devel/2013-November/004965.html

Nothing changed in this respect since 2013.

I would rather use something like the Google C++ Testing Framework, however, it uses to much resources for our low level targets.

https://git.rtems.org/sebh/rtems-gtest.git/

I don't think there exists a ready to use testing framework which meets our requirements. What are our requirements by the way? This should be addressed first.

What is the specification input for the tests itself?

How is the output produced at the device level?

How it is ensured the output processing doesn't influence the test outcome in unexpected ways across targets?

How is the output produced for test suite status consumers? Maybe have a look at XO(1).

How is this synchronized with RTEMS qualification efforts?

How it is guaranteed that we don't drop test cases accidentally during the conversion? Some tests are hard to understand. Do we keep the existing test suite as is?

And so on.

It is a several man month project if you want to do this right.

Author: Chris Johns 2017-03-29T06:23:07.000Z

Replying to Sebastian Huber:

> How is the output produced for test suite status consumers? Maybe have a look at XO(1).
>
> The only consumer on the table at the moment is `rtems-test` and I would prefer we do not fragment how tests are run. The `rtems-test` tool is designed to provide a consistent user interface across varying ways we test RTEMS. What happens under the hood is flexible so I hope it can be updated to handle any new test data formats.

Author: Trac Migrate 2017-03-29T16:33:38.000Z

- **Cc** added @aadit0402@gmail.com, @cpodonnell8@gmail.com

Author: Amar Takhar 2018-10-21T04:20:12.000Z

- **Resolution** set to ~"invalid"
- **Status** changed from *assigned* to *closed*

Closing this due to it's irrelevance. There have been far too many chances to this I'll open a new ticket for the suite I am working on in the future.

2.8 RTEMS / RTOS / RTEMS

Go to *Issues* (page 998) or *Merge Requests* (page 2535)

Issues Summary

5398 - Backport to 6 branch: "cpukit/jffs2: Add EBS (erase block summary) support" (page 446)
5397 - Backport "bsps/shared: Add XNandPsu flashdev backend" (page 445)
5396 - Backport JFFS2 CRC32 updates (page 444)
5392 - Backport to 6 branch: "Fixes for flashdev API and xqspi support" (page 447)
5380 - Backport to 6 branch "bsps/jffs2_flashdev: Return correct value for OOB size" (page 450)
5379 - Backport to 6 branch "bsps/jffs2_flashdev: Return correct value for OOB size" (page 449)
5372 - Backport Make flash config table static to 6 branch (page 455)
5371 - Backport ZynqMP XQspiPsu flashdev backend addition to 6 branch (page 454)
5369 - Backport jffs2 flashdev NAND support to 6 branch (page 452)
5365 - Backport live lock fix for split reads" (page 456)
5350 - Backport flashdev NAND support to 6 branch (page 457)
5348 - Backport libdebugger ARM SMP fixes (page 460)
5347 - Backport JFFS2 filesystem size enforcement to 6 branch (page 459)
5346 - Backport flashdev destructor changes to 6 branch (page 467)
5338 - Backport Doxygen changes for generated sources (page 448)
5337 - Backport storage class qualifier rearrangements (page 433)
5336 - Backport rtems_barrier_get_number_waiting() (page 451)
5313 - Backport use of generic TLS accessor (page 476)
5311 - Backport Chris's libio fix to 6 branch (page 438)
5309 - Backport missing header guard and extern declarations to 6 branch (page 475)
5303 - Deprecate and Remove Mongoose Web Server (page 462)
5302 - Backport pthread_sigmask return fixup to 6 branch (page 474)
5288 - Backport RISC-V Double Trap extension fix to 6 (page 481)
5284 - Backport mvme3100 fixes to 6 (!541) (page 453)
5283 - Backport 6.2: bsps/noelv: Fix using console in polled mode (page 482)
5281 - RTEMS 6.1 GR740 Multiprocessing build fails (page 434)
5273 - Backport libdebugger setjmp fix to 6 branch (page 480)
5271 - Backport libdebugger TLS support to the RTEMS 6 branch (page 479)
5254 - i386/pc BSP ATA driver asserts with node errors on FAT disk mount (page 483)
5232 - Backport "spec: Install missing header files for GRLIB and SPARC" to 6 branch (page 487)
5222 - RTEMS Priority range API change (regression) (page 465)
5218 - RTEMS Release 6.1 build error texinfo-7.0.3 on arm64-apple-darwin24.3.0-1 (page 471)
5216 - Deprecate powerpc/mvme5500 in favor of powerpc/beatnik (page 463)
5205 - Back port "grlib/occan: Fix baud rate calculation" to 6 (page 489)
5198 - Connect interrupt to gpio Input Pin on beaglebone black (bsps/shared/dev/gpio/gpio-support.c) (page 468)

continues on next page

Table 1 – continued from previous page

5189 - Backport libdl ARM trampoline crash fix (page 489)
5187 - Backport 6.2: bsps/shared: NS16550 driver updates the line control register during operation (page 458)
5184 - cpukit/libmisc/capture: rtems_capture_flush incorrectly clears the RTEMS_CAPTURE_INIT flag (page 437)
5180 - Backport stack-smash-protect feature to the 6 branch (page 461)
5173 - powerpc/qoriq: Avoid spurious interrupt fatal errors (page 488)
5146 - Follow-up from "Draft: timespec.h, etc.: Eliminate use of 32-bit for time_t" (page 493)
5130 - aarch64/raspberrypi: improve UART (page 468)
5107 - timespecaddto.c: Use of 32-bit time_t (page 432)
4964 - rtems-test can hang indefinitely (page 494)
4958 - NTP broadcast client fails to open sockets on lwIP (page 490)
4956 - Deadlock caused by locking inversion in JFFS2 (page 477)
4675 - sleep should be a thread cancellation point (page 430)

Merge Requests Summary

852 - cpukit/jffs2: Add erase block summary (EBS) support (page 496)
850 - bsps/shared: Add XNandPsu flashdev backend (page 498)
848 - cpukit,spec: Swap JFFS2 to zlib CRC32 (page 500)
830 - Fixes for flashdev API and xqspi support (page 501)
816 - bsps/shared/dev/flash/jffs2_flashdev.c: Fixed fatal heap error on failed mount (page 504)
814 - bsps/jffs2_flashdev: Return correct value for OOB size (page 506)
796 - cpukit/close.c: Open flag corrected for busy closes (page 502)
775 - cpukit/close.c: Fix reference counting under concurrent access. (page 507)
772 - bsps/dev/spi/xqspipsu_flash_config.h: Make flash config table static (page 510)
767 - spec/bsps/aarch64/xilinx-zynqmp: Add XQspiPsu flashdev backend (page 511)
765 - bsps/shared/dev/flash/jffs2: Add support for NAND (page 512)
762 - Backport: cpukit: Raise internal error if we cannot open stdin with fileno 0 (page 508)
758 - cpukit/jffs2/gc.c: Prevent live lock for split reads (page 513)
748 - libdebugger: Add SMP support for ARM (page 518)
743 - cpukit/flashdev: Add full support for NAND devices (page 515)
742 - bsps/shared/dev/flash: Enforce maximum JFFS2 filesystem size (page 519)
741 - cpukit/flashdev: Add unregister call and private data destructor (page 520)
722 - rtems: Backport Doxygen changes (page 524)
721 - validation: Move storage class qualifier (page 517)
720 - rtems: Add rtems_barrier_get_number_waiting() (page 521)
637 - cpukit/libdebugger/server: Use generic TLS accessor (page 525)
635 - cpukit/libio: Support close with IOP references held (page 495)
626 - bsps/include/dev/spi: Add missing extern and guard (page 529)
548 - cpu/riscv: Add Smdbltrp extension compatibility to 6 branch (page 530)
537 - bsps/noelv: Backport polled mode console to 6 (page 531)
532 - bsps/sparc/leon3: Backport GPTIMER timer index logic fix to 6 (page 532)
524 - cpukit/libdebugger: Prevent hang on memory access (page 534)

continues on next page

Table 2 – continued from previous page

518 - cpukit/libdebugger: Add support for TLS variables (page 526)
492 - bsps/shared/dev/ide: Initalise ATA request links as off chain (page 535)
461 - cpukit/libdl: Fix loading symbols from an object file at runtime (page 538)
459 - Backport "spec: Install missing header files for GRLIB and SPARC" to 6 branch (page 539)
418 - gitlab: Add link to CI (page 539)
416 - machine/timecounters: Add _Timecounter_Getboottime, _Timecounter_Getboottimebin decls (page 536)
413 - Revert "build: Provide LDFLAGS for pkg-config" (page 540)
404 - grlib/occan: Fix baud rate calculation (page 546)
381 - cpukit/termios: Fix ordering of baud rate table (page 547)
367 - cpukit/libdl/arm: Fix trampoline alignment (page 550)
365 - Backport 6.2: bsps/shared: NS16550 driver updates the line control register during operation (page 548)
361 - cpukit/libmisc: fix flag in capture.c (page 549)
354 - score: Fix RTEMS_DEBUG build (page 536)
345 - bsp/qoriq: Ignore spurious interrupts (page 541)
335 - build: Provide LDFLAGS for pkg-config (6.1) (page 544)
222 - posix/aio_misc.c/aio_init(): lock before accessing data (page 522)

348 - libmisc/stackchk: Add stack smashing protection (closed) (page 551)

2.8.1 Issues

2.8.1.1 4675 - sleep should be a thread cancellation point

Id	4675

Original author: aoliva

GCC has worked around, in the libstdc++ testsuite, the fact that nanosleep (as well as sleep and clock_nanosleep) should be thread cancellation points, per POSIX, but RTEMS may want to make them so. https://gcc.gnu.org/pipermail/gcc-patches/2022-June/597003.html

(I haven't checked that other functions that should be thread cancellation points are, I only noticed that this one wasn't, and decided to file this ticket because for other issues in which I explicitly identified RTEMS I got a request to do so)

Author: Trac Migrate 2022-07-07T12:40:48.000Z

Original author: aoliva

Thanks for reporting the issue. I think we have currently no cancellation points in RTEMS at all. I think this is intentional, so I would mark this bug as WONTFIX.

Author: Joel Sherrill 2023-03-18T17:43:07.000Z

Original author: aoliva

Do you have a test to show something isn't right? sleep() and nanosleep() ultimately call clock_nanosleep() and the requested blocking state is "STATES_WAITING_FOR_TIME | STATES_INTERRUPTIBLE_BY_SIGNAL"

https://git.rtems.org/rtems/tree/cpukit/posix/src/clocknanosleep.c#n77

RTEMS state bits consist of the type of object is being blocked on and attributes such as interruptible. It has been this way for a LONG time.

As a random thought, if you don't build RTEMS with POSIX enabled, then POSIX signals are disabled and then this likely wouldn't work.

Author: Joel Sherrill 2023-03-18T17:43:24.000Z

Original author: aoliva

- **Milestone** set to %"6.1"

Author: Trac Migrate 2023-04-22T05:32:10.000Z

Original author: aoliva

The unpatched libstdc++ testcase is a test that shows the problem. An explicit pthread_testcancel shouldn't be needed. Functions that are cancellation points should (as-if) call it implicitly.

Summary

Coverity CID 1512527

Coverity spotted this where time_t variables/structure elements are assigned to uint32_t. Notice that the return type is uint32_t which propagates to callers of this such as rtems_timespec_add_to().

```
46 uint32_t _Timespec_Add_to(
47   struct timespec       *time,
48   const struct timespec *add
49)
50{

CID 1512527: (#1 of 1): Use of 32-bit time_t (Y2K38_SAFETY)
1. store_truncates_time_t: A time_t value is stored in an integer with too few␣
↪bits to accommodate it. The expression add->tv_sec is cast to uint32_t.
51   uint32_t seconds = add->tv_sec;
```

Summary

When building the GR740 BSP with `RTEMS_MULTIPROCESSING` set to `true` , the build will fail.

Steps to reproduce

The INI file contents are:

```
[DEFAULT]
RTEMS_POSIX_API = True

[sparc/gr740_mp]
INHERIT=gr740
RTEMS_MULTIPROCESSING=True
```

I configure the Waf system with:

```
./waf configure --prefix=$RTEMS_PREFIX --rtems-config=gr740.ini
```

And then `./waf` to build the BSP. I get the following output:

```
Waf: Entering directory `/scratch/matteo/rtems-build/src/rtems-6.1/build'
Waf: Leaving directory `/scratch/matteo/rtems-build/src/rtems-6.1/build'
'build' finished successfully (0.081s)
Waf: Entering directory `/scratch/matteo/rtems-build/src/rtems-6.1/build/sparc/
↪gr740_mp'

Expected behaviour

Build should complete successfully.

Possible fix

From my own investigation this comes from `bsps/sparc/leon3/include/bsp/leon3.h` . `leon3_timer_core_index` is only declared if `LEON3_GPTIMER_BASE` is not defined but later in the file the `LEON3_CLOCK_INDEX` macro is defined in the following way:

```
/**
* @brief This constant defines the index of the GPTIMER timer used by the
*   clock driver.
*/
#if defined(RTEMS_MULTIPROCESSING)
#define LEON3_CLOCK_INDEX \\
( leon3_timer_core_index != 0 ? 0 : 2 * LEON3_Cpu_Index )
#else
#define LEON3_CLOCK_INDEX 0
#endif
```

So when `RTEMS_MULTIPROCESSING` is used the `LEON3_CLOCK_INDEX` will expand to use the `leon3_timer_core_index` variable which won't be declared as the GPTIMER base is defined for the GR740 BSP.

I don't fully understand why the `LEON3_CLOCK_INDEX` macro is defined this way but changing it's define conditional to:

```
#if defined(RTEMS_MULTIPROCESSING) && !defined(LEON3_GPTIMER_BASE)
```

Will make the BSP build successfully, I haven't had the time to test this fix, it might break something else at runtime.

The following discussion from !337 should be addressed:

- [] @gedare started a discussion:

  The RTEMS_CAPTURE_OVERFLOW is an overflow flag for each CPU, and its value is the same as RTEMS_CAPTURE_INIT. Executing rtems_capture_flush will set the RTEMS_CAPTURE_INIT flag to 0 in the global flags.

The commit 0cf6de01df734c11212e63134551ee344a10ecec introduced a couple of issues:

- ABI changes on a release branch
- Redundant LIBIO_FLAGS_FREE flag: an iop is free if and only if it is on the free list.
- When the iop is freed, its reference count was set to zero. The iop reference count must never be set to a specific value after initialization at system start. The only valid operations are increments and decrements.
- In the iop free handling, there was a deadlock potential by obtaining the libio lock while owning a file system lock.
- The reference counting did not work at all under concurrent access. This was indicated by the failing spintrcritical24 test program.

The spintrcritical24 test was specifically added to test the file descriptor reference counting. It fails now on at least the sparc/gr740 and arm/xilinx_zynq_zc702 simulators. It fails since `rtems_libio_free()` may free the iop by looking at the current flags. This is plainly wrong, actions must be carried out when certain state changes happen. Consider this sequence of events:

```
int close(
int  fd
)
{
rtems_libio_t *iop;
unsigned int   flags;
int            rc;

if ( (uint32_t) fd >= rtems_libio_number_iops ) {
rtems_set_errno_and_return_minus_one( EBADF );
}

iop = rtems_libio_iop( fd );
flags = rtems_libio_iop_flags( iop );

while ( true ) {
unsigned int desired;
bool         success;

if ( ( flags & LIBIO_FLAGS_OPEN ) == 0 ) {
rtems_set_errno_and_return_minus_one( EBADF );
}

/* The expected flags depends on close when busy flag. If set
* there can be references held when calling the close handler */
if ( ( flags & LIBIO_FLAGS_CLOSE_BUSY ) == 0 ) {
flags &= LIBIO_FLAGS_FLAGS_MASK;
}

desired = flags & ~LIBIO_FLAGS_OPEN;
success = _Atomic_Compare_exchange_uint(
&iop->flags,
&flags,
desired,
ATOMIC_ORDER_ACQ_REL,
ATOMIC_ORDER_RELAXED
);

if ( success ) {
break;
}

if ( ( flags & LIBIO_FLAGS_REFERENCE_MASK ) != 0 ) {
rtems_set_errno_and_return_minus_one( EBUSY );
}
}

<--- Lets suppose LIBIO_FLAGS_CLOSE_BUSY is cleared. At this point we␣
↪cleared
LIBIO_FLAGS_OPEN above and the reference count is zero. Let an interrupt
```

(continues on next page)

(continued from previous page)

```
call for example fstat(fd). It will hold and drop the iop. The drop will
call rtems_libio_free() which will calle rtems_libio_free_iop() since the
iop is no longer open and has a zero reference count. This will clear the
iop->pathinfo.  This will lead to a NULL pointer access here:

rc = (*iop->pathinfo.handlers->close_h)( iop );

rtems_libio_free( iop );

return rc;
}
```

set status to **To do**

Author: Sebastian Huber 2025-10-13T16:28:49.550Z

There are more issues associated with the reference counting change.

1. There is an API change on a release branch (`rtems_libio_fcntl_flags()` was renamed).
2. There are ABI changes (`LIBIO_FLAGS_FREE` and related flags).
3. With reference counting you must never set the count to a specific value. The only valid operations are increments and decrements. This leads to problems:

```
void rtems_libio_free_iop(
rtems_libio_t *iop
)
{
size_t zero;

rtems_libio_lock();

if ( !rtems_libio_iop_is_free( iop ) ) {
<- Lets assume someone calls rtems_libio_iop_hold() here and gets a reference count of 1.
/*
* Clear the flags. All references should have been dropped.
*/
_Atomic_Store_uint( &iop->flags, LIBIO_FLAGS_FREE, ATOMIC_ORDER_RELAXED );
<- This sets the reference count to zero. Lets assume the caller of rtems_libio_iop_hold() notices that the file descriptor is bad. It calls rtems_libio_iop_drop(). The reference count is now -1.

rtems_filesystem_location_free( &iop->pathinfo );
```

4. Calling `rtems_filesystem_location_free( &iop->pathinfo )` while owning the libio lock (`rtems_libio_lock()`) may cause lock order reversal issues (deadlock).
5. You should not use snapshots of the flags, actions should be based on state changes. For example:

```
@@ -226,7 +226,10 @@ static int vfcntl(

if (ret >= 0) {
int err = (*iop->pathinfo.handlers->fcntl_h)( iop, cmd );
-    if (err) {

```

(continues on next page)

(continued from previous page)

```
<-- Here you started with a valid open file descriptor. The higher
↪level code cannot decide the outcome of the fcntl_h handler.

+    if (err == 0 && !rtems_libio_iop_is_open( iop ) ) {
+      err = EBADF;
+    }
+    if (err != 0) {
errno = err;
ret = -1;
}
```

6. I think there is an issue with the recent fixes.
7. My patch doesn't work also.

The reference counting state machine has to work on paper. The previous state machine was pretty simple. Now that you want to have the busy close feature, you have to somehow figure out at each place which decrements the reference count, if the node has to be freed. Using a 1 to 0 transition is not enough, since file descriptors are always visible and some actor might just work with a bad file descriptor. Here actually the `LIBIO_FLAGS_FREE` could be useful, but not how it is currently used. Maybe this works: if the reference count transitions from 1 to 0, call a maybe free function. This function tries to set a closed, not free, reference count 0 file descriptor to free. If this was successful, it frees the node. I would do this exercise not on the RTEMS 6 release branch and go back to the previous implementation. This busy close feature is something for RTEMS 7.

Backport of https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5179

Summary

Calling `tcsetattr` even with only changes to the timeout conditions will reset the line control register temporary which can corrupt ongoing data transfers.

Steps to reproduce

- Continuously write data to the serial port (ideally with high baud rates like 921600 bps).
- Change the timing settings like `VMIN` or `VTIME`
- Receive corrupted data

Expected behaviour

- Data transfer is not corrupted.

Merges	0

Summary

The Mongoose webserver (mghttpd) in RTEMS is old and pre-dates the change to GPL. The project forked and the permissive licensed code lives on as Civitweb. The mghttpd code in RTEMS is from before the split and is unmaintained upstream.

Civitweb can be built using the RSB. It is an active project.

It is recommended that users migrate to Civitweb.

The mghttd code is deprecated in RTEMS 6 and will be removed before RTEMS 7 branches.

The following discussion from !436 should be addressed:

- [] @chris started a discussion: (+4 comments)

  > Yes I could add `CONFIGURE_MAXIMUM_PRIORITY` with `255` to resolve the problem in my application. Why should I? The code base that brought this problem to my attention was originally developed on RTEMS 4 on a Zynq and the user wants to use SMP?
  >
  > My investigation to understand the problem has raised a number of concerns and I do not think this MR is the place to discuss them. The MR may in the end be a suitable resolution however we need to first have a wider discussion.
  >
  > I believe the changing of the priority range is a **_regression_** with respect to the historical user interfaces until we decide otherwise. I do not remember a specific discussion about the range changing in regards to this context, the effects, other possible options or how we convey this to users? I believe a number of separate changes over a period of time have come together to bring about my concerns. Each piece on its own makes sense and seems reasonable however together there are issues. We need to respect our users, existing code and the need to make things as simple as possible simple configurations.

> I am also using this specific example to bring about a policy change. API changes needs to be announced and a specific discussion happen for the change to accepted. Approval and merging of changes in isolation does not mean an acceptable of change. If this happens we need to discuss the impact, look at solutions I have labelled this MR API however I wonder if we need an `api-change` label as well?

The default SMP scheduler is an EDF scheduler. This has other implications. For example, the use of rate-monotonic objects changes drastically. If you want maximum backward compatibility, the default SMP scheduler could be changed back to deterministic priority.

- Add support for four new ports, UART2-UART5.
- Add build options to allow console device configuration.
- Segregate device-specific definitions from the device family files. X macros

are used to maintain a single source of truth and have the configuration done at compile-time * Add raspberrypi_uart_init() to make it convenient for users to install uart devices

2.8.1.30 5198 - Connect interrupt to gpio Input Pin on beaglebone black (bsps/shared/dev/gpio/gpio-support.c)

Summary

I am currently testing the RTEMS Release 6.1. I have taken a Beaglebonblack board for this purpose because was referred to in the Quick-Start Manual.

It looks good as it is. But what I can't do is connect an interrupt to a GPIO pin. I have already worked my way through all the banks (different GPIOs on P8, P9) but always without success. I can follow the level change on the pin but I can't see that the generic_bank_isr (bsps/shared/dev/gpio/gpio-support.c) gets called. I have tried debugging and it looks good so far. The interrupt is registered and also the interrupt enabled:

```
sc = rtems_gpio_bsp_enable_interrupt(bank, pin, interrupt);
(e.g. enable interrupt bank : 0, pin : 27 interrupt : 1)
```

But unfortunately I can't get any further. If I remember correctly, I have always failed in the last 2-3 years. Have anybody ever managed to generate an interrupt on this board on a gpio input pin?

Is there a test code for this?

Author: Gedare Bloom 2025-01-30T16:46:54.343Z

assigned to @gedare

Author: Heinz Junkes 2025-01-31T19:22:26.275Z

I just wanted to let you know that I'm working on it myself. I replaced the bsps/arm/beagle.gpio/bbb-gpio.c with the variant from ketul93 (https://gist.github.com/ketul93/d717555951174a74c8b4). Unfortunately, the interrupt handling is not fully implemented there. By adding

```
+  mmio_set((gpio_bank_addrs[bank] + AM335X_GPIO_IRQSTATUS_SET_0), BIT(pin));
+  mmio_set((gpio_bank_addrs[bank] + AM335X_GPIO_IRQSTATUS_SET_1), BIT(pin));
```

I have managed to call the generic_isr. I am now struggling through the Reference Manual of the AM335x (4156 pages) to understand the GPIO support ...

Author: Gedare Bloom 2025-01-31T19:22:26.123Z

That should be the same baseline as the code in the tree, starting at 151e53feabbe8ebdcbb491f06afeee8ea596ed6c

then there were additional fixes made. See: `git log --follow bsps/arm/beagle/gpio/bbb-gpio.c`

Author: Gedare Bloom 2025-01-31T19:22:47.689Z

assigned to @junkes

Author: Heinz Junkes 2025-02-07T20:57:38.216Z

Interrupts enabled for BBB. ACQUIRE/RELEASE locks tidied up so that the gpio calls can also be used in other threads.

I haven't quite got through the section with threaded interrupts yet. I am also unsure whether I am following the code guidelines of RTEMS.

patch

Author: Heinz Junkes 2025-05-09T14:47:09.205Z

mentioned in issue #5235

Author: Heinz Junkes 2025-05-09T14:48:24.152Z

Some improvements. Allows more GPIO Pins to run in Mode7. Interrupts connected to the GPIOs patch_2

Author: Heinz Junkes 2025-09-03T14:11:07.617Z

Add adc-section patch3.patch

Author: Amar Takhar 2025-09-03T14:11:07.617Z

Can you submit this as a merge request please? It'll be easy for others to review it that way no worries if it's still a draft. :)

Author: Heinz Junkes 2025-09-03T14:06:39.352Z

mentioned in merge request !697

Author: Heinz Junkes 2025-09-03T14:11:32.539Z

I have made a merge request. However, this is still based on version 6.1:

```
Merge request !697 can no longer be merged due to conflict.

Project:Branches: junkes/rtems:6 to rtems/rtos/rtems:main

Author: Heinz Junkes

Assignees:

Reviewers:
```

Author: Amar Takhar 2025-09-03T14:11:32.499Z

The merge request is opened against the main branch (7) you'll want to open it against 6.1 if that's the branch it's for which is why you're getting a bunch of conflicts.

Author: Amar Takhar 2025-09-03T14:12:41.863Z

I have edited the merge request and set the branch target to 6

When the code for delayed writes was added to support JFFS2 on NAND, it introduced a possible locking inversion when managing the delayed write work queue.

This has been partially addressed by fa85760c99a72b8186c70c896b98efe0d7cde2b6, but there are other issues with this code that need to be addressed as well.

First is that when not compiling with RTEMS_DEBUG, nodes are not automatically set as off the chain upon extraction and this behavior is depended upon.

~~Second is that protected (ISR-locked) chain calls are used when they are not necessary due to already being locked.~~ This code has been restructured and this component is no longer relevant.

Third is that the bug fixed by the referenced commit needs a test that verifies the fix.

Author: Trac Migrate 2023-09-26T00:41:07.000Z

Hey i'm interested working on this ticket would the nodes be set off only if

Author: Kinsey Moore 2023-09-26T13:16:46.000Z

Hey, thanks for the interest. I actually have a patch on the mailing list that just got approved for fixing this, so it should be going into the codebase shortly. I still need to write a test that produces the original issue, though.

Author: Trac Migrate 2023-09-26T13:38:00.000Z

In [changeset:"99c637fbd973a3d2f6e5adf38aac8f3f588cbb7e/rtems" 99c637f/rtems]:

```
cpukit/jffs2: Avoid use of off-chain semantics

This reworks the JFFS2 delayed work queue to avoid use of
on-chain/off-chain semantics since they vary in behavior under
RTEMS_DEBUG and are not guaranteed to be safe to use in SMP systems.
This adds all delayed work structs to the chain on FS init and does not
remove them until umount.

Updates #4956
```

- **Status** changed from *new* to *assigned*

Author: Kinsey Moore 2024-05-02T23:19:35.303Z

A baseline set of tests has been added to the RTEMS testsuite to test JFFS2 on a simulated NAND device. This baseline set of tests does not trigger the original condition that necessitated this ticket and I have thus far been unable to trigger the deadlock from a test with rolled-back code.

2.8.1.38 5288 - Backport RISC-V Double Trap extension fix to 6

If the Double Trap Extension is implemented, the MDT bit of the mstatus (or mstatush in RV32) register will be set when a trap is to be taken.

The MIE (Machine Interrupt Enable) bit can only be set to 1 if the MDT bit is zero.

Thus, we need to clear MDT first if we want to enable interrupts when dispatching a thread.

MDT is also cleared in register `a1` before restoring the interrupt frame as writing 1 to MDT will cause MIE to be set to 0. In RV64 this happens regardless of the value written to MIE in the same write.

In RV32, MDT is in mstatush so we do not need to clear during restore as this register is not restored.

With this change all 60 SMP tests pass (compared to 20/60 before the fix). The tests have been run on hardware using two RV64 CPUs that implement the double trap extension.

Merges	2

Summary

bsps/noelv: Fix using console in polled mode

The console driver needs `BSP_CONSOLE_USE_INTERRUPTS` to be defined or it does not build. The intent was to use polled mode if the macro was equal to zero but not using interrupt means the macro won't be defined instead.

This is the faulty code:

```
if (BSP_CONSOLE_USE_INTERRUPTS) {
handler = &apbuart_handler_interrupt;
}
```

In `bsps/riscv/noel/console/console-config.c` .

Steps to reproduce

Create a INI with the following contents:

```
[riscv/noel64imafd_polling]
INHERIT = noel64imafd
RTEMS_SMP = True
BSP_CONSOLE_USE_INTERRUPTS = 0
```

Build the RTEMS kernel, it will fail to build due to `BSP_CONSOLE_USE_INTERRUPTS` being undefined.

Expected behaviour

BSP should build successfully.

Reproduction: * Install lwIP on top of a compatible BSP * Modify the existing ntp01 test to use the broadcast client * Set NTP_DEBUG to 1 * Replace the first two lines of etc_ntp_conf with: * broadcastclient * disable auth * Build rtems-net-services against the installed BSP with lwIP network stack * Run the modified ntp01 test

Expected result: NTP opens broadcast listener successfully.

Actual result: NTP fails to open broadcast listener with error message: bind(37) AF_INET 0.0.0.0#123 flags 0x409 failed: Address already in use

Workaround: In open_socket() in bsd/freebsd/contrib/ntp/ntpd/ntp_io.c, there is a test for wildcard addresses inside a OS_NEEDS_REUSEADDR_FOR_IFADDRBIND conditional. If the set_wildcard_reuse() call is made unconditional, the socket creation succeeds.

The root cause is that behavior differs between LibBSD and lwIP. On lwIP, early-bound wildcard and non-wildcard address bindings succeed, but late-bound wildcard address bindings fail. Once any any address is bound, lwIP will fail to bind any further wildcard sockets. Either we can change lwIP's behavior to be closer to LibBSD or we can alter the NTP client to check for lwIP or blindly apply the address reuse flags.

Author: Kinsey Moore 2023-10-04T19:44:27.000Z

- **Description** changed

```
Reproduction:
* Install lwIP on top of a compatible BSP
* Modify the existing ntp01 test to use the broadcast client
- ** Set NTP_DEBUG to 1
?  -

+  * Set NTP_DEBUG to 1
? +

- ** Replace the first two lines of etc_ntp_conf with:
?  -

+  * Replace the first two lines of etc_ntp_conf with:
? +

- *** broadcastclient
?  --

+   * broadcastclient
? ++

- *** disable auth
?  --

+   * disable auth
? ++

* Build rtems-net-services against the installed BSP with lwIP network␣
↪stack
* Run the modified ntp01 test

Expected result:
NTP opens broadcast listener successfully.

```

(continues on next page)

(continued from previous page)

```
Actual result:
NTP fails to open broadcast listener with error message:
bind(37) AF_INET 0.0.0.0#123 flags 0x409 failed: Address already in use

Workaround:
In open_socket() in bsd/freebsd/contrib/ntp/ntpd/ntp_io.c, there is a test for wildcard addresses inside a OS_NEEDS_REUSEADDR_FOR_IFADDRBIND conditional. If the set_wildcard_reuse() call is made unconditional, the socket creation succeeds.

The root cause is that behavior differs between LibBSD and lwIP. On lwIP, early-bound wildcard and non-wildcard address bindings succeed, but late-bound wildcard address bindings fail. Once any any address is bound, lwIP will fail to bind any further wildcard sockets. Either we can change lwIP's behavior to be closer to LibBSD or we can alter the NTP client to check for lwIP or blindly apply the address reuse flags.
```

Author: Chris Johns 2023-10-04T21:30:43.000Z

I think NTP is using _normal_ behavior so lwIP is not compliant in this case. Adding a work around to NTP solves this problem but leaves the issue present other packages may trip over.

Have you asked lwIP about this?

Author: Kinsey Moore 2023-10-05T17:08:40.000Z

I haven't. This was an issue I noticed and wanted to document that it existed with current thoughts, but I hadn't moved beyond that yet since the broadcast client isn't on my priority list at the moment. I'll agree with you that fixing lwIP to be more "normal" is probably the right solution. I'll get more context from lwIP.

When using the RTEMS automated tester configured with TFTP, there is a state that can occur in which the tester never times out a test. This was discovered when testing with the AArch64 Xilinx ZynqMP BSP where the board did not actually power on even though it was instructed to do so. This left the tester running the TFTP server waiting more than 4 full days (left to run over a long weekend) for the target to start without progressing to the next test.

The failure to start on the target side was due to a missing minimum settling time between off and on states that is apparently influenced by the environment.

Commit	0cf6de01df734c11212e63134551ee344a10ecec

Summary

cpukit/libio: Support close with IOP references held

- Provide an option for a file system to support close wtih

references held. This can happen in more complex file systems and file descriptor handling with more complete reference handling implementations where an fd can hold other fds and close can be call on any fd and succeed.

- Fix open IOP leaks in the error paths.
- Provide better definition of the IOP flags to help clarify

the code.

Commit	dd210293e00042ebfeb5069f7977cb818a3485ba

Summary

cpukit,spec: Swap JFFS2 to zlib CRC32

Move JFFS2 from the Cygwin implementation of CRC32 to the zlib implementation which can take advantage of hardware acceleration and reduces code duplication. Synthetic benchmarks on AArch64 hardware show approximately a 17x improvement in CRC32 calculation speed and real-world testing with JFFS2 shows a 1% improvement in mount times, a 5% improvement in data write times, and a 9% improvement in garbage collection times.

A test was written to compare hash generation between the two algorithms and a partition was created with one and then remounted with the other with no errors.

Commit	23accdc0bbcec53ee8ebce9babcb46d42400ebe0

Summary

cpukit/flashdev: Return error for missing callbacks

When a callback does not exist, the Flashdev API should return error where possible instead of success. When the API returns success for missing callbacks, the Flashdev API client code may end up using uninitialized variables as if they were filled by the API.

Commit	665b09e692b2c4f46c1fac38ca1db0c0a4a64e82

Summary

bsps/jffs2_flashdev: Return correct value for OOB size

Return the actual out of bounds size per page instead of the ioctl return status. JFFS2 will happily operate with an OOB size of 0 and instead put cleanmarkers in the normal page space of the flash.

Closes #5379

Commit	074cb8f33735e4383992542a17b8d8725214114c

Summary

cpukit: Raise internal error if we cannot open stdin with fileno 0

If someone manages to open a file before rtems_libio_post_driver is run, open() may allocate a file number other than 0 for stdin. This leads to a silent failure of the logic in rtems_libio_post_driver, and confusing behavior because your BSP behaves as if it doesn't have a console.

Instead of failing silently, raise an internal error if open() succeeds but gives us an unexpected file number for stdin.

Commit	df40ffa9dcb21dba1e81403b2eb33ae83c98814e

Summary

cpukit/jffs2/gc.c: Prevent live lock for split reads

In some cases a file read is not completed in a single call into the JFFS2 layer and the inode is left in the READING state. When this happens, it's possible for a garbage collection pass to be initiated before completion of the read. In some such cases, the garbage collection pass is executed in a tight loop that expects granular locking to allow forward progress of the read between collection passes. With RTEMS monolithic locking of the JFFS2 layer, forward progress is not possible in this situation since the monolithic lock is never released inside the loop.

The solution is to have the garbage collection pass return failure when no progress is possible due to a bad inode state. This allows the read to complete and the collection pass can be attempted at a later time.

Commit	b05ae8a6d49327225abfc202b8dcbb1bb97c88a3

Summary

bsps/shared/dev/flash: Enforce maximum JFFS2 filesystem size

The maximum size of JFFS2 is 4GB minus the block size of the flash. Enforce this limitation when setting up a filesystem on a flashdev region that is larger than the maximum.

This also resolves some off-nominal memory leaks.

Commit	d0190f0718fb7466af0e296248c6ac3967544073

Summary

cpukit/flashdev: Add unregister call and private data destructor

This adds an API call allowing for unregistration to include destruction of private data that is not managed by the flashdev framework. This also updates the existing consumers of flashdev to use the new private data destructor callback.

Commit	1240e8f81b39fab0551da0971ff57a560f06a025

Summary

cpukit/libdebugger: Add support for TLS variables

This adds support for the “vGetTLSAddr” GDB query which retrieves the address of a TLS variable by offset from the beginning of the TLS memory space for the given thread. This offset does not include the size of the thread control block which is at the beginning of every TLS area as used by RTEMS. Notably, the returned address is big-endian rather than the little-endian typical with other responses.

This functionality does not include retrieval of addresses for TLS variables hosted in loadable modules, only TLS variables in the host binary.

Commit	e7fa90ab0ccd0566dd0b136c62aa729515c3b011

Summary

cpu/riscv: Add Smdbltrp extension compatibility

If the Double Trap Extension is implemented, the MDT bit of the mstatus (or mstatush in RV32) register will be set when a trap is to be taken.

The MIE (Machine Interrupt Enable) bit can only be set to 1 if the MDT bit is zero.

Thus, we need to clear MDT first if we want to enable interrupts when dispatching a thread.

MDT is also cleared in register a1 before restoring the interrupt frame as writing 1 to MDT will cause MIE to be set to 0. In RV64 this happens regardless of the value written to MIE in the same write.

In RV32, MDT is in the mstatush so we do not need to clear during restore as this register is not restored.

With this change all 60 SMP tests pass (compared to 20/60 before the fix). The tests have been run on hardware using two RV64 CPUs that implement the double trap extension.

Commit	dd490c5c2d02e472c83b7052612b554e8b74358f

Summary

bsps/noelv: Fix using console in polled mode

Before, the console driver needed `BSP_CONSOLE_USE_INTERRUPTS` to be defined or it would not build. The intent was to use polled mode if the macro was equal to zero.

This change makes it so interrupt mode is used if the macro is defined and polled mode is used if the macro is not defined.

Close #5283

Author: Joel Sherrill 2025-06-27T13:32:10.089Z

This needs an issue for the backport and the issue needs to be associated with the 6.2 release epic.

If that needs clarification, this is documented somewhere. Ask on Discord and hopefully someone can give you a pointer.

If you need help, ask on Discord.

Author: Matteo Concas 2025-06-27T13:32:10.089Z

I created issue #5283, but I can't seem to add it to the 6.2 release epic or add labels to it. I guess only maintainers have these rights.

Commit	d010f6ae8bc4e2ccfcc162b256e18ed61b71820d

Summary

bsps/sparc/leon3: Fix GPTIMER timer index logic

The old logic would lead to an error when multiprocessing was enabled and `LEON3_GPTIMER_BASE` was defined due to `leon3_timer_core_index` being undefined.

The new logic fixes this and keeps the same intent:

- If multiprocessing is not enabled, the timer index is 0
- If multiprocessing is enabled and `LEON3_GPTIMER_BASE` is defined, the timer index is twice the CPU boot index
- If multiprocessing is enabled and `LEON3_GPTIMER_BASE` is not defined, we fallback to the old logic using the GPTIMER core index.

Commit	3d8b56f10c9cabe8cc731ada636af59f71e8e10b

Summary

cpukit/libdebugger: Prevent hang on memory access

When memory is accessed by the remote debugging client, the access is sandboxed with setjmp/longjmp and appropriate exception handlers to prevent the attempted access from causing a failure of the debugger or otherwise altering execution. The existing implementation works as expected when the context executing the memory access and the exception context resulting from a failed access do not share a stack.

In the case of AArch64, a failed access when the debugger is already in exception context causes a re-entry into exception context where the machine state is pushed onto the same stack that was in use where the exception occurred. When setjmp is called inside a stack frame and the exception occurs outside that stack frame, the stack frame is unwound before the exception occurs and the exception entry overwrites the area previously occupied by the stack frame housing the setjmp and corrupting the link register that is stored there. After restoration of state using longjmp(), this corrupted link register information is loaded from the stack frame and undesired behavior occurs.

In the instance of this bug that was encountered, the corrupted link register contained an unaligned pointer which caused an unending cascade of prefetch abort exceptions presenting as a hard hang.

Commit	f769b20c98e48c4351c540ac53c443acf64cd6b1

Summary

cpukit/libdl: Fix loading symbols from an object file at runtime

- Assume a relocation record with a symbol name with a length of 0 is resolved. ARM seems to create a symbol with no name for R_ARM_V4BX relocation records.
- Move the addition of the rtems_rtl_base_sym_global_add symbol to the global symbol table to the weak rtems_rtl_base_global_syms_init call. If symbols are embedded the support for runtime loading symbols is over loaded. This change is required so the base object has a valid global symbol table attached to track dependencies.

Fixes #5236

Commit	e421c922a87842f0613a269054acd041e46c91cd

Summary

bsp/qoriq: Ignore spurious interrupts

For example, with edge triggered external interrupts we may see spurious interrupts. Ignore them instead of issuing a fatal error.

Use eieio to synchronize access to the IACK and EOI registers.

Use a loop to immediately services the next pending interrupt without having to go through the exception epiloge and prologue.

Close #5173.

Commit	e36ba91110724b5cc8a9e07659d98d0bcb96e4d4

Summary

build: Provide LDFLAGS for pkg-config

Some pkg-config variants perform transformations on the –libs options. This may lead to completely broken linker options. Provide the LDFLAGS as a variable. Remove “Ldflags:” since this is an unsupported field.

Update #5165.

Commit	84c2cf3da9983ef7eadb11d4a676449d6b3ef875

Summary

cpukit/libdl/arm: Fix trampoline alignment

This commit aligns trampolines for THUMB and ARM instructions (CALL/JUMP24 and THM_JUMP24/THM_PC22).

According to the ARM technical reference in section “Register-relative and PC-relative expressions”:

In Thumb code: * For B, BL, CBNZ, and CBZ instructions, the value of the PC is the address of the current instruction plus 4 bytes. * For all other instructions that use labels, the value of the PC is the address of the current instruction plus 4 bytes, with bit[1] of the result cleared to 0 to make it word-aligned.

Closes #5189

https://developer.arm.com/documentation/dui0473/m/symbols–literals–expressions–and-operators/register-relative-and-pc-relative-expressions

Author: Kinsey Moore 2025-01-23T22:49:30.326Z

I have created #5189 for this MR to reference with appropriate epic and milestone. Could you please reference it with “Closes #5189” on a new line at the end of the commit message?

Move libbsd to libbsd-fb14

- Move to FreeBSD 14 for RTEMS 6

Closes #6

Commit	d140be8dd4c6c5f992a18feddd73db322a951150

Summary

gitlab: Add link to CI

This runs only the commit message and merge request checker.

Required so we can have ‘all pipelines must pass’ enabled due to a bug in GitLab.

2.12 RTEMS / Tools / RTEMS Source Builder

Go to *Issues* (page 302) or *Merge Requests* (page 319)

Issues Summary

150 - Release URL handling in download is broken (page 572)
148 - Only support SHA512 hashes (page 573)
146 - Export as JSON the sources details from sb-get-source command (page 576)
139 - Use the RTEMS cache first for downloads (page 577)
128 - GNU FTP URLs are broken after moving to ftpmirror.gnu.org (page 578)
126 - Change ftp.gnu.org to ftpmirror.gnu.org (page 579)
119 - DTC missing checksum after change to .xz (page 580)
113 - Backport mirror name change patch to 6 branch (page 600)
112 - Backport glib download isolation to 6 branch (page 599)
110 - Backport mirror updates to 6 branch for future releases (page 601)
109 - Backport GDB TLS support patches to 6 branch (page 584)
104 - Backport QEMU version update to 6 branch (page 586)
103 - Update git package regerences for 6 (page 585)
101 - Backport UTF-8 fix to 6 branch (page 597)
98 - Can not Build gdb-15.2-arm64-apple-darwin (page 587)
95 - RTEMS tester fails to run correctly under python 3.13 (page 602)
86 - Add build support for LibBSD FreeBSD 14 (page 598)
30 - RSB build failure on the latest code (page 582)

Merge Requests Summary

206 - Fix release downloads (page 603)
203 - bare/devel: Fix QEMU libusb patch hash (page 604)
202 - Support only SHA512 Checksums (page 605)
198 - Add file cache support (page 606)
197 - Add catalog support to get sources (page 607)
185 - Fix GNU FTP links to support mirroring (page 608)
182 - rtems: Change ftp.gnu.org to ftpmirror.gnu.org (page 608)
167 - config: Update to new mirror names (page 611)
162 - Backport download isolation fixes to 6 branch (page 609)
159 - config: Migrate mirror links and hashes (page 612)
157 - rtems/config/tools/gdb: Add TLS support patch (page 613)
150 - devel/qemu-5.2.0: Update to the non-RC version (page 614)
147 - rtems: Update package git references (page 615)
145 - source-builder/sb/path.py: Avoid discarding utf-8 (page 617)
143 - rtems: Fix building on recent MacOS (page 616)
139 - Add support for the 6-freebsd-14 branch to RTEMS 6 (page 618)
128 - gitlab: Add link to CI (page 619)
88 - gmp: Use ftp.gnu.org mirror (page 615)

175 - config/devel/dtc-1.6.1-1.cfg: Update checksum (closed) (page 620)
146 - Update package git references to allow testing (closed) (page 622)

The RTEMS file cache only supports SHA512 hashes. A file using a different hash cannot be fetched from the file cache. Removing all other types of hashes will make us update all the configuration to SHA512.

Author: Chris Johns 2025-11-05T04:07:20.437Z

marked this issue as related to #138

Author: Amar Takhar 2025-12-14T23:59:59.252Z

FYI sha512 is because I thought this is what the RSB used, it uses something else? I was trying to use the same hash.

Author: Kinsey Moore 2025-12-14T23:59:59.252Z

There is a mix of SHA512, SHA256, and MD5 at the moment. SHA512 is the default for anything new going in.

Author: Chris Johns 2025-12-14T23:59:59.252Z

Looking at this issue some more. I have only added this issue to the 7 branch because I thought changing checksums on a release branch was too much however we need the file cache support for 6 so @amar which way should we move? This would also extend back to the 5 branch as well as I suppose we need to deal that version as well?

Author: Chris Johns 2025-12-14T23:59:59.252Z

To add to my last comment I am fine to update all the hashes to SHA512 on 6 and 5 if we think it is OK to do. It is a better hash.

Author: Amar Takhar 2025-12-14T23:59:59.252Z

I'm thinking we should use sha256 it's easier to manage. I just picked 512 because for whatever reason I thought that's what the RSB was using.

Author: Chris Johns 2025-12-14T23:59:59.666Z

There is a mix and most are 512 so I think it is simpler to stay with 512 and change any others.

Summary

Adding a project cache to the RTEMS project requires a list of sources each branch needs to maintain the cache. Export the file list as JSON from the `sb-get-sources` tool to feed into the cache management tools.

Update the RSB to use the RTEMS file cache at https://dl.rtems.org/ first when downloading sources.

The file caches references a file usings it SHA512 hash. If the RSB does not have that hash this file cache is not used. We should obsolete all hash types expect SHA512 so we clean up the configurations.

An example file download is:

```
https://dl.rtems.org/
↪d213e5db09fd56b8977b187c5a756f60d6e3e998be172550c2892dbdb4b2a8e8c750202bc863fe27d0d1c577ab9de1

Looking forward to these patches. With our site restrictions, we can not reliably build the tools.

Author: Amar Takhar 2025-11-06T22:28:41.556Z

The cache is setup now but it's not useful as you need to know the sha512 of the file before downloading it's located at https://dl.rtems.org/ Chris is working on modifying the RSB to use it.

Change any ftp.gnu.org URLs to ftpmirror.gnu.org to use GNU FTP Mirror support. This helps with loading on GNU's machines and the mirrors are faster due to GNU FTP rate limiting repeat downloads from the same user.

The referenced commit is under main/7, not 6 branch. As far as I can tell, 6 still pulls the DTC tarball correctly for devel/qemu-couverture. What is the command used to trigger this error on 6 branch?

Author: Chris Johns 2025-09-18T01:27:42.737Z

The command that sees the error is getting the sources which has to get all sources in the buildsets and configurations. The change moved the extension to `.xz` in the base recipe however:

```
$ grep gz bare/config/devel/dtc*
bare/config/devel/dtc-1.2.0.cfg:%hash sha512 dtc-%{dtc_version}.tar.gz␣
↪d7a8...
bare/config/devel/dtc-1.4.1-1.cfg:%hash sha256 dtc-%{dtc_version}.tar.
↪gz 03e7...
bare/config/devel/dtc-1.6.0-1.cfg:%hash sha256 dtc-%{dtc_version}.tar.
↪gz 9fbe0...
bare/config/devel/dtc-1.6.1-1.cfg:%hash sha256 dtc-%{dtc_version}.tar.
↪gz 38a6...
```

shows there are older existing versions still on the `.gz` extension. The change should have added a macro that defines the extension and used that. An example is GDB with `%{gdb_src_ext}`.

Author: Chris Johns 2025-09-18T01:39:27.924Z

Once @amar adds the build cache this error will be detected and we can make an issue or whatever to get it sorted. The build cache uses the get source tool to build a catalog.

Author: Amar Takhar 2025-09-18T01:39:27.879Z

I finished the build cache the same day we talked about it. What we're waiting on is an option to the RSB to dump all the upstream resources to a JSON file so we can continuously scan and load the cache. Though we'll have to account for situations like this.

Then the RSB can be modified to use it.

Author: Chris Johns 2025-09-18T05:22:12.115Z

Yes this is understood. A checksum error has become a hard error because people did not set or get is right and each release there was a lot of work to clean it up. For example the `gcc-head-newlib-head` configuration has a bad checksum after the path was redirected to our gitlab.

1000/tools/rtems-default-tools reporting: tools/rtems-binutils-2.43.cfg -> aarch64-rtems6-binutils-2.43-x86_64-linux-gnu-1.txt making dir: /home/yangzhang/code/github/rtems-source-builder/rtems/build/tmp/aarch64-rtems6-binutils-2.43-x86_64-linux-gnu-1-1000/home/yangzhang/RTEMS/rtems/6/share/rtems/rsb reporting: tools/rtems-binutils-2.43.cfg -> aarch64-rtems6-binutils-2.43-x86_64-linux-gnu-1.xml making dir: /home/yangzhang/code/github/rtems-source-builder/rtems/build/tmp/aarch64-rtems6-binutils-2.43-x86_64-linux-gnu-1-1000/home/yangzhang/RTEMS/rtems/6/share/rtems/rsb config: tools/rtems-gcc-13.3-newlib-head.cfg error: shell macro failed: cat "/home/yangzhang/code/github/rtems-source-builder/rtems/config/stdcxx-template.py" | sed "s/@RSB_GCC_VERSION@//bin/sh: 1: /home/yangzhang/RTEMS/rtems/6/bin/aarch64-rtems6-gcc: not found/g" > "/home/yangzhang/RTEMS/rtems/6/share/gdb/python/rtems/stdcxx.py": 2: /bin/sh: 1: cannot create /home/yangzhang/RTEMS/rtems/6/share/gdb/python/rtems/stdcxx.py: Directory nonexistent

Steps to reproduce

1. git clone https://gitlab.rtems.org/rtems/tools/rtems-source-builder.git current commit is :632ccda714fdba59c39bb126cf417f2b101c8929 2. cd ~/rtems-source-builder/rtems ../source-builder/sb-set-builder –prefix="PATH" 6/rtems-aarch64

Additional Information

First, i git clone https://github.com/RTEMS/rtems.git when build with config.ini([aarch64/xilinx_zynqmp_lp64_qemu]) i found fail Log: ../../../cpukit/libcsupport/src/getrusage.c: In function 'getrusage': ../../../cpukit/libcsupport/src/getrusage.c:113:8: error: 'RUSAGE_THREAD' undeclared (first use in this function); did you mean 'SIGEV_THREAD'? 113 | case RUSAGE_THREAD: | ^~~~~~~~~~~~~~ | SIGEV_THREAD ../../../cpukit/libcsupport/src/getrusage.c:113:8: note: each undeclared identifier is reported only once for each function it appears in ————————————————- I found in the toolchain, only define RUSAGE_SELF and RUSAGE_SELF, no RUSAGE_THREAD, so i think i should update toolchain. Then i clone the newest rsb code, and then build, but rsb build failure as above.

Hello this has already been reported and there is a fix in issue https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/issues/29

I am closing this as it seems to be a duplicate if it is not please re-open.

Author: Amar Takhar 2024-08-22T01:15:16.813Z

Re-opening to use duplicate command I forgot existed.

Author: Amar Takhar 2024-08-22T01:15:32.085Z

marked this issue as a duplicate of #29

Author: Amar Takhar 2024-08-22T01:15:32.341Z

marked this issue as related to #29

2.12.1.9 109 - Backport GDB TLS support patches to 6 branch

Summary

Can not build gdb-15.2 on arm64-apple-darwin.

```
Apple clang version 17.0.0 (clang-1700.0.13.3)
Target: arm64-apple-darwin24.4.0
Thread model: posix
InstalledDir: /Applications/Xcode.app/Contents/Developer/Toolchains/XcodeDefault.
↪xctoolchain/usr/bin
```

Steps to reproduce

I have tried it with RTEMS6.1 release and the current one (7-origin/main).

```

assigned to @chris

Author: Chris Johns 2025-04-18T22:39:28.023Z

I wonder if we need to upgrade GDB to 16 like we have on RTEMS 7? I think some testing is needed.

Author: Heinz Junkes 2025-05-23T02:39:28.956Z

Unfortunately, it looks to me like a problem with the Apple OSx. Everything works perfectly with Sequoia 15.0. I got the problems after upgrading to 15.4. The main problem I see is that XCode is usually also updated during an upgrade of the OS and then problems like this occur. Unfortunately I can't select an older XCode on a new Apple OS? Apple simply changes too much at their own discretion :-(

Author: Amar Takhar 2025-05-23T02:39:28.956Z

There's no option to use homebrew / macports or just install the CLI tools without XCode? XCode is always a moving target and very hard to do longterm development for anything non-GUI. If you're doing GUI work then you need to accept that Apple does this if you want your software to work.

Author: Heinz Junkes 2025-04-22T09:40:33.211Z

It would be really nice if we had a builder-config that would work with the homebrew - installation only.

Author: Heinz Junkes 2025-04-22T14:48:25.853Z

Same error with rtems7 and gdb16:

Author: Heinz Junkes 2025-04-22T15:11:35.960Z

I found this at the Homebrew Docu: “Homebrew depends on having an up-to-date version of Xcode because it comes with specific versions of build tools, e.g. clang.”

Author: Chris Johns 2025-05-03T00:30:32.343Z

The issue is related to the version of `zlib` in GDB. GDB needs a newer version as https://github.com/madler/zlib/blob/develop/zutil.h has the `MACOS` section removed.

Author: Chris Johns 2025-05-03T18:24:46.060Z

I was checking 16.2 which is our GDB for RTEMS 7. I checked gdb's git repo and the ``ziib `` header is still broken. I have raised a bug on gdb: https://sourceware.org/bugzilla/show_bug.cgi?id=32933

Author: Chris Johns 2025-05-03T02:31:07.808Z

It seems `binutils-2.44` has the same issue.

Author: Chris Johns 2025-05-03T09:29:22.052Z

GCC also suffers from the same issue.

Author: Chris Johns 2025-05-03T10:12:38.678Z

These patches let `aarch64` tools build on Sequoia and the latest Xcode.

gcc-13.3.0-zlib-macos-fix.diff

binutils-2.44-zlib-macos-fix.diff

gdb-16.2-zlib-macos-fix.diff

Author: Chris Johns 2025-05-03T10:13:47.560Z

cloned to #100

Author: Joel Sherrill 2025-05-05T01:58:40.938Z

@chris Did you submit these patches to the upstream projects?

Author: Chris Johns 2025-05-05T01:58:40.903Z

No. Upstream needs to pick up a newer `zlib` but there is shared complexity across a range of projects that share this. I have raised issues or there is a known issue.

Author: Chris Johns 2025-05-05T02:34:29.090Z

We need these changes to avoid changing the release. I have no idea if a gcc-13.x will ever see an updated `zlib` .

Author: Heinz Junkes 2025-05-05T01:57:29.301Z

Just for the sake of completeness. I have unfortunately encountered another problem. To solve it I had to do:

ln -s /opt/homebrew/Cellar/ncurses/6.5/include/ncursesw /usr/local/include/ncursesw

Unfortunately, I have not yet understood how I can use this fixed source builder to install version 6.1? (Does this refer to Joel's comment? 'upstream-projects'?)

rtems: Add paches to fix building on MacOS

- The zlib packages in gdb, binutils and gcc are broken on a
current MacOS. Patch around this until fixed upstream
```

Author: Chris Johns 2025-05-05T01:57:29.260Z

That looks like a homebew issue. It is why I build without it as it helps us isolate what are problems we have and what are Homebrew related.

Author: Chris Johns 2025-05-04T00:50:35.434Z

The 6 branch patches:

gdb-15.2-zlib-macos-fix.diff

binutils-2.43-zlib-macos-fix.diff

Author: Chris Johns 2025-05-04T01:24:18.010Z

mentioned in merge request !143

Author: Joel Sherrill 2025-05-23T02:39:22.978Z

See GCC issue 105404 for where they are tracking issues with zlib like this. Looks like GCC 16 is the first version that might address MacOS and update to pick up CVEs.

We need to carry the patch on 7 for at least GCC 13-15.

Author: Joel Sherrill 2025-05-23T02:39:22.978Z

A response from the gcc issue:

> note that the issue on macOS starts with Xcode16.3 on recent OS versions which have an up to date installed zlib (so the –with-system-zlib is a reasonable work-around).

Author: Chris Johns 2025-05-23T02:39:22.978Z

It is a work around unfortunately we have no history of adding this option to previous MacOS builds and what works and does not work. I also do not know how we could key option against MacOS version and Xocde versions.

changed the description

Author: Chris Johns 2025-04-18T22:47:41.035Z

The config naming should only reference the version of FreeBSD being built. This simplifies the external user interface between versions of RTEMS. For example `7/rtems-libbsd.bset` becomes `7/rtems-libbsd-fb-14.bset` and we add `6/rtems-libbsd-fb-14.bset` to the 6 branch.

I have found the error codes returned by OpenSSL on FreeBSD 12 are different to the codes returned by FreeBSD 14. It is an example of why we need to remove the default branch from `libbsd` support and support active FreeBSD branches on an RTEMS release.

Milestone	6.2
Labels	tool::test
Link	https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/work_items/95
Merges	0

Summary

When attempting to run the RTEMS tester with Python 3.13, these error messages are produced:

```
.../rtems-tools/tester/rt/test.py:76: SyntaxWarning: invalid escape sequence '\\['
status_regx = re.compile('^\\[\\s*\\d+/\\s*\\d+\\] p:.+')
.../rtems-tools/tester/rt/test.py:188: SyntaxWarning: invalid escape sequence '\\.
↪'
norun = re.compile('.*\\.norun.*')
Incorrect RTEMS Tools installation
```

This was tested on the 6.1 branch, but there appear to be no changes to main that would have fixed this.

Steps to reproduce

2.12.1.18.2.1 Pre-set options

Author: Kinsey Moore	2025-02-28T22:39:31.957Z

assigned to @opticron

Author: Kinsey Moore	2025-02-28T22:39:32.416Z

Author: Kinsey Moore	2025-03-02T02:13:13.434Z

On further investigation, this is 2 separate issues. The escapes need to be fixed to resolve the warnings and the actual exit is caused by missing telnetlib since it was deprecated in 3.11 and removed in 3.13.

Author: Kinsey Moore	2025-03-02T02:13:13.403Z

On debian systems, there is currently a workaround for the actual exit issue by installing `python3-zombie-telnetlib`.

Author: Kinsey Moore	2025-03-02T02:21:56.118Z

moved to rtems-tools#22

Commit	cbc93a5a714662e58e9106d3a75e01a405b33d19

Support only SHA512 check-sums to be compatible with the RTEMS file cache at https://dl.rtems.org.

1. Remove patchwork down loader support as the `--rsb-file` option can be used. This is a better and simpler alternative. A patchwork patch used SHA256.
2. Switch any remaining configurations to SHA512.

I have run `sb-get-sources`.

Updates #148

Commit	e139977d351305775c4effa3c0b4a52531e38083

Summary

gmplib.org blocks IPs associated with Microsoft/GitHub for performance reasons. This poses a problem for GitHub CI/CD configurations that build the toolchains using rtems-source-builder, although it's easy to fix with a quick `patch`.

Nonetheless, it might be a good idea to reduce traffic to gmplib.org, since their infrastructure doesn't seem particularly beefy.

Commit	15e5be5a328d099369dcba795ccc6ff33b82d055

Summary

source-builder/sb/path.py: Avoid discarding utf-8

On MSYS2 on Windows 10, non-ASCII utf-8 characters should not be discarded since filesystems on this platform can support them. This fixes a build issue in GCC where a Go test file includes a non-ASCII character.

config/devel/dtc-1.6.1-1.cfg: Update checksum

The file extension was wrong, checksum was incorrect, and the checksum needed to be sha512.

restored source branch `6-update-dtc-hash`

Author: Kinsey Moore 2025-09-16T17:52:52.497Z

changed the description

Author: Kinsey Moore 2025-09-16T19:15:43.221Z

This needs a backport issue and this should really be 1 commit.

Author: Joel Sherrill 2025-09-16T19:15:43.221Z

Chris' original issue was for 6 and I pulled the fix forward. Isn't that the same?

Author: Joel Sherrill 2025-09-16T19:10:09.540Z

added 1 commit

- 6b09eae6 - config/devel/dtc-1.6.1-1.cfg: Update hash

Compare with previous version

Author: Joel Sherrill 2025-09-16T19:14:45.286Z

added 1 commit

- bea88efb - config/devel/dtc-1.6.1-1.cfg: Update checksum

Compare with previous version

Author: Kinsey Moore 2025-09-16T19:15:43.239Z

resolved all threads

Author: Kinsey Moore 2025-09-16T19:47:04.352Z

As far as I can tell, this is only an update of the hash from 256 to 512 and there is no error to resolve on 6 branch.

Summary

When attempting to run the RTEMS tester with Python 3.13, these error messages are produced:

```
.../rtems-tools/tester/rt/test.py:76: SyntaxWarning: invalid escape sequence '\\['
status_regx = re.compile('^\\[\\s*\\d+/\\s*\\d+\\] p:.+')
.../rtems-tools/tester/rt/test.py:188: SyntaxWarning: invalid escape sequence '\\.
↪'
norun = re.compile('.*\\.norun.*')
Incorrect RTEMS Tools installation
```

This was tested on the 6.1 branch, but there appear to be no changes to main that would have fixed this.

This issue also includes the `telnetlib` issue.

Steps to reproduce

2.13.1.2.2.1 Pre-set options

Author: Kinsey Moore 2025-03-02T02:21:55.776Z

assigned to @opticron

Author: Kinsey Moore 2025-02-28T22:39:31.957Z

assigned to @opticron

Author: Kinsey Moore 2025-02-28T22:39:32.416Z

Author: Kinsey Moore 2025-03-02T02:13:13.434Z

On further investigation, this is 2 separate issues. The escapes need to be fixed to resolve the warnings and the actual exit is caused by missing telnetlib since it was deprecated in 3.11 and removed in 3.13.

Author: Kinsey Moore 2025-03-02T02:13:13.403Z

On debian systems, there is currently a workaround for the actual exit issue by installing `python3-zombie-telnetlib`.

Author: Amar Takhar 2025-03-02T02:28:45.323Z

The current state of telnetlib isn't great I don't think there are any maintained ones. This one is its own project but no activity from the maintainer in years: https://github.com/jquast/telnetlib3

The Python one was just removed there is nobody touching the code anymore which is why they called it 'zombie' .. apt name.

`telnetlib3` is at least installable via pypi. I'm not sure if it's a drop in replacement does it work can you try it out?

FreeBSD for example has no telnet library for python available and I'm sure that's true for most OS the Python project itself recommends either telnetlib3 or Exscript which is even more out of maintainership

Author: Kinsey Moore 2025-03-02T02:34:43.202Z

`telnetlib3` *appears* to be a mostly drop-in replacement (s/telnetlib/telnetlib3/g), but I don't have an example of a tester configuration that actually uses it, so I can't verify that functionality completely.

Author: Chris Johns 2025-03-02T02:37:05.927Z

https://docs.rtems.org/docs/main/user/testing/configuration.html#console and look for:

```
%define bsp_tty_dev      1.2.3.4:8989
```

Author: Kinsey Moore 2025-03-02T02:43:13.300Z

Ah, I *do* actually have a test configuration that I can verify this on. It'll probably have to wait until Monday.

Author: Kinsey Moore 2025-03-02T02:21:56.083Z

moved from rtems-source-builder#95

Author: Kinsey Moore 2025-03-02T02:22:42.566Z

mentioned in merge request !53

Author: Kinsey Moore 2025-07-30T18:50:47.695Z

The situation has been improved by 0efe888 in that the reason for exit is displayed. This still needs work to verify the migration path to telnetlib3.

Author: Chris Johns 2025-10-02T22:41:29.516Z

changed the description

Author: Chris Johns 2025-10-02T22:44:15.955Z

This is issue cover two problem. We need to split it as the syntax issue has been fixed and we should close this issue.

@chris Please provide feedback on this so we can publish it. You mentioned something about libbsd before Christmas. When I looked at https://ftp.rtems.org/pub/rtems/releases/6/6.2/, I do not see a distinction on libbsd. What libbsd branch was this cut from? I thought there would be a libbsd branch component in the file name. Help appreciated.

Author: Chris Johns 2026-01-20T20:32:04.939Z

Yes. We provide but have obsoleted rtems-libbsd-6.2.tar.xz and we recommend all users move to [rtems-libbsd-fb14-6.2.tar.xz](https://ftp.rtems.org/pub/rtems/releases/6/6.2/sources/rtems-libbsd-fb14-6.2.tar.xz).

Author: Joel Sherrill 2026-01-20T20:32:04.939Z

@chris Is it OK now?

Author: Chris Johns 2026-01-20T20:32:04.939Z

Sorry I cannot see any change mentioning obsoleting `libbsd-fb12` ?

CHAPTER

THREE

RTEMS 6.1

3.1 RTEMS / Documentation / Documentation

Go to *Issues* (page 346) or *Merge Requests* (page 351)

Issues Summary

69 - waf probe for python module is broken on windows/MSYS2 (page 642)
62 - Update waf to 2.1.4 : rtems/docs/rtems-docs (page 646)
61 - Document Running rpi4 on Qemu (page 657)
60 - Missing module 'distro' (page 651)
58 - waf.py: SyntaxWarning: invalid escape sequence (page 654)
55 - Version not showing in left panel (page 658)
53 - Typos (page 645)
52 - singlehtml menu is broken (page 658)
50 - Add documentation for flashdev command (page 661)
48 - Highlight the benefits of the new Rtems release/releases :rocket: (page 660)
47 - Fix broken API documentation links (page 663)
45 - Remove the menu bar in the documentation or fix all the broken links (page 664)
44 - Point stale default branch references to "main" (page 643)
43 - Fix references to old branches (page 666)
42 - Dangling references (page 666)
39 - User manual IRC section (page 669)
31 - Update link to rtems-gtest (page 672)
30 - C Classic API manual SMP link points to git.rtems.org (page 671)
24 - Deprecating Interfaces needs moving from wiki (page 668)
22 - Link to non exisent repository (page 670)
18 - Checking if Sphinx is between 1.3 and 5.9 (page 673)
17 - docs.rtems.org needs changes to reflect gitlab and master->main rename (page 662)
15 - Update amd64 User Manual documentation to include how to create bootable image for the rtems-test config (page 639)
14 - Update POSIX Compliance Guide for New Standards Editions (page 675)
12 - Manuals refer to ssh://git@gitlab.rtems.org:2222/... which is not accessible for users without SSH-key (page 640)
11 - Mention GitLab in user/migration/v5-to-v6.rst (page 661)
10 - Manuals refer to git.rtems.org (page 679)
8 - Document Merge Request Workflow (page 676)
5 - Contributing guidance is outdated (page 677)
4 - Rewrite bug user story (page 678)
3 - sync git.rtems.org (page 680)
2 - Rewrite trac links to gitlab (page 679)
1 - Update docs to reflect docs.rtems.io (page 642)

Merge Requests Summary

131 - common: waf bugfix for msys2 (page 696)
117 - common/eng/user: Update docs links (page 697)
115 - eng/user: Replace references to master where possible (page 698)
113 - user/cpu-supplment: Fix minor typos (page 699)

continues on next page

Table 2 – continued from previous page

105 - waf: update waf to waf-2.1.4 (page 700)
99 - common: remove dead code (page 700)
98 - user/bsps/raspberrypi4: running on qemu (page 701)
94 - sphinx: Remove digest strings and fix sidebar (page 702)
91 - riscv/niosv: Updated configuration INI default values to match MR !270 (page 703)
88 - user: refactor migration to add release highlights (page 705)
86 - README: Clarify waf invocation in Building (page 706)
84 - user: mention GitLab in migration/v5-to-v6 (page 707)
83 - Change theme to sphinx-book-theme (page 704)
82 - user/zynqmp: Reword for BSP renaming (page 711)
80 - user: Update Tracing - Event Recording (page 708)
76 - Add website icons. (page 711)
74 - shell: Added flashdev documentation (page 712)
73 - user/start: fix instructions for running rtems-test and use replaceables (page 721)
72 - user: migrate content and remove installation section (page 722)
70 - Add icons used for GitLab (page 720)
69 - versal: Update BSP names for changes in RTEMS (page 719)
68 - Use replaceables in shell examples. (page 723)
67 - Migrate deprecating interfaces from wiki to user manual. (page 724)
66 - Update from IRC to Discord (page 725)
64 - user: Update for zynqmp renaming (page 718)
62 - eng: Update the release procedure (page 731)
61 - Add new logo SVGs (page 726)
60 - Update waf to 2.1.2 to match RTEMS (page 730)
59 - Add missing reference to user docs (page 729)
56 - Update cpu_usage_statistics.rst: insert missing fullstop; delete remnants of a... (page 738)
52 - user: Document ZynqMP RPU BSP variants (page 728)
48 - user: Add –release option to Rust instructions (page 694)
47 - posix-compliance: Update API tracking csv to account for lio_listio (page 742)
46 - user/bsps/atsam: Migrate from BSP README.md (page 693)
45 - Add BeagleV-Fire Board Documentation (page 713)
44 - posix-users/input_and_output.rst: Update AIO docs (page 681)
43 - Add section "Debugging" to RTEMS documentation (page 686)
42 - user/bsps/x86_64: Update amd64 documentation (page 683)
40 - Minor cleanup (page 766)
39 - Add Intel NIOS V BSP to RISC-V section of user's manual (page 749)
38 - Remove old references to devel.rtems.org (page 767)
37 - Update old git.rtems.org links to GitLab (page 768)
36 - Update source browser URLs to GitLab (page 770)
35 - Point to new LICENSE.md (page 771)
34 - Remove mention of MAINTAINERS file (page 772)
33 - Convert LICENSE file to MarkDown (page 772)
32 - user/stm32h7: Separate comment block (page 773)
31 - posix-user: Add getrusage (page 765)
30 - Simplify system termination procedure (page 743)
29 - user: Swap to https from ssh (page 741)

continues on next page

Table 2 – continued from previous page

28 - c-user: Document timeout/try_wait function for counting semaphore (page 762)
27 - posix-compliance: Update tracking CSV for published POSIX-2024 (Issue 8) (page 774)
26 - posix-users/input_and_output.rst: Update AIO Documentation (page 763)
25 - user/raspberrypi: Update copyright and stale info (page 762)
24 - c-user: Document INTERNAL_ERROR_CANNOT_DISABLE_DATA_CACHE (page 757)
23 - c-user: Clarify system termination procedure (page 759)
22 - c-user: Mention RTEMS_INTERRUPT_LOCK_NEEDS_OBJECT (page 758)
21 - c-user: Document typedef parameters (page 756)
20 - eng: Document assert-in-set action (page 754)
19 - posix-compliance: Update tracking CSV and standards descriptions (page 775)
18 - raspberrypi4.rst: Documation for the gpio driver (page 760)
17 - Fix rtems version (page 756)
16 - user/testing: Update documentation for RTEMS 6 (page 776)
15 - Fix parallel building (page 783)
14 - Spelling corrections. (page 753)

Merges	1

Summary

Update the amd64 section on the User Manual to describe how to create the bootable image required for the BSP tester config added in this MR

Author: Matheus Pecoraro 2024-06-15T20:43:03.248Z

@amar I imagine based on our previous conversations it would contain a link to a pre-made image and a tutorial on how to create it. If that's the case where would the image be hosted?

Merges	0

Summary

@gedare thankfully did the painful work of changing all the references from `git.rtems.org` to the new `gitlab.rtems.org`. Unfortunately, the SSH protocol was used. For example in (`rtems-docs.git`) `user/start/sources.rst` is says now:

```
git clone ssh://git@gitlab.rtems.org:2222/rtems/tools/rtems-source-builder.git rsb
```

This does not work for users which have no Gitlab account or have not (yet) deposited an SSH public key. It would be better to use the HTTPS protocol as this permits to clone and update the repos without Gitlab account. For example:

```
git clone https://gitlab.rtems.org/rtems/tools/rtems-source-builder.git rsb
```

Steps to reproduce

I used a container to verify:

```
$ podman run -it --rm ubuntu:latest bash
root@35177ab8d4a3:/# apt update
[...]
root@35177ab8d4a3:/# apt install git
[...]
root@35177ab8d4a3:/# cd
root@35177ab8d4a3:~# git config --global user.email "user@example.com"
root@35177ab8d4a3:~# git config --global user.name "User Name"

root@35177ab8d4a3:~# git clone ssh://git@gitlab.rtems.org:2222/rtems/tools/rtems-
↪source-builder.git rsb
Cloning into 'rsb'...
The authenticity of host '[gitlab.rtems.org]:2222 ([140.211.10.148]:2222)' can't␣
↪be established.
ED25519 key fingerprint is SHA256:9UCwVh/lXqg0AG8rjTSB2AJIMPpoh3aL8atLTjQ4ASo.
```

(continues on next page)

(continued from previous page)

```
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '[gitlab.rtems.org]:2222' (ED25519) to the list of known hosts.
git@gitlab.rtems.org: Permission denied (publickey).
fatal: Could not read from remote repository.

Please make sure you have the correct access rights
and the repository exists.

root@35177ab8d4a3:~# git clone https://gitlab.rtems.org/rtems/tools/rtems-source-builder.git rsb

Thanks you're right ssh:// won't work unless you have an account _and_ have added an SSH key. Anyone who wants to open an issue will not need an SSH key, either. The only time you need it is if you plan to submit changes via Git.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T01:08:46.506Z

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

Merges	0

Summary

Reported in #58

```
$ ./waf configure --plantuml --ditaa --pdf --singlehtml --prefix=/home/minna/src/
↪artifacts/html
[...]
Checking for program 'pdf2ps'                   : /usr/bin/pdf2ps
Checking for program 'makeglossaries'           : /usr/bin/makeglossaries
Traceback (most recent call last):
File "/home/minna/src/rtems-docs/common/latex.py", line 85, in host_name
```

(continues on next page)

(continued from previous page)

```
from distro import linux_distribution
ModuleNotFoundError: No module named 'distro'
```

How come this is showing up now was something pulling it before? Docs need to be updated.

Steps to reproduce

3.1.1.8.2.1 Pre-set options

Author: Chris Johns 2024-11-24T22:20:48.273Z

It is in a `try/except` in the code on `main`:

!`image <https://gitlab.rtems.org/-/project/uploads/ac9c83434b039fe7c86ba94107bc5f0e/image.png>`_

Author: Chris Johns 2024-11-24T22:28:12.954Z

Looks like the call has gone:

!`image <https://gitlab.rtems.org/-/project/uploads/54d1e59be8549741a7b7598ead055d8e/image.png>`_{width=746 height=149}

I do not use Linux or have a suitable set up to sort this out. I am giving this to the Linux people we have I know of.

Author: Frank Kuehndel 2024-12-03T12:30:56.878Z

I guess, this again has become two independent topics:

1. At least on OpenSUSE, the `distro` package is not installed by default. It should be mentioned somewhere in the `README.md` to add it to the Python environment. I just do not see the right place and do not know whether other Linux distributions have `distro` installed by default or not.
2. Deprecation of `platform` and `linux_distribution()`:

According to Distro - an OS platform information API *Python's original ``platform.linux_distribution`` function ([has been] removed in Python 3.8)*.

According to distro package version 1.9.0 API `distro.linux_distribution()` is deprecated. I guess in `common/latex.py`, `distro[0]` should be replaced by `distro.name()`, and `dirsto[1]` by `distro.version()` ... or somehow similar (I do not know how much compatible you must be to old Python versions with `platform.linux_distribution` function).

I tested this and I can build the RTEMS docs without the `distro` package on OpenSUSE, now. Thanks @gedare

3.1.1.9 58 - waf.py: SyntaxWarning: invalid escape sequence

Id	58
State	closed
Type	ISSUE
Author	Frank Kuehndel
Assignee(s)	Amar Takhar
Closed by	Chris Johns
Created	2024-11-22T13:02:32.215Z
Closed	2024-11-26T05:27:22.714Z
Updated	2024-12-18T21:40:15.528Z
Milestone	6.1
Link	https://gitlab.rtems.org/rtems/docs/rtems-docs/-/work_items/58
Merges	2

Summary

I am adapting our CI pipeline which build the RTEMS Docs to the latest changes and recognized the following warnings:

```
$ cd rtems-docs
$ ./waf configure --plantuml --ditaa --pdf --singlehtml --prefix=/home/minna/src/
↪artifacts/html

/home/minna/src/rtems-docs/common/waf.py:111: SyntaxWarning: invalid escape␣
↪sequence '\\D'
ver = tuple(map(int, re.split('[\\D]', version)))

/home/minna/src/rtems-docs/common/waf.py:118: SyntaxWarning: invalid escape␣
↪sequence '\\D'
ver = tuple(map(int, re.split('[\\D]', version)))

/home/minna/src/rtems-docs/common/latex.py:9: SyntaxWarning: invalid escape␣
↪sequence '\\d'
'\\documentclass[a4paper,11pt,english]{report}']
```

Moreover, using OpenSUSE as basis for the builds, the python package `distro` is missing:

```
$ ./waf configure --plantuml --ditaa --pdf --singlehtml --prefix=/home/minna/src/
↪artifacts/html
[...]
Checking for program 'pdf2ps'                  : /usr/bin/pdf2ps
Checking for program 'makeglossaries'          : /usr/bin/makeglossaries
Traceback (most recent call last):
File "/home/minna/src/rtems-docs/common/latex.py", line 85, in host_name
from distro import linux_distribution
ModuleNotFoundError: No module named 'distro'
```

This missing module can easily installed in the environment with `pip install distro`.

Steps to reproduce

See README.md

Hello Frank this issue has two problems? The errors and the missing module? I'm not sure w hat to say about the missing module that is not something I have changed. @chris will have to speak about that one.

As for the syntax error that is also not something I've changed what version of Python are you using? I'm on 3.11 but it should work on 3.9+

A change has removed the version string from the left panel. The 6.1-rc4 build of the documentation shows it:

!`image.png <https://gitlab.rtems.org/-/project/uploads/786867c7fab7c1d4101412121d1bfb69/image.png>`_

and the latest build of the docs is:

!`image.png <https://gitlab.rtems.org/-/project/uploads/6dbb2123a908bca48fb4fb325a86e8ec/image.png>`_

Author: Chris Johns 2024-11-14T06:45:53.724Z

changed the description

Author: Gedare Bloom 2024-11-14T06:46:08.463Z

Compare: * https://docs.rtems.org/docs/main/user/overview/index.html * https://ftp.rtems.org/pub/rtems/releases/6/rc/6.1-rc4/docs/html/user/overview/index.html

Author: Amar Takhar 2024-11-14T06:56:41.757Z

The new theme has a version switcher allowing you to switch between doc versions and keep the section you're on. It's right where that version is.

Author: Amar Takhar 2024-11-14T06:58:49.092Z

If you look beside 'PyData Theme' here: https://pydata-sphinx-theme.readthedocs.io/en/stable/user_guide/indices.html you can switch between versions it's pretty handy.

Author: Chris Johns 2024-11-14T07:57:03.182Z

I cannot see any version box in our docs? What happens in the released?

Author: Amar Takhar 2024-11-14T07:57:03.150Z

No idea I haven't changed anything are those versions pulled from somewhere?

FYI I have fixed this in the new theme it shows up there.

Author: Chris Johns 2024-11-22T00:45:04.994Z

The following page describes problems to address when migrating to a new version https://docs.rtems.org/branches/master/user/migration/index.html

However, the documentation is missing what is new and exciting in the latest version. Why should anyone upgrade to the latest release? What is new and sparks joy? :sparkles: Are there new features? Are there new platforms? :computer:

Concrete suggestion: * Rename Changing versions to “upgrading to Rtems 6” * Add a section about “What is new in Rtems 6” or “Highlights of this new version”

Merges	0

Summary

https://docs.rtems.org/ still has `/master/` as the URL. This needs to be changed to main we can have an automatic forward in the webserver to redirect `https://docs.rtems.org/*/master/*` to ``https://docs.rtems.org/*/main/*``.

This step needs to be completed before docs can be automated anyway so it is a blocking change to that but I'm unsure if CI doc building will happen before %6.1 or not.

Merges	0

Summary

3.1.1.17.1.1 Development:

- Please rename “RTEMS CPU Kit Doxygen” to “RTEMS API documentation” linked from https://docs.rtems.org/
- Please fix the link https://docs.rtems.org/doxygen/branches/master/ so that it reads “main” instead of “master”
- Please update the API documentation to 5.3 because it is only for “RTEMS 5.0.0” on the main branch

3.1.1.17.1.2 Release 5.3

- Please rename “RTEMS CPU Kit Doxygen” to “RTEMS API documentation” linked from https://docs.rtems.org/
- Please fix the link to the API documentation on 5.3 because the link is currently broken https://docs.rtems.org/doxygen/releases/rtems-5.3/ with error 404

The API docs links for 5.2, 5.1 and 4.11 are not broken, so something terrible happened recently :grimacing: :skull_crossbones:

Merges	0

Summary

The following links need updating as they all point to a blank page about a Gitlab migration: * Documentation->wiki * Documentation->view tickets * Documentation->new ticket * Documentation->git repository

```
have migrated to GitLab please see https://gitlab.rtems.org/groups/rtems/

If you have any questions you can find us on our Discord at
https://www.rtems.org/discord in #gitlab-support for updates
```

In addition: * The “Home” button on the top-left corner does not point back to rtems.org but to the documentation itself https://docs.rtems.org/index.html - how should one return to rtems.org? * The rtems logo does not link back to rtems.org

It seems that the entire navigation bar should be removed.

Summary

These docs refer to `4.11` which was released 20 years ago.

- https://docs.rtems.org/branches/master/user/installation/developer.html

We should fix this to use replaceables which should stay accurate for the commandlines even though the screen output may be wrong it will at least be a little closer.

Note the documentation itself needs to be fixed as well.

Steps to reproduce

Try to follow the documentation.

3.1.1.20.2.1 Pre-set options

Author: Amar Takhar 2024-10-29T20:42:49.956Z

changed the description

Author: Amar Takhar 2024-10-29T20:43:15.367Z

changed the description

Author: Gedare Bloom 2024-10-29T20:48:04.074Z

I think this entire section should be removed in favor of the Quick Start. Some relevant text could be migrated there.

https://docs.rtems.org/branches/master/c-user/symmetric_multiprocessing_services.html#per-processor-data reference the `percpudata.h` file in the old repo.

Author: Chris Johns 2024-08-18T01:40:21.685Z

changed title from **C Classic API manu SMP link points to git.rtems.org** to **C Classic API manu{+al+} SMP link points to git.rtems.org**

Author: Chris Johns 2024-08-18T01:55:30.516Z

The SMP needs some work. There are a number of references to web sites that need to be updated or the references removed.

Author: Chris Johns 2024-08-18T01:57:36.118Z

I cannot see a link in the SMP section in the C manual to the “SMP Schedulers” and “Directives” section of “Scheduling Concepts” of the C API manual. I think it would be helpful to have links.

Author: Gedare Bloom 2024-10-07T20:16:48.305Z

This was fixed by !11. I’ll migrate the other comments to a new issue.

Author: Gedare Bloom 2024-10-07T20:18:30.766Z

Milestone	6.1
Labels	doc::sphinx
Link	https://gitlab.rtems.org/rtems/docs/rtems-docs/-/work_items/18
Merges	0

Summary

I naively installed Sphinx through pip in a virtual environment and got:

```
Checking if Sphinx is between 1.3 and 5.9 : Sphinx version is too new: 7.3
```

Is this version limitation still applicable?

Author: Joel Sherrill 2024-07-03T22:42:14.934Z

Weird. I use the sphinx provided with Rocky 9 and it reports “sphinx-build 7.2.6.” I do not seem to be tripping that.

And I do not see “is between 1.3” when I grep rtems-docs. common/waf.py has this:

```
# If you do not want to check for a maximum version, set it to None.
sphinx_min_version = (1, 3)
sphinx_max_version = None
```

Are you up to date?

Author: Chris Johns 2024-07-03T22:42:14.906Z

Where is there a need to cap the version at 5.9?

Author: Amar Takhar 2024-07-03T22:18:29.437Z

I forget what broke in Sphinx however I am re-working the build system for the documentation to allow individual docs to build again and fix some things that were broken as well as bring us up to date.

You can target a specific version with:

```
pip install sphinx==5.3.0
```

You can remove it first and re-install. I do not think it's worth updating yet because as far as I know the rendering issues have not been resolved.

Author: Chris Johns 2024-07-03T22:48:37.244Z

I am using 7.3.7. My configure is:

```
Setting top to                           : /opt/work/chris/rtems/docs/
↪rtems-docs.git
Setting out to                           : /opt/work/chris/rtems/docs/
↪rtems-docs.git/build
Checking for program 'git'               : /usr/local/bin/git
Checking for program 'sphinx-build'      : /opt/work/chris/rtems/r-py-3/
↪bin/sphinx-build
Checking for program 'aspell'            : not found
Checking if Sphinx is at least 1.3       : yes (7.3)
Checking Sphinx Options                  : none
Checking Sphinx Nit-Pick mode            : no
Checking for 'sphinx-rtd-theme'          : found
Checking for 'sphinx.ext.autodoc'        : found
Checking for 'sphinx.ext.coverage'       : found
Checking for 'sphinx.ext.doctest'        : found
Checking for 'sphinx.ext.graphviz'       : found
Checking for 'sphinx.ext.intersphinx'    : found
Checking for 'sphinx.ext.mathjax'        : found
Checking for 'sphinxcontrib.bibtex'      : found
Checking for 'sphinxcontrib.jquery'      : found
```

The build result is:

```
Waf: Leaving directory `/opt/work/chris/rtems/docs/rtems-docs.git/build'
'build' finished successfully (42.631s)
```

Host:

```
FreeBSD torea 14.0-RELEASE FreeBSD 14.0-RELEASE #0 releng/14.0-n265380-
↪f9716eee8ab4: Fri Nov 10 05:57:23 UTC 2023     root@releng1.nyi.
↪freebsd.org:/usr/obj/usr/src/amd64.amd64/sys/GENERIC amd64
```

I am not sure what the issue is?

Author: Amar Takhar 2024-07-03T22:48:37.217Z

No idea I just remember the latest version breaking the theme some time ago and it was capped? Was that fixed?

Author: Chris Johns 2024-07-03T22:49:16.982Z

Yes

Author: Chris Johns 2024-07-03T22:52:00.753Z

After reading the question in the description by @sebhub I see this is a question and not a problem. @sebhub no it should not be a problem. Where is the limit stated?

Author: Sebastian Huber 2024-07-04T05:28:23.896Z

Sorry for the trouble, this was caused by a configuration error on my side. The rtems-docs submodule in rtems-central is pretty outdated right now.

Author: Chris Johns 2024-07-04T05:28:23.863Z

No problem and thanks for the update.

3.1.1.27 14 - Update POSIX Compliance Guide for New Standards Editions

Summary

Update the documentation regarding the amd64 BSP

Closes #15

Author: Matheus Pecoraro 2024-08-13T17:58:06.071Z

changed the description

Author: Matheus Pecoraro 2024-10-09T20:28:27.139Z

@amar The one thing left in this MR is documenting the FreeBSD boot image. We had talked having an already ready one available for download, I'd like to know where it would be hosted and how should I add this to the documentation? Should there be a section with the download link but also explaining how to create it?

Author: Amar Takhar 2024-10-09T20:28:27.139Z

Yes we need to document how it's created from scratch as for where to put it we can find a place on the RTEMS FTP for now. Do you have a download URL for the image we can use? I'll talk about it with @chris.

Author: Matheus Pecoraro 2024-10-09T20:28:27.139Z

I have it uploaded here: https://drive.google.com/drive/folders/1c0YcrCCXoL4As99S0dH9iWIvELxM_ieX

Author: Joel Sherrill 2024-10-09T20:28:27.139Z

@amar @chris Do either of you have suggested home for this image? It is keeping this MR from being able to be resolved.

Author: Amar Takhar 2024-10-09T20:28:27.139Z

@chris @joel I'm not sure where this should go. Also we have the question about how to handle versioning. For now I have put it here:

- https://ftp.rtems.org/pub/rtems/archive/misc/FreeBSD/boot/2024-10-01/

I put it under a date in case we have to update it we'll know what version it is.

Author: Amar Takhar 2024-10-09T20:28:27.139Z

@mpec Sorry for the delay I completely forgot about this and just came across it now the update is above for the URL the docs can be updated with this URL.

Author: Joel Sherrill 2024-10-09T20:28:27.139Z

@mpec Please update to include the new URL.

Author: Matheus Pecoraro 2024-10-09T20:28:27.139Z

URL and section on the FreeBSD boot image added.

Author: Kinsey Moore 2024-08-14T01:51:43.576Z

Oxford comma.

Commit	6dac3891c3e753ed63edaad651af67180630f042

Summary

This MR adds a new section - Debugging - to the RTEMS documentation.

This adds the Documentation required for the changes caused by MRs https://gitlab.rtems.org/rtems/rtos/rtems/-/merge_requests/98 and https://gitlab.rtems.org/rtems/tools/rtems-source-builder/-/merge_requests/35.

Author: Christian Mauderer 2024-08-19T06:33:42.924Z

Please don’t add editor-specific configurations.

Author: Suraj Kumar 2024-08-19T06:33:42.924Z

I had added that by mistake. I will squash this along with the others.

Author: Suraj Kumar 2024-08-19T06:33:42.924Z

This is now fixed @c-mauderer

Author: Christian Mauderer 2024-08-19T06:35:59.468Z

Is there some reason for the & or is it just meant as an and? I'm not a native speaker so maybe it's quite common to write it like that. But it's something I would need a moment to think about while reading. From my point of view, that's usually not good for a manual.

Author: Suraj Kumar 2024-08-19T06:35:59.468Z

Yep sure, I will make this change

Author: Suraj Kumar 2024-08-18T17:05:17.675Z

changed this line in version 2 of the diff

Author: Suraj Kumar 2024-08-19T06:35:59.468Z

Fixed

Author: Christian Mauderer 2024-08-19T07:22:30.487Z

I think I would move the *Short term* to the first point and call it *Suggested safe method*. Instead of *Long term* I would use *Lazy unsafe method*. Just to make it clear that the RTEMS project is not recommending the unsafe method.

Author: Suraj Kumar 2024-08-18T17:05:18.397Z

changed this line in version 2 of the diff

Author: Suraj Kumar 2024-08-19T07:22:30.487Z

Changed

Author: Christian Mauderer 2024-08-19T07:22:30.487Z

Like I said, I most likely would also swap the first and second point so that the save method is the first one. But let's wait whether someone else will also ask for that or whether everyone else is OK with that order.

Author: Suraj Kumar 2024-08-19T07:22:30.487Z

On second thought, I feel like swapping the 1st and 2nd points makes sense. Should I just go ahead and do that?

Author: Christian Mauderer 2024-08-19T07:22:30.487Z

Like I said: I would move the save method to the first point. So if I convinced you of that: Yes, please swap them.

Author: Suraj Kumar 2024-08-19T07:22:30.487Z

This is done, please check it out now

Author: Christian Mauderer 2024-08-19T07:22:30.487Z

Looks good. Thanks.

Author: Christian Mauderer 2024-08-19T06:38:07.344Z

Are you sure, you want to use the short form ``b`` instead of the long (but better readable) ``break``?

Author: Suraj Kumar 2024-08-18T17:05:18.814Z

changed this line in version 2 of the diff

Author: Suraj Kumar 2024-08-19T06:38:07.344Z

Changed

Author: Christian Mauderer 2024-08-19T06:40:03.894Z

Maybe it's because I'm not a native speaker but somehow that sentence feels odd. Shouldn't it be something like

```
... low level high speed serial interface provided by modern processors␣
↪as a means ...
```

Beneath that: I think I would use ``most`` instead of ``modern``. I don't think I have seen much processors that don't provide a JTAG (or a derived version of it).

Author: Suraj Kumar 2024-08-19T06:40:03.894Z

I had copied this word for word from the older documentation and did not want to touch as I do not have much knowledge about JTAG debugging. Would you like me to still modify this?

Author: Suraj Kumar 2024-08-18T17:39:20.064Z

changed this line in version 5 of the diff

Author: Suraj Kumar 2024-08-19T06:40:03.894Z

@c-mauderer Let me know what you think of this framing instead. I read up on OpenOCD a bit

Author: Christian Mauderer 2024-08-19T06:40:03.894Z

I think your new version is better readable. Thank you.

Author: Christian Mauderer 2024-08-19T06:49:44.880Z

More general note regarding that chapter: I think it's partially copied from ``10. 6 Debugging`` of the current manual, right? If yes: Can you please remove the sections that are replaced by that? I don't like having the same information twice in a manual. Beneath that, it's possible that ``git`` detects that and marks the text as moved instead of added.

Author: Suraj Kumar 2024-08-19T06:49:44.880Z

I don't think I follow what you are referring to? Are there repeating sections anywhere?

If I am not wrong, I removed the Debugging section from underneath Executables and made it standalone, and wrote everything from scratch except the JTAG and OpenOCD parts. Please let me know where information is repeating so I can rectify it.

Author: Christian Mauderer 2024-08-19T06:49:44.880Z

Your patches don't remove the ``user/exe/debugging.rst``. So even if you removed the link to that file in ``user/exe/index.rst``, the file itself is still there. If you replaced ``user/exe/debugging.rst`` please remove that file.

Author: Suraj Kumar 2024-08-19T06:49:44.880Z

Oops, that is a slip up. I fixed that. Thanks for catching it. I had removed it in my test environment but forgot to when pushing

Author: Christian Mauderer 2024-08-19T06:45:17.253Z

Do you need the empty lines? Has it side-effects like starting a new enumeration after each empty line?

Author: Suraj Kumar 2024-08-19T06:45:17.253Z

If you are referring to lines 11 and 17 here, then yes. When I built without those newlines they rendered something like this:

```
A debugger allows us to: #. Set breakpoints to pause execution at␣
↪specific points
```

Turns out ReST needs a newline in most places in order to have formatting take effect.

And nope, when I rendered they all load well, you can take a look here from my local build:

!`image.png <https://gitlab.rtems.org/-/project/uploads/5e4b004e7c9b7fe14f09a303a01dd9b8/image.png>`_{width=747 height=395}

I hope that clarifies things

Author: Christian Mauderer 2024-08-19T06:45:17.253Z

No, I meant the lines between the points of the enumeration. You have:

```
#. Set breakpoints to pause execution at specific points

#. Step through code line-by-line or instruction by instruction

#. Inspect/modify variables and memory

#. Monitor a program's call stack and thread states
```

What I would expect:

```
#. Set breakpoints to pause execution at specific points
#. Step through code line-by-line or instruction by instruction
```

(continues on next page)

(continued from previous page)

```
#. Inspect/modify variables and memory
#. Monitor a program's call stack and thread states
```

But both seems to work without problems. So it should be OK.

Author: Suraj Kumar 2024-08-19T07:17:22.310Z

changed this line in version 8 of the diff

Author: Christian Mauderer 2024-08-19T07:15:28.097Z

Additionally to the comments: You should think about squashing the commits. I think some of them look like intermediate work versions.

Author: Suraj Kumar 2024-08-19T07:15:28.097Z

Yes I will squash the commit where I accidentally added the `.vscode` file as well. That was an accident

Author: Christian Mauderer 2024-08-19T07:15:28.097Z

I would also squash the commits that add the files except if there is a sensible reason to split them. If I would submit this patch, I most likely would only use one. But two steps could be fine too:

1. Move the debugging section to a top level.
2. Rework the debugging section.

That line is now longer than 80 characters. I noted a few more like the warning in line 37 or the line 43. Please re-check the line length in your patches. Sometimes it's not avoidable to have longer lines. But for the text blocks it shouldn't be a problem.

Summary

user: Add –release option to Rust instructions

This is a workaround for #32.

Close #32

Author: Amar Takhar 2024-09-20T13:14:11.056Z

Hi there Frank did you mean to leave this as a draft?

Author: Frank Kuehndel 2024-09-20T13:14:11.056Z

First of all, our CI pipeline is happy with this change. That was what I wanted to test.

Rust community will likely fix this bug but it may need some time. I am out of office for the next two weeks and I am unsure whether to merge it or wait till afterwards.

Author: Amar Takhar 2024-09-20T13:14:02.691Z

Also is it worth linking the issue in the docs to note this is a workaround and not considered a permanent fix? Thanks.

Author: Frank Kuehndel 2024-09-20T13:14:02.691Z

I will add a note.

Commit	c5f8b54a274e13b856c4aa563605a103b40d076c

Summary

eng/user: Replace references to master where possible

This removes references to master and replaces them with main or more appropriate terms where possible.

Closes rtems/docs/rtems-docs#44

Author: Kinsey Moore 2025-01-14T04:01:21.890Z

assigned to @opticron

Author: Kinsey Moore 2025-01-14T04:05:33.672Z

This does not actually fix the docs.rtems.com URLs that contain “master”.

Commit	ca3080f0f71515375afe97f781ed6e7db4c64436

Summary

sphinx: Remove digest strings and fix sidebar

Inliner is old there are no alternatives so remove the ?digest= and ?v= strings so itcan build the source from the new theme.

Also fix the html_sidebars from the commandline use singlehtml_sidebars.index. The behaviour of html_sidebars was changed in:

https://github.com/sphinx-doc/sphinx/pull/12600

It will no longer take a string from the commandline.

Fixes: #57, #58

Commit	9e9c54735c94300a48f5f7c71a0dfa4d2b8e77ec

Summary

Change theme to sphinx-book-theme

Sphinx booktheme is a more modern theme based off of of the PyData theme for science.

It is cleaner and more suitable for the RTEMS documentation. Works very well for mobile and is easier to navigate for large, complex documents.

This also includes the refreshed logo and favicon

Some other cleanups to conf.py to make it easier to manage.

Commit	bc9870e7002ece12690629b65f04257c780b7193

This merge request adds documentation for the BeagleV-Fire board. The new content provides detailed steps for setting up and configuring the BeagleV-Fire board with RTEMS, including: * Introduction to BeagleV-Fire Board * Information on the existing base BSP and support for the riscv/beaglevfire BSP variant * Explained config.ini file for building the riscv/beaglevfire BSP variant. * Explanation of both uni-processing and multi-processing modes. * Step-by-step commands for configuring and building RTEMS for BeagleV-Fire * Instructions on how to convert .exe files to .elf and generate payloads using the HSS payload generator. * Steps for setting up UART communication from the host PC. * Instructions for transferring the payload binary to the BeagleV-Fire board via the eMMC/SD card. * Commands and expected output to validate the successful loading and execution of the payload.

Author: Joel Sherrill 2024-11-09T21:43:51.357Z

This still sounds like a final report. The Base BSP has since been enhanced to include X, Y, and Z. We shouldn't need the github reference since it should all be in gitlab.rtems.org. And make sure that it all is. :)

Author: Purva Yeshi 2024-11-09T21:43:51.357Z

Got it. I'll update the documentation to reflect that the BSP is already in place, and I'll remove the BSP links.

Some lines look well over 80 columns. Make a pass.

Author: Purva Yeshi 2024-11-09T21:43:41.961Z

Okay, I'll adjust the lines to be within 80 characters.

Author: Gedare Bloom 2024-11-09T21:43:14.115Z

changed this line in version 2 of the diff

Author: Joel Sherrill 2024-11-09T21:43:36.991Z

Why wouldn't SMP be supported. I suspect it is just not required.

Author: Purva Yeshi 2024-11-09T21:43:36.991Z

Understood. Should I remove the SMP use cases from the documentation, or would you prefer I modify them to clarify that SMP is supported but just not required in this scenario?

Author: Joel Sherrill 2024-11-09T21:43:36.991Z

I think I would be prone to leave it alone and delete the sentence "This mode is suitable for . . . "

Author: Purva Yeshi 2024-11-09T21:43:36.991Z

Alright.

Author: Gedare Bloom 2024-11-09T21:43:15.059Z

Author: Joel Sherrill 2024-11-09T21:43:24.573Z

I thought the exe file was an elf file. Please confirm whether this step is needed or not.

Author: Purva Yeshi 2024-11-09T21:43:24.573Z

Yes, that step is needed for HSS. HSS requires a .bin file, and there is a command in HSS that converts an .elf file into a .bin file using the hss-payload-generator. So, we need to convert the .exe file into an .elf file first.

Author: Gedare Bloom 2024-11-09T21:43:24.573Z

this is just copying it directly, might as well do `mv hello.exe hello.elf`

Author: Gedare Bloom 2024-11-09T21:43:16.830Z

changed this line in version 2 of the diff

Author: Joel Sherrill 2024-11-09T21:32:32.485Z

This ultimately needs to be an RSB generated executable package. Resolve this by filing an issue in the rtems-source-builder project and citing it in the reply. Make sure that issue says to update this text when the RSB supports HSS.

Author: Purva Yeshi 2024-11-09T21:32:32.485Z

I've created an issue on the RTEMS Source Builder project to request the addition of support for HSS payload generation. You can view the issue here

Author: Gedare Bloom 2024-11-09T21:44:22.837Z

This first requires `make` in that directory.

Author: Gedare Bloom 2024-11-09T21:44:27.972Z

This is with the Debug serial console. Note that the 6-pin connector is NOT compatible with 6-pin FTDI cables, it seems some of the `NC` are actually connected somewhere, and driving signals on them causes problems. Use a 3-pin/breakout of an FTDI with only GND, TX, and RX.

- 81cdc84c - user/start: fix instructions for running rtems-test and use replaceables

Compare with previous version

Author: Chris Johns 2024-10-29T23:31:51.699Z

Why do you need to add the `--rtems-tools` path? The `rtems-test` command should search under its install prefix and if built with all the tools it should be OK?

Author: Gedare Bloom 2024-10-29T23:25:38.304Z

changed this line in version 3 of the diff

Author: Gedare Bloom 2024-10-29T23:31:51.699Z

Yes, you're right. I was running in a checked-out repo `./rtems-test` and that needs the path. I reverted this part.

Author: Chris Johns 2024-10-29T23:31:51.699Z

Yes you need the `--rtems-tools` option in that case but that is a developers option and not what the user normally sees.

Compare with previous version

Author: Christian Mauderer 2024-10-23T06:42:27.990Z

For the non inkscape versions: Would it make sense to convert the text to a path? Otherwise, the logo will only be displayed correctly if the font `Helvetica Black, Heavy` is installed. The German ubuntuusers wiki lists the Helvetica family as non-free font and therefore Ubuntu seems to not provide that font by default.

Author: Amar Takhar 2024-10-23T06:42:27.990Z

Good catch! It was supposed to be and it looks like I forgot to do that.

The font is historical which is why we stuck with it. I will fix this

Author: Amar Takhar 2024-10-23T06:42:27.990Z

This is done.

Author: Christian Mauderer 2024-10-23T06:43:34.439Z

Author: Amar Takhar 2024-10-22T23:59:42.569Z

Looks great to me. Just a note pushing to repositories is disabled and we can add tags / branches online which is restricted to the maintainer level and above. It's great for now so we can preserve what needs to be done when CI is up and running there will be a lot more involvement in setting up tags and branches.

Author: Amar Takhar 2024-10-22T23:56:24.460Z

Also thanks for adding `-modified` that's really handy to have.

What is a “valid version controlled repository”?

Author: Chris Johns 2024-10-24T05:31:20.744Z

I valid version controlled repository is one where the commands and tools used to access a repository can access it and report its status. The language is attempting to be non-specific as well as handling implementation issues like a users `git` commands are stuffed and do not work. In that case the release label is the default (`not-released`).

Author: Joel Sherrill 2024-10-24T05:27:04.219Z

This doesn’t account for vendor specific versioning past the RTEMS source baseline.

Author: Gedare Bloom 2024-10-24T05:27:04.219Z

I think it allows it, as I think the label may include further . within it?

Author: Chris Johns 2024-10-24T05:27:04.219Z

Yes a release label is a string and could be `joel-3.4.5.beta` creating a version string of `6.1.0-joel-3.4.5.beta` and for `rtems.git` it would be `6.1.0.joel-3.4.5.beta`.

Author: Joel Sherrill 2024-10-24T05:25:00.504Z

changed this line in version 2 of the diff

Author: Joel Sherrill 2024-10-24T05:13:17.939Z

Is there a difference between index.txt and README.txt? The descriptions look quite similar.

Author: Chris Johns 2024-10-24T05:13:17.939Z

They are generated from a single markdown file. If you drop into the directory on ftp.rtems.org you get the web page and if you `wget` the release for an offline site you can see the same data as text.

Author: Joel Sherrill 2024-10-24T04:59:36.631Z

What about net services and lwip? Is this intended to be a complete list?

Update: Probably is a complete list. Just confused by diff. Mark resolved if the list is complete.

Author: Chris Johns 2024-10-24T05:24:27.614Z

The list is:

- `rtems.git`
- `rtems-deployment.git`
- `rtems-docs.git`
- `rtems-examples.git`
- `rtems-libbsd.git`
- `rtems-lwip.git`
- `rtems-net-legacy.git`
- `rtems-net-services.git`
- `rtems-release.git`
- `rtems-source-builder.git`
- `rtems-tools.git`
- `rtems_waf.git`

English band from the ’80s?

Author: Joel Sherrill 2024-10-24T04:55:11.071Z

Are there specific permissions and owners on the files and directories that should be checked?

Author: Chris Johns 2024-10-24T04:55:11.071Z

Yes. There is a separation of the administrator related functions and the release process and the responsibilities of the release manager. The admin side is a work in progress and I can fill both roles but we need to move to a more formal approach.

The perms are set so only @amar and I myself have access. I have done this to minimize possible mistakes as `dispatch@` access lets the user see the ftp files and to enforce once a release is public no one can touch the released file tree.

Author: Joel Sherrill 2024-10-24T04:50:09.324Z

“an in” is missing a word.

Author: Joel Sherrill 2024-10-24T04:49:38.867Z

If you install, is this included? Something similar? Can you tell the version of an installed BSP build?

Author: Chris Johns 2024-10-24T04:49:38.867Z

Thanks, I have added some mode about this.

The version detail in the `VERISON` file is parsed and then embedded into the tool or package being built. In `rtems.git` it is a header file that is installed plus the version string is compiled into an object file. The `rtems all` command prints all known version details. The tests also print this detail with each test so a capture of the test output lets you know the release the test output is from.

In the RSB the `VERSION` data is added to the GCC version string and you can see that by invoking `gcc` with the `--version` option. For example:

```
aarch64-rtems6-gcc (GCC) 13.3.0 20240521 (RTEMS 6, RSB␣
↪8fc070bc4a6b4382e4fefbe5872aebb009f976e9, Newlib 1b3dcfd)
```

This procedure deals with releases where the git hash is replaced by the release string. A vendor making an RTEMS package for users is encouraged to embed something about themselves using the release label.

Author: Joel Sherrill 2024-10-23T17:48:04.041Z

Most of these are minor. Feel free to mark comments as resolved if the solution is obvious.

Author: Gedare Bloom 2024-10-24T04:39:32.140Z

typo: number

Author: Gedare Bloom 2024-10-24T04:38:56.370Z

This sentence seems wrong as the number should increment with each release made on that branch.

Author: Chris Johns 2024-10-24T04:38:56.370Z

I have updated the sentence so I hope it is better.

Summary

user: Swap to https from ssh

Users running through the getting started process won't be likely to have a GitLab account and so SSH access is out of reach for them. This changes all new-user-facing repository clones to HTTP to avoid issues in this process.

Commit	b48c84bc4906d74ae644f005ae485e108cdb006d

Summary

In the system termination procedure, everything after invoking the fatal extensions is essentially dead code. Simplify the procedure and provide a reasonable safe fall-back for badly configured applications. Just execute an idle loop with maskable interrupts disabled.

This removes the need for CPU ports to provide a fatal halt handler.

Update https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5067

“were” -> “are”

Author: Sebastian Huber 2024-08-14T20:55:11.644Z

Actually, right now in the code, the fatal extensions are invoked without explicitly disabling maskable interrupts. After a second look, I think this should be changed as well to:

```
void _Terminate(
Internal_errors_Source the_source,
Internal_errors_t      the_error
)
{
ISR_Level level;

_ISR_Local_disable( level );
(void) level;
_User_extensions_Fatal( the_source, the_error );

/*
* Everything after invoking the fatal extensions is essentially dead code.
* At least one fatal extension of the initial extension sets should not
* return and for example reset the system.  See section "System Termination
* Procedure" in the RTEMS Classic API Guide.
*
* The following code is only executed in badly configured applications.
*/
_CPU_Thread_Idle_body( 0 );
}
```

These links will not longer be there. The `rtems-bsps` command in a the RTEMS RTOS (`rtems.git`) provides these lists.

Author: Frank Kuehndel 2024-05-23T23:17:54.507Z

Thanks for the hint. I remove the links and mention the rtems-bsps command instead.

Author: Frank Kuehndel 2024-05-23T11:38:04.545Z

changed this line in version 3 of the diff

Author: Chris Johns 2024-05-23T23:17:43.810Z

If you change `6` to `@rtems-ver-major@` the version will be maintained for you.

Author: Frank Kuehndel 2024-05-23T23:17:43.810Z

I replace “6” everywhere where it is used as RTEMS version.

Is there a way to know in advance by which number `@rtems-ver-major@` will be replaced? I am running a script which parses the shell instructions out of the page sources for testing the instructions. The script needs to replace `@rtems-ver-major@`. I currently hard coded “6” but the day will come when this is wrong.

Author: Frank Kuehndel 2024-05-23T11:38:05.446Z

changed this line in version 3 of the diff

Author: Chris Johns 2024-05-23T23:17:32.192Z

Maybe fixed up the `6` but the other values are ok. I suggest a comment that the tool versions may vary.

Author: Frank Kuehndel 2024-05-23T23:17:32.192Z

As written above, I replace all “6”. I also add a comment that the version numbers may to match the ones a reader may see.

Author: Frank Kuehndel 2024-08-12T18:29:19.296Z

@chris Many thanks for the review. I implemented your suggestions and I updated a few other parts. My latest changes are part of this merge request, now.

How to proceed? This merge request contains 3 patches, now. One of them is a true merge of 11 commits (i.e. not a singe line of commit histories but Gitlab produced a graph of parallel commits) made to rtems-docs while my first patch was on hold. Can this stay as it is or shall I open a new merge request which contains only a single patch and withdraw this merge request?

Author: Chris Johns 2024-08-12T18:29:19.296Z

@frank_k I had not notice this when I reviewed the comments and your changes. I now see there was a merge branch. How did you make the merge commit?

If you need to update you need to rebase your branch locally and force push and not add onto the branch.

Author: Frank Kuehndel 2024-08-12T18:29:19.296Z

I though Gitlab would take care of the workflow. What happens was that I first needed to update my branch of my personal fork of Gitlab “rtems-docs” to the latest state. All which Gitlab offered for this purpose was a “Merge” button. So I used that and pulled the result onto my laptop to fix the issues you had found.

Since I found this process not RTEMS-like, I wrote the comment above.

If I would had rebased my branch locally and forced push it onto Gitlab, would that not confuse Gitlab? Would Gitlab still be able to show your comments with the correct files and show the differences with the changes I had made in the mean time?

There seems to be no merge in current rtems-docs. Did you manually remove the merge and rebase the commits or did Gitlab that automatically?

Author: Frank Kuehndel 2024-08-12T18:30:29.247Z

From my point of view, this merge request is done and can be closed. The documentation is already merge into rtems-docs. Maybe @chris needs to resolve the open thread - or do I have to do that? Yet, beside of this its done.

By the way, I did set up a CI job which automatically carries out the instructions in the Rust-for-RTEMS doc on our servers and checks the results. It found the last incident last week where apparently a bug in Rust was introduced and removed in the meantime.

Author: Amar Takhar 2024-08-12T18:30:29.247Z

When it is merged it is considered complete. 'closed' is a state that happens when it does not get merged. I just resolved the open thread.

That is great about the CI we will have this setup eventually here. great to hear about others doing it!

changed this line in version 3 of the diff

Author: Kevin Kirspel 2024-08-12T20:39:32.623Z

Capitalized Verilog in latest commit.

Author: Joel Sherrill 2024-08-12T21:26:15.098Z

Does this impact the multilib used?

On other architectures, this is detected via cpp predefines from GCC and on the RISC-V, it looks the same. Looking at riscv-context-switch.S, it appears that (__riscv_flen > 0) is used to enable the FP context switch.

Author: Kevin Kirspel 2024-08-12T21:26:15.098Z

Yes, the NIOS_IS_NIOSVG and NIOS_HAS_FP flags select what ABI is used in the YML files since the developer may choose a V/m, V/g. or V/g with FPU.

Hi @kirspelk this is still marked as draft is it ready? If so you can unmark it and merge it.

Author: Kevin Kirspel 2024-08-14T06:06:14.933Z

What's the workflow for marking as draft and marking as ready. When I submitted the merge request initially, it was marked as ready. Chris changed it to draft after having given feedback for changes. I haven't touched the ready status since.

Author: Amar Takhar 2024-08-14T06:06:14.933Z

Good catch I looked but now that you mention it I did see that he marked it as a draft @chris does this still need to be set to draft?

The workflow is typically the one who sets the draft removes it but not always sometimes it's set to draft in the case where we want to make sure it's not merged yet. We're still sorting out documentation and a new feature is coming in GitLab 17.2 that will help with this immensely and make the use of draft not as necessary.

Author: Chris Johns 2024-08-14T06:06:14.933Z

No. I marked it draft to stop it bring approved and merged. If the questions are resolved it can be changed.

Compare with previous version

Author: Kevin Kirspel 2024-08-14T19:04:43.111Z

OK, I figured it out. It's properly rebased now. There is an ongoing conversation in the merge request for the RTEMS repo about the README.md documentation that is in the BSP directory. We may want to hold off on this merge until that discussion has been concluded because I may need to add documentation here.

Author: Amar Takhar 2024-08-14T19:04:43.111Z

That's OK just create a new MR if that ends up happening.

Commit	427902a9a2822aac1d82a16603ddeb8aee96ecc2

Summary

posix-users/input_and_output.rst: Update AIO Documentation

Updated the POSIX API guide related to asynchronous input and output. These changes follow recent corrections made to the implementation, see: https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/5039

Author: Joel Sherrill 2024-07-02T19:36:09.927Z

Look at clock.rst to see how returning -1 and setting errno is done. I think the main thing you missed is the markup on errno itself.

`clock.rst:On error, this routine returns -1 and sets ````errno`` to one of the following:```

Author: Joel Sherrill 2024-07-02T19:37:11.978Z

Add a blank line above.

Author: Alessandro Nardin 2024-07-02T16:18:01.100Z

changed this line in version 2 of the diff

Author: Joel Sherrill 2024-07-02T19:34:44.588Z

In the background hints at the thread(s) servicing requests. Are they mentioned anywhere?

Author: Joel Sherrill 2024-07-02T19:36:21.699Z

Same errno comment.

Author: Alessandro Nardin 2024-07-02T16:18:01.602Z

changed this line in version 2 of the diff

Author: Joel Sherrill 2024-07-02T19:37:00.437Z

Same comments as above. A section on the configuration of the thread is needed. I don't remember what the user can specify.

Author: Alessandro Nardin 2024-07-02T19:37:00.437Z

For thread configuration, are you referring to AIO_MAX_THREADS and AIO_MAX_QUEUE_SIZE ?

Author: Joel Sherrill 2024-07-02T19:37:00.437Z

Yes. Are they hard-coded or configurable?

May want a ticket to make them configurable and then close this.

Resolved by making another ticket. The limit is not currently configurable.

Author: Joel Sherrill 2024-06-28T16:32:26.868Z

Generally it was the same comments repeated for each method. Just sweep the file with my suggestions.

Commit	05f9a3d56b45e700104d22bf40881ef89fff5d91

Summary

Remove old references to devel.rtems.org

Some were deleted as the content was imported.

Other references were updated.

There is content that still needs to be imported and I have opened issues to handle this:

- 05f9a3d5 - Remove old references to devel.rtems.org

Compare with previous version

Author: Amar Takhar 2024-07-27T00:10:32.967Z

changed the description

Author: Joel Sherrill 2024-07-28T12:10:15.376Z

Deleting this would lose the idea that something needs to be done. I think this info is in the software engineering guide so reference it instead.

Author: Amar Takhar 2024-07-28T12:10:15.376Z

I removed it because the content was imported it wasn't? I'll check again thanks

Author: Amar Takhar 2024-07-28T12:10:15.376Z

Yes the content of that file is from the wiki .. not sure what you're asking here? Someone has already done the transition but forgot to remove the comment. Am I missing something?

Author: Joel Sherrill 2024-07-28T04:48:38.342Z

Turn reviewing this into an issue and assign it to me. I think this is at least an unfair or out of date statement

The site review.rtems.org does not exist. I don't know why this was ever here. Can it be deleted in this pass?

Author: Amar Takhar 2024-07-26T19:48:05.977Z

It's not used anywhere it'll be killed eventually not working on content with these changes.

Author: Joel Sherrill 2024-07-26T19:47:22.637Z

Does this need to point somewhere else?

Author: Amar Takhar 2024-07-26T19:47:22.637Z

Not working on fixing content these are something Gedare is working on.

Author: Joel Sherrill 2024-07-26T19:47:18.719Z

Both of these are deadends also

Author: Amar Takhar 2024-07-26T19:47:18.719Z

Not working on fixing content these are something Gedare is working on.

Author: Joel Sherrill 2024-07-26T19:46:57.366Z

This probably should be closed with an issue to update this to use gitlab processes.

Author: Amar Takhar 2024-07-26T19:46:57.366Z

That is under @gedare I'm not updating any of these docs.

Author: Joel Sherrill 2024-07-26T19:37:22.387Z

Feel free to resolve with an issue as appropriate. Gedare was supposed to be addressing development process documentation changes so assign to him where applicable.

This is probably “resolve by filing issue”. Do we want the headings to be the real name of the license? Include an SPDX tag in the section? The anchor could be the SPDX name.

Author: Amar Takhar 2024-07-24T18:15:38.857Z

When I convert documentation I don’t make changes to the documentation at the same time. That way you can track old to new. If we want to change contents we should do that after it’s been converted. I do make some changes when the old content is really bad but titles I keep the same so the old ‘License 2’ can be tracked to its new place and then we can change it.

Commit	7b3db9d6c1a7ecfa2c9ff9fe1f939081de17e743

Summary

POSIX-2024 (Issue 8) was recently published. The information in that column was double-checked versus the published edition.

RTEMS support for new Issue 8 functions was checked.

standards.rst was updated to mention Issue 8 and use the word function not method.

Is this the state for not supported by the processor? This is not mentioned and I think it is important to mention.

Author: Sebastian Huber 2024-05-25T08:50:05.113Z

This text is basically the same for all interrupt vector related functions. If it is not clear, then we should find a better standard text for this error.

Author: Chris Johns 2024-05-25T08:50:05.113Z

I am not sure how that relates? Are you saying all interrupts calls a required to return a specific error code for the exact same reasons?

Author: Sebastian Huber 2024-05-25T08:50:05.113Z

Yes, for the RTEMS_INVALID_ID, there is a common text:

```
grep -rn RTEMS_INVALID_ID c-user/interrupt/ -A 2
c-user/interrupt/directives.rst:1230::c:macro:`RTEMS_INVALID_ID`
c-user/interrupt/directives.rst-1231-    There was no interrupt vector␣

Author: Chris Johns 2024-05-25T08:50:05.113Z

All I am asking is there is a reminder to the user to check the BSP specifics to find out if the feature is supported. With out this a new user or a user that does not know the BSP or RTEMS may assume what they are doing is the reason.

Author: Chris Johns 2024-05-25T08:49:59.854Z

But they can use the attach calls or should they be naked?

Author: Sebastian Huber 2024-05-25T08:49:59.854Z

If this works or not depends on the architecture and chip.

Author: Chris Johns 2024-05-25T08:49:59.854Z

Then I suggest this be explained.

Author: Sebastian Huber 2024-05-24T08:47:15.779Z

changed this line in version 3 of the diff

Author: Chris Johns 2024-05-21T11:36:06.524Z

This is fine but I think the same issue as the code is the state when there is a lack of support. It could be confusing to a new user if the call fails and the BSP is missing the support.

Author: Sebastian Huber 2024-05-21T12:58:50.223Z

I would say that changing the interrupt priorities is something for experts. You have to know the constraints of the interrupt controller to work with them. The BSP documentation should address the implementation status.

This needs to be updated to reflect using forks and not direct MR from an Issue. Also may write documentation how to undo such a direct MR from an Issue and use this MR as a test case for the same.

The URL https://docs.littlevgl.com/en/html/index.html used in the README.md appears to be broken.

If LittleVGL changed their domain or organization, rtems-littlevgl needs a review and update.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T01:08:46.506Z

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

Commit	2022f56af43f69c357a953b47604cc40298de9b3

Summary

- Fix lvgl documentation URL (Fixes #2)
- Fix building of the library

Note: The library builds again with this. But I did not test whether it runs.

Feel free to merge it. But the contact information is old. Our area code is 256 and Google says that was split from 205 in 1998.

We no longer have a fax.

Include this link: https://rtems.com/contact

Copy the address from there. We still have the 256-722-9985 number

Summary

Move contents of SUPPORT file into README.md

This removes all the static contact information and links directly to OARs website so we no longer have to worry about outdated information.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
```

(continues on next page)

(continued from previous page)

```
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T01:08:46.506Z

assigned to @amar

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

It looks like POSIX is not enabled in the RTEMS build. The `configure` here should check for POSIX being enabled and fail with an error.

Author: Ning Yang 2024-11-13T09:25:04.432Z

It works. Thanks!

Author: Chris Johns 2024-10-24T20:52:22.184Z

This is fixed in 419e923cf5414e8b5655c5906a71bdcf938c43de yet I am seeing a build issue with RTEMS Deployment which implies the RSB packages are not updated. I am testing the merge request rtems/tools/rtems-source-builder!71.

The RSB update patch has:

```
-%define rtems_net_services_version␣
↪9b08a578ceece64ffda5ae0271e2d66ddc112524
+%define rtems_net_services_version␣
↪419e923cf5414e8b5655c5906a71bdcf938c43de
```

Author: Chris Johns 2024-10-24T22:03:56.081Z

It looks like the submodule is not right when getting the tar from gitlab. The URL is from:

```
https://gitlab.rtems.org/rtems/pkg/rtems-net-services/-/archive/%{rtems_
↪net_services_version}/rtems-net-services-%{rtems_net_services_version}
↪.tar.%{rtems_net_services_ext}
```

Author: Chris Johns 2024-10-24T22:06:17.319Z

The bug is RSB net-service config needs to have the updated RTEMS Waf commit:

```
+ /usr/bin/bzip2 -dc /opt/work/chris/rtems/deploy/rtems-deployment.git/
↪sources/rtems_waf-68654b4f995382765605dc16917baad4bdbf7f7c.tar.bz2
```

Author: Chris Johns 2024-10-28T21:01:46.904Z

Fixed with the update to the RSB.

3.4.1.5 2 - Test binaries are installed in target directory

Commit	b8feed99f5f9bd519af6fcd53bb416a120c16adc

Summary

ntp: Ensure socketpair sockets are closed on exit

The close() wrapper was interfering with blocking_child cleanup causing the sockets allocated during socketpair creation to remain unclosed after application shutdown. This was especially evident when the NTP daemon was started and stopped repeatedly.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

Steps to reproduce

3.5.1.2.2.1 Pre-set options

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

Commit	97b7d0f27a6204db302a0c6c2f38fc4f88507684

Summary

Passing the protocol parameter of a socket function to lwip_socket, eg. supporting the ping command requires IP_PROTO_ICMP

Author: Kinsey Moore	2024-09-15T04:16:42.121Z

Thanks! The change itself looks fine, but I need to do some testing to verify functionality.

Commit	28dbe42d7eaae6d3dc454baf1c5ea01cacab9440

Summary

Merge COPYING.* into LICENSE.md

COPYING is a GNU layout also there is no need to have them in different files we should be consistent in all our repositories.

Author: Amar Takhar 2024-07-09T07:26:00.917Z

assigned to @amar

Author: Gedare Bloom 2024-07-20T03:14:53.588Z

Please update the README file accordingly at “The sources presented here originate in one of several locations described by the ORIGIN.* files and whose license is described by the COPYING.* files.”

Author: Amar Takhar 2024-07-20T03:14:53.588Z

I’m confused but what you’re asking here. The sources you mean the source tree or the contents of the `README.md` also the contents of the old `COPYING` files went into `LICENSE.md` shouldn’t the notice go there instead?

RTEMS Waf returns the revision field as an `int` if released. The net legacy build system assumes it is a string it needs to quote.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
```

(continues on next page)

(continued from previous page)

```
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

Commit	d9aa500d6838ddf1f784275cbb8b944174601a9c

This change makes the legacy network stack tasks all the same name. The name is the same as libbsd and is `_BSD`. Libdebugger needs to know the name of the networking tasks so it does not suspend them disconnecting itself from `gdb` .

Merges	2

Add support to libbsd for FreeBSD 14. The work is to create a `6-freebsd-14` branch that can be released with 6.1. The 6.1 release may have more than one libbsd branch depending on the support coverage and testing between the branch bring available the level of testing.

A separate branch provides a way for users to test and migrate.

The branch is a staging point to get the `main` branch to tracking FreeBSD 15 or `CURRENT`.

The initial work is focused on the `6-freebsd-12` branch. Changes only on the `main` branch may need to be brought across to the `6-freebsd-14` branch.

Author: Sebastian Huber 2024-09-11T02:49:47.237Z

From my past experience synchronizing with FreeBSD, I would not use the 6-freebsd-12 branch to do the update. I would first bring the main branch close to 6-freebsd-12, integrate everything present in 6-freebsd-12, and then move on at the main branch with rebases. I would straight go to FreeBSD 15.

The first step is to update the network header files in Newlib to FreeBSD 14 and make sure they are compatible with the 6-freebsd-12 or vice versa.

Author: Chris Johns 2024-09-11T02:49:47.204Z

As documented we will be supporting `6-freebsd-14` and we move to `CURRENT` on `main` after.

We will consider the points you raise.

Author: Chris Johns 2024-11-07T23:53:19.681Z

Yes it would be good to have the `6-freebsd-12` history on `main`. A way to do this is an equivalent of:

1. Branch `main` to `6-freebsd-13` . Note, we have a tag for `6-freebsd-13` and @amar says a tag will maintain the commits in the repo to a tag so we can use this and branch the tag if we need to
2. Delete the commits on `main` on base to the origin of `6-freebsd-12`
3. Merge `6-freebsd-12` on to `main`
4. Update this MR to keep the `6-freebsd-12` changes and add the FreeBSD 14 changes as a single commit

Author: Christian Mauderer 2024-09-11T22:45:42.975Z

Great that someone finds time for that update. Just a side-note from me: I noted that on some earlier update, the `default.ini` buildset has been used in some steps. Due to that, some files have been missed and for example WLAN made problems. For updates, the `everyting.ini` buildset would be the right one. I'm not sure whether that's documented anywhere.

Author: Chris Johns 2024-09-11T22:45:42.943Z

Thanks for the suggestion.

Author: Chris Johns 2024-09-26T05:38:39.864Z

The directory `ipsec-tools` will not be brought into the `6-freebsd-14` branch. The project shutdown in 2014.

Author: Aaron Nyholm 2024-11-04T01:04:00.966Z

mentioned in merge request !17

Author: Sebastian Huber 2024-11-04T22:35:47.292Z

The !17 adds a couple of files which are also in RTEMS, for example:

```
./cpukit/include/machine/_kernel_mman.h
./cpukit/include/machine/_kernel_types.h
./cpukit/include/machine/_kernel_in6.h
./cpukit/include/machine/_kernel_uio.h
./cpukit/include/machine/_kernel_param.h
./cpukit/include/machine/_kernel_in.h
./cpukit/include/machine/_kernel_time.h
./cpukit/include/machine/_kernel_cpuset.h
```

These files should move from RTEMS to the current libbsd main and 6-freebsd-12 branches.

Author: Chris Johns 2024-11-04T22:35:47.255Z

https://lists.rtems.org/pipermail/devel/2024-July/077842.html

Would making this change now effect the `6-freebsd-12` branch?

Author: Sebastian Huber 2024-11-04T23:03:08.598Z

Ok, I forgot that RTEMS sources use also kernel-space headers. These files cannot be moved and they should not be present in libbsd.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

3.7.1.4 13 - bus_teardown_intr does not work on nexus bus

Id	13

Summary

To remove a registered interrupt handler from `bus_setup_intr`, I called the `bus_teardown_intr` function however the implementation of the teardown function for the nexus bus does install again the interrupt handler instead of removing it. This can be seen in the function `nexus_teardown_intr` at rtemsbsd/rtems/rtems-kernel-nexus.c.

The function probably should also free the cookie that `nexus_setup_intr` has allocated.

@loris.nardo Would you mind give the patch in !35 a try to see if it solves your issues? I was able to test that everything compiled and that my existing test cases work, but I don't think I have a code path that runs through bus_teardown_intr.

Author: Loris Nardo 2024-12-20T04:27:05.867Z

@opticron I'll check it in the next hours, at first glance it seems ok

Author: Loris Nardo 2024-12-20T13:56:39.070Z

@opticron I've checked it and it works

Author: Kinsey Moore 2024-12-20T13:56:39.037Z

Great, thanks for checking!

3.7.1.5 14 - dhcp issue when zynqmp BSP is not configured for SMP

Summary

When showing people how to configure, build, and use RTEMS, I tend to start with simple configurations. Below is the configuration I used this time

```
[aarch64/zynqmp_qemu]
RTEMS_POSIX_API = True
BUILD_SAMPLES = True
```

I used the uniprocessor configuration and build libbsd. The goal was to show telnetd01.exe working with a shell you could telnet to. The application configuration was slightly modified to turn on DHCPCD (client). The application failed to get an address. This was the same for multiple other people in the class who tried.

Today, I asked @opticron for help debugging this. We confirmed my tools, qemu, rtems, and libbsd matched his. We even tried my telnetd01.exe on his system. It behaved the same. His telnetd01.exe worked for me.

At this point, @opticron quickly deduced that SMP was the difference although we had to verify his insight. It is important to note that for the zynqmp BSP on real hardware, they will enable SMP. This was the configuration for RTEMS which resulted in a working libbsd telnetd01.exe

```
[aarch64/zynqmp_qemu]
RTEMS_POSIX_API = True
RTEMS_SMP = True
BUILD_SAMPLES = True
```

In summary, libbsd works with the zynqmp_qemu BSP in SMP mode but not in uniprocessor mode.

Feel free to put on a puzzled expression.

Steps to reproduce

Author: Joel Sherrill 2024-11-19T00:11:07.466Z

assigned to @opticron

Author: Chris Johns 2024-11-20T22:38:58.534Z

I have been running `freebsd-12` on a ZynqMP with SMP and without SMP (the XIlinx JTAG box only supports a single core) without issue. I will test again today.

This is on a K26 with 4 cores and local mods for the weird KR260 MII bus layout.

Author: Kinsey Moore 2024-11-20T22:39:19.334Z

From my testing (all QEMU is user-mode networking, DHCP is used as a proxy for functional network communication): * 6-freebsd-12 QEMU SMP works * 6-freebsd-12 QEMU non-SMP doesn't work * 6-freebsd-12 ZCU102 SMP works * 6-freebsd-12 ZCU102 non-SMP works

- 6-freebsd-13 QEMU SMP works
- 6-freebsd-13 QEMU non-SMP works
- 6-freebsd-13 ZCU102 SMP doesn't work (produces a large number of PHY read timeouts)
- 6-freebsd-13 ZCU102 non-SMP doesn't work (produces a large number of PHY read timeouts)

```
poll: Bad file number
```

6-freebsd-14 and main seem to fail during DHCP start with: These don't perform DHCP correctly at all.

Author: Kinsey Moore 2024-11-20T22:47:57.638Z

With 6-freebsd-12 working everywhere except QEMU non-SMP, I ok to note that and move forward with the release as-is.

Author: Kinsey Moore 2024-11-20T22:48:26.464Z

@gedare do you have any thoughts on the matter?

Author: Chris Johns 2024-11-20T23:06:28.704Z

@opticron DHCP has debug options to log what it is doing. Have you enabled this and then compared the SMP to non-SMP runs?

Author: Gedare Bloom 2024-11-21T03:38:45.081Z

It doesn't seem to be worth holding the release up.

Author: Kinsey Moore 2024-11-21T15:22:06.950Z

@chris for 6-freebsd-12, it's obviously trying to send DISCOVER messages, but I haven't looked into it beyond that. I'll try to pull packet captures for both.

Author: Kinsey Moore 2024-11-21T19:29:56.913Z

Upon further investigation, this message is produced on the non-SMP QEMU instance:

```
mbuf_cluster] kern.ipc.nmbclusters limit reached
```

`netstat -m` for non-SMP QEMU yields:

```
1151/134/1285 mbufs in use (current/cache/total)
1024/0/1024/1024 mbuf clusters in use (current/cache/total/max)
1024/0 mbuf+clusters out of packet secondary zone in use (current/cache)
0/0/0/512 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/151 9k jumbo clusters in use (current/cache/total/max)
0/0/0/85 16k jumbo clusters in use (current/cache/total/max)
2335K/33K/2369K bytes allocated to network (current/cache/total)
0/2/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/1/0 requests for mbufs delayed (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters delayed (4k/9k/16k)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
```

`netstat -m` for SMP QEMU yields:

```
1109/271/1380 mbufs in use (current/cache/total)
1031/95/1126/1274 mbuf clusters in use (current/cache/total/max)
1031/94 mbuf+clusters out of packet secondary zone in use (current/
↪cache)
0/0/0/762 4k (page size) jumbo clusters in use (current/cache/total/max)
```

(continues on next page)

(continued from previous page)

```
0/0/0/401 9k jumbo clusters in use (current/cache/total/max)
0/0/0/335 16k jumbo clusters in use (current/cache/total/max)
2339K/257K/2597K bytes allocated to network (current/cache/total)
0/0/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/0/0 requests for mbufs delayed (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters delayed (4k/9k/16k)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
```

`netstat -m` for non-SMP ZCU102 yields:

```
280/230/510 mbufs in use (current/cache/total)
263/113/376/1024 mbuf clusters in use (current/cache/total/max)
263/112 mbuf+clusters out of packet secondary zone in use (current/
↪cache)
0/0/0/512 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/151 9k jumbo clusters in use (current/cache/total/max)
0/0/0/85 16k jumbo clusters in use (current/cache/total/max)
596K/283K/879K bytes allocated to network (current/cache/total)
0/0/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/0/0 requests for mbufs delayed (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters delayed (4k/9k/16k)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
```

This appears to be partially caused by QEMU indicating the MII busses on all interfaces are active and so LibBSD brings up all interfaces. On hardware, interfaces with non-terminated MII busses are not brought up. It also appears that there are slightly more mbuf clusters available on SMP builds since this particular test is not configured to bring up additional cores.

Given the above, this is technically a configuration issue.

Author: Kinsey Moore 2024-11-21T19:29:56.785Z

6-freebsd-12 commit b9880143628ad4d1b2c7423d28d852988f7a469e is what allows this to work in SMP mode.

thread now?

3.7.1.6 9 - Kernel RPC header installed

Id	9
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Closed by	Chris Johns
Created	2024-09-19T00:37:08.200Z
Closed	2024-09-25T00:58:04.776Z
Updated	2024-09-25T00:58:04.821Z
Milestone	6.1
Labels	libbsd, libbsd::freebsd-12
Link	https://gitlab.rtems.org/rtems/pkg/rtems-libbsd/-/work_items/9
Merges	1

The build support is installing the kernel RPC header file `rpc/auth.h`. This clashes with the user land version of the same header file. Only install the user land version of the header file. The build output is:

```
....
rtems-libbsd-c88476d8c0def10bd3fcc0983c19f6d2536f65e1-x86_64-..../lib/include/rpc/
↪auth.h (from freebsd/sys/rpc/auth.h)
....
rtems-libbsd-c88476d8c0def10bd3fcc0983c19f6d2536f65e1-x86_64-..../lib/include/rpc/
↪auth.h (from freebsd/include/rpc/auth.h)
...
```

Noitice the same destination for the different files. This has been present for a long time and effects `waf` install if you have a lot of cores (edited output):

```
Build failed
Traceback (most recent call last):

3.7.1.7 8 - dhcpcd has broken memory handling

Id	8

Summary

Code sometimes crashes after `dhcpcd` starts but not always. It depends on the gap between the interface being assigned an address, something else requesting heap memory, how that memory is used and the configuration of the DHCP server.

I have a hard crash on an KR260 board with two interfaces mounting an NFSv4 export soon after `dhcpcd` as started and an interface being assigned an IP4 address. Debugging the crash I discovered the location being changed was the upper 32bits of a XDR buffer pointer and the update correlated to index 324 of the `requiremask6` fields of the `struct if_options` that is allocated then `dhcpcd` first reads its configuration.

```
(gdb) p 0xa5010c - (int) &ifo->requiremask6
$26 = 324
```

I have seen random failures and crashes on Zynq systems I could not track it down. I now believe those are related. `dhcpcd` frees the read options before it enters the event loop and there must be a reference some where.

Steps to reproduce

1. Use an AARCH64 BSP and build `6-freebsd-12`
2. Configure 2 interfaces
3. Use the default `dhcpcd` configuration with the options of `--debug --nobackground --timeout 30`
4. Mount and NSFv4 export soon after the interfaces are assigned IP4 addresses

Analysis

1. The `if_options` structure is allocated memory when the options are read.
2. Options are assigned to interfaces.
3. The global `if_options` variable is freed and set to `NULL` before the event loop runs.

My guess is the options pointer is being held in an interface (or somewhere else) and something related to the IP6 DHCP protocol handling updates an option setting in the `requiremask6` field. It could be related to the configuration of the DHCP server and an option given sets and option in `requiremask6` to `1`.

Commit	c9e8c28ed1f50618de48a4eb0f34aa9bf02ee36b

The change changes TTCP to NUTTCP. The command changes from `ttcp` to `nuttcp`. The command struct is the same name so avoid breaking existing builds.

Author: Chris Johns 2024-09-08T01:57:36.711Z

assigned to @chris

Author: Joel Sherrill 2024-09-08T21:26:03.410Z

Do not worry about preserving the old ttcp command line as a hint to the user.

Author: Chris Johns 2024-09-08T21:26:03.410Z

I agree, the overhead is too high. It would be easier to add if the shell allowed setting of the `alias` field when adding a command `struct` but that is currently not supported.

Commit	3b14ed85b8ce8d616d1967b1da9477f140683293

Summary

The first patch fixes an issue with a bad patch backport.

The second patch in the set bumps up the available memory for ZynqMP systems to allow all 4 interfaces to function simultaneously by default.

Commit	4524dd5247dc4628d0816a8ce1fd771a09616c47

Summary

Regression from 7a86bf1467a53ab28f4fd66bbdfa2b09d9c8e222

<rpc/rpc.h> includes <rpc/types.h>. FreeBSD seems to install sys/rpc/types.h, so that's what I've done here.

This was causing a build error in the EPICS asyn module.

Commit	ddccd332f63c82184de35d777a418b3ebd3e47a5

Summary

rtemsbsd/kernel-init: Ignore EEXIST for /etc

This restores previous behavior of allowing processing to continue in the case that /etc already exists while still checking for other directory creation errors.

3.8 RTEMS / Programs / Google Summer of Code

Go to *Issues* (page 68) or rtems/programs/gsoc-merges

Issues Summary

79 - GDB script entries in EXE (page 945)
76 - dtc build failure on msys2 - all rtems6 target tools fail to build on Windows 10 (page 957)
73 - Make Stack Checker Error Handler Configurable (page 956)
72 - Use thread-local storage for Newlib reentrancy objects (page 961)
67 - Port Rust to RTEMS (page 917)
66 - Replace Mongoose with Civetweb (page 914)
61 - Improve Exception Output (page 916)
59 - Add BSP for Polarfire based Beagle (page 951)
57 - Add Python initializer for gdb RTEMS specific support (page 954)
51 - Basic Support for Trace Compass (page 938)
47 - TLS support for libdl (page 923)
40 - Add RSB Support for CivetWeb (page 949)
37 - RTEMS Testing TFTP Proxy Project (page 940)
35 - RTEMS Release Notes Generator (page 904)
31 - Add Benchmarking statistics for block device drivers (page 943)
26 - Add SDIO driver support to rtems-libbsd (page 944)
23 - Port RTEMS to Microblaze (page 968)
21 - Improve Coverity Scan Integration (page 931)
9 - Add Classic API Barrier "get number waiting" Service (page 919)

RTEMS Release Notes Generator

[Contents, inline)]

3.8.1.1.1.1 Mentors

Chris Johns

3.8.1.1.1.2 Students

Past, Present, and Potential Students

3.8.1.1.1.3 Status

This is an existing project. The history is:

GSoC/2018

3.8.1.1.1.4 Introduction

The RTEMS release process generate the release notes from Trac. All changes on a release branch must have a ticket and the ticket is assigned the Version and Milestone. During the release process a Trac TicketQuery is run on release milestone and the resulting pages are converted to a PDF as the release notes. The Trac ticket pages are downloaded in a format suitable for parsing such as XML.

The RTEMS 4.11.3 release notes are:

https://ftp.rtems.org/pub/rtems/releases/4.11/4.11.3/rtems-4.11.3-release-notes.pdf

and all the tickets and so all the changes have been captured however the release notes have some issues.

1. The tickets only have the descriptions and no comments. This means any discussion on the resolution of the ticket is missing.
2. The date is relative so **4 days ago** is relative to the date of the release.
3. There are some formatting issue. See page 3/8 of the 4.11.3 notes on the link above.

Comments cannot be easily added. Trac's TicketQuery does not support adding the Comments. There has been many requests for this over the years and it has not been added.

The date is a local setting which means logging in to get a setting and the release process is anonymous and gets the default.

The formatting could be the current release process's CSS file used to generate the PDF.

3.8.1.1.1.5 Goal

- Automatically create the release notes for a release from the Trac data.
- Include all of the ticket's data in the release notes.
- Use the full date.
- Provide better formatting of the ticket such as each ticket starting on a new page.
- Be able to provide HTML and PDF version of the output.

3.8.1.1.1.6 Prerequisite ==

- Knowledge of Python
- Knowledge of HTML and CSS
- Knowledge of XML
- Knowledge of ReST (Sphinx)

3.8.1.1.1.7 Tasks

1. Develop a Python class to read an RSS page from Trac. An RSS page is basically HTML in XML.
2. Develop a Python class to get a list of tickets for a milestone from Trac using the RSS format.
3. Develop a Python class to get all the ticket data for a milestone.
4. Generate ReST output that can be wrapped in coverpages to create a document.
5. Have Sphnix generate create HTML and PDF output.
7. Package the tool in the `rtems-tools` repo.
8. Update the RTEMS release process to create the new format release notes.

RTEMS has an old version of Mongoose using a permissive license before it was relicensed to GPL. There was a fork at the point of it being relicensed and it is now called Civetweb (https://github.com/civetweb/civetweb).

This project would remove mongoose from RTEMS and ideally replace it with an RSB built version of Civetweb. This would enable it to be used on top of any TCP/IP stack RTEMS supports.

One challenge will be figuring out how to deal with all the options Civetweb has, making these accessible to the user building Civetweb via RSB, and documenting them.

When debugging a divide by zero error on the x86, an exception was printed which was marginally useful. However, it printed the task id in decimal and did not print the exception type as a string. This task is to review the exception handler for each architecture and attempt to make it more user friendly.

- Print values in the most appropriate numeric base
- Print exceptions as strings and with any accompanying details

This can be done an architecture at a time as a small task or as a set for a Summer of Code style project.

With at least two architectures (SPARC and RISC-V) buildable with LLVM/clang, it is now time to consider porting Rust to RTEMS.

This project will be to target the Rust compiler to RTEMS, port the Rust run-time to RTEMS, and run the test suite for Rust.

All LLVM modifications should be submitted to LLVM which means a contributors agreement to them will have to be executed.

Note: RISC-V RTEMS support for LLVM may still be a work in progress.

rtems/rtos/rtems#4623 may be a prerequisite for this. Being able to build LLVM with RTEMS support for any architecture and test it with normal C support is critical.

Potential mentors: Joel Sherrill, Sebastian Huber, Chris Johns, Gedare Bloom Skills: C, some Rust Difficulty: Hard

Not sure if this project is not going against the wind here. If nobody steps in, then RTEMS project may get Rust language support for “free” by just waiting and seeing how https://rust-gcc.github.io/ completes. And then by enabling it in RSB I would guess. And well, porting its runtime to newlib. But hopefully effort will be lower than porting whole LLVM framework “just” to bring Rust in.

Background

Given that a barrier can be set to manually release, it would be useful to know how many threads are waiting at it. An extension to the barrier API could be useful.

Approach

Talk to the mentors. Tests and documentation are required.

Knowledge/Skills

- C
- Synchronization primitives

Possible Mentors

TLS support for libdl

[Contents, inline)]

3.8.1.6.1.1 Mentors

Chris Johns

3.8.1.6.1.2 Status ==

Introduction =

The goal of this project is to support TLS variables in code loaded using `libdl`.

RTEMS supports the run-time loading of the executable code using the `dlopen` family of calls. The implementation is in `libdl`. Thread Local Storage (TLS) is not support. Code containing TLS will not load and so cannot be run.

3.8.1.6.2.1 TLS Varables

TLS data is private to each thread. A thread is allocated a block of data when it is create to hold the system wide TLS variables. When code references a TLS variable it uses an offset from a system defined and reserved register to access the memory. With a statically linked executable all the TLS variables are known so the space allocated is known. Initialized TLS variables need to initialized when a thread is created.

TLS has an overhead. The thread specific storage adds to the allocation overhead when a thread is created, as well as thread create time as the memory needs to be initialized or cleared. It is useful to hold pointer to large object and use by RTEMS system level software should be avoided.

TLS needs compiler support to work and this means the ABI the compiler implements defines how TLS variables are defined and operate.

3.8.1.6.2.2 Run-time Loaded TLS Variables

Run-time loading TLS variables complicates the how TLS variables are implemented in RTEMS and how TLS variables are used. Space needs to be reserved in all threads to cater for variables that are loaded at run-time.

Space is allocated to TLS variables from the special memory attached to each thread as they are loaded until the reserved space is consumed. TLS variable symbols are treated differently to other variables loaded at run-time. Space allocated to a TLS cannot be used again until the TLS symbol that references it is removed from the system by the unloading of the executable object file that contains it.

Initialization of new variables in existing threads can happen without suspending a thread. A new TLS variable is only available to a running thread once the executable object has finished being loaded so the memory can be touched while the thread is running. The thread cannot be deleted while the initialisation is happening. Threads that start after TLS variables have been loaded need to have their TLS memory initialized.

RTEMS cannot afford to suspend threads to dynamically allocate more space to TLS variables.

Project

The project is to add support to the RTEMS `score` and `libdl` to support the loading of executable object files with TLS variables.

3.8.1.6.3.1 Goal

- Update the `score` to allow reserve extra TLS memory
- Provide an allocator to the memory.
- Add a TLS symbol table to `libdl`.
- Add TSL variable tests to the testsuite.

3.8.1.6.3.2 Prerequisite

This is an advanced project with a lot of detail. Parts of the code need to be in the `score` and deep in the TCB for threads. Code accuracy and clarity is important.

- Advanced knowledge of C.
- An understanding of ELF and TLS.
- Ability to read detail documents on file formats and operating characteristics such as ABI details for an architecture.
- Experience with a few RTEMS tier 1 architectures.

3.8.1.6.3.3 Difficulty

This is a large (350-hour) project of hard difficulty.

3.8.1.6.3.4 Resources

- Current RTEMS developers.

Tasks

The following are the tasks:

TDB

Acknowledgements

None.

Miscellaneous Sections

As the project progresses, you will need to add to the RTEMS Testing section of the User manual. This section does not currently exist but it should be present even in a skeleton form.

References

- None.

The goal of this project is to create better workflows to incorporate static analysis into the RTEMS development and release cycle. This project can be done with other static analyzers such as Codiga

Mentors

Gedare Bloom, Joel Sherrill

Skills

Python, Data manipulation

Difficulty

This is a small (175-hour) project of medium difficulty.

More Information

Coverity Scan is a static analyzer that can identify various types of potential software defects. Coverity offers free use of this analyzer for free software projects. Issues identified for RTEMS are at https://scan.coverity.com/projects/rtems.

Coverity Scan identifies POTENTIAL issues. Some may be real bugs. Others may indicate that Coverity Scan does not have full awareness of the program life. For example, memory allocated during RTEMS initialization may appear to be leaked because it is never freed, but this is deliberate and the issue marked as such in Coverity Scan.

You can get an account on Coverity Scan and request access to the [RTEMS Project](https://scan.coverity.com/projects/rtems) to contribute.

The current process for dealing with Coverity Scan is entirely manual. See, for example, Google Code-In task instructions for Coverity. This manual process has several drawbacks. The purpose of this GSoC Project would be to simplify the process of working with Coverity, and to automate it where possible. We have identified two starting directions, and encourage interested students to brainstorm on other ways to improve the Coverity Scan integration.

Reducing False Positives Static analysis suffers from a high number of false positives. Coverity Scan provides two methods for removing false positives. First is by creating an optional _modeling **file**_ to accommodate for special cases where the data flow analysis breaks, for example due to missing functions that are linked outside the analyzed source code. A modeling file usually is used to identify functions that terminate execution, allocate memory, or free memory. Second, source code annotations in specially formatted comments can also be used to suppress warnings. This project should determine which approach to take, and design/implement a path forward.

Testing Fixes Since security tools tend to be costly in terms of time or compute resources, they are normally run on nightly or even weekly builds rather than on every commit as done for typical continuous integration (CI). It can be tedious to merge commits to the development master and trigger a scan to determine if the issue has been fixed. Instead, we would like to develop fixes and trigger Coverity Scan as needed (subject to staying within the allowed scan rates). Coverity Scan integrates with Github and can be triggered to scan by merging new code to a specific git repository branch. As a first step, a special 'coverity' branch could be created for scanning commits that are pushed there, so that developers who are testing changes can work through the coverity branch before merging fixes into the master. Alternate solutions should be discussed with any mentors.

Coding Rule Scans Investigation on this direction is needed. Coverity supports for example a couple of MISRA rules: https://www.synopsys.com/content/dam/synopsys/sig-assets/datasheets/coverity-misra-standards-ds-ul.pdf

These rules are not enabled currently. Would it be possible to enable a subset of these rules in our current setup?

3.8.1.8 51 - Basic Support for Trace Compass

Id	51
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-02-20T12:02:45.000Z

Milestone	6.1
Labels	gsoc, priority::normal, resolution::fixed, tickettype::project, tool, version::5
Link	https://gitlab.rtems.org/rtems/programs/gsoc/-/work_items/51
Merges	0

Original author: sebastian.huber

The Trace Compass is a tool to analyse and display trace data. Trace data can be gathered from RTEMS applications via various means, for example: * RTEMS Trace Linker * Event Recording * Capture Engine

The goal of this project is to enable the Trace Compass to analyse and display some basic information using the Event Recording infrastructure. Basic information is defined by the Linux kernel trace support (lttng) and includes (see Trace Compass project explorer Tracing -> Traces -> Something):

- kernel
- Views
- CPU usage
- CPU usage
- IRQ Analysis
- IRQ Statistics
- IRQ Table
- IRQ vs Count
- IRQ vs Time
- Linux Kernel
- Control Flow
- Resources

Example data can be obtained from the Trace Visualization Labs.

Advanced support for Trace Compass could include dynamic memory traces, stack usage, network packet flow, etc.

There are four main problems.

1. Generation of sufficient trace events, currently the interrupt entry/exit events are not available for example.

2. The trace data must be transferred from the target system running the RTEMS application to a host computer running the Trace Compass (transfer via TCP is available, for UDP based transfer see rtems/rtos/rtems#3695).
3. The Trace Compass must be able to analyse and display the information obtained from the Event Recording.
4. The RTEMS user must be able to use this infrastructure. This requires that it is easy to use, availability of tutorials and documentation.

To tackle problem 3. there are two approaches possible. You can extend the Trace Compass to work with the trace data provided by RTEMS as is. Alternatively, the RTEMS trace data could be converted to Linux kernel trace data (lttng) which Trace Compass already understands.

Related topics are Common Trace Format, [Babeltrace](https://diamon.org/babeltrace/), [barectf](https://github.com/efficios/barectf), rtems/rtos/rtems#2961 and rtems/rtos/rtems#3028.

Skills Needed

You need good C and C++ skills with a proven record. You need to show socket level and networking programming skills. In case Trace Compass needs to be extended this requires Java skills and familiarity with the Eclipse framework. Knowledge of YAML and XML is helpful. High end RTEMS targets can generate a huge number of events per second (10MiB/s trace data is 1310720 events per second; on a 4GHz host processor this is 3051 instructions per event under real-time processing conditions) which imposes a considerable work load to modern host computers, so the host programs must work efficiently.

Difficulty

We consider this an advanced project.

RTEMS Testing TFTP Proxy Project

[Contents, inline)]

3.8.1.9.1.1 Mentors

Chris Johns

3.8.1.9.1.2 Status ==

Introduction =

This project involves working with the RTEMS Testing Tool that resides in the RTEMS Tools package and is part of the RTEMS Tools Project. The RTEMS Testing Tool provides a consistent way to test BSPs on different hardware. The tool aims to integrate with a wide range of testing tools and methods generating a consistent report for the RTEMS test suite.

An important part of test is testing on real hardware and this may use the TFTP protocol. The RTEMS Testing Tool contains a TFTP server so a single run of the tool results in a sequential run of the tests for the hardware. It also means there can only be a single test run on the host. These are both seen as limitation as the time to run all the tests on real hardware is long.

Project

The project is to develop a TFTP proxy in C++ that is built for a host when the RTEMS Tools project is build on a host. The TFTP is to take a configuration that maps the TFTP client IP address to a proxy port. The `rtems-test` tool can be configure to connect to the proxy port and so to a TFTP client which is the board running the tests.

The RTEMS Tool's `rtems-test` command can test on hardware using the TFTP protocol and U-boot however the `rtems-test` command needs to be run as `root` because the standard TFTP port can only be used when `root`. A proxy can be run as `root` while the RTEMS Testing tool can be run as a user.

The U-Boot has support in the code to set a server IP address however there was no configuration option and the support is not built in by default. Using the server IP would mean standard U-Boot loaders shipped with boards could not be used.

3.8.1.9.3.1 Goal

- Create a service or daemon that can run as `root` to proxy TFTP requests.
- Read an INI configuration file of TFTP Client IP address mapped to remote IP and port.
- Send a request from a client to the configured remote IP and port and so `rtems-test` for that board.
- Provide optional logging via `syslog`.
- Provide command line options to trace the proxy tool when integrating.

3.8.1.9.3.2 Prerequisite

- Knowledge of C, C++ and Python programming languages.
- Knowledge of Unix software and Unix networking protocols.
- Knowledge of the RTEMS Tool's Toolkit.
- Requires Unix (Linux or FreeBSD) host.
- Requires modern PC hardware. Building all tests and running takes.
- A Zedboard, MicroZed or BeagleBone Black.
- Optionally a Windows 10 machine to test and check.

3.8.1.9.3.3 Resources

- Current RTEMS developers.
- The existing RTEMS Testing Tool.

Tasks

The following are the tasks:

3.8.1.9.4.1 Proxy Tool ==

Build a program to:

1. Listen on the detault TFTP port for UDP requests 1. Extract the source IP address and locate the IP address and port. 1. Send the request to the remote IP address and port. 1. Determine if the TFTP protocol will continue between the client and the remote server or the proxy tool need to listen for the remote's response to send to the client.

3.8.1.9.4.2 Configuration Files

Develop a simple configuration for management of boards and testers.

Acknowledgements

None.

Miscellaneous Sections

As the project progresses, you will need to add to the RTEMS Testing section of the User manual. This section does not currently exist but it should be present even in a skeleton form.

SDIO interface nowadays, is widely used for connecting WiFi/Bluetooth chips on ARM boards, like Wandboard, Raspberry Pi 3 or Banana Pi. Adding SDIO support to RTEMS will thus, allow us to exploit these features.

Summary

This issue tracks patches we use to test how auto-loading works in GDB.

We know from Tom static support is not well done. It could be something we could work on and improve. A response in GDB IRC:

I have review the coded. What I was after was:

```
diff --git a/testsuites/samples/hello/init.c b/testsuites/samples/hello/
↪init.c
index 83f6342ab3..56d1e2eed0 100644
--- a/testsuites/samples/hello/init.c
+++ b/testsuites/samples/hello/init.c
@@ -35,10 +35,20 @@

const char rtems_test_name[] = "HELLO WORLD";

+/* Note: The "MS" section flags are to remove duplicates.  */
+#define DEFINE_GDB_PY_SCRIPT(script_name) \\
+  asm("\\
+      .pushsection \\".debug_gdb_scripts\\", \\"MS\\",@progbits,1\\n\\
+      .byte 1 /* Python */\\n\\
+      .asciz \\"" script_name "\\"\\n\\
+      .popsection \\n\\
+      ");
+
static rtems_task Init(
rtems_task_argument ignored
)
{
+  DEFINE_GDB_PY_SCRIPT("rtems-gdb-init.py");
rtems_print_printer_fprintf_putc(&rtems_test_printer);
TEST_BEGIN();
printf( "Hello World\\n" );
```

Building the samples, which RTEMS does by default, generates this in the sections:

```
$ readelf -e build/arm/xilinx_zynq_a9_qemu/testsuites/samples/hello/
↪init.c.579.o | grep gdb
[ 7] .debug_gdb_script PROGBITS        00000000 000078 000013 00  MS  0␣
↪  0  1
```

however the section does not end up in the executable:

```
$ readelf -e build/arm/xilinx_zynq_a9_qemu/testsuites/samples/hello.exe␣
↪ | grep gdb
$
```

The `linkercmd` needs updating to place the `.debug_gdb_script` in the output.

This approach will let us test what works with GDB and how to make it work.

Author: Chris Johns 2024-06-11T06:06:20.853Z

Updating the `linkcmds.base` file for ARM places it into the exe:

```
diff --git a/bsps/arm/shared/start/linkcmds.base b/bsps/arm/shared/start/linkcmds.base

Author: Chris Johns 2024-06-11T06:06:20.853Z

Running qemu and connecting with GDB shows this:

```
(gdb) info auto-load
gdb-scripts:  No auto-load scripts.
local-gdbinit:  Local .gdbinit file was not found.
python-scripts:
Loaded  Script
No      rtems-gdb-init.py
```

I am not sure what it means yet and where GDB searched. GDB reported:

```
Reading symbols from /opt/work/chris/rtems/kernel/rtems.git/build/arm/xilinx_zynq_a9_qemu/testsuites/samples/hello.exe...
warning: Missing auto-load script at offset 0 in section .debug_gdb_scripts
of file /opt/work/chris/rtems/kernel/rtems.git/build/arm/xilinx_zynq_a9_qemu/testsuites/samples/hello.exe.
Use `info auto-load python-scripts [REGEXP]' to list them.
```

Author: Chris Johns 2024-06-11T06:06:20.853Z

GDB does not search the `auto-load` paths with a script in `.debug_gdb_scripts`. Adding python text does execute then the executable is loaded. This is the path to follow.

Author: Suraj Kumar 2024-06-11T06:06:20.853Z

@chris GDB searches by default for scripts loaded in `.debug_gdb_scripts` in the `source` directory specified (which, by default is `cwd`). However, even for scripts loaded as text inside the section, a file name needs to be specified, and that filename needs to be in an auto-load safe path (as Christian noted, not doing so would be a security issue).

May I please know what name you specified for the script when loading Python as text?

Author: Chris Johns 2024-06-11T06:06:20.853Z

I am working through this and I have provided the detail in a new thread closing this one.

Author: Chris Johns 2024-06-11T06:05:25.345Z

I have pushed some code to my personal repo that runs. The branch is https://gitlab.rtems.org/chris/rtems/-/commits/79-gdb-script-entries-in-exe. It modifies the `iostream` sample to add

1. The special section GDB searches
2. The linker command file change for the object file section to be written into the executable
3. And a vector in C++ to test pretty printing with

The GDB support is:

```
#define DEFINE_GDB_PY() \\
asm( \\
".pushsection \\".debug_gdb_scripts\\", \\"MS\\",@progbits,1\\n" \\
".byte 4\\n" \\
".ascii \\"gdb.inlined-script\\\\n\\"\\n" \\
".ascii \\"import sys\\\\n\\"\\n" \\
".ascii \\"import os.path\\\\n\\"\\n" \\
".ascii \\"sys.path.append(os.path.join(gdb.PYTHONDIR, 'rtems'))\\\\n\\
↪"\\n" \\
".ascii \\"print(sys.path)\\\\n\\"\\n" \\
".ascii \\"print(gdb.PYTHONDIR)\\\\n\\"\\n" \\
".ascii \\"import rtems.stdcxx as stdcxx\\\\n\\"\\n" \\
".byte 0\\n" \\
".popsection\\n" \\
)
```

- This test code appends to Python's system search path the RTEMS Python support. The `gdb.PYTHONDIR` is the install prefix path as we assume GDB and `rtems-tools` are installed under the same `$prefix`.
- Loads an RTEMS python script called `stdcxx` from the RTEMS Python. This does not exist yet. This file will need to figure out the location of the GCC install `libstdcxx` python code and integrate it.

The C++ test code is:

```
auto v = std::vector<int>({1, 2, 3, 5, 7, 8});
for (auto i: v) {
std::cout << i << ' ';
}
```

The expected output is:

```
(gdb) p v
$1 = std::vector of length 6, capacity 6 = {1, 2, 3, 5, 7, 8}
```

3.8.1.13 40 - Add RSB Support for CivetWeb

Background

`CivetWeb <CivetWeb>`_(https://github.com/civetweb/civetweb) is a permissive licensed fork of the last permissively licensed Mongoose version. We would like to support CivetWeb on RTEMS as a third-party package.

Approach

There needs to be instructions to configure and building CivetWeb by hand and an RSB recipe for this. It needs to build against libbsd as a minimum and lwip is desirable.

Knowledge/Skills

C/C++, Python

Possible Mentors

There is a new RISC-V based Beagle based on the Polarfire SOC. This project is to create a BSP for that.

The following is a list of peripherals that have been identified based on information from https://www.microchip.com/en-us/products/fpgas-and-plds/system-on-chip-fpgas/polarfire-soc-fpgas

Another dev kit could be https://www.microchip.com/en-us/development-tool/mpfs-disco-kit

This ticket is related to the BeagleBoard 2022 GSoC effort: https://elinux.org/BeagleBoard/GSoC/Ideas-2022#RTEMS_on_RISC-V

As of 2022/3/1, at least these BSP components are supported:

- CPU Cores (both E51 and U54)
- Interrupt controller (PLIC)
- Timer (CLINT)
- UART (mmuart, 16550-compatible or close enough)

Unsupported:

- Ethernet (mss-gem, not in libbsd or upstream FreeBSD, lwIP support unknown)
- U54 MMU (bare and Sv39 modes)

There is Linux support under development for this. We need to pursue asking for dual-licensing at least the network driver as NXP did for qoriq.

All other peripherals have not been checked for existing support.

Currently, the stack checker has a built in error reporting method that is invoked when it determines that a stack overflow has occurred. This should turned into a configuration point. The user should be able to provide their own handler for this.

As a check, when this is done, it should be possible for the stack checker to be enabled and printk() not pulled into an application.

Problem

The state of the art architectures supported by RTEMS have all efficient support for thread-local storage (MIPS has issues with thread-local storage, however, is MIPS state of the art?).

Newlib currently uses a huge object of type `struct _reent` to store thread-specific data. This object is returned by `__getreent()`. It is related to the `__DYNAMIC_REENT__` Newlib configuration option which is always defined for RTEMS.

The reentrancy structure contains `errno` and also the standard input, output, and error file streams. This means that if an application only uses `errno` it has a dependency on the file stream support event if it does not use it. This is an issue for lower end targets and the pre-qualification of RTEMS.

Solution

One approach to disentangle the dependencies introduced by `struct _reent` is to get rid of this structure and replace the individual members of the structure with thread-local objects. For example, instead of

```
struct _reent {
int _errno;
__FILE *_stdin;
__FILE *_stdout;
__FILE *_stderr;
};
```

use

```
_Thread_local int _errno;
_Thread_local __FILE *_stdin;
_Thread_local __FILE *_stdout;
_Thread_local __FILE *_stderr;
```

Newlib already has access macros for the `struct _reent` members, for example:

```
#define _REENT_SIGNGAM(ptr) ((ptr)->_new._reent._gamma_signgam)
#define _REENT_RAND_NEXT(ptr)       ((ptr)->_new._reent._rand_next)
#define _REENT_RAND48_SEED(ptr)     ((ptr)->_new._reent._r48._seed)
#define _REENT_RAND48_MULT(ptr)     ((ptr)->_new._reent._r48._mult)
#define _REENT_RAND48_ADD(ptr)      ((ptr)->_new._reent._r48._add)
```

How-to Implement

The member access macros are incomplete. The first step is to use the Newlib configuration for RTEMS as is and rename all `struct _reent` members, for example add an `TEMPORARY` prefix to all member names, `_errno` to `TEMPORARY_errno`. Then add member access macros until Newlib builds again. Install this Newlib and check that RTEMS and libbsd compiles. Run the RTEMS and libbsd test suites to check for regressions.

In a second step to this for the `_REENT_SMALL` configuration of Newlib.

The third step is to add a new Newlib configuration option, for example `_REENT_THREAD_LOCAL` which turns the `struct _reent` members into thread-local objects with corresponding "member" access macros. Define `_REENT` to `NULL`.

Skills

C and assembly

Difficulty

This is a large (350-hour) project of hard difficulty.

One issue with this is that TLS is not supported on all architectures. We would either have to have two methods (current and TLS) to do this or fix TLS everywhere.

Author: Trac Migrate 2021-12-03T19:20:33.000Z

Original author: sebastian.huber

I am not sure what the Newlib maintainer say if we try to add a third reentrancy approach. I guess for backward compatibility they want to keep the existing methods anyway.

Port RTEMS to Microblaze

Students: Past, Present, and Potential Students

Status: The tools build from RSB properly, but GDB is not compatible with current XDM (Xilinx Debugging Module), Xilinx GDB version is working fine.

Introduction: A new architecture port, not just BSP. Include a BSP for GDB simulator. Also needs BSP for more complete HW on simulator.

Goal: Update the preliminary Microblaze port, complete clock timer support, merge into RTEMS, and continue to improve the BSP/port.

Some work has been initiated here [1] (By Joel Sherrill and Hesham ALMatary) to get hello world working. It has been tested on Atlys FPGA board [2]. The BSP can run virtually on every FPGA board the Xilinx tools support building MicroBlaze on.

The work will need to be updated against the current RTEMS version and tools and then completed. There are multiple boards supported by qemu-system-microblaze. One of these should be suitable for completing the port including interrupts. It will require investigation to know if qemu includes networking support for the Microblaze but this is likely.

3.9 RTEMS / RTOS / RTEMS

Go to *Issues* (page 998) or *Merge Requests* (page 2535)

Issues Summary

5185 - Waf version support breaks if the version has no version label (page 1393)
5183 - On some platforms, linking requires ABI flags (page 1395)
5171 - Allow relocateable installations for legacy Makefile support (page 1392)
5167 - Update waf to 2.1.4 : rtems/rtos/rtems (page 999)
5164 - While at low sporadic server priority, changing the real priority leads to unpredictable system behaviour (page 1006)
5161 - Zynq QSPI Flash erases two sectors when requested erase is the sector size. (page 1409)
5159 - SMP: Race condition in thread priority changes (page 1387)
5157 - Add interface between Flashdev and JFFS2 (page 1407)
5152 - RTEMS FDT Add read/write handler support to the shell command (page 1382)
5150 - record-server.c: CID 1634787: Error handling issues (page 1412)
5149 - arm/xilinx_zynq_microzed: Microzed timer is running 3 times the required frequency (page 1419)
5148 - Release notes needed from "Improve event record handling" (page 1420)
5147 - Clean up projects list (page 1396)
5144 - libdl and related shell extensions are not supported on RISC-V (page 1401)
5142 - Xilinx Zynq devcfg driver changes. (page 1436)
5139 - RISC-V: hello.exe crashes since 2024-Oct-26 (page 1429)
5133 - README.md does not reference the main branch (page 1438)
5126 - poll.h is in both rtems and newlib (page 1472)
5123 - ZynqMP Cortex-R5 RPU BSP broken (page 1474)
5120 - Refactor xilinx_zynqmp_lp64_cfc400x BSP watchdog disable (page 1405)
5119 - AMD (Xilinx) ZymqMP BSP Review (page 1443)
5118 - confdefs/libio.h references librtemsNfs.h which does not exist (page 1406)
5117 - Spelling of network configuration wrong (page 1347)
5114 - Is xilinx-zynqmp console.c specific to the aarch64/xilinx_zynqmp_lp64_cfc400x BSP? (page 1476)
5113 - bdpart-register.c: Calling close() with negative value (page 1479)
5112 - flashdisk.c: Invalid printf format string (page 1480)
5111 - kern_ntptime.c: Assigning time_t to 32-bit variable truncates time (page 1478)
5110 - Work around STM32 H7 errata unsupported read access with unaligned address (page 1348)
5109 - open: Race condition when called with O_TRUNC (page 1350)
5103 - libdebugger: Add SPDX annotation (page 1471)
5102 - aio_fsync.c: Use of uninitialised memory (page 1475)
5100 - aio_fsync.c: Coverity reports dead code (page 1481)
5099 - Installation is broken by recent text to md file transition (page 1353)
5098 - Add libdebugger support for PowerPC (page 1481)
5097 - testsuites: some fstest on JFFS2 and RFS are being compiled and run even on target that should exclude them (page 1355)
5096 - bsps/m68k/uC5282/README.md: Delete timing test results (page 1353)

continues on next page

Table 3 – continued from previous page

5084 - objectinitializeinformation.c: Coverity spotted possible over indexing (page 998)
5082 - Change the default stack checker reporter to be a quiet reporter (page 1351)
5080 - Lowercase all directories and files in source. (page 1491)
5076 - objectgetinfo.c: Potential access past end of array (page 1495)
5075 - Update STM32 H7 HAL implementation to the latest 1.11.2 release (page 1352)
5074 - getdents does not hold the IOP of the file descriptor (page 1355)
5072 - JFFS2 rtime decompression bug (page 1390)
5071 - rmdir does not handle dot-dot as specified by POSIX (page 1211)
5069 - rfs: Does not check for names too long (page 1212)
5068 - Asynchronous I/O Interface does not generate notification at request completion (page 1213)
5067 - Remove essentially dead code from _Terminate() (page 1441)
5063 - Add a call to return open file descriptors (page 1498)
5062 - Return task and idle time with getrusage (page 1499)
5061 - waf creation of compile_commands.json (page 1214)
5060 - Add CPU Usage calls to return the time or ticks accounted for in tasks (page 1503)
5058 - dhrystone: Prevent procedure merging (page 1507)
5056 - Add SPI support to Raspberry Pi 4B BSP (page 1215)
5055 - Self-contained object: Add timeout and try wait function for counting semaphore (page 1216)
5053 - testsuit/libtest/dl12: build error (page 1217)
5052 - amd64 BSP crashes on QEMU with KVM enabled (page 1218)
5050 - Add fatal error for rtems_cache_disable_data() (page 1508)
5049 - Add sys/tree.h from newlib to the score with a different name (page 1500)
5046 - x86_64: Global constructors/destructors don't get called (page 1218)
5044 - FAT32 creating a file after a rename of a still opened file can yield back the same file (page 1219)
5043 - Remove e500 instructions from PowerPC BSPs that are not E500 (page 1510)
5042 - amd64: console_initialize throws fatal error due to console device_file having the same path (page 1220)
5041 - x86_64: ISR handler macros do not follow expected behavior (page 1221)
5040 - aio_fsync() does not support O_DSYNC (page 1222)
5039 - aio_return() can be called indefinitely. (page 1224)
5038 - CPUKit score uses empty structs (page 1007)
5037 - Waf does not handle VERSION file (page 1421)
5036 - Fix incorrect macro definition for pl011 driver (page 1226)
5035 - Add GDB debug script section to executable (page 1226)
5032 - Add a doxygen group for the amd64 BSP (page 1229)
5030 - Deprecate Multiple m68k BSPs in rtems6 (page 1467)
5029 - Add gpio driver for aarch64/raspberrypi BSP (page 1230)
5028 - Refactor the amd64 BSP spec files (page 1231)
5026 - Refactor the pl011 driver to be extensible (page 1232)
5020 - Deprecate lm32 port in rtems6 (page 1468)
5019 - Deprecate bfin port in rtems6 (page 1469)
5018 - x86_64/amd64 start.S - Check ISR Stack Assumptions (page 1234)
5017 - Creation of an helper method for rtems_aio_handle() (page 1532)

continues on next page

Table 3 – continued from previous page

5016 - Wrong output in psxaio01.scn (page 1235)
5015 - Error in aio_read.c header comment (page 1235)
5014 - Add a Bit Banged SPI (page 1236)
5013 - Generate release notes. (page 1505)
5012 - termios: scanf() is not blocking in UART interrupt mode (page 1237)
5011 - arm: Make _CPU_Fatal_halt() BSP-specific (page 1240)
5010 - aarch64: Make _CPU_Fatal_halt() BSP-specific (page 1241)
5007 - typo in CODEOWNERS (page 1542)
5006 - typo in CODEOWNERS (page 1560)
5005 - Migrate commits from master to main after gitlab transition (page 1561)
5003 - Make GCC ARM Cortex-A53 errata workarounds available (page 1549)
5001 - LittleVGL URL Broken (page 1241)
4999 - missing bsp's in rtems 6.1 rc2 (page 2050)
4997 - GMP not building when not installed (page 1520)
4995 - powerpc/qoriq_e6500_64 rtems-syms unknown machine type (cloned) (page 2052)
4994 - Documentation Sphinx theme broken for HTML (page 2055)
4993 - Increase FD_SETSIZE to 256 (page 1554)
4991 - RSB source and patch checksum updates (page 1557)
4986 - Improve CONFIGURE_TICKS_PER_TIMESLICE configuration and documentation (page 1009)
4982 - Add support for TMS570LC4357 for the arm/tms570 BSP (page 1452)
4980 - Build documentation using sphinx 7.2 (page 2060)
4977 - tmux bug swaps lines and columns (page 2062)
4975 - Terminal row/col probe timeout too fast (page 2063)
4974 - rtems-tools buid failed with '–host=x86_64-w64-mingw32' (page 2053)
4973 - Add RSB options to control a specific python (page 2063)
4971 - Report that nested validation test cases did run (page 1565)
4970 - Fix C++ 17 deprecated functionality in rtems-tools (page 2064)
4969 - Update libibery sources in rtems-tools (page 2054)
4968 - Python 3.12 fix escape sequences and remove SafeConfigParser (page 1553)
4967 - strtof leaks memory (page 2056)
4965 - "trace" tool source requires C++17, build fails without it. (page 1242)
4962 - MicroBlaze BSPs modify carry flag before MSR is saved (page 1530)
4961 - Document and test CONFIGURE_JFFS2_DELAYED_WRITE_TASK_PRIORITY (page 1550)
4960 - User manual test documentation update (page 1529)
4959 - rtems-test tftp does not a session timeout (page 2061)
4957 - spstdc17 warnings building i386/pc686 (page 1010)
4955 - sparc: Potential stack corruption in uniprocessor configurations during start multitasking (page 1562)
4954 - sparc: Simplify the clock driver and CPU counter support (page 1566)
4953 - Use of symbol addresses for arbitrary values may not work for some code models (page 1570)
4952 - rtems-ld created wrong RAP file on arm (page 1548)
4951 - rtems-tools fail on FreeBSD to get number of cores (page 2069)
4950 - libdl test dl07 fails on PowerPC (page 2072)
4947 - Testsuite libtest tests not built with optimise or debug flags (page 2067)
4945 - rtems-test SIS support is broken (page 2077)

continues on next page

Table 3 – continued from previous page

4944 - libdl test dl09 fails on arm and aarch64 (page 2073)
4943 - ARM unwind register is not being hooked (page 2081)
4942 - Regulator warnings (page 2079)
4941 - Test suite files produced by rtems-syms are not reproducible (page 1012)
4938 - RSB: 6/rtems-arm fails on soon to be released FreeBSD 14.x (page 1245)
4935 - 7/rtems-mips get source fails (page 2066)
4934 - Update STM32 H7 HAL/LL drivers code (page 2082)
4931 - User manual RSB BSP build examples need updating (page 1470)
4930 - rtems_waf: type and logic issue when enforcing libbsd checking. (page 1246)
4929 - RTEMS tools installs into $PREFIX/share/rtems and not $PREFIX/share/rtems6 (page 1400)
4925 - Deal with GR740 errata: Level-2 Cache Issues H1 2023 (GRLIB-TN-0021) (page 1409)
4924 - Add Regulator Helper to RTEMS (page 2078)
4923 - FPU context init/switch not working well on more than 2 tasks on Cortex-Mx/ARMv7-M platform (page 1532)
4921 - Tool versions for RTEMS 6.1 release (page 1448)
4917 - rtems_waf errors on checking installed BSPs (page 1248)
4915 - Building sphinx 7.0.1 fails (page 1574)
4913 - libbsd/ipsec-tools: Problems with more than 64 open files (page 1032)
4912 - Collect Compression Library Source in Single Place (page 2098)
4910 - RSB options for python selection (page 1552)
4909 - Multiple Protected Heap Functions are Ununused (page 1576)
4908 - Unable to build with LLVM 16 (page 1249)
4907 - libbsd: Header installed multiple times (page 1252)
4906 - libbsd not working on nucleo-h743ZI (page 2097)
4905 - SuperCore _TOD_Adjust No Longer Referenced and Should be Removed (page 2101)
4902 - Update zlib to version 1.2.13 (page 2102)
4901 - rtems_task_construct Documentation Missing Some Details (page 2099)
4900 - PowerPC score warnings in score headers (page 1577)
4899 - BSP powerpc/qoriq_e6500_64 and powerpc/qoriq_e6500_32 fail to build (page 2092)
4896 - Makefile.inc exported BSP include path not a system include path (page 2103)
4894 - RSB: does not build tools for x86_64 due to gdb failure. (page 1253)
4892 - MacOS tools build failures on Ventura and M series processors (page 2104)
4889 - Remove file scanning from rtems-lwip (page 2116)
4887 - RTEMS Net Legacy does not build as a package in the RSB (page 2088)
4884 - I2C default ioctl handler does not handle set clock (page 2117)
4882 - mvme2703 legacy network build failure (page 2090)
4881 - powerpc gas and ld warnings (page 2117)
4879 - Use Cortex-Mx fault registers to show more information about the fault while printing exception info. (page 1256)
4878 - sptests/spsysinit01 sem_open call only has 3 parameters with O_CREAT flag (cloned) (page 2119)
4876 - RISC-V BSP Variant for the Kendryte K210 SoC (page 1257)
4875 - LEON3FT - Power-down workaround (page 1410)
4874 - Undefined behaviour (page 1580)

continues on next page

Table 3 – continued from previous page

4873 - Registers definitions wrongly defined when there are reserved bits (page 1260)
4872 - GDB 13.1 does not build on FreeBSD 13.1 (page 2120)
4870 - Add features for QSPI Flash on Xilinx Versal (page 1522)
4869 - Add QSPI Flash Device API (page 2084)
4867 - Clean up rtems-lwip uLan directory (page 2083)
4863 - Operations evaluation order. (page 1582)
4862 - score/ & bsps/: Unused input parameters (page 1584)
4861 - "Single HTML" links on docs.rtems.org lead to empty pages (page 1519)
4860 - Waf Failure on CentOS 8 Stream (page 1589)
4859 - Update gdb to 12.1 (page 2124)
4858 - GDB fails to build on any host with readline 8.2 or newer (page 2125)
4857 - RSB Recipe Missing %hash Does Not Fail (page 2087)
4855 - Input validity unchecked (page 1593)
4854 - Deprecated Functions (page 1262)
4851 - Variable not initialized in any file / missing #ifdefs (page 1263)
4850 - LEON3 - Variable not initialized in any file / missing #ifdefs (page 1596)
4847 - Goto statements (page 1597)
4845 - Global variable declared/defined in the wrong file (page 1599)
4844 - Score Unchecked boundaries (page 1544)
4843 - Output value not assigned (page 1600)
4842 - SPARC/grlib - Registers definitions wrongly defined when there are reserved bits (page 1602)
4841 - Setup Wiki.js for new wiki. (page 1264)
4838 - Fix for UART interrupt on aarch64 Versal (page 2130)
4835 - medit malloc problem of RTEMS (cloned) (page 1376)
4834 - close_editor problem of RTEMS4.13/5.1 (cloned) (page 1366)
4832 - CLANG flagged error (page 1609)
4828 - Macro defined but magic number used instead (page 1611)
4822 - Function returning unchanged function input (page 1613)
4821 - Ubuntu Host Instructions Wrong (page 2131)
4820 - Hazardous cast (page 1615)
4818 - Incomplete Statement in "cpu->heir" (page 1616)
4803 - Revert or Mark CAN API as experimental (page 2082)
4783 - Fix issues when compiling dtc with Cygwin (page 1540)
4782 - Correct Issues in Rate Monotonic Manager Background Section (page 2133)
4779 - RISC-V: Remove RISCV_ENABLE_HTIF_SUPPORT option (page 1265)
4778 - Deployed RSB does not find release version config (page 2089)
4775 - RISC-V: Default RV64 BSPs to medany (page 2121)
4772 - Remove use of interval from rtems_task_wake_after() documentation (page 1017)
4771 - Versal UART issues (page 2100)
4769 - config: Add CONFIGURE_RECORD_INTERRUPTS_ENABLED (page 1020)
4768 - Use tarballs for stable versions development tools (page 1451)
4767 - Add rtems-lwip to release packages (page 1399)
4766 - Classic API User Guide Index has Functions without Parentheses (page 2137)
4763 - Detect terminal size (page 1373)
4762 - Add Versal SDHCI Arasan driver to libbsd (page 2185)
4760 - RSB fatal error on missing hash checksums (page 1033)

continues on next page

Table 3 – continued from previous page

4759 - TLS support is broken for ARMv6 (page 1367)
4756 - Docs build system does not build singlehtml (cloned) (page 2136)
4753 - Encountered "fatal source: 9 (RTEMS_FATAL_SOURCE_EXCEPTION)" when booting up with RTEMS 6 on stm32h7 board (page 1267)
4751 - chmod problem in shell of RTEMS 6 (page 1370)
4750 - Linker discards RTEMS_SYSINIT_ITEM object (page 2189)
4746 - Armv7-M SysTick clock driver uses off by one reload value (page 2200)
4744 - libdebugger arm backend does not single step (page 2195)
4741 - Fix GCC PR 107248 (page 1618)
4740 - Teach libdebugger to wait for GDB to connect and ask to continue (page 1269)
4738 - psxrwlock01 uses uninitialized lock that may or may not autoinitialize (page 1273)
4732 - Set top in RSB version.py (page 1040)
4730 - rtems-source-builder doesn't generate tar archives for all packages any more (page 1041)
4729 - Add 64bit address support to RTEMS FDT (page 2184)
4728 - RISC-V console device tree parsing fails with a list of properties (page 1274)
4726 - RSB decode exception stops build (page 1035)
4724 - Git commit message format instructions (page 2134)
4723 - Issue with NFSv4 (page 1275)
4722 - Odd IDLE thread ID printing from various BSPs in minimum.exe (page 1280)
4719 - risc-v fe310 console driver uart read error (page 1282)
4718 - Coverity issues in cpukit/libfs/src/ftpfs/tftpDriver.c (page 1558)
4714 - Use waf for LwIP walk sources (page 2138)
4713 - Make pthread_atfork follow FACE Technical Standard Behavior for Single Process Environments (page 2222)
4712 - powerpc: Add AltiVec VRSAVE support (page 2214)
4710 - RSB does not expand dir type macros correctly (page 1042)
4706 - Installed header break C++ (page 1619)
4705 - Installed header clean up (page 2159)
4703 - NetSNMP 5.7.2.1 Patch (page 2226)
4702 - Fix warnings for indexing past array bounds (primarily validation tests) (page 1022)
4701 - Relocatable write data is placed in read-only region on some BSPs (page 2227)
4700 - Fix instances of "is" operator used with literals (page 2226)
4697 - Documentation for libbsd Configure options (page 1621)
4695 - Automatic version numbers in the documentation (page 1434)
4694 - sptests/sp37 fails to compile if RTEMS_SMP is not defined (page 2229)
4693 - Remove ILP32 aarch64/xilinx_versal_* BSPs (page 2224)
4691 - Add support for FACE Technical Standard Restriction on POSIX Absolute Timers (page 1622)
4690 - CLOCK_REALTIME thread queue not updated as part of clock_settime call (page 1626)
4689 - mips/jmr3904 Massive Number of Test Failures (page 2196)
4688 - Support /etc/sysctl.conf in libbsd (page 1283)
4686 - Refactor shared code in Arm and AArch64 (page 2228)
4684 - Support Versal DDRMC0 regions 0 and 1 (page 2235)

continues on next page

Table 3 – continued from previous page

4682 - Add AArch64 support to libdl (page 2230)
4680 - POSIX tasks cancelled through rtems_task_delete() should have an exit value of PTHREAD_CANCELED (page 1629)
4679 - Use priority inheritance for thread join (page 1630)
4677 - incorrect handling of "inactive_per_block" from "Objects_Information" structure (cloned) (page 1496)
4673 - Runtime loader exported symbols address size not consistent (page 2232)
4672 - Thread-local storage should be usable once an idle thread exists (page 1633)
4670 - Add option to build RTEMS with coverage instrumentation (page 1025)
4668 - Use thread-local storage in libstdc++ (page 1635)
4667 - include/sys/_bitset.h defines struct bitset, pollutes namespace (page 1637)
4666 - TFTP: Implement block and window size options (page 2057)
4662 - Fix GCC 12 warnings (page 1640)
4661 - GCC 12 generates wrong code (page 2236)
4658 - Fix build issue with riscv sample test (page 2139)
4657 - Apple M1 hardware is not able to compile rtems toolchain while using RSB. (page 1284)
4656 - sync() whould synchronize all file descriptors (cloned) (page 2249)
4648 - Documentation Needs to Use Version Variables not Hard-Coded Numbers (page 1439)
4646 - Control buildsets using the –with- command line option* (page 2251)
4645 - waf crashes when building PSXTESTS (page 1286)
4642 - RSB: log.py tends to remove relevant error messages (page 1288)
4641 - x86_64 elf_machdep header file missing body (page 2256)
4639 - Error in imfs memfile when device is full (page 2257)
4635 - untar on JFFS slow down (page 2258)
4634 - Fix hash for glib-2.48 (page 2132)
4632 - Error in rtems/thread.hpp with GCC 12 (page 2259)
4631 - RSB fails to build gdb with Python 3.10 (and newer) (page 2253)
4629 - shell: Potential stack corruption in rtems_shell_init() (page 1372)
4625 - Cleanup of IMD and embedded brains File Headers (page 1294)
4621 - libbsd/ipsec: ipsec-tools allocate big buffers (page 1305)
4619 - riscv/rv32iac: minimum sample test fails to build (page 2141)
4617 - Potential non-monotonic CLOCK_MONOTONIC (page 1650)
4615 - Deprecate v850 port in rtems6 and remove in rtems7 (page 2128)
4614 - Deprecate sh port in rtems6 and remove in rtems7 (page 2129)
4613 - Deprecate sparc64 port in rtems6 and remove in rtems7 (page 2128)
4610 - BSP/atsam: UART driver sends data with a small gap (page 1307)
4607 - support for SATAAHCI drives (page 2234)
4592 - BSP/Atsam: I2C driver doesn't return errors on NACK (page 1308)
4588 - RTEMS Stack Checker Report Bad Access When Not Enabled (page 2265)
4585 - Multiple Prototype Issues/Mismatches in rtems-examples from trace linker (page 2267)
4583 - rtems-bsp-builder: Do not vary on network (page 2278)
4581 - Add AArch64 to Tier 1 BSPs (page 2277)
4580 - Update BSP for STM32H7 (page 1314)
4578 - arm/atsamv: UART loses receive characters when the system has a high interrupt load (cloned) (page 1319)
4574 - Unable to setup rtems in (arm-apple) m1 Mac mini. (page 1321)

continues on next page

Table 3 – continued from previous page

4572 - Improve Clarity for New Clock Manager Directives (page 1651)
4569 - aarch64 cache support does not provide rtems_cache_disable_data() (page 2313)
4568 - untar: problems with existing directories (page 1322)
4566 - Atomic store does not use the order parameter for C++ (page 1653)
4557 - medit problem in RTEMS6 (was 4.11/5.1) (page 1380)
4550 - Add –rtems-version to rtems-test (page 1654)
4548 - Add RTEMS version option to waf configure (page 2260)
4543 - cannot build multiprocessor application on eclipse (page 2307)
4540 - Healthcare Mailing Lists (page 1325)
4533 - libdebugger should only build for archs with a backend (page 2320)
4528 - rate monotonic: reset of CPU usage time not always detected (page 1654)
4527 - Add new directives to get all time values provided by the timehands (page 2316)
4526 - pthread_cond_wait() causes an INTERNAL_ERROR_BAD_THREAD_DISPATCH_DISABLE_LEVEL (page 1326)
4525 - rtems-tld.cpp: Logically dead code error spotted by Coverity (page 2322)
4524 - Re-add lost capability for custom stack allocator to allocate IDLE thread stacks (page 1658)
4522 - Optimize red-black tree insert/extract (page 1509)
4519 - record-main-lttng.cc: Out-of-bounds access (page 2324)
4518 - RTEMS and LibBSD both provide competing pipe() interfaces (page 2330)
4517 - Build failures for MacOS (page 2142)
4513 - Document parts of the Cache Manager in the Classic API Guide (page 1661)
4510 - Fix ILP32 multilib variant in newlib for AArch64 (page 1329)
4509 - Message queue priority dicipline is broken in SMP configurations (page 1661)
4508 - rtems_message_queue_receive(): flush() does not release waiting tasks (page 1662)
4507 - mount call retruns error number and it should return -1 (page 2334)
4506 - posix_devctl() should return the errno directly not -1 and set errno (page 2335)
4504 - RTEMS6 has incorrect code generation for stm32f4 bsp (page 1334)
4503 - Add glibc malloc family extension malloc_usable_size() (page 1335)
4502 - rld-rap.cpp: Uncaught exception issue spotted by Coverity (page 2323)
4501 - TraceConverter.cc: Uncaught exception issue spotted by Coverity (page 2310)
4500 - rld-dwarf.cpp: Uninitialized scalar field (page 2337)
4499 - rtems-exeinfo.cpp: Uninitialized scalar field error spotted by Coverity (page 2339)
4493 - pppd broken if serial driver can't handle big data (page 1337)
4492 - ObjdumpProcessor.cc: Uninitialized pointer field (page 2325)
4491 - TraceWriterQEMU.cc: Buffer not null terminated issue spotted by Coverity (page 2329)
4489 - waf configure's –rtems-config and build create an error (page 2141)
4488 - TraceWriterQEMU.cc: Uninitialized scalar variable issue spotted by Coverity (page 2328)
4487 - GcovData.cc: Uninitialized scalar field error spotted by Coverity (page 2338)
4486 - TraceWriterQEMU.cc: String not null terminated issue spotted by Coverity (page 2343)
4485 - GcovData.cc: Out-of-bounds acces errors spotted by Coverity (page 2344)

continues on next page

Table 3 – continued from previous page

4484 - GcovFunctionData.cc: Not restoring ostream format error spotted by Coverity (page 2352)
4483 - GcovData.cc: Not restoring ostream format error spotted by Coverity (page 2353)
4482 - Document kernel character I/O support in Classic API Guide (page 1665)
4475 - Add NFSv4 client support to libbsd (page 2240)
4473 - AddressToLineMapper.h: Pointer to local outside scope error spotted by Coverity (page 2354)
4472 - ReportsText.cc: Not restoring ostream format error spotted by Coverity (page 2350)
4471 - ReportsHtml.cc: Not restoring ostream format error spotted by Coverity (page 2346)
4470 - CoverageMapBase.cc: Not restoring ostream format error spotted by Coverity (page 2347)
4469 - rtems-exeinfo.cpp: Not restoring ostream format errors spotted by Coverity (page 2348)
4468 - waf build system does not generate the same bspopts.h (page 2340)
4462 - CID 1437638: Logically dead code (page 2192)
4460 - CID 1437647: Explicit null dereferenced (page 2194)
4459 - Handling of unexpected traps is unreliable on SPARC (page 1340)
4458 - Simplify trap table initialization (page 1666)
4455 - bsps/i386: TSC calibration inaccurate (page 1671)
4454 - bsps/i386: TSC calibration inaccurate (page 1673)
4453 - Global vs Local Attribute Unclear for SMP/Distributed MP (page 2135)
4451 - DesiredSymbols: Implement move assignment operator (page 2336)
4450 - cpu/armv7m: MPU initialized incorrect (page 1342)
4448 - covoar reports uncovered ranges of size 1 (page 1674)
4446 - CID 1472578: Uninitialized scalar variable (page 1343)
4445 - CID 1468684: Uninitialized scalar variable (page 2364)
4444 - CID 1399727: Copy into fixed size buffer (page 2364)
4442 - CID 1399721: Copy into fixed size buffer (page 1676)
4440 - enhancement: Add missing rtems_mutex_try_lock() and rtems_recursive_mutex_try_lock() (page 1344)
4439 - Open of /dev/console should only be in SysInit List if Console Enabled (page 2377)
4438 - powerpc/shared/irq/ppc-irq-legacy.c: Use rtems_malloc() not malloc() (page 2378)
4437 - powerpc/shared/sbrk.c: Do not reference errno (page 2298)
4436 - Libbsd needs ability to configure network task priority (page 1345)
4435 - Thread cancellation may produce ready threads with an active thread timer (page 1677)
4434 - record-filter-zlib.cc: Uninitialized pointer field error spotted by Coverity (page 2326)
4433 - DesiredSymbols.h: Uninitialized pointer field error spotted by coverity (page 2327)
4432 - GcovFunctionData.cc: Uninitialized pointer field error spotted by coverity (page 1678)
4430 - DesiredSymbols.cc: Uninitialized pointer read error spotted by Coverity (page 1680)

continues on next page

Table 3 – continued from previous page

4428 - ReportsBase.cc: Dereference after null check error spotted by Coverity (page 1681)
4427 - GcovData.cc: Dereference after null check error spotted by Coverity (page 1682)
4426 - clock_nanosleep() may use wrong clock for relative times (page 1054)
4425 - GcovFunctionData.cc: Copy into fixed size buffer errors spotted by Coverity (page 1683)
4424 - rtems-bin2c.c: Copy into fixed size buffer spotted by Coverity (page 1685)
4423 - record-client.c: Unchecked return value error spotted by Coverity (page 1686)
4422 - ReportsBase.cc: Resource leak error spotted by Coverity (page 1687)
4421 - DesiredSymbols.cc: Resource leak error spotted by Coverity (page 1688)
4420 - TraceWriterQEMU.cc: Resource leak error spotted by Coverity (page 1689)
4419 - TraceReaderLogQEMU.cc: Resource leak error spotted by Coverity (page 1690)
4418 - GcovData.cc: Resource leak error spotted by Coverity (page 1691)
4417 - Explanations.cc: Resource leak error spotted by Coverity (page 1692)
4416 - rtems-exeinfo.cpp: Division or modulo by zero errors spotted by Coverity (page 1693)
4415 - ReportsBase.cc: Division or modulo by float zero error spotted by Coverity (page 1695)
4414 - Return RTEMS_CALLED_FROM_ISR in rtems_task_delete() (page 1696)
4413 - Allow pthread_cancel() from within interrupt context (page 1697)
4412 - Unexpected rtems_task_restart() behaviour if called from within interrrupt context (page 1698)
4411 - rtems_task_restart() should set the real priority to the initial priority (page 1700)
4406 - rtems: Constify rtems_task_wake_when() (page 1701)
4405 - ipsec-tools/setkey is leaking file descriptors (cloned) (page 1346)
4403 - rtems_timer_fire_when() returns wrong status code when wall_time argument is NULL (page 2378)
4402 - rtemstoolkit/mailer.py option added twice (page 2380)
4401 - rtems: Change rtems_scheduler_get_processor_set() status (page 1703)
4400 - Change filesystem utime_h to utimens_h to support nanosecond granularity (page 2365)
4399 - Add tests for futimens() and utimensat() (page 2366)
4398 - Make utimes() use utimensat() (page 2367)
4397 - Make utime() use utimensat() (page 2368)
4396 - Add futimens() and utimensat() (page 2369)
4395 - Workspace initialization is broken for arm/imx7 and arm/raspberrypi (page 2383)
4393 - rtems: Change rtems_task_get_affinity() status (page 1705)
4392 - rtems: Constify timer fire when directives (page 1706)
4391 - SPARC GCC no longer needs sysconf(515) (_SC_STACK_PROT) (page 2363)
4390 - Make zero size allocation result consistent across directives (page 1707)
4389 - Undefined behaviour if the area size calculation in calloc() and rtems_calloc() overflows (page 1709)
4388 - Copy improved mailer.py from rtems-tools (page 2375)
4387 - covoar marks taken/not taken incorrectly for AArch64 (page 1710)
4386 - covoar missing conditional branch instructions on ARM (page 1711)

continues on next page

Table 3 – continued from previous page

4384 - Add SMTP login to rtems-tools mailer (page 2384)
4383 - covoar keeps DWARF info in memory too long (page 1712)
4382 - mingw - add flex to packages needed (page 2137)
4380 - Update RTEMS POSIX Compliance Spreadsheet (page 2390)
4378 - covoar/symbol-sets add libuuid to symbol-sets.ini (page 1714)
4377 - covoar/Explanations Explanations::writeNotFound() NULL check of wrong variable (page 1714)
4376 - covoar/ReportsBase Coverage::GenerateReports() uses raw pointer to std::list (page 1716)
4375 - Add futimens() and utimensat() (page 2299)
4374 - Handle symbol sets in covoar (page 1718)
4372 - STM32H7: SDMMC driver (page 1060)
4368 - rtems–tools tool kit temp file constructor does nothing (page 2393)
4367 - gdb-9-1 fails to build for powerpc (cloned) (page 1063)
4366 - gdb-9-1 fails to build for powerpc (page 1063)
4365 - main_cp.c: Ignore return value from stat() (page 2372)
4363 - GDB does not build on Windows for MSYS2 (page 2165)
4361 - libbsd: racoon and ping6 don't honor file descriptor maximum (page 1065)
4360 - libbsd: racoon and ping6 don't honor file descriptor maximum (page 1066)
4358 - Priority discipline is broken for semaphores and message queues in SMP configurations (page 1720)
4356 - rtems_semaphore_set_priority() uses an invalid SMP lock (page 1721)
4355 - Remove leon3 test configurations which assume sis is built into gdb from rtems-test (page 2395)
4350 - Infinite loop in rtems-fdt.c (page 1067)
4346 - Require RTEMS_PRIORITY for MrsP semaphores (page 1722)
4345 - Nexus Driver for Marvell mv643xx Ethernet Adapter (powerpc/beatnik BSP, MVME6100 board) (page 2262)
4343 - sp14 test failing on ARM and AArch64 (page 1068)
4342 - disp_hcms29xx.c: Unused value error spotted by Coverity (page 2386)
4341 - fastlz.c: Unused value error spotted by Coverity (page 2387)
4340 - print-ls.c: Unused value error spotted by Coverity (page 2388)
4339 - main_cp.c: Unused value error spotted by Coverity (page 2389)
4338 - rtems_clock_set(): Cannot set future dates later than approximately 2105 (page 1423)
4337 - RSB build error with gmp-6.1.0.cfg (cloned) (page 1069)
4336 - Improve the workaround for the LEON3FT store-store errata: TN-0009 on master (page 2396)
4335 - RSB build error with gmp-6.1.0.cfg (page 1070)
4331 - main_pci.c: Dereference after null check error spotted by Coverity (page 2126)
4330 - RSB: Build error with rtems-bsp.cfg (cloned) (page 1072)
4329 - main_rtrace.c: Dereference after null check error spotted by Coverity (page 2381)
4326 - objectextendinformation.c: Dereference after null check error spotted by Coverity (page 2382)
4324 - grlib,grcanfd: extend the GRCAN driver with GRCANFD support (page 2397)
4323 - grlib,can: introduce a new common CAN baud-rate timing calculating functions (page 2399)

continues on next page

Table 3 – continued from previous page

4321 - Add spi driver for AXI SPI ip core from Xilinx (page 2394)
4320 - Add driver for cadence-spi device for xilinx based BSPs (page 2400)
4319 - RSB: Build error with rtems-bsp.cfg (page 1073)
4302 - Obsolete powerpc/haleakala board (page 2279)
4301 - grcan.c: Unused value error spotted by Coverity (page 2403)
4297 - rtems-fdt.c: Resource leak error spotted by Coverity (page 1074)
4295 - b1553brm.c: Unsigned compared against 0 error spotted by Coverity (page 2404)
4294 - satcan.c: Unsigned compared against 0 error spotted by Coverity (page 2405)
4293 - Remove unused files from beatnik/net (page 1075)
4291 - main_help.c: Unchecked return value from library error spotted by Coverity (page 2370)
4290 - gr_cpci_gr740.c: Unchecked return value from library error spotted by Coverity (page 2406)
4289 - gr_tmtc_1553.c: Unchecked return value from library error spotted by Coverity (page 2407)
4288 - gr_701.c: Unchecked return value from library error spotted by Coverity (page 2408)
4287 - gr_rasta_adcdac.c: Unchecked return value from library error spotted by Coverity (page 2409)
4286 - gr_rasta_tmtc.c: Unchecked return value from library error spotted by Coverity (page 2410)
4285 - gr_leon4_n2x.c: Unchecked return value error from library error spotted by Coverity (page 2411)
4284 - gr_rasta_io.c: Unchecked return value from library error spotted by Coverity (page 2413)
4283 - gr_rasta_spw_router.c: Unchecked return value from library error spotted by Coverity (page 2414)
4282 - pwdgrp.c: Unchecked return value from library error spotted by Coverity (page 1356)
4281 - main_chmod.c: Unchecked return value from library error spotted by Coverity (page 2402)
4280 - gen_uuid.c: Unchecked return value from library errors spotted by Coverity (page 2373)
4279 - pci_cfg_read.c: Missing break in switch error spotted by Coverity (page 2412)
4278 - cpuusagetop.c: Missing break in switch errors spotted by Coverity (page 2415)
4277 - grtc.c: Missing break in switch errors spotted by Coverity (page 2417)
4271 - Add common malloc family extension method malloc_usable_size() (page 1076)
4270 - A failing task extension produces zombi objects and resource leaks (page 1723)
4269 - Add rtems_get_build_label() (page 1725)
4267 - Add rtems_get_target_hash() (page 1727)
4265 - Add rtems_get_build_hash() (page 1730)
4264 - Activate ehci_pci in rtems-libbsd (cloned) (page 2401)
4262 - rtems-debugger-threads.c: Unchecked return value error spotted by Coverity (page 2422)
4261 - getgrent.c: Unchecked return value error spotted by Coverity (page 2423)

continues on next page

Table 3 – continued from previous page

4260 - record-client.c: Unchecked return value error spotted by Coverity (page 2424)
4259 - grspw.c: Unchecked return value error spotted by Coverity (page 2419)
4258 - printertask.c: Unchecked return value errors spotted by Coverity (page 2425)
4257 - main_edit.c: Unchecked return value error spotted by Coverity (page 1077)
4256 - fdt_rw.c: Unchecked return value error spotted by Coverity (page 1078)
4255 - aarch64 GCC alignment bug (page 1079)
4254 - shell.c: Dereference before null check error spotted by Coverity (page 2433)
4253 - grspw_pkt.c: Dereference before null check error spotted by Coverity (page 2426)
4252 - grtc.c: Dereference before null check error spotted by Coverity (page 2427)
4251 - b1553rt.c: Dereference before null check error spotted by Coverity (page 2429)
4250 - b1553brm.c: Dereference before null check error spotted by Coverity (page 2430)
4246 - Add libbsd DC NIC support to mvme2700 board (page 2166)
4245 - Add PCI regions support to RTEMS nexus bus support (page 1733)
4244 - Possible infinite recursion in Classic API Signal handling (page 1735)
4242 - rtems-debugger-threads.c: Three Dereference before null check errors spotted by Coverity (page 2442)
4241 - rtems-debugger-threads.c: Three Dereference before null check errors spotted by Coverity (page 2436)
4240 - rtems-debugger-target.c: Dereference before null check spotted by Coverity (page 2437)
4239 - PowerPC shared ISA IRQ support is broken (page 2434)
4238 - Change motorola_powerpc bsp to support irq-generic (page 2435)
4237 - consolesimpletask.c: Two Unchecked Return Values Spotted by Coverity (page 2438)
4231 - MVME 2600/2700 has no console output (page 1447)
4230 - Timeout for automatic barriers is broken (page 1739)
4229 - conf.py files need updated for sphinxcontrib-bibtex ver. 2.0.0 and greater (page 2431)
4228 - rtems_build_name() depends on the signedness of char type (page 1741)
4227 - arm-gicv2.c causes build warning when compiling rtems6 for aarch64/xilinx_zynqmp (page 1080)
4225 - Cobham Gaisler NOEL-V RISC-V 32- and 64-bit processor BSP (page 2223)
4223 - Missing "extern" in RTEMS_LINKER_ROSET_ITEM_ORDERED_DECLARE() (page 1742)
4222 - Add a per mount flag to not create a node on O_CREAT in open (page 2445)
4221 - dtc recipe issue – dependency on yaml.h (page 2317)
4220 - imx BSP: System counter is not initialized on i.MX6UL/ULL with certain bootloaders (page 1082)
4219 - gdb master does not compile on CentOS 7 (page 2447)
4218 - aarch64 as internal error with spconfig01 (page 2321)
4217 - Change status code for nested obtain of MrsP semaphores (page 1743)
4216 - prinf/vsnprintf crash when used in interrupt context (page 1083)
4215 - nios2: Add multilib with all custom floating-point instructions supported by GCC (page 2238)
4214 - nios2: Add thread-local storage support (page 2239)
4212 - libio leaks location clones (page 2166)

continues on next page

Table 3 – continued from previous page

4211 - _Timespec_To_ticks overflow (page 1084)
4209 - STM32H743ZI Nucleo Consle support not working without workaround (page 2160)
4207 - PZERO define in RTEMS is wrong (page 2447)
4206 - aarch64/xilinx_zynqmp_lp64 does not run with RTEMS_DEBUG enabled (page 2420)
4204 - Make Termination Handler which Prints Exit Information Less Scary (page 2306)
4202 - Add BSP for ARM Fixed Virtual Platform with a Cortex-R52 (page 2202)
4201 - waf building out of source tree does not find all configured bsps (page 2146)
4200 - Build system doco link in the User Guide is broken (page 2148)
4198 - arm: Add multilib for Cortex-R52 processor (page 2275)
4197 - testsuite: ts-validation-0 broken on AArch64 due to SIZE_MAX issues in the test design (page 2421)
4196 - Improve gcov support provided by GCC for RTEMS (page 1744)
4195 - Add gr740 support available in SIS 2.25 to the RTEMS Tester (page 1750)
4194 - RSB failed with mail subject: Build Linux: PASSED 6/rtems-arm on x86_64-linux-gnu (page 2305)
4193 - devctl.h does not compile from C++ (cloned) (page 2450)
4192 - bsp/xilinx_zynq: Enable support for small MMU pages (page 2298)
4191 - MSYS2 build error (page 1086)
4186 - Update QuickStart 2.4 for git install (page 1088)
4184 - arm/bsps: Small MMU pages are rounded to 1 MiB (page 2449)
4181 - Add CONFIGURE_INIT_TASK_STORAGE_SIZE (page 1751)
4180 - Add BSP for i.MXRT1050 (page 2285)
4178 - Resolve use of SUBALIGN in AArch64 under ILP32 multilib variant (page 1089)
4177 - Update arm64/aarch64 support (page 1090)
4176 - Address libbsd build issues with AArch64 (page 1091)
4175 - Resolve warning during AArch64 build (page 2451)
4173 - atsam BSP: SD/MMC driver doesn't work any more (page 1092)
4172 - atsam BSP: SD/MMC driver doesn't work any more (page 1093)
4167 - Coverity Scan Does Not Run on rtems6 (page 2263)
4166 - rtems-bsp-builder: Add way to select rtems version (6 vs 7) (page 2148)
4164 - Fix NVMe disk synchronization and media block handling (page 2453)
4163 - Error in documentation regarding C/C++ large comment styles (page 1094)
4158 - rtems_interrupt_server_delete() does not destroy the ISR lock of the server control (page 2453)
4157 - pthread_spin_unlock() may corrupt the thread stack if RTEMS_PROFILING and RTEMS_SMP is enabled (page 1755)
4155 - Add a workaround for the LEON3FT RETT Restart errata: TN-0018 (page 1756)
4148 - RFS bit map search buffer overflow (page 2454)
4145 - rtems-source-builder: Update RTEMS Kernel Recipe to Use waf for RTEMS (page 2319)
4143 - fileio - Stack too small for login with password (page 1358)
4142 - Sparse disk destroys data when it grows (page 2457)
4140 - waf install of RTEMS breaks Makefile system in rtems-examples (page 2464)

continues on next page

Table 3 – continued from previous page

4134 - rtemsspec: Support user-defined ordering of directives in header files (Doxygen) (page 2458)
4131 - "fdisk DISK_NAME mount" in bdpart-mount.c uses non-existing file system type "msdos" (page 1383)
4129 - x86_64 not listed as architecture in components in Trac (page 2283)
4128 - all griscv variants fail to build on master (page 2462)
4127 - x86_64/amd64 fails to build (page 2459)
4126 - Remove legacy networking stack from rtems.git and place in a new repo (page 2309)
4124 - rtems-bsp-builder needs to be switched to waf builds (page 2376)
4123 - rtems-bsps needs to be switched to look at waf info for BSPs (page 2452)
4122 - Change RTEMS_NO_RETURN to use C11 and C++11 standard means (page 1759)
4121 - lm3s3749 fails to build all tests on master (page 2467)
4120 - altcycv_devkit and imx7 fail to build all tests on master (page 2471)
4118 - Add clang variants for sparc BSPs (page 2473)
4117 - lpc1768_mbed_ahb_ram_eth sp01 and others fail to link (page 2468)
4116 - raspberrypi fails to build on waf and autoconf (page 2466)
4115 - Cortex-A9 MPCore based BSPs should include the workaround for Errata 794072 and 845369 (page 2455)
4113 - add rtems_cmdline option 129 to dhcpcd (page 1095)
4110 - Ubuntu package list is broken (page 2280)
4108 - Review minimum and ensure it really is a minimum configuration (page 2213)
4107 - waf -j24 fails on powerpc/psim – probable dependency issue (page 2481)
4105 - Add RTEMS_PARTITION_ALIGNMENT (page 1760)
4103 - BeagleBoard BSPs Fail to Build (page 2476)
4101 - atsamv fails to build on master (page 2474)
4100 - arm/edb7312 Build Failure When SMP is Enabled (page 2478)
4098 - All BSP bsets fail to build on master (page 2297)
4097 - shell: CRTL-U sets the cursor to the wrong position (cloned) (page 1377)
4093 - bsps/pc386: Add missing license header (page 2487)
4090 - libbsd: bfin architecture build is broken (page 1096)
4089 - lm32: internal compiler error: in dwarf2out_frame_debug_expr, at dwarf2cfi.c:1809 (page 1097)
4086 - libbsd: v850 architecture build is broken (page 1099)
4084 - throwing std::runtime on PC BSP fails (page 2479)
4081 - Remove Autoconf/Automake based build system (page 2314)
4080 - build: Add start.o dependency to the executable link step (page 1761)
4079 - build: i386/pc686/appstart.o is created more than once (page 2489)
4078 - GCC C++ compiler for powerpc defines _GNU_SOURCE as a built-in (page 2219)
4077 - Implement LibBSD module dependencies in the build system (page 2485)
4076 - i386: bad asm in smp mode (page 2492)
4074 - Add CONFIGURE_MAXIMUM_THREAD_LOCAL_STORAGE_SIZE (page 1764)
4070 - RISC-V Multiple Definition Error (many BSPs) (page 2305)
4069 - dl06 does not link on RISCV (page 1483)

continues on next page

Table 3 – continued from previous page

4067 - Libbsd build system does not separate kernel and user land include paths (page 2486)
4066 - test running for too long (page 2485)
4065 - Typo in rtems-boot.ini "ubootdior" should be "ubootdir" (page 2149)
4063 - Change to a simpler TFTP server for rtems-test (page 2495)
4062 - waf configure fails on Ubuntu 20.04 with python error. (page 1100)
4061 - The reworked <rtems/confdefs.h> has a cyclic dependency with RTEMS_MULTIPROCESSING enabled (cloned) (page 2497)
4055 - bsps/xilinx-zynq: Flush TX-Buffer before initializing the zynq-uart (page 2496)
4054 - RTEMS_BARRIER_AUTOMATIC_RELEASE and RTEMS_BINARY_SEMAPHORE options have the same value (page 1766)
4052 - [libbsd] e1000 driver not working for i386 based BSP in current rtems-libbsd master (page 1360)
4050 - Change verson details to be version.revision (page 1107)
4048 - Move RTEMS 5 BSP and package build sets and configs to RTEMS 6 (page 2170)
4046 - Remove RSB sb-bootstrap command (page 2502)
4045 - Remove RSB sb-builder command (page 2503)
4044 - Add RSB Track command (page 2504)
4043 - Update software eng manual to rtems-central (page 2504)
4042 - dosfs: Memory leak on failed mount attempts (cloned) (page 1108)
4041 - dosfs: Memory leak on failed mount attempts (page 1109)
4040 - coverhd.h remnants left to remove (page 2494)
4039 - arm/atsam/SC16IS752: Make interrupt server configurable (cloned) (page 2505)
4037 - Python script distribution standardisation (page 2152)
4036 - Track dependency command for the RSB (page 2499)
4035 - Reserved identifier "time" re-used in rtems_clock_get_tod_timeval() (page 1110)
4034 - Add rtems_interrupt_server_create() and rtems_interrupt_server_destroy() (cloned) (page 2490)
4032 - Make deferred free in malloc() support optional (page 1767)
4031 - i386: ISR can overwrite its own stack during system initialization (cloned) (page 2506)
4029 - i386: SMP-System hangs with non-consecutive APIC IDs (page 2507)
4025 - NFS Client is broken on 64-bit targets (page 2270)
4020 - Change all version numbers to RTEMS 6 on the master branches (page 2270)
4018 - libcpusupport: Architecture defines are present outside CPU port (page 2510)
4007 - Add rtems_message_queue_construct() (page 1769)
4000 - Unexpected test failures the arm/xilinx-zynq BSPs (page 1112)
3999 - Unexpected test failures on arm/beagleboneblack (page 1113)
3998 - fenv support is missing on arm (page 2171)
3997 - fenv support is missing on sparc (page 2171)
3996 - fenv support is missing on powerpc (page 2172)
3994 - Generate Doxygen markup for the application configuration options (page 1778)
3993 - Specify the RTEMS Classic API (page 1779)
3991 - Remove deprecated Thread typedef (page 1819)

continues on next page

Table 3 – continued from previous page

3990 - Remove deprecated rtems_get_processor_count() (page 1820)
3989 - Remove deprecated rtems_get_current_processor() (page 1821)
3988 - Remove deprecated rtems_extension (page 1822)
3982 - Test failures on BSPs with sbrk() support (page 2443)
3981 - Remove _Copyright_Notice from API header file (page 1823)
3980 - Remove deprecated <rtems/system.h> (page 1824)
3979 - Remove RTEMS_MAXIMUM_NAME_LENGTH (page 1825)
3978 - Move _RTEMS_version to implementation header file (page 1826)
3977 - Add unexplained-failure as option for Test Configuration Files (page 2150)
3965 - Doxygen Wiki Page Has Content Not in Software Engineering Guide (page 1114)
3962 - Licensing Requirements for Submissions Poorly Documented (page 2511)
3959 - Add rtems_task_construct() (page 1827)
3957 - Review wiki/Developer for deletion (page 1854)
3951 - Remove obsolete powerpc BSPs (page 2272)
3950 - Just trying something (page 1115)
3947 - fdt_rw.c: Unchecked return value (CID #1047324) (page 1854)
3942 - multiple definition of `pci_indirect_functions' (page 2173)
3941 - Remove epiphany architecture support (page 2508)
3937 - Move content of bsp_specs to GCC (page 1856)
3935 - Remove use of RTEMS_INLINE_ROUTINE in the RTEMS sources (page 1859)
3929 - Document use of virtualenv (page 2175)
3925 - Optimize work area initialization (page 1869)
3924 - Test the application configuration options (page 2218)
3922 - [rtems-docs] user/rsb: Typos in multiple files (page 1116)
3920 - Update POSIX compliance guide (page 1117)
3915 - File or Fix an RTEMS Ticket for a Coverity Scan Issue (page 1118)
3913 - Review wiki references in rtems-docs for removal (page 1118)
3910 - Add BSP for STM32H7 (page 1309)
3906 - Clean Up User Manual Wiki Pages (page 1122)
3905 - Clean Up BSP Wiki Pages (page 1123)
3897 - Dhcpcd does not daemonize (page 2215)
3892 - RTEMS Python Standardisation – Pure Python project. (page 1125)
3886 - Fail an RSB build with –mail option if a repo is not clean (page 2498)
3883 - Trace linker is broken on small-data area targets (page 2488)
3880 - Update sphinx_rtd_theme to 68a19ca / 0.4.3.dev0. (page 1133)
3879 - Coverity reports out of bounds access in bsps/shared/irq/irq-server.c (page 1134)
3878 - rtems06: All BSPs Fail to build with BSP Builder on rtems 6 (page 2304)
3869 - Add i.MX6UL/ULL support to imx BSP (page 1135)
3866 - Add support for GCC 10 noinit attribute (page 1861)
3853 - Add and use project-wide glossary to documentation (page 1863)
3847 - Test programs are not re-linked if a start.o or linker command file changes (page 2233)
3846 - Build system does not track the dependencies of start.o files (page 1867)
3828 - Switch over to new build system (page 2283)
3827 - make fail following quickstart guide (page 1139)
3818 - New build system (page 1870)

continues on next page

Table 3 – continued from previous page

3816 - Windows / MSYS2 build error for Sparc/SIS - missing sys/socket.h (page 1141)
3807 - Windows / MSYS2 build error for Sparc/SIS (page 1144)
3799 - confdefs.h declares an array with zero elements, that's invalid C (page 1147)
3787 - bsps/arm/shared: Add GICv3 Implementation (page 1151)
3786 - Add JSON report generation capability to rtems-tools tester (page 1151)
3782 - Beagle Bone Black BSP / libbsd: Some pinmux settings are initialized twice (page 1152)
3780 - Beagle Bone Black BSP: Missing nocache section (page 1154)
3779 - arm_switch_reg undeclared when building libdebugger/rtems-debugger-arm (page 1155)
3772 - missaligned pointer dereference in cpukit/libnetworking/libc/res_query.c:131 (page 1163)
3764 - Beagle BSP: I2C driver has problems with certain sequences (page 1170)
3761 - RTEMS Object creation failed when using RTEMS with LEON3 BSP. (page 1171)
3749 - Rtems-libbsd build faiure in SMP configuration (page 1173)
3730 - Adding PRU Support (page 1174)
3726 - Select a requirements engineering tool (page 1892)
3719 - Update libcrypt to latest FreeBSD to address Coverity Scan Issues (page 1893)
3718 - Add support for test plans (page 1895)
3717 - Add test guidelines chapter to RTEMS Software Engineering Handbook (page 1896)
3715 - Add Requirements Engineering chapter to RTEMS Software Engineering Handbook (page 1898)
3709 - rtems-libbsd build failure under Python 2 (page 1177)
3707 - Assign each code file to a Doxygen group (page 1414)
3706 - Create a hierarchy of RTEMS software components using Doxygen groups (page 1921)
3705 - Software Design Document (SDD) for space profile (page 1969)
3704 - Review and update Doxygen recommendations (page 1971)
3702 - Space profile for RTEMS SMP (page 1973)
3698 - libdl failure on many PowerPC BSPs (page 2293)
3689 - bdbuf: Replace automatic read-ahead with rtems_bdbuf_peek() (page 2391)
3659 - LEON3 kernel entry point is overwritten - secondary processors may enter into spurious handler (page 2005)
3657 - Add support for poll.h method - poll (page 2006)
3634 - Add getline() to Newlib (page 1182)
3632 - [haunted D drive]Getting "d" Empty Folder when commiting in a rtems-docs OR rtems Repository (page 1182)
3627 - powerpc/qoriq_e6500_64 rtems-syms unknown machine type (page 1183)
3623 - rtems-syms invoking m68k-rtemsundefined-gcc (page 1184)
3616 - [patch] rtems-tools - elftoolchain native elf detection broken on x86_64 machines (page 1185)
3615 - Convert Tools_Used Wiki page into Support Tools Selection with Criteria (page 2179)
3613 - Remove m32c architecture port from upstream tools (page 2281)
3611 - qemu/glib fails to build with newer gcc (page 1188)
3608 - RISC-V Simulator Not in RSB Qemu Version (page 1190)

continues on next page

Table 3 – continued from previous page

3596 - Remove deprecated rtems_rate_monotonic_period_time_t (page 2007)
3594 - Remove deprecated rtems_thread_cpu_usage_t (page 2008)
3592 - Remove deprecated region_information_block (page 2009)
3590 - Remove deprecated rtems_context_fp (page 2010)
3588 - Remove deprecated rtems_context (page 2011)
3586 - Remove deprecated proc_ptr definition (page 2012)
3584 - Remove types which are only available if RTEMS_DEPRECATED_TYPES is defined (page 2013)
3581 - Structurally dead code in fifo.c (CID 1437649) (page 1191)
3575 - Typo in RTEMS docs, "cons void" (page 1192)
3574 - DHCP request includes host name option even if hostname is zero length (page 1193)
3573 - DHCP request includes host name option even if hostname is zero length (page 1194)
3572 - DHCP request includes host name option even if hostname is zero length (page 1195)
3567 - Convert SPARC Call Info Web Page to Rst (page 1196)
3566 - Remove checks for Newlib features introduced during the RTEMS 5 development (page 2274)
3565 - Or1k tools do not build. (page 1198)
3564 - Epiphany tools do not build. (page 1200)
3563 - Epiphany does not build. (page 1201)
3509 - bootstrap -p option (page 1201)
3493 - Documentation buglets in sparc.html (page 1202)
3487 - libbsd: IPSec support (page 1204)
3473 - Getting Started Wiki Page Redundant with Users Guide (page 1205)
3457 - rtems-tools has errors with waf-2.0.7 and later. (page 1206)
3456 - Add support for CPU counter timestamps (page 2014)
3450 - Space character in path breaks rtems build on Linux (page 1207)
3427 - Improvements to barectf (page 1209)
3420 - Deprecate/obsolete rtems_io_lookup_name (page 2188)
3414 - Remove Makefiles from rtems-examples? (page 2175)
3331 - i386 targets don't compile with –enable-smp (page 1056)
3322 - powerPC bsp not booting with memory larger than 256Mb (page 1057)
3321 - Improve console driver documentation (page 2274)
3269 - Make the IRQ extensions API a standard API (page 2018)
3250 - Remove Use of bsp_specs (page 2038)
3199 - New test framework (page 1983)
3143 - Remove obsolete rtems_gxx_*() implementation (page 2266)
2985 - Add documentation for printk() (page 2041)
2971 - Add fenv.h to newlib (page 2042)
2872 - Get rid of CONFIGURE_MAXIMUM_PTYS (page 2282)
2871 - Use bibtex references thoughout the documentation (page 2201)
2869 - Remove support for 16-bit object identifiers (page 2269)
2828 - Remove libmisc/serdbg (page 2127)
2778 - Error building RTEMS Source Builder recipe for libxml (page 2177)
2365 - Task pre-emption disable is broken due to pseudo ISR tasks (page 2044)
2349 - Timecounter: Add PPS support (page 1360)
2348 - Timecounter: Add NTP support (page 1044)

continues on next page

Table 3 – continued from previous page

2330 - nios2 missing atomics, fails to link C++ (page 2355)
2301 - cpukit is built in BSP, and BSP custom, specific part of build tree but isnt built using BSP's spec file (page 2357)
2300 - MIPS Tools fail to build. (page 1030)
2269 - x86 Context Switch Synchronization and SMP (page 2512)
2215 - Duplicate code for TAR support (page 2513)
2189 - Insufficient documentation for rtems_clock_get_tod() (page 2048)
2114 - statvfs for MS-DOS filesystem and 'df' coomand for shell (page 2514)
2111 - AVR needs avr-libc to compile RTEMS. (page 2515)
2071 - The object-file suffixes for default-bsp-post-link in leaf.cfg don't work with make-exe... (page 2518)
2000 - Re-add removed LINK_OBJS to MP tests (page 2360)
1820 - sptests/sp36: Improper buildsystem integration (page 2521)
1815 - _ISR_Nest_level should be protected with interrupts disabled in function _Watchdog_Insert (page 2523)
1728 - Patch for RTEMS-BSP m68k/mcf5225x (page 2525)
1712 - Add LWIP Support to RTEMS (page 2300)
1593 - RTEMS Sequenced Initialization API (page 2528)
1459 - Add rtems_shell_main_monitor to cpukit/libmisc/shell/shell.h? (page 1374)
1318 - libcpu/shared is not helpful (page 2533)
550 - fcntl() fails to put a non-blocking socket into blocking mode (page 1524)

Merge Requests Summary

362 - waf: Handle no version label in VERSION when a release (page 2564)
359 - spec/pkgconfig: Account for separate compilation and linking (page 2565)
350 - waf: Update to waf-2.1.4 (page 2567)
342 - build: Improve Makefile.inc (page 2568)
332 - 6.1: rtems: Remove pre-qualified constraints (page 2569)
331 - posix/lio_listio: corrected addition of system event (page 2572)
330 - 6.1: Fix POSIX sporadic server (page 2570)
328 - cpukit/jffs2/rtime: Fix off-by-one error in decompression check (page 2573)
327 - cpukit/jffs2/rtime: Fix off-by-one error in decompression check (page 2574)
325 - bsps/xilinx-zynq: Fixed QSPI Flash sector erase (page 2589)
324 - build: Fix native Windows build (page 2590)
322 - Workaround for the in GR740 errata: Level-2 Cache Issues H1 2023 (GRLIB-TN-0021) (page 2597)
321 - LEON3: Update power-down function (page 2598)
320 - SMP: Fix race condition in thread priority changes (page 2566)
319 - bsps/shared/flash: Add a JFFS2 flashdev driver (page 2587)
317 - confdefs: do not CONFIGURE_FILESYSTEM_NFS in ALL (page 2585)
316 - RTEMS FDT Add shell read and write handler support (page 2599)
315 - bsps/aarch64/zynqmp: Factor out the CFC-400X management console (page 2584)
312 - Add RISCV libdl support (page 2574)
311 - libtests/ttest01: Fix CPU counter precision issues (page 2562)
310 - validation: Clarify SMP EDF test case (page 2615)
308 - spfatal34/spfatal36: Avoid RTEMS_UNREACHABLE() (page 2617)
307 - powerpc/qoriq: Enable RTEMS_SMP for BSP family (page 2618)

continues on next page

Table 4 – continued from previous page

306 - doxgen: Document build system provided files (page 2614)
305 - spec/bsps/xilinx-microzed: Fix the default setting for the Avnet Microzed PCLK (page 2635)
304 - shell01: Fix test failure (page 2631)
303 - fstests: Fix name of JFFS2 NAND tests (page 2632)
302 - dev/serial/sc16is752-spi: Fix warnings (page 2633)
301 - dev/slcr: Fix warning (page 2634)
300 - Only restore terminal settings on exit when captured (page 2609)
299 - rtems: Remove <rtems/rtemsdialer.h> (page 2616)
298 - bsps: Fix Doxygen groups (page 2608)
295 - bsps/xilinx-zynq: Add QSPI flash driver (page 2635)
293 - spec: Update smallmem test list (page 2641)
292 - spec: Update no-rfs test list (page 2642)
290 - libmisc/rtems-fdt: Path find need a sorted index table (page 2639)
289 - build: Fix spec cache (page 2640)
288 - build: Report normal Git hash (page 2592)
287 - Arm PMSA improvements (page 2643)
286 - bsp/xilinx-zynq: Resolve MR review comments (page 2659)
285 - microblaze: fix warnings about the clock. (page 2654)
284 - Fix Zynq SMP on QEMU (page 2676)
283 - bsp/xilinx-zynq: Add devcfg and slcr drivers (page 2660)
282 - Improve event record handling (page 2619)
279 - riscv: fix FDT loads during work area init (page 2656)
278 - waf: Update waf to version 2.1.3 (page 2677)
276 - riscv/beaglevfire: disable BSP_START_COPY_FDT_FROM_U_BOOT by default (page 2658)
274 - spec/aarch64: Rename Versal BPSs to be in line with ZynqMP (page 2688)
272 - cpukit/libmisc/shell: Remove shell prompt carriage return (page 2694)
271 - bsps: Remove imported Xilinx headers (page 2679)
270 - riscv/niosv: Adding a new NIOS V BSP to RISC-V (page 2689)
268 - Set Python scripts to use Python 3 (page 2696)
266 - spec/bsps/aarch64/zynqmp: Complete the transition to consistent naming (page 2710)
264 - spec/bsps/aarch64/zynqmp: Remove overly specific BSP and rename generic BSP (page 2711)
263 - bsps/aarch64/mmu: Update mapping function to new API (page 2716)
262 - spec/bsps/aarch64: Update BSP naming to be more consice (page 2714)
261 - rtems: Simplify optionsimpl.h (page 2717)
260 - spec/bsps: Clean up stale references to minimum.exe in test configurations (page 2715)
259 - spec/bsps/arm: Remove the mercury-specific BSP (page 2718)
258 - Revert "libmisc/stackchk: Change stack checker reporter function signatures" (page 2712)
257 - waf: Fix handling of the VERSION file in a release (page 2663)
256 - GRLIB: Fix Coverity issues (page 2691)
255 - Improve aarch64 BSPs (page 2721)
250 - waf: Update waf to version 2.1.2 (page 2728)
249 - git: Remove auto files from git ignore* (page 2729)
247 - cpukit/aarch64: Fix spelling (page 2729)

continues on next page

Table 4 – continued from previous page

246 - spec/libtests: Exclude Thumb-only BSPs from building dl13 (page 2730)
245 - bsps/aarch64/mmu: Align dynamically mapped blocks (page 2726)
244 - cpukit/libdl/arm: Support BLX relocations that require a trampoline (page 2718)
241 - testsuites/sptree01: Fix missing prototype warning (page 2756)
240 - spec/build: make minimum sample norun (page 2557)
235 - Improve and simplify SMP start (page 2750)
234 - aarch64/raspberrypi: improve UART (page 2681)
233 - aarch64: Add _AArch64_Get_current_processor_for_system_start() (page 2766)
231 - spec/aarch64: Add missing symbols to ILP32 linker script (page 2561)
230 - Improve arm/xilinx-zynqmp-rpu BSP familiy (page 2732)
229 - bsp/aarch64:Fix _CPU_SMP_Get_current_processor() (page 2558)
228 - spec: Refactor arm-pl011 build options (page 2547)
226 - bsps/arm: Fix BSP_START_VECTOR_RESERVED_SLOT (page 2552)
225 - tests: Enable ISR in fatal extensions (page 2549)
224 - dev/serial: Fix uninitialized variable warnings (page 2551)
223 - cpukit/libdl/arm: Add support for Thumb to ARM transitions and accompanying test (page 2761)
220 - bsps/arm/atsam: Remove README.md (page 2542)
218 - posix/aio: updated documentation after changes to lio_listio() (page 2555)
217 - libtests/shell01:add test empty and NULL usernames check (page 2548)
216 - libmisc/stackchk: fix Doxygen file comment (page 2556)
214 - kvprintf(): Fix '+' conversion handling (page 2560)
213 - ntptime: Use time_t for tv_sec related variables (page 2554)
212 - poll.h and sys/poll.h were in both RTEMS and Newlib (page 2811)
211 - Add aarch64 cpukit paravirtualization support (page 2753)
210 - cpukit/libmisc/shell:fix command df overflow (page 2549)
209 - score/cpu/arm/cpu.c: Fine tune paravirtualization for interrupt set/get level (page 2815)
208 - spmsgq_err[12]: Add message sizes to configuration (page 2816)
207 - bsps/i386/include/bsp/irq.h is pc386 specific (page 2812)
206 - bsps/stm32h7/spi: Add full duplex and interrupt support (page 2603)
204 - stm32h7: Resolve warnings and add SPI support (page 2817)
203 - cpukit/posix/src/aio_misc.c: Fix for illegal memory access. (page 2553)
202 - shell:Ignore empty user names as input (page 2543)
201 - Revert "bsps/stm32h7: Workaround STM32 H7 errata by enforcing aligned access only" (page 2535)
199 - dev/serial/zynq: Improve baud calculation and simplify code (page 2805)
198 - arm: Improve default exception handling (page 2851)
197 - cpukit/stackchk: Remove additional offset of SANITY_PATTERN_SIZE_WORDS (page 2848)
196 - spec/zynqmp: Install ECC header definitions (page 2861)
195 - Add support for more than 2G of DDR memory to ZynqMP BSPs (page 2769)
194 - Add BSP for BeagleV-Fire board (page 2647)
193 - jffs2: Add checks for long file name (page 2536)
192 - x86_64: Add TLS support (page 2537)
191 - Unify the parameters in the function declaration (page 2540)
189 - bsps/stm32h7: Honor the intent of the MPU alignment option (page 2865)

continues on next page

Table 4 – continued from previous page

188 - cpukit/posix/aio: Implemented lio_listio()* (page 2820)
187 - confdefs: Fix extensions.h (page 2813)
186 - cpukit/libblock: Close all valid FDs (page 2917)
185 - bsps/shared: Add Abracom EOZ9 RTC driver (page 2541)
183 - Flashdisk.c: Invalid printf format string (page 2540)
182 - bsps/stm32h7: Fix typo causing crash on USB 2 initialization (page 3060)
181 - libblock/src/bdpart-register.c: Do not pass bad value to close() (page 2924)
180 - bsps/stm32h7: Workaround STM32 H7 errata by enforcing aligned access only (page 2846)
179 - cpukit/score/src/kern_ntptime.c: Use time_t not a 32-bit type (page 2922)
178 - open: Fix race condition when called with O_TRUNC (page 2918)
177 - msdos: Fix file truncated to 0 (page 2884)
176 - bsp/gen5200: Add section for GDB pretty-printing (page 3079)
175 - timespec.h, etc.: Eliminate use of 32-bit for time_t (page 2600)
174 - Adding a new NIOS V BSP to the RISC-V architecture (page 2701)
172 - aio_fsync.c: Use calloc() to ensure memory is initialized (page 2854)
171 - objectinitializeinformation.c: Add Assert for API index too high (page 2936)
170 - bsps/shared/arm-gicv3: Calculate cpu_count correctly (page 3053)
169 - x86_64/amd64: Add SMP support (page 2856)
168 - amd64: Restructure the APIC code (page 2920)
167 - bsps: Convert README and other file to MarkDown (page 3078)
166 - bsps/m68k/uC5282/README.md: Delete timing results (page 3084)
165 - aio_fsync.c: Address Coverity dead code issue (page 3081)
164 - fix waf install (page 3067)
163 - libdebugger: Add support for PowerPC (page 2932)
162 - testsuites: Update list of excluded testcases for targets without JFFS2 and RFS (page 3056)
161 - libtests/stackchk04: Add a new testsuite for the detailed reporter (page 3073)
160 - disp_hmsc29xx.c: Address Coverity flagged negative shift (page 3055)
158 - fix system fatal error caused by imperfect user input commands, e.g. "rtl sym -u" (page 3073)
157 - bsps: Fold various files into README.md (page 3086)
156 - Revert "objectgetinfo.c: Add test case for API field too high" (page 3122)
155 - bsps: Fold external documentation into README.md (page 3109)
154 - bsps/stm32h7: update STM32 H7 HAL (page 3069)

3.9.1 Issues

3.9.1.1 5084 - objectinitializeinformation.c: Coverity spotted possible over indexing

Id	5084
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Joel Sherrill
Closed by	Joel Sherrill
Created	2024-08-02T16:13:29.457Z
Closed	2024-08-11T01:40:00.135Z
Updated	2026-03-13T01:11:25.623Z
Milestone	6.1
Labels	qualification, rtems::score, scan::coverity
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5084
Merges	3

Summary

Coverity flagged a spot where the _Objects_Information_table may be used with an index that is too large. However, this method is only used during initialization and the API and class fields passed should be able to be trusted. In light of this, the decision was made to add an _Assert which will let Coverity Scan know it is accounted for.

Coverity CID 1512508

```
71  /*
72   *  Register this Object Class in the Object Information Table.
73   */

CID 1512508: (#1 of 1): Out-of-bounds read (OVERRUN)
1. overrun-local: Overrunning array _Objects_Information_table of 4 4-byte␣
↪elements at element index 7 (byte offset 31) using index _Objects_Get_
↪API(maximum_id) (which evaluates to 7).
74  _Objects_Information_table[ _Objects_Get_API( maximum_id ) ]
75    [ _Objects_Get_class( maximum_id ) ] = information;
```

For https://gitlab.rtems.org/rtems/rtos/rtems.

Summary

The latest verison of waf fixes several issues on Windows. We also have a huge inconsistency in the version we're running which we should probably fix:

```
./rtems-deployment/waf       waf 2.0.24 (1af97c71f5a6756abf36d0f78ed8fd551596d7cb)
./rtems-docs/waf             waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
./rtems-examples/waf         waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-libbsd/waf           waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-littlevgl/waf        waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-lwip/waf             waf 2.0.18 (314689b8994259a84f0de0aaef74d7ce91f541ad)
./rtems-net-legacy/waf       waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems-net-services/waf     waf 2.0.25 (2db0b41b2805cd5db3b55476c06b23c1e46d319f)
./rtems-tools/waf            waf 2.1.2 (8504c212ce81919a5858a5118570613422338852)
./rtems/waf                  waf 2.1.3 (ee9a11d51e94d31c548fd5b6a8103c68327b3354)
```

changed the description

Author: Gedare Bloom 2024-11-17T00:11:44.128Z

Should we automate an approach to keep all our repos in sync with waf version?

Author: Amar Takhar 2024-11-17T00:19:39.724Z

Yeah I already have that written down but it's not that easy. We need to think about the workflow of how this should happen. There needs to be a process to test the new version against all the repositories to make sure it works and then update so we need to be more deliberate about it.

I have some ideas about it but the procedural part needs to be discussed: what's important enough to upgrade for and do we want to support one repo getting ahead of others to avoid increasing the size of our repositories or whether we care or not. Clearly the above is not great having `2.0` vs `2.1` Having said that `2.1.4` has fixes we really want for Windows.

Author: Amar Takhar 2024-11-17T04:22:19.639Z

After this update is done I'll create another issue for the next update. As we require an update we should collect reasons, issues and MRs until we trigger the next update. Of course a critical issue should be an immediate update but smaller things for instance if it's specific to one repo we can let that one repo get out of sync until we have more of are reason to update project-wide. otherwise we may end up update too often.

3.9.1.3 5164 - While at low sporadic server priority, changing the real priority leads to unpredictable system behaviour

Id	5164
State	closed
Type	ISSUE
Author	Sebastian Huber
Assignee(s)	Sebastian Huber
Closed by	Chris Johns
Created	2024-11-26T02:06:04.732Z

Milestone	6.1
Labels	api::posix, qualification
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5164
Merges	0

Summary

The POSIX sporadic server removes the real priority while a thread is in low priority mode. All operations which change the real priority and assume that the real priority node is active corrupt the system state (`rtems_task_set_priority()`, `rtems_task_set_scheduler()`, `rtems_task_restart()`, `pthread_setschedprio()`).

Merges	1

Summary

GCC is now generating a warning for empty structures. We are using them and we should address as I do not think it is part of the C standard.

An example warning:

```
In file included from ../../../cpukit/include/rtems/rtems/intr.h:73,
from ../../../cpukit/include/rtems.h:69,
from ../../../testsuites/sptests/spstdc17/init.c:32:
../../../cpukit/include/rtems/score/isrlock.h:72:9: warning: struct has no␣
↪members [-Wpedantic]
72 | typedef struct {
|         ^~~~~~
```

Steps to reproduce

Build using this configuration:

```
[DEFAULT]
RTEMS_DEBUG = True
RTEMS_POSIX_API = True

[aarch64/xilinx_zynqmp_lp64_zu3eg]
BUILD_TESTS = True
```

Original author: sebastian.huber

The documentation allows a value of zero for CONFIGURE_TICKS_PER_TIMESLICE. This should be changed to make zero an invalid value and it should be rejected by an #error configuration error.

Author: Trac Migrate 2024-03-21T07:07:18.000Z

Does removing the precompiler defines affect how gcc sees struts? right now i removed the defines to fix this issue

typedef struct { SMP_lock_Control Lock; } ISR_lock_Control;

for example removing the #defines gives me this compiler error? do you have any suggestions?

../../../cpukit/include/rtems/score/isrlock.h:73:3: error: unknown type name ‘SMP_lock_Control’ 73 | SMP_lock_Control Lock; | ^~~~~~~~~~~~~~~~~ smplock.h is defined above

Author: Joel Sherrill 2023-10-18T02:44:14.000Z

It has a single field which is smp specific. When built for uniprocessor, the structure ends up with no fields which is the problem. I am guessing that all code that uses this should be smp only and the structure not present.

Author: Trac Migrate 2023-10-18T05:17:50.000Z

Through typedefs this structure is part of the API. We could add a dummy member to the API visible structure for uniprocessor configurations if we really want to fix warnings like this. Internally, we need more #ifdefs to avoid using the lock control.

Original author: sebastian.huber

The test suite files produced by rtems-syms

- dl01-sym.o
- dl02-sym.o
- dl04-sym.o
- dl05-sym.o
- dl06-sym.o
- dl07-sym.o
- dl08-sym.o
- dl09-sym.o
- dl10-sym.o
- dl11-sym.o

are not reproducible. They change after each build. Maybe the mtime is added to the archive.

Author: Chris Johns 2023-08-11T00:03:24.000Z

Original author: sebastian.huber

What is the requirement you are attempting to resolve here? I am not aware of any requirement in the current project related to reproducibility?

Would any test that embeds a tar file have the same issue?

Author: Trac Migrate 2023-08-11T05:07:23.000Z

Original author: sebastian.huber

From my point of view reproducible builds are state of the art. Yes, tar files generated by the build need to be reproducible as well.

Author: Chris Johns 2023-08-11T05:29:25.000Z

Original author: sebastian.huber

Does the setting the metadata in the tar file resolve this issue?

Author: Chris Johns 2023-08-11T05:30:14.000Z

Original author: sebastian.huber

Replying to Sebastian Huber:

> From my point of view reproducible builds are state of the art.
>
> Is this a new requirement for 6 for it to be released?

Author: Trac Migrate 2023-08-11T05:44:52.000Z

Original author: sebastian.huber

After the fix for the tar archives, the only not reproducible build artifacts are:

- testsuites/libtests/dl01.exe
- testsuites/libtests/dl01/dl01-sym.o
- testsuites/libtests/dl02.exe
- testsuites/libtests/dl02/dl02-sym.o
- testsuites/libtests/dl04.exe
- testsuites/libtests/dl04/dl04-sym.o
- testsuites/libtests/dl05.exe
- testsuites/libtests/dl05/dl05-sym.o
- testsuites/libtests/dl06.exe

- testsuites/libtests/dl06/dl06-sym.o
- testsuites/libtests/dl07.exe
- testsuites/libtests/dl07/dl07-sym.o
- testsuites/libtests/dl08.exe
- testsuites/libtests/dl08/dl08-sym.o
- testsuites/libtests/dl09.exe
- testsuites/libtests/dl09/dl09-sym.o
- testsuites/libtests/dl10.exe
- testsuites/libtests/dl10/dl10-sym.o
- testsuites/libtests/dl11.exe
- testsuites/libtests/dl11/dl11-sym.o

For me this issue is not important enough to delay the release.

Author: Chris Johns 2023-08-11T05:47:01.000Z

Original author: sebastian.huber

What if the files are stripped?

Do you know why they are different?

Author: Trac Migrate 2023-08-11T05:51:05.000Z

Original author: sebastian.huber

My off hand guess is that a file mtime, ctime, or atime is added to the *-sym.o object by rtems-syms.

Author: Chris Johns 2023-08-11T05:54:01.000Z

Author: Sebastian Huber 2024-07-09T08:09:15.242Z

The issue is that `rtems-syms` directly creates the object file using a temporary source file. The name of this temporary file changes each time the object file is created. This can be fixed by creating the source file and then compile the object using the build system.

3.9.1.8 4772 - Remove use of interval from rtems_task_wake_after() documentation

Id	4772
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Kinsey Moore
Created	2022-12-06T22:35:30.000Z
Updated	2026-03-12T06:55:59.203Z
Milestone	6.1
Labels	priority::normal, qualification, resolution::fixed, ticket-type::enhancement, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4772
Merges	0

The Classic API documentation for `rtems_task_wake_after()` refers to an **interval** while the call accepts `ticks`. The exact interval is not known because the period of time to next tick is not known when the call is made.

1. Clarify the wording
2. Recommend new applications use the POSIX based calls `nanosleep()` and `clock_nanosleep()` for applications that have intervals in a time base rather than system ticks.

The Gemini, Verify the fidelity of RTEMS System Tick issue provides some back ground to this change.

Author: Joel Sherrill 2023-06-22T22:03:49.000Z

This is requested as an outcome of RTEMS System Tick Resolution (#30) from NSF NOIRLab / Gemini. This is about verifying the fidelity of RTEMS System Tick. A recent test of our systemTickTest tool inside GemUtils is discussed here.

https://gitlab.com/nsf-noirlab/gemini/rtsw/epics-base/epics-base/uploads/3ef07e7417e9e14903de65fd91c8417f/EPICS_Task_Sleep-CCJ.pdf

The intent is to be clear it is “number of ticks” and not an arbitrarily precise “interval”. Now that RTEMS can have nanosecond granularity this distinction becomes important.

Building for AArch64 <BSP> it looks like most of the warnings are for indexing past the end of an array. Most are from the validation tests, but a few aren't. Hopefully they all have the same fix.

I attached the log file of the warnings.

Original author: sebastian.huber

In [changeset:"0bb7b84698e380b86896a3163371648e88f2af21/rtems" 0bb7b84/rtems]:

```
build: Improve value substitution

The waf build system uses lists for tool flags.  The build items may use
variable substitution.  Add the ability to use the variable substitution in
lists.  For example:

MORE_FLAGS = ['-more', '-flags']

flags:
- -some-flag
- ${MORE_FLAGS}

Before this change, the ${MORE_FLAGS} was substituted to "-more -flags".  This
would be passed by waf as a single command line argument to the tool.

After this change, the ${MORE_FLAGS} list extends the flags list:

flags = ['-some-flag', '-more', '-flags']

This list extension is performed if a list element consists of exactly one
variable.

Update #4670.
```

Author: Trac Migrate 2022-07-04T06:25:08.000Z

Author: Gedare Bloom 2015-03-12T13:51:22.000Z

xgcc: error: addsf3: No such file or directory xgcc: error: subsf3: No such file or directory gmake[4]: *** [subsf3.o] Error 1 ../../../../gcc-4.9.2/libgcc/config/t-hardfp:71: recipe for target ‘subsf3.o’ failed

Author: Gedare Bloom 2015-03-12T14:49:25.000Z

- **Milestone** changed from %”4.11” to %”4.11.1”

Tools build fine on Ubuntu 14.04. I am unable to reproduce your bug.

Author: Gedare Bloom 2015-03-12T14:50:47.000Z

Check your gcc version. My host gcc uses 4.8.2

Author: Chris Johns 2015-03-12T20:46:11.000Z

- **Milestone** changed from %”4.11.1” to %”4.11”

It fails on FreeBSD so that is a 4.11 issue. FreeBSD uses clang so that could be an issue.

Author: Trac Migrate 2015-08-30T10:46:49.000Z

This is a bug in the build system of GCC 4.9+, the sed scripts in t-hardfp use non-standard regexes that require GNU sed. See GCC bug 62097, https://gcc.gnu.org/bugzilla/show_bug.cgi?id=62097

Author: Joel Sherrill 2015-09-02T14:11:59.000Z

I tracked the change down to the particular commit by Richard Sandiford and assigned it to him. I would expect him to be reasonably responsive.

Author: Chris Johns 2022-09-14T06:22:21.000Z

- **Owner** set to @chrisj
- **Version** changed from ~"4.11" to ~"6"

This is caused by the MIPS build of gcc requiring a GNU sed. It is the only architecture we support that has a need for GNU sed. It seems this will not change and I believe GCC says GNU sed is required.

Check the host sed command to see if it is GNU sed and if not build a local copy. No need to add it as a dependency package a host has to install.

Original author: Christian Mauderer

IPSec with racoon doesn't work if there are more than 64 open file descriptors in the system.

In [changeset:"dfb21446417ba93240d018bebe84a51601ba2df5/rtems-libbsd" dfb2144/rtems-libbsd]:

```
ipsec-tools: Fix copying fd_set prior to select

The racoon session code copies an fd_set from one variable into another
prior to calling select. That works well for simple structures.

In libbsd we have to allocate fd_sets instead of using fixed structures
to avoid a problem with file numbers bigger than FD_SETSIZE. The simple
assignment didn't work in that case.

This patch makes sure that a memcpy is used instead.

Update #4913
```

The time has come to raise a fatal error if a hash is missing rather than a warning. This will stop missing checksums being present when releasing.

It also makes it simpler to test releases for no missing checksums.

Author: Joel Sherrill 2023-02-09T20:56:06.000Z

Hasn't this been implemented?

```
GIT_HEAD="6fe98f91d94bbf965bc0e78015585ff8823d17bd
BUILD_ACTUAL_RSB_OPTIONS="--with_ada --with_cxx --with_objc --jobs=12"
building: v850-rtems6-gcc-0f001dd-newlib-d88cbd0-x86_64-linux-gnu-1
18:55:36  Exception in thread _stderr[]:
18:55:36  Traceback (most recent call last):
18:55:36    File "/usr/lib/python3.8/threading.py", line 932, in _
↪bootstrap_inner
18:55:36      self.run()
18:55:36    File "/usr/lib/python3.8/threading.py", line 870, in run
18:55:36      self._target(*self._args, **self._kwargs)
18:55:36    File "/home/minna/src/rtems-source-builder/source-builder/
↪sb/execute.py", line 204, in _readthread
18:55:36      data = data.decode(sys.stdout.encoding)
18:55:36  UnicodeDecodeError: 'utf-8' codec can't decode bytes in
↪position 4094-4095: unexpected end of data
```

Setting the _locale_ to any “only-one-byte-unicode” linke `LANG=en_US.iso885915` when invoking the source-builder avoids the error.

There is most likely no error in the input data but the loop decoding it has probably a bug. Unicode code points encoded in UTF-8 can be up to 4 bytes long. The input data is read by `source-builder/sb/execute.py` in blocks of 4096 bytes. I guess it cuts through a multi-byte code point with the first byte(s) at the end of the current block and the rest of the bytes in the beginning of the next block. Note that the error always points to the end of the block `position 4095` or `position 4094-4095`. Moreover, `byte 0xe2` indicates that this is not the last byte of the code point (`0xe2` is the first byte of a 3 byte code point?).

I know in Linux there exist some GNU Unicode decoding function which keeps a state between consecutive calls. This function is intended for use in cases where not the complete text can be decoded at once. I guess there is such a function for Python too. An alternative may be to read and decode the input in one large piece.

Author: Chris Johns 2022-09-29T09:26:56.000Z

Thanks for input and feedback. I agree with what you are saying.

The input can be in hundreds of mega so that is not practical to hold it until the end. This code is a performance hot spot so what happens needs to be kept as simple as possible.

Would you be able to make a buffer of data I could test solution with?

Author: Chris Johns 2022-09-29T09:34:21.000Z

It looks like using Python `codecs` with streaming is the way to handle this.

Again thank you for the insights in how the data is handled.

Author: Trac Migrate 2022-09-29T10:00:33.000Z

I case this helps, this script

1) writes 4093 spaces (note the field with is 4094)
2) a single “A” character
3) A 4 byte unicode
4) A new line

```
env LANG=en_US.UTF-8 printf '%4094c\\U0001F0A1\\n' A >file.txt
```

You can visualize it:

```
$ wc file.txt
1    1 4099 file.txt
$ hexdump -C file.txt
00000000  20 20 20 20 20 20 20 20  20 20 20 20 20 20 20 20  |                |
*
00000ff0  20 20 20 20 20 20 20 20  20 20 20 20 20 41 f0 9f  |             A..|
00001000  82 a1 0a                                        |...|
00001003
```

Author: Chris Johns 2022-09-29T10:22:52.000Z

Thanks. I have a patch I am testing. It uses the `codecs.getincrementaldecoder()` factory function to create a decoder that hold state across decodes.

Author: Chris Johns 2022-09-29T10:23:27.000Z

- **Description** changed

```

Author: Chris Johns 2022-09-29T10:46:08.000Z

I am testing with this code:

```
import codecs
import sys
bad = True
if bad:
data = ''
with open('file.txt', 'rb') as f:
while True:
block = f.read(4096)
data += block.decode(sys.stdout.encoding)
if len(block) < 4096:
break
print(len(data), len(block))
else:
decoder = codecs.getincrementaldecoder(sys.stdout.encoding)()
data = ''
with open('file.txt', 'rb') as f:
while True:
block = f.read(4096)
data += decoder.decode(block)
if len(block) < 4096:
break
print(len(data), len(block))
```

and I cannot generate a failure with `bad = True`.

Author: Trac Migrate 2022-09-29T11:05:33.000Z

When I paste your code in `f.py` with `bad = True` I get the error:

```
$ python f.py
Traceback (most recent call last):
File "f.py", line 9, in <module>
data += block.decode(sys.stdout.encoding)
File "/usr/lib64/python2.7/encodings/utf_8.py", line 16, in decode
return codecs.utf_8_decode(input, errors, True)
UnicodeDecodeError: 'utf8' codec can't decode bytes in position 4094-
↪4095: unexpected end of data
```

with `bad = False` it works:

```
$ python f.py
(4096, 3)
```

I tested on an OpenSUSE 15.4, `file.txt` produced by the line from comment 4. `locale` prints

```
$ locale
LANG=en_US.UTF-8
LC_CTYPE="en_US.UTF-8"
LC_NUMERIC="en_US.UTF-8"
LC_TIME="en_US.UTF-8"
LC_COLLATE=POSIX
LC_MONETARY="en_US.UTF-8"
LC_MESSAGES="en_US.UTF-8"
LC_PAPER="en_US.UTF-8"
LC_NAME="en_US.UTF-8"
LC_ADDRESS="en_US.UTF-8"
LC_TELEPHONE="en_US.UTF-8"
LC_MEASUREMENT="en_US.UTF-8"
LC_IDENTIFICATION="en_US.UTF-8"
LC_ALL=
```

Author: Chris Johns 2022-09-29T11:12:41.000Z

Thanks for testing. I think the patch I posted to the devel list should fix this. If you could be so kind and review the patch I would appreciate it.

Setting the top lets the code be used in deployment to get the version of the RSB being used. An RSB version lets a user track the exact tools being built and version numbers reported by the tools can match the packaged build, eg an rpm name and version info.

Original author: Christian Mauderer

Like discussed in the following mailing list thread, the rtems-source-builder doesn't generate tar archives for all packages anymore:

https://lists.rtems.org/pipermail/devel/2022-September/073369.html

All RTEMS tools build sets 6/rtems-* work fine except for 6/rtems-microblaze. devel/qemu and devel/dtc do not generate a tar archive. If the patch

https://git.rtems.org/rtems-source-builder/commit/?id=6205068c5a429e9ee1b471f4c8a3a119bb6757b2

is reverted, the tar files are generated just like before.

3.9.1.18 4710 - RSB does not expand dir type macros correctly

Id	4710
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Created	2022-08-28T22:34:02.000Z
Updated	2025-09-19T01:11:12.328Z
Milestone	6.1
Labels	priority::normal, resolution::fixed, tickettype::defect, tool::rtems-source-builder, version::6
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4710
Merges	0

The expansion of the `dir` type macros is not done correctly. Macro replacement only appends the file part to the last element of a path list. For example:

```
%{mydir}/abc.cfg
```

with a path of:

```
%define mydir x:y:z
```

results in:

```
x:y:z/abc.cfg
```

The config load code handles this but it is wrong. The expansion of `dir` type macro variables should handle path separators (`:`) so you get:

```
x/abc.cfg:y/abc.cfg:z.abc.cfg
```

This has not been a problem in the RSB because the `_configdir` has only had two elements and the last one only ever had subdirectories.

Author: Trac Migrate 2022-09-09T01:32:29.000Z

- **Resolution** set to ~"fixed"

Original author: sebastian.huber

The FreeBSD timecounter implementation supports the NTP. This support is currently disabled in RTEMS.

Author: Chris Johns 2017-08-14T00:08:25.000Z

Original author: sebastian.huber

- **Milestone** changed from %”5.0” to %”Indefinite”
- **Version** ~”4.11” deleted

Author: Chris Johns 2021-10-27T00:47:22.000Z

Original author: sebastian.huber

There needs to be an interface in the `score` to provide access to `ntp_update_second()`. The call may not be present in the kernel sources, it will mostly likely be provided by an application or an external library such as `libbsd.a`.

I suggest a file is added to the `score` that contains `ntp_update_second()` and that function checks a function pointer and if set the function is called. This brings `kern_tc.c` closer to upstream FreeBSD sources.

While on the topic of `kern_tc.c` and being as close to FB as we can, I think the RTEMS doxygen comments should be removed. We should maintain a common policy for imported sources like this.

Author: Trac Migrate 2021-10-27T05:37:47.000Z

Original author: sebastian.huber

Good timing, I recently updated kern_tc.c to the latest FreeBSD version:

https://git.rtems.org/sebh/rtems.git/log/?h=timecounter-2021

I just didn't send the patch set for review yet, since nobody commented on the new clock manager directives so far:

https://lists.rtems.org/pipermail/devel/2021-October/069697.html

The kern_tc.c is quite close to the original FreeBSD code and the Doxygen comment block on top of the file is not an issue.

In this patch set I removed the NTP code block since nobody was interested in NTP support in the last 6 years:

https://git.rtems.org/sebh/rtems.git/commit/?h=timecounter-2021&id=f85259b1edfff1d89c013c97510a9427825ea81b

This enabled a performance optimization here:

https://git.rtems.org/sebh/rtems.git/commit/?h=timecounter-2021&id=04ed8d3c8cf88b7f1e3fb7ad78a91be1fefc396c

The performance optimization is important for targets with slow 64-bit divisions (which are most RTEMS targets). If you want to add NTP support, then we have to restructure the FreeBSD code a bit. This can be integrated in FreeBSD. I can do this it just depends on how urgent it is.

In a first approach the proposed callback makes sense. If someone using lwIP needs NTP support, then we can add kern_ntptime.c to RTEMS.

Author: Chris Johns 2021-10-27T06:33:28.000Z

If you want to add NTP support, then we have to restructure the FreeBSD code a bit. This can be integrated in FreeBSD. I can do this it just depends on how urgent it is.

Original author: sebastian.huber

`kern_ntptime.c` is ported from freebsd-org to freebsd in rtems-libbsd. The last commits of this branch https://github.com/GabrielDai/rtems-libbsd/tree/ptpd show the changes.

Regarding adding the function `ntp_update_second()` in `score`, do you know where the function pointer should be updated (to point to `ntp_update_second()` in `kern_ntptime.c`)?

> The callback for `ntp_update_second()` is currently not implemented. I would like to integrate my patch set which updates `kern_tc.c` to the latest FreeBSD version first. I would like to also try to rearrange the code a bit in the FreeBSD upstream. For libbsd my approach would be to add an internal API to `#include <rtems/score/timecounter.h>` which can be used to set the NTP callback in `kern_ntptime.c`.

I updated the timecounter update branch to include support for an NTP update second handler:

https://git.rtems.org/sebh/rtems.git/log/?h=timecounter-2021

https://git.rtems.org/sebh/rtems.git/commit/?h=timecounter-2021&id=817437b6dda00764f368b2da9eeab67ec284a3bd

I wait for some feedback on the FreeBSD mailing list before I send the patch set for review.

A rule in the ticket may not be clean and suitable documentation however it provides me with a means to show what we consider as OK if you could provide this.

The libbsd contributing rules make sense for libbsd which deals with a couple of hundred files and a semi-automatic synchronization support. External files placed in the score should integrate into the score documentation and be maintainable. Here we need a bit more flexibility.

This makes sense. Should the documentation should be limited to a single block at the start of the file and else where in the file the LibBSD rules apply?

Original author: amaan

Build error:

```
/home/amaan/repos/rtems/kernel/cpukit/include/rtems/score/percpu.h:384:23: error:␣
↪variable or field 'Interrupt_frame' declared void
CPU_Interrupt_frame Interrupt_frame;
^~~~~~~~~~~~~~~
/home/amaan/repos/rtems/kernel/cpukit/include/rtems/score/percpu.h:520:8: error:␣
↪size of array 'unused_space_for_cache_line_alignment' is too large
char unused_space_for_cache_line_alignment
^~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Makefile:764: recipe for target 'ckinit.o' failed
```

Besides these compile and link-time issues, the i386 does not support SMP fully, but as a first step, we should at least have it build.

Possibly related to #2623.

Original author: e.tremblay

Whenever memory available to the bsp is greater than 256Mb the bootloader remain stuck after decompressing the kernel.

My understanding of the problem is that the bootloader only give access to the 1st 256Mb of RAM but when more memory is used the kernel and other components are stored in the top of the RAM beyond the first 256Mb.

The provided patch gives top of the RAM access to the system so it can correctly boot.

I am using: * source from rtems release 4.11.3 * Qemu v2.5.0 * Host system is Ubuntu Linux 16.04.1 in a VM (x86 64bits)

The problem is easily reproducible with Qemu with the following command but could surely affect hardware too:

qemu-system-ppc -M prep -kernel ./hello.ralf -bios /home/qemu_fakerom/qemu_fakerom.bin -cpu 750cxe -nographic -no-reboot -m 384

Console output:

Model: Serial: Processor/Bus frequencies (Hz): 300000000/100000000 Time Base Divisor: 1000 Memory Size: 18000000 Residual: 102afd4 (length 27148)

PCI: Probing PCI hardware

RTEMS 4.x/PPC load: Uncompressing the kernel... Kernel at 0x00000000, size=0x495b0 Initrd at 0x00000000, size=0x0 Residual data at 0x0004a000 Command line at 0x00051000 done Now booting... <<<<< execution stuck here

- qemu_powerpc_largememory.diff

Author: Joel Sherrill 2018-03-16T17:43:19.000Z

Original author: e.tremblay

I wanted to note two things:

- Chris is supposed to be given access to real hardware to test this on.
- Sebastian committed a change to switch qemuppc to use the shared linker script. This might impact your patch. Please update the patch if needed per the master.

Author: Trac Migrate 2018-03-17T10:05:10.000Z

Original author: e.tremblay

We have two Qemu PowerPC BSPs qemuprep and qemuppc. I touched qemuppc. This ticket is for qemuprep?

Author: Joel Sherrill 2018-03-17T14:30:28.000Z

Original author: e.tremblay

The patch touches code used by motorola_shared and beatnik. The patch has only been tested on qemu. We need it tested on hardware.

Author: Trac Migrate 2018-03-19T15:09:27.000Z

Original author: e.tremblay

- **Attachment** qemu_powerpc_largememory.diff added

Corrected comments and removed unnecessary label in assembly file.

Cloned from #4360:

---

racoon and ping6 use fd_sets. If RTEMS is build with a big number of file descriptors, the default fd_set size is too small and memory near the fd_set can be overwritten. Other applications in libbsd use allocated fd_sets to avoid that problem.

Original author: niteesh

The function rtems_fdt_load in file rtems-fdt.c contains an infinite loop. https://git.rtems.org/rtems/tree/cpukit/libmisc/rtems-fdt/rtems-fdt.c#n583 The loop termination condition, size is not being decremented in the above line. Instead, the amount of bytes read is being decremented.

This bug is present in RTEMS 6 as well as 5

I have attached a patch below that fixes this.

- 0001-rtems-fdt-rtems-fdt.c-Fix-bug-in-loop-termination.patch

Author: Trac Migrate	2021-03-21T07:01:00.000Z

3.9.1.29 4343 - sp14 test failing on ARM and AArch64

Id	4343
State	closed
Type	ISSUE
Author	Kinsey Moore
Assignee(s)	Trac Migrate
Created	2021-03-15T21:34:01.000Z
Updated	2025-09-19T01:06:56.970Z
Milestone	6.1
Labels	priority::normal, resolution::fixed, tickettype::defect

Merges	0

Since 8778a0e1188ee00932ce47d410de54c4e053f3bf got merged, sp14 fails on at least ARM and AArch64 due to a new conditional added to rtems_signal_catch that returns RTEMS_NOT_IMPLEMENTED.

Author: Kinsey Moore 2021-03-15T21:43:28.000Z

Specifically, this was tested on the xilinx_zynq_a9_qemu BSP.

Author: Kinsey Moore 2021-03-16T02:38:25.000Z

The subsequent commit a7e180b95dcc3c2f0bab82ec8eaa211cb0a4956a seems to have broken sp14 on AArch64 further, but did not affect ARM. I need to look closer to see why.

Author: Trac Migrate 2021-03-16T06:44:38.000Z

Somehow I didn't notice this during my test runs using the arm/realview_pbx_a9_qemu BSP which I normally use for development.

The sp14 test case is broken on CPU ports with:

```
#define CPU_ENABLE_ROBUST_THREAD_DISPATCH TRUE
```

I will fix this.

Author: Trac Migrate 2021-03-16T13:01:39.000Z

Build FAILED
Build Set: Time 0:00:00.045206
Build FAILED
```

Author: Chris Johns 2021-03-09T02:55:12.000Z

Original author: thelunatic

Does another BSP build?

I suggest running with `--trace` and comparing the output with a libbsd with `--trace`.

Author: Chris Johns 2021-03-09T02:58:38.000Z

Original author: thelunatic

Also use `--dry-run` and comment some of the packages int he bset you do not need to build, ie gcc etc, to speed things up.

RTEMS already has this functionality so it should not be hard to implement this.

https://man7.org/linux/man-pages/man3/malloc_usable_size.3.html https://www.freebsd.org/cgi/man.cgi?query=malloc_usable_size

The prototype would need to be added to the appropriate newlib header file with the same guard as Linux and FreeBSD.

The method would need to be fully tested.

The method would need to be documented.

Merges	0

This issue exists to track <gcc bug will be added when I can submit it>. GCC generates bad alignments for sections with elements smaller than 8 bytes on AArch64.

This was previously worked around by using SUBALIGN() in the linker script, but this causes other problems when larger elements are stored in linker sections.

Author: Kinsey Moore 2021-03-02T14:09:12.000Z

I can't edit the ticket description. Here is the link to the GCC bug: https://gcc.gnu.org/bugzilla/show_bug.cgi?id=99143

According to the commentary on the bug, these alignments are not guaranteed and a patch to address them is currently up for review on the mailing list.

Author: Trac Migrate 2021-03-05T14:43:38.000Z

- **Owner** set to Kinsey Moore <kinsey.moore@oarcorp.com>
- **Resolution** set to ~"fixed"

In [changeset:"bbc9974a2450e7599cf9c08dbfd394b523bf6c51/rtems" bbc9974a/rtems]:

```
cpukit: Explicitly enforce alignment requirements

According to commentary on GCC bug
https://gcc.gnu.org/bugzilla/show_bug.cgi?id=99143, the alignment
behavior of linker sections on which RTEMS has relied was never
guaranteed to be consistent across platforms and any alignment
requirements for linker sections needs to be enforced explicitly.
This adds those explicit alignment requirements.

Closes #4255.
```

Original author: stephenclark

Commit b5aceef5d921de3d146b45c20f6f8aa7e9413717 seems to have introduced a build warning on aarch64/xilinx_zynqmp. When trying to build rtems 6 for xilinx_zynqmp, waf gives the following build warning:

```
../../../bsps/shared/dev/irq/arm-gicv2.c:53:6: warning: no previous prototype for
↪'bsp_interrupt_dispatch' [-Wmissing-prototypes]
53 | void bsp_interrupt_dispatch(void)
|      ^~~~~~~~~~~~~~~~~~~~~~
```

This was built using aarch64-rtems6-gcc (GCC) 10.2.1 20200918 (RTEMS 6, RSB f5fc2bfabbd18f31901ffa6fc0e5b6b47874797c, Newlib 749cbcc).

When the bug occurred, the config.ini file used by waf contained the following:

```
[aarch64/xilinx_zynqmp_lp64]
BUILD_TESTS = True
RTEMS_POSIX_API = True
[aarch64/xilinx_zynqmp_ilp32]
BUILD_TESTS = True
RTEMS_POSIX_API = True
```

RTEMS crashed when i used printf() to print a float/double data in interrupt service routine. the test code is simple and shown below: float f = 3.131415926; printf("logi float: %fn", f);

any help would be appreciated.

Author: Trac Migrate 2021-01-20T08:34:05.000Z

Original author: ceasar

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

Using any of the printf() functions in interrupt context is undefined behaviour. You can use the interrupt server to run interrupt handlers in a thread context. You can use the event recording as a low overhead alternative to printf() to trace your application:

https://docs.rtems.org/branches/master/user/tracing/eventrecording.html

Author: Trac Migrate 2021-01-20T10:03:53.000Z

Original author: ceasar

Hi Sebastian ,

What you said any of the printf() functions in interrupt context is undefined is really true. I wrongly thought only float/double data print by printf() in interrupt context would crash, but int play the same. after a test.

I show you the background why i get the wrong thought. I implemented a system logger feature which supply LOG_I/LOG_E/LOG_W interface to format and record logs to the storage device in RTEMS, supported both in thread and interrupt. Logs in interrupt context formatted to a string by vsnprintf firstly and then send to a async handler task by using message queue. Teammate raise an issue said float/double data deliver to LOG_X interface in interrupt context would crash OS.

After a deep dig, i found the stack as follows: vsnprintf->_vsnprintf_r->_svfprintf_r->cvt->_DTOA_R->d2b an data abort exception happened in d2b() function. So i just want to double check vsnprintf() function have the same defect as printf().

BTW can you tell me why printf function can't used in interrupt? I heard if irq handler cost more than 1ms RTEMS would go wrong in some way.

Author: Trac Migrate 2021-01-20T11:05:55.000Z

Original author: ceasar

The printf() family of functions may use mutexes and dynamic memory (this includes the string variants).

The FreeBSD NFSv4 sets a timeout of `INT_MAX` seconds and that translates as a call to `tvtohz()` with the `struct timeval` argument fields set to:

```
tvtohz: tv_sec=2147483647 tv_usec=0
```

The call overflows the unsigned 32bit integer number of ticks. Should an overflow be checked and the maximum number of ticks returned?

Author: Trac Migrate 2021-01-07T08:23:23.000Z

I would simply use the tvtohz() implementation from FreeBSD.

Author: Chris Johns 2021-01-07T22:21:25.000Z

Replying to Sebastian Huber:

> I would simply use the tvtohz() implementation from FreeBSD. The ticket is about correctness in the `score` and not `libbsd`.

Author: Trac Migrate 2021-01-08T05:42:44.000Z

Replying to Chris Johns:

> Replying to Sebastian Huber:
>
> > I would simply use the tvtohz() implementation from FreeBSD.
>
> The ticket is about correctness in the `score` and not `libbsd`. The ticket description doesn't mention _Timespec_To_ticks().
>
> _Timespec_To_ticks() is used for the sporadic server and the POSIX timer. Maybe the implementation should be changed to use CLOCK_MONOTONIC, but I don't really know what is specified by POSIX. Maybe Joel can have a look at this.

Author: Trac Migrate 2021-01-08T05:44:23.000Z

Replying to Sebastian Huber:

> Replying to Chris Johns:

> The ticket description doesn't mention _Timespec_To_ticks(). Sorry, it is in the subject.

Author: Trac Migrate 2021-01-08T06:07:06.000Z

I think the general question is what should be the behaviour if a user specifies a timeout which is after the specified uptime of the system (which is WATCHDOG_MAX_SECONDS, about 544 years). See also _Watchdog_Is_far_future_timespec().

Author: Chris Johns 2021-01-10T01:09:21.000Z

Replying to Sebastian Huber:

> I think the general question is what should be the behaviour if a user specifies a timeout which is after the specified uptime of the system (which is WATCHDOG_MAX_SECONDS, about 544 years). See also _Watchdog_Is_far_future_timespec().

> Yes that would work. If the `tv_sec` field is more than `WATCHDOG_MAX_SECONDS` limit it to that value. We need to make the conversion predictable for all possible `timespec` input values.

Author: Joel Sherrill 2021-12-17T17:04:17.000Z

Original author: rmueller

When installing the tool suite for a git clone, the build set 5/rtems-sparc does not appear to be available anymore.

It would be a good idea to update to Quick Start guide accordingly.

Running ../source-builder/sb-set-builder –list-bsets yields:

6/rtems-aarch64.bset 6/rtems-all.bset 6/rtems-arm.bset 6/rtems-autotools-base.bset 6/rtems-autotools-internal.bset 6/rtems-autotools.bset 6/rtems-base.bset 6/rtems-bfin.bset 6/rtems-default.bset 6/rtems-i386.bset 6/rtems-kernel.bset 6/rtems-libbsd.bset 6/rtems-llvm.bset 6/rtems-lm32.bset 6/rtems-m68k.bset 6/rtems-microblaze.bset 6/rtems-mips.bset 6/rtems-moxie.bset 6/rtems-nios2.bset 6/rtems-or1k.bset 6/rtems-packages.bset 6/rtems-powerpc.bset 6/rtems-riscv.bset 6/rtems-sh.bset 6/rtems-sparc.bset 6/rtems-sparc64.bset 6/rtems-tools.bset 6/rtems-v850.bset 6/rtems-x86_64.bset 7/rtems-aarch64.bset 7/rtems-all.bset 7/rtems-arm.bset 7/rtems-base.bset 7/rtems-bfin.bset 7/rtems-default.bset 7/rtems-i386.bset 7/rtems-lm32.bset 7/rtems-m68k.bset 7/rtems-microblaze.bset 7/rtems-mips.bset 7/rtems-moxie.bset 7/rtems-nios2.bset 7/rtems-or1k.bset 7/rtems-powerpc.bset 7/rtems-riscv.bset 7/rtems-sh.bset 7/rtems-sparc.bset 7/rtems-sparc64.bset 7/rtems-v850.bset 7/rtems-x86_64.bset bsps/atsamv.bset bsps/beagleboneblack.bset bsps/erc32.bset bsps/gr712rc.bset bsps/gr740.bset bsps/imx7.bset bsps/pc.bset bsps/qoriq_e500.bset bsps/qoriq_e6500_32.bset bsps/qoriq_e6500_64.bset bsps/raspberrypi2.bset bsps/xilinx_zynq_zc702.bset bsps/xilinx_zynq_zc706.bset bsps/xilinx_zynq_zedboard.bset databases/sqlite.bset devel/autotools-base.bset devel/autotools-internal.bset devel/autotools.bset devel/capstone.bset devel/dtc.bset devel/libtool.bset devel/libusb.bset devel/or1ksim.bset devel/qemu-couverture.bset devel/qemu.bset devel/sis.bset devel/spike.bset devel/swig.bset ftp/curl.bset gnu-tools-4.6.bset gnu-tools-4.8.2.bset graphics/freetype2.bset graphics/graphics-all.bset graphics/libjpeg.bset graphics/libpng.bset graphics/libtiff.bset graphics/microwindows.bset graphics/nxlib.bset graphics/t1lib.bset lang/gcc491.bset net-mgmt/net-snmp.bset net/lwip.bset net/ntp.bset net/protobuf.bset rtems-base.bset rtems-package.bset rtems-urls.bset rtems-version.bset

So installing 5/rtems-sparc is not possible.

3.9.1.46 4178 - Resolve use of SUBALIGN in AArch64 under ILP32 multilib variant

Id	4178
State	closed
Type	ISSUE
Author	Kinsey Moore
Assignee(s)	Trac Migrate
Created	2020-11-16T16:38:20.000Z
Updated	2025-09-19T01:06:53.481Z

Merges	0

Currently, the AArch64 ILP32 multilib variant is functional, but requires use of SUBALIGN to adjust the default alignment of the rtemsroset and rtemsrwset from 8 bytes to 4 bytes to match the pointer size. Without this alignment adjustment, execution of linker set based initializers on ILP32 results in a crash due to the 4 bytes above the aligned pointer being treated as another initializer pointer.

Though this is currently functional, it would be best to understand why this alignment change is required for AArch64 ILP32 when other architectures such as SPARC don't require this change to be explicitly made between their 32 and 64 bit variants.

Original author: abutterfield

In the RTEMS Software Engineering manual, Sec 6.3.2.1

https://docs.rtems.org/branches/master/eng/coding-80cols.html#breaking-long-lines

it recommends excessively long comments be broken as follows:

```
/* first line
* second line
* third, and in this case last line */
```

After a discussion on the devel mailing list at

https://lists.rtems.org/pipermail/devel/2020-October/062906.html

it was agreed that it should be

```
/*
* first line
* second line
* third line (no longer matters that it is last)
*/
```

Python 3.8.2
```

Author: Chris Johns 2020-08-25T22:42:47.000Z

Original author: kgardas

I cannot repeat the error. I have installed `Python 3.8.5` on FreeBSD 12 and successfully run:

```
python3.8 -m venv sphinx38
. ./sphinx38/bin/activate
pip install --upgrade pip
```

(continues on next page)

(continued from previous page)

```
pip install Sphinx
pip install sphinxcontrib-bibtex
cd rtems-docs.git
./waf distclean configure
```

The pip configuration is:

```
(sphinx38) ruru rtems-docs.git $ pip list
Package                       Version

Author: Trac Migrate 2023-07-10T08:29:50.000Z

Original author: kgardas

With the suggested way of using it:

```
python3.8 -m venv sphinx38
. ./sphinx38/bin/activate
pip install --upgrade pip
pip install Sphinx
pip install sphinxcontrib-bibtex
cd rtems-docs.git
./waf distclean configure
```

this runs fine. But when I try to add `--pdf` into waf I get following error:

```
(sphinx38) rtems@silence:~/git/rtems/rtems-docs$ ./waf distclean␣
↪configure --pdf
'distclean' finished successfully (0.003s)

The RTEMS version code expects `major.minor.revision` to support `__RTEMS_MAJOR__`, `__RTEMS_MINOR__`, and `__RTEMS_REVISION__`. These labels are now misleading as they do not match the version numbering we have. RTEMS's version number is `version.revision`.

Author: Joel Sherrill 2021-12-21T15:12:41.000Z

What specifically is "RTEMS version code" and where is it all? What needs fixing?

Author: Chris Johns 2022-11-29T23:08:40.000Z

- **Milestone** changed from %"6.1" to %"7.1"
- **Version** changed from ~"6" to ~"7"

Across the RTEMS code base and ecosystem we need to make the versioning consistent. At the moment is it not.

Do we keep `major.minor.revision` with `revision` always `0` and the leave things as they are or do we change it? There needs to be a policy established first.

Is this better handled in 7?

Original author: Christian Mauderer

Cloned from #4041:

If the mount for a dosfs (FAT) fails, the `converter` that is used to encode and decode the file names is not destroyed. That will lead to memory leaks.

Note that there are two cases:

1. User doesn't provide a converter. In this case a default converter is created implicitly.
2. User does provide a converter.

Both have to be handled slightly different.

Author: Trac Migrate 2020-08-04T06:25:51.000Z

In [changeset:"87fdb206fa018bd1366434a5535e608eb7f45137/rtems" 87fdb20/rtems]:

```
dosfs: Fix memory leak on failed mounts.

Currently if mount fails, a converter isn't destroyed. We have to take
care of two cases:

1. The user doesn't provide a converter.

In this case mounting a dosfs creates a default converter. This patch
makes sure that the converter is destroyed again if mount failes for
this case.

```

(continues on next page)

(continued from previous page)

```
2. The user provides a converter.

In this case it's not sure that the dosfs specific routines are reached
because mount can fail before that. Therefore the user has to destroy
the converter himself again. This patch adds a documentation for that
and implements it in the media server.

Closes #4042.
```

Original author: JSchweikhardt

The ISO C identifier “time” from time.h is re-used in the prototype and definition of the rtems_clock_get_tod_timeval() function (and maybe elsewhere too). In certain cases this could lead to undefined behavior. It certainly upsets our lint (Gimpel FlexeLint).

It's good software hygiene to avoid shadowing ISO C identifiers. Desired change: in cpukit/rtems/src/clockgettodtimeval.c use an unreserved identifier.

- x.diff

Author: Trac Migrate 2020-07-31T13:58:47.000Z

Original author: JSchweikhardt

The header should also be fixed, cpukit/include/rtems/rtems/clock.h

Author: Joel Sherrill 2020-07-31T14:31:47.000Z

Original author: JSchweikhardt

Could you please provide a patch for this? It seems like a reasonable and mostly benign change but will ripple to Doxygen and documentation. If you fix the code to make your Flexelint happy, then we can be sure it is really fixed.

Author: Trac Migrate 2020-08-01T08:38:16.000Z

time-is-reserved

Author: Trac Migrate 2020-08-01T08:45:40.000Z

Original author: JSchweikhardt

I've attached a patch renaming time to the_time, also in doxygen comments. I'm new to git and followed the instructions for patch creation but ran into a wall with git format-patch (no output anywhere I could find). So I used git diff. The commit message could be

> Rename the reserved identifier "time" to "the_time" to not invade ISO C name space.

This task asks you to check the development manuals from https://docs.rtems.org/ for links to this wiki (devel.rtems.org) and to identify whether the linked content has been moved to the manuals, or whether it should be moved to the manuals. It it has been moved, the reference in the manual should be to where it is in the manual. If the wiki content should be moved, determine how to move it and submit a patch to move the linked content. Once you identify

the linked content is in the docs, update the link to reference to the location of the content in the docs.

Long term, there is much content in the wiki that needs to find a new home in rtems-docs so it can be version controlled and packaged in sync with releases. Or it needs to be removed. The analysis of each wiki link may result in converting content to .rst and deleting the Wiki page, correcting links within the .rst documentation on previously converted documentation, or something else. Figure out what you think is the best place for the content given that we want as much as possible in rtems-docs for better version control and access. Make a recommendation, follow up with patches, lists of places to change references that you can't, etc.

There are similar tasks to review and convert specific categories of wiki pages. This may cross over with that task but this list is from the rtems-docs perspective.

To get the list:

```
cd ...../rtems-docs
grep -r "http:.*wiki"
```

There are a few categories of this on first review:

- Wiki pages converted to .rst content for the Software Engineering Guide. These are denoted by a comment with the Wiki URL in the text as a comment. Review the SW Eng version and verify it correctly represents the Wiki content. Fix any references to wiki pages remaining in the converted text and submit a patch. The end result of this should be to delete the original wiki page and identify where this page was referenced so those can be updated.
- References to BSP wiki pages. Hopefully all the BSP wiki pages can be reviewed and either deleted as obsolete or of marginal value or converted to content in the Users Guide.
- References to other Wiki pages. These may be correct or incorrect. The content of the Wiki page may need to be merged into somewhere in rtems-docs. The analysis will determine what the best thing to do is.

↪^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
↪^^^^^^^^^^^^

Long term, there is much content in the wiki that needs to find a new␣
↪home in rtems-docs so it can be version controlled and packaged in␣
↪sync with releases. Or it needs to be removed. The analysis of each␣
↪wiki link may result in converting content to .rst and deleting the␣
↪Wiki page, correcting links within the .rst documentation on␣
↪previously converted documentation, or something else. Figure out␣
↪what you think is the best place for the content given that we want␣
↪as much as possible in rtems-docs for better version control and␣
↪access. Make a recommendation, follow up with patches, lists of␣
↪places to change references that you can't, etc.

There are similar tasks to review and convert specific categories of␣
↪wiki pages. This may cross over with that task but this list is from␣
↪the rtems-docs perspective.

To get the list:

{{{
cd ...../rtems-docs
grep -r "http:.*wiki"
}}}

There are a few categories of this on first review:

* Wiki pages converted to .rst content for the Software Engineering␣
↪Guide. These are denoted by a comment with the Wiki URL in the text␣
```

(continues on next page)

(continued from previous page)

```
↪as a comment. Review the SW Eng version and verify it correctly␣
↪represents the Wiki content. Fix any references to wiki pages␣
↪remaining in the converted text and submit a patch. The end result of␣
↪this should be to delete the original wiki page and identify where␣
↪this page was referenced so those can be updated.

* References to BSP wiki pages. Hopefully all the BSP wiki pages can be␣
↪reviewed and either deleted as obsolete or of marginal value or␣
↪converted to content in the Users Guide.

* References to other Wiki pages. These may be correct or incorrect.␣
↪The content of the Wiki page may need to be merged into somewhere in␣
↪rtems-docs. The analysis will determine what the best thing to do is.
```

There is still a significant amount of content listed under https://devel.rtems.org/wiki/TBR/UserManual in the Wiki which needs to find a new home in some manual in the rtems-docs repository or be removed entirely.

This ticket can be closed when all Wiki pages under UserManual are removed.

This has already been posted and discussed a bit on the development list (https://lists.rtems.org/pipermail/devel/2020-March/058220.html). The goal of this series of tasks is to eliminate all BSP Wiki pages and merge useful content into the Users Guide.

Start by picking a BSP from the list at https://devel.rtems.org/wiki/TBR/Website/Board_Support_Packages. Look at the BSP specific wiki page.

Is the BSP still in the source tree? If not, post to devel@ and recommend the page be removed. This requires admin privileges in the Wiki.

If the BSP is still in the source tree, convert the text and merge it into the appropriate place in the Users Guide (hosted in rtems-docs repo). Make sure all the links are still active. This may require pointing some to archive.org. If you have doubt about the quality or value of the information on the Wiki page, please ask on devel@ before spending time on the conversion.

This ticket can be closed when all BSP Wiki pages are removed.

[Contents, inline)]

Mentors

Amar Takhar

Status =

GSoC project or looking for funding.

Introduction

A qualified developer for this project does not need to know anything about RTEMS or an RTOS in general. It is also not required to know C, C++ or any other programming language outside of Python.

Project

RTEMS currently has several Python tools that need to be brought under the same ecosystem and several tools that are missing that need to be written.

This task also includes the creation of a beginners tutorial with ASCII screen-capture on using the new tools created for testing code on real hardware.

3.9.1.71.4.1 Goal

- Runs under Python 2.x and 3.x.
- A general RTEMS tool library with a standard API to handle common tasks.
- All utilities callable as a function within the API with the tool itself being a thin layer.
- Testing on all API commands under both Python 2.x and 3.x.
- In-source documentation.
- Tutorial using new Python utility for running code on hardware.

3.9.1.71.4.2 What you will learn

- How to properly test Python software.
- Using code coverage tools.
- Using performance tools.
- Writing technical documentation both in and out of source.,
- Writing a beginner tutorial from a technical perspective.
- Library/API design and consumption.
- Using modern documentation tools.

3.9.1.71.4.3 Prerequisite

- Medium knowledge of Python.
- Knowledge of how to write well-written Python following PEPs,
- Understanding of how libraries and APIs work.
- A Beaglebone Black with an FTDI cable.
- Basic knowledge of UNIX commandline and Git.

3.9.1.71.4.4 Good to have

None of these are required but having them will strengthen a candidates chances of being accepted.

- Cross-platform programming experience.
- Knowledge of debugging and profiling Python code
- Experience with writing documents.

3.9.1.71.4.5 Current tools

The following tools are among the programs that current exist that need to be worked on.

- rtems-run
- rtems-test
- tftp proxy
- rtems-source-builder

3.9.1.71.4.6 New tools

Currently, low-level tools exist that help with running binaries on real hardware. However RTEMS lacks a high level management utility for configuring `tftp-proxy`, `rtems-test`, `rtems-run` and `ser2net`.

Further to this there are other tasks that need to be completed such as creating a usable `u-boot` image with the correct `FDT` files. `mkimage` must be used over test binaries to create a flashable image to be sent to the hardware for execution.

3.9.1.71.4.7 Tutorial

RTEMS lacks a general tutorial for new users to the project. Part of writing a new tool for handling running code on real hardware is to lower the burden of new users to test RTEMS for their requirements.

A new tutorial describing this process and the usage of the new tool is required for successful completion.

3.9.1.71.4.8 Testing

The entire API will need to be tested using `pytest`. This will include running under Python 2.x and 3.x for compatibility purposes on our main platforms. `FreeBSD`, `Linux`, `Windows`, and `OS X`.

Code coverage should be at or near 100% upon the completion of this project.

```

- **Summary** changed from *RTEMS Python Standardisation* to *RTEMS Python Standardisation – Pure Python project.*

Note that this is a pure python project in the title to help it stand out for Python-only students.

Also note that only Python is required in the introduction and add a note about knowing basic UNIX CLI and Git.

Author: Trac Migrate 2021-12-26T12:01:17.000Z

I would like to contribute for this project as a GSoC 2022 student. I'm quite comfortable with python.

Original author: md403

I am attempting to follow the quickstart guide.

Host: Macbook Pro 2.3 GHz Quad-Core Intel Core i5 16 GB 2133 MHz LPDDR3 MacOS 10.15.1 Catalina

Target: RISC-V rv32i

I am in step 2.6 of the quickstart (Build a BSP). Everything up to and including creating the Makefile appears to have gone fine.

I build the Makefile with the following command, modified from the quickstart guide:

```
cd $HOME/projects/rtems_root/build/b-rv32i
export PATH=$HOME/projects/rtems_root/rtems/5/bin:$PATH
$HOME/projects/rtems_root/src/rtems/configure \\
--prefix=$HOME/projects/rtems_root/rtems/5 \\
--enable-maintainer-mode \\
--target=riscv-rtems5 \\
--enable-rtemsbsp=rv32i \\
--enable-tests
```

I type

```
make
```

and it proceeds just fine for a while and then I get the following:

```
rtems-ld -r /Users/michaeldodson/projects/rtems_root/build/b-rv32i/riscv-rtems5/c/
↪rv32i \\
-C riscv-rtems5-gcc -c "-march=rv32i -mabi=ilp32" \\
-O rap -b dl06.pre -e rtems_main -s \\
-o dl06.rap dl06-o1.o dl06-o2.o -lm
error: rap::object: Section index '0' not found: dl06-o1.o
make[5]: *** [dl06.rap] Error 10
```

I submit this with some trepidation, as a) I'm brand new, and b) I see there's one ticket with a similar complaint (though no description) which is about a year old...

Looking at winsock2.h it appears some POSIX'ish methods are available for sockets, so it may not be hard to support MingWin.

Original author: jeff.mayes

I can make sis compile under mingw but only without the gdb interface. The windows socket API is slightly different from unix, and I am not a windows user. . .

I can see two short-term fixes: disable the gdb interface in sis when building for mingw (WIN32) or disable building sis altogether when building RSB on a WIN32 host.

note: if you are on windows 10, you could always install WSL with an ubuntu 18.04 image and build RSB there . . .

Author: Joel Sherrill 2019-11-05T21:28:44.000Z

Original author: jeff.mayes

Everyone doesn't have the option to install WSL. How about temporarily disabling the gdb interface and update this ticket with that commit. Hopefully someone who knows winsock can fix it.

Author: Chris Johns 2019-11-05T23:38:20.000Z

Original author: jeff.mayes

I have implemented Windows socket support before . . .

https://sourceforge.net/p/bdm/code/ci/master/tree/m68k/gdbserver/remote-utils.c

If I get time I will look at adding the support.

changed the description

3.9.1.78 3799 - confdefs.h declares an array with zero elements, that's invalid C

Id	3799
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2019-10-02T14:59:41.000Z
Updated	2025-09-19T01:06:48.463Z
Milestone	6.1
Labels	priority::normal, resolution::fixed, tickettype::defect
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3799
Merges	0

Original author: JSchweikhardt

I'm looking at rtems/cpukit/include/rtems/confdefs.h

```
1189        #ifdef CONFIGURE_INIT
1190          RTEMS_DEFINE_GLOBAL_SYMBOL(
1191            _ISR_Stack_size,
1192            CONFIGURE_INTERRUPT_STACK_SIZE
1193          );
1194
1195          char _ISR_Stack_area_begin[
1196            _CONFIGURE_MAXIMUM_PROCESSORS * CONFIGURE_INTERRUPT_STACK_SIZE
1197          ] RTEMS_ALIGNED( CPU_INTERRUPT_STACK_ALIGNMENT )
1198          RTEMS_SECTION( ".rtemsstack.interrupt.begin" );
1199
1200          const char _ISR_Stack_area_end[ 0 ]
1201            RTEMS_SECTION( ".rtemsstack.interrupt.end" ) = { };
1202        #endif
```

Note line 1200: `const char _ISR_Stack_area_end[ 0 ]` This crashes (yes, it goes boom) one of our Static Analyzer tools (Mathworks Polyspace if you must know).

According to the ISO C11 Standard,

> **6.7.6.2 Array declarators Constraints** 1 In addition to optional type qualifiers and the keyword `static`, the `[` and `]` may delimit an expression or `*`. If they delimit an expression (which specifies the size of an array), the expression shall have an integer type. **If the expression is a constant expression, it shall have a value greater than zero.**
>
> Could this either be fixed to declare a one element array, or, if you must use 0 for some reason, be a macro that I can override for Polyspace?

Author: Trac Migrate 2019-10-04T13:36:37.000Z

Original author: JSchweikhardt

See:

https://lists.rtems.org/pipermail/devel/2019-October/055804.html

I would write a bug report for the Mathworks Polyspace as well.

Author: Trac Migrate 2019-10-07T05:07:53.000Z

Original author: JSchweikhardt

Please test this patch set and check if it fixes the Mathworks Polyspace issue.

Author: Trac Migrate 2019-10-07T07:16:55.000Z

Original author: JSchweikhardt

It's difficult for me to apply the patch set since we use the RTEMS 5.x as shipped by Cobham/Gaisler Research for their RCC 1.3-rc6-gcc. This differs enough from current RTEMS to make this a bit involved. However, I've locally patched it simply by changing `[0]` to `[1]` and Polyspace R2013a no longer crashes. I fully trust your patch set to fix this as well, so go ahead and close this as fixed. Thanks a lot for your work, Sebastian!

Author: Joel Sherrill 2019-10-09T14:38:45.000Z

Original author: JSchweikhardt

Do you have any instructions or guidance for using Polyspace on RTEMS that could be place in the documentation?

Author: Trac Migrate 2019-10-22T09:52:09.000Z

Original author: JSchweikhardt

In general, Polyspace needs to see the same code the compiler sees. This requires that Polyspace needs to be told the compiler's predefined macros. With gcc or clang that's easy. To do that, ask for the predefined macros with `$(CC) -E -dM -x c /dev/null` and turn that into `-D` options for Polyspace.

In addition, you might want to fix/work around various language extensions Polyspace does not understand. I use

```
-D __extension__=
-D __builtin_va_list=void*
-D __builtin_offsetof(t,m)=0
-D _Noreturn=
-D __restrict=
```

but this might need to be tweaked for your particular compiler and Polyspace release.

```
score: Add and use RTEMS_SYMBOL_NAME()

Update #3799.
```

Author: Trac Migrate 2020-04-08T17:23:06.000Z

Original author: JSchweikhardt

In [changeset:"099ab00d160be82952d59de6ad7ef18896adb420/rtems" 099ab00/rtems]:

```
config: Fix _ISR_Stack_area_end

In the previous implementation, the _ISR_Stack_area_begin and
_ISR_Stack_area_end symbols were in different sections. If they do not
have the same alignment, then the following linker directive could
separate them:

*(SORT_BY_ALIGNMENT (SORT_BY_NAME (.rtemsstack*)))

Do not use different sections and instead define _ISR_Stack_area_end
directly.

Update #3799.
```

With the commit

https://git.rtems.org/rtems-libbsd/commit/?id=59ce99a357d7e283b2f463d3e22189e88b2ed412

some settings of the pin multiplexer are initialized twice (like I2C pins which are already initialized by the I2C driver). Ideally that should be replaced with one clean (maybe device tree based) initialization during BSP startup.

This could be part of a GSoC project (#3791).

host is MacOS 10.14.6

target is stm32f4

configure string is: $HOME/quick-start/src/rtems/configure –prefix=$HOME/quick-start/rtems/5 –target=arm-rtems5 –enable-rtemsbsp=stm32f4 –enable-tests –disable-networking –enable-posix

I am building off of a head pull of the tools and RTOS source as of Monday August 5, late evening GMT-7.

I believe the important error message is: /Users/andreichichak/quick-start/src/rtems/c/src/../../cpukit/libdebugger/rtems-debugger-arm.c:1308:53: error: ‘arm_switch_reg’ undeclared (first use in this function)

define EXCEPTION_ENTRY_EXC() (void) arm_switch_reg

^ /Users/andreichichak/quick-start/src/rtems/c/src/../../cpukit/libdebugger/rtems-debugger-arm.c:1324:3: note: in expansion of macro ‘EXCEPTION_ENTRY_EXC’ EXCEPTION_ENTRY_EXC(); ^~~~~~~~~~~~~~~~~~~~ /Users/andreichichak/quick-start/src/rtems/c/src/../../cpukit/libdebugger/rtems-debugger-arm.c:1308:53: note: each undeclared identifier is reported only once for each function it appears in

define EXCEPTION_ENTRY_EXC() (void) arm_switch_reg

Author: Trac Migrate 2019-10-01T12:13:53.000Z

Original author: Andrei Chichak

I’m new to rtems. I also encountered this problem. I dig into source code, in commit:8798372261ed1:cpukit/libdebugger/rtems-debugger-arm.c:83-95:

```
#if !ARM_THUMB_ONLY && defined(__thumb__)
#define ARM_SWITCH_REG       uint32_t arm_switch_reg
#define ARM_SWITCH_REG_ASM   [arm_switch_reg] "=&r" (arm_switch_reg)
#define ARM_SWITCH_REG_ASM_L ARM_SWITCH_REG_ASM,
#define ASM_ARM_MODE         ".align 2\\nbx pc\\n.arm\\n"
#define ASM_THUMB_MODE       "add %[arm_switch_reg], pc, #1\\nbx %[arm_
↪switch_reg]\\n.thumb\\n"
#else
#define ARM_SWITCH_REG
#define ARM_SWITCH_REG_ASM
#define ARM_SWITCH_REG_ASM_L
#define ASM_ARM_MODE
#define ASM_THUMB_MODE
#endif
```

here, code for stm32f4 is compiled with flag -mpu cortex-m4, which is ARM_THUMB_ONLY, __ARM_ARCH_7M__, so above defines will result ARM_SWITCH_REG to empty.

in line 1592, 1593,

it is defined as

```
#elif defined(ARM_MULTILIB_ARCH_V7M)
#define EXCEPTION_ENTRY_EXC()              (void) arm_switch_reg
```

when compiled, it will report undeclared identifier arm_switch_reg

Author: Trac Migrate 2019-10-01T13:06:20.000Z

Original author: Andrei Chichak

I think if there is no need for arm_switch_reg, how about I void exception_entry_exc()?

Original author: johill

nios2-rtems4.11-gcc (GCC) 4.9.3 20150626 (RTEMS 4.11, RSB no-repo, Newlib 2.2.0.20150423)

configure –target=nios2-rtems4.11 –prefix=/ade/rtems/install/rtems-4-11 –disable-itron –disable-tests –enable-posix –enable-cxx –enable-rtemsbsp=altera-sys-config-S43X-TDAQ-dev –enable-networking

This is occurring in 4.11.1.99.

I don't suggest that this fix is a great design, but its what we are currently using here to get our regression tests to pass w/o causing a misaligned pointer exception. This change probably requires at least gcc 4.6 to properly align a char buffer on the stack this way.

```

Are you compiling with any type of strict alignment flags?

Is the stack itself properly aligned initially?

I agree that it's an ugly solution but it is clear that you can't assume proper alignment of a byte buffer without either a union, compiler magic, or an attribute. A union requires more modification of the software I think. RTEMS has this macro to help avoid compiler dependencies. I am almost OK with using it and the CPU_ALIGNMENT constant as the alignment. Are we sure 4 is a portable answer. What's the first field of HEADER?

include/rtems/score/basedefs.h: #define RTEMS_ALIGNED(_alignment) __attribute__((__aligned__(_alignment)))

Author: Trac Migrate 2019-07-25T00:13:25.000Z

Original author: johill

Are you compiling with any type of strict alignment flags?

Not that I know of, this is what we are using, and probably nothing additional relevant in the specs file.

-O3 -ggdb -Wall -Wmissing-prototypes -Wimplicit-function-declaration -Wstrict-prototypes -Wnested-externs -MT serial/libserialio_a-mc68681.o -MD -MP -MF

A union requires more modification of the software I think.

That would be more portable. The cplusplus 11 has alignment features but C doesn't yet at this time probably?

Are we sure 4 is a portable answer.

The particular alignment issue causing the failure is probably a two byte one, based only on use of htons in that place in the code, but I definitely haven't looked around in this code to find the worst case alignment issue. Furthermore, I suspect there are additional instances of these char aligned buffers getting casted alarmingly into random data types therein . . .

Is the stack itself properly aligned initially?

I suppose that we _are_ an unusual BSP/ARCH, so there could be some suspicion there. I am looking at the _CPU_Context_Initialize we are using, which probably is mostly unmodified from stock RTEMS. The comment about the broken stack allocate functionality is concerning. I don't recall noticing it before. Nevertheless, wouldn't we see some fireworks if the stack pointer wasn't initially native word aligned?

```
1  void _CPU_Context_Initialize(
2  Context_Control *context,
3  void *stack_area_begin,
4  size_t stack_area_size,
5  uint32_t new_level,
6  void (*entry_point)( void ),
7  bool is_fp,
8  void *tls_area
9  )
10 {

Author: Trac Migrate 2019-07-25T00:27:27.000Z

Original author: johill

I suppose that if 4 bytes _is_ the correct alignment then buf could be array of native words, as a less unsightly fix.

The harvard risc nios2 is passing parameters in registers so perhaps gcc has less stringent stack alignment constraints?

Author: Joel Sherrill 2019-07-25T20:00:43.000Z

Original author: johill

Per https://www.intel.com/content/dam/www/programmable/us/en/pdfs/literature/hb/nios2/n2cpu_nii51016.pdf it looks like the stack only requires 32-bit alignment. If RTEMS meets that, then the only solution is to somehow properly align the buffer.

Author: Gedare Bloom 2019-07-31T19:32:12.000Z

Original author: johill

Probably the 'buf' should be aligned to the structure alignment since it gets cast to HEADER struct. You can at least use CPU_STRUCTURE_ALIGNMENT macro, or else create a union, something like this might work

```
union {
struct {
HEADER header;
u_char payload[RTEMS_ZERO_LENGTH_ARRAY];
};
u_char buffer[MAXPACKET];
} x;
u_char *buf = x.buffer;
```

The current Beagle I2C driver is quite specific to reading EEPROMs. A lot of other cases won't work.

Author: Trac Migrate 2019-06-29T07:38:44.000Z

Original author: Christian Mauderer

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"b89d6cc5e4eb29d54d9b64b9374c4cb3208d0d66/rtems" b89d6cc/rtems]:

```
bsp/beagle: Partial re-write of I2C driver.

The old driver worked well for EEPROMS with the RTEMS EEPROM driver. But
it had problems with a lot of other situations. Although it's not a
direct port, the new driver is heavily modeled after the FreeBSD ti_i2c
driver.

Closes #3764.
```

I am building dual core using LEON3 IP cores provided with GRLIB library in Cobham Gaisler website. The RTEMS 5 version is also provided in the same website. I have instantiated 2 LEON3 IP cores. Enabled SMP. Created a simple rtems C program of creating a task. But task creation is failing with Statius code - RTEMS_INVALID_ADDRESS In my makefile I have used -qbsp=leon3_smp switch.

Author: Joel Sherrill 2019-06-24T11:26:21.000Z

Original author: ashrithams

You will have to provide your task create call. But this error is documented as meaning the I'd parameter is NULL.https://docs.rtems.org/releases/rtemsdocs-4.6.2/share/rtems/html/c_user/c_user00065.html

Author: Trac Migrate 2019-06-25T03:50:29.000Z

Original author: ashrithams

Thank You for the reply. I have gone through the link you have provided and I am aware of it from C User documentation of RTEMS. However in what case does ID parameter be NULL, When I am very much declaring it? I have taken the code from the example application(1.37) provided in the RTEMS C User Documentation. Its as follows :

rtems_task Init(rtems_task_argument ignored) { rtems_id id;

status = rtems_task_create(rtems_build_name('T', 'A', ch, ' '), 1, RTEMS_MINIMUM_STACK_SIZE, RTEMS_NO_PREEMPT, RTEMS_FLOATING_POINT, &id); if (status!=RTEMS_SUCCESSFUL) { if (status = RTEMS_INVALID_ADDRESS) printf("TASK CREATION : RTEMS_INVALID_ADDRESS ERROR n"); }

}

Author: Trac Migrate 2019-06-27T07:14:08.000Z

Original author: ashrithams

Replying to Ashritha: [...]

> if (status = RTEMS_INVALID_ADDRESS) printf("TASK CREATION : RTEMS_INVALID_ADDRESS ERROR n"); [...]
>
> You should turn on and pay attention to compiler warnings to avoid bugs like this. Here you assign the value RTEMS_INVALID_ADDRESS to status.

Author: Trac Migrate 2019-07-06T09:25:55.000Z

Original author: ashrithams

Thank You for bringing out the mistake in the program. However after I set it correct, task creation is still failing. But now it is showing RTEMS_UNSATISFIED error.

Does it mean the stack size defined by RTEMS_MINIMUM_STACK_SIZE is not available really or should we based on the application redefine the MINIMUM_STACK_SIZE ?

Author: Joel Sherrill 2019-07-06T13:54:52.000Z

Original author: ashrithams

If that's your entire configuration, you forgot to configure any application tasks. Look at any of the examples.

Author: Trac Migrate 2019-07-08T05:38:46.000Z

Original author: ashrithams

Please have a look at the API documentation:

https://docs.rtems.org/branches/master/c-user/task_manager.html#rtems-task-create

RTEMS_UNSATISFIED non-preemption mode not supported on SMP system

You should update to the latest RTEMS master, if you want to use the SMP support.

Author: Trac Migrate 2019-07-08T05:39:57.000Z

Original author: ashrithams

- **Resolution** set to ~"invalid"
- **Status** changed from *new* to *closed*

The right error status is returned for this application error.

Original author: jbrandmeyer-piq

rtems master df8d7bd76f501 introduced an API change to SMP_Multicast_action that changed the number and meaning of this function's arguments. However, RTEMS-libbsd was not updated to use the new API.

Since that time, rtems-libbsd fails to build against an SMP BSP, starting in rtems-kernel-epoch.c line 285 or so.

The RTEMS configuration tested below is based on xilinx-zynq configured with with –disable-networking –enable-cxx –enable-smp –target=arm-rtems5 –enable-posix –enable-rtemsbsp=xilinx_zynq_zedboard BSP_ZYNQ_RAM_LENGTH=1024M

Build failure looks like this:

~/workspace/rtems/rtems-libbsd-git$ python3 ./waf

Waf: Entering directory `/home/sara/workspace/rtems/rtems-libbsd-git/build/arm-rtems5-xilinx_zynq_zedboard-default'

The Programmable Real-Time Unit (PRU) from Texas instruments is a dedicated i/o processeor on TIs Sitara Chips (e.g. Am35xx on the Beaglebone). Its main feature is that most of its i/o is accessible within one cycle of the PRU.

The driver needs to provide the following features: 1. Load Binaries on the PRU cores. 2. Control PRU Execution (start, stop, etc.). 3. Manage Resources (memory, interrupt mapping, etc.). 4. Provide a Method to send/receive messages for interacting with the PRU.

Linux loads Binaries to the PRU with remoteproc or UIO (userspace).

Communication can be provided via Interrupts (see https://elinux.org/Ti_AM33XX_PRUSSv2#Communication).

For detailed Information see: https://elinux.org/Ti_AM33XX_PRUSSv2 BeagleBoard Community PRU driver and Documentation: https://github.com/texane/pru_sdk

Original author: nilhoel

Some odd basic questions.

- Is this the official source? https://github.com/beagleboard/am335x_pru_package
- Is the PRU still included in newer CPUs? What about the Octavo like in the PocketBeagle? I don't want to see you spend time on something that is at the end of its lifecycle.
- Is all software that will be included on the RTEMS target system and PRU appropriately licensed (e.g. not proprietary or GPL)?
- Will the RTEMS side of the PRU client library have RSB recipes? Answer should be yes. :)

Author: Trac Migrate 2019-04-02T17:57:57.000Z

Original author: nilhoel

Replying to Joel Sherrill:

> Some odd basic questions. * Is this the official source? https://github.com/beagleboard/am335x_pru_package These are Files Provided by TI and altered by the BeagleBoard community.
>
> - Is the PRU still included in newer CPUs? What about the Octavo like in the PocketBeagle? I don't want to see you spend time on something that is at the end of its lifecycle.
>
> Yes. The PRU is included in the whole Sitara line by TI. The Octava is just a System in Package using the same AM33xx as the Beagle-Bone Black. For a full view of the Sitara line see: https://www.ti.com/processors/sitara-arm/overview.html.
>
> - Is all software that will be included on the RTEMS target system and PRU appropriately licensed (e.g. not proprietary or GPL)?
>
> The TI compiler is proprietary. TI uses this license head on their open source files:

> https://github.com/beagleboard/am335x_pru_package/blob/master/pru_sw/utils/LICENCE.txt.
> I think it should be fine but please double check.
>
> - Will the RTEMS side of the PRU client library have RSB recipes? Answer should be yes. :)
>
> I haven't red into the RSB yet, could you provide me a link to a good starting point in the Documentation. Then I will try to add this to my GSoC Proposal.

I see `pru_sdk` contains binaries. Is there source for these? Do the tools run on hosts other than Linux?

Author: Trac Migrate 2019-04-03T08:34:37.000Z

Original author: nilhoel

Replying to Chris Johns:

> I see `pru_sdk` contains binaries. Is there source for these? Do the tools run on hosts other than Linux? I am sorry I provided the wrong link there. The community PRU is @https://github.com/beagleboard/am335x_pru_package i will change that in the ticket. You will find the PRU Assembler sources there. TI provides SDKs for Windows and Linux with their Code Composer IDE. http://software-dl.ti.com/processor-sdk-linux/esd/AM335X/latest/index_FDS.html

3.9.1.89 3709 - rtems-libbsd build failure under Python 2

Id	3709
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Closed by	Kinsey Moore
Created	2019-02-26T15:57:10.000Z
Closed	2025-01-31T18:27:53.646Z

Original author: jbrandmeyer-piq

Waf was unable to build rtems-libbsd using the default python. Executing it with Python 3 succeeded. Full reproduction details follow, but the summary is that running the build step with `./waf` fails immediately with the error `Could not create the directory ///h`. Running configuration and build with python 3 succeeds.

Host operating system is Debian Stretch /usr/bin/python is 2.7.13 /usr/bin/python3 is 3.5.5

Perhaps this is Unicode-specific? `locale` reports:

```
LANG=en_US.UTF-8
LANGUAGE=
LC_CTYPE="en_US.UTF-8"
LC_NUMERIC="en_US.UTF-8"
LC_TIME="en_US.UTF-8"
LC_COLLATE="en_US.UTF-8"
LC_MONETARY="en_US.UTF-8"
LC_MESSAGES="en_US.UTF-8"
LC_PAPER="en_US.UTF-8"
LC_NAME="en_US.UTF-8"
LC_ADDRESS="en_US.UTF-8"
```

(continues on next page)

(continued from previous page)

```
LC_TELEPHONE="en_US.UTF-8"
LC_MEASUREMENT="en_US.UTF-8"
LC_IDENTIFICATION="en_US.UTF-8"
LC_ALL=
```

Reproduction: Fresh git checkouts of rtems, rtems-libbsd, and rtems-source-builder, all under ~/src, all at master, with the following sha:

```
rtems-source-builder: 38241392a4f96da
rtems: 7abc497b6c763c
rtems-libbsd: 5432c6bed37fa26a
```

Build the rtems toolchain, from rtems-source-builder/rtems, executed:

```
../sb-set-builder --prefix=$HOME/Programs/rtems_5 --with-fortran --with-lto 5/
↪rtems-arm
```

Rebuild the rtems build scripts. With $HOME/Programs/rtems_5/bin in the PATH, in the cwd of ~/src/rtems:

```
./bootstrap -c
$HOME/src/rtems-source-builder/source-buildersb-bootstrap
```

Create a separate build directory ~/src/build-rtems-zynq, cd into it and build rtems with:

```
../rtems/configure --prefix=$HOME/Programs/rtems_5 --disable-networking --enable-
↪cxx --enable-smp --target=arm-rtems5 --enable-posix --enable-rtemsbsp=xilinx_
↪zynq_zedboard
make -j<many>
```

Configure rtems-libbsd. In a pwd of ~/src/rtems-libbsd:

```
git submodule init
git submodule update rtems_waf
./waf configure --prefix=$HOME/Programs/rtems_5 \\
--rtems-bsps=arm/xilinx_zynq_zedboard \\
--buildset=buildset/default.ini
./waf
```

Now the bug: Configuration appears to succeed. However, subsequent execution of waf all by itself immediately fails with the error “Could not create the directory ///h”.

The sequence:

```
python3 ./waf configure --prefix=$HOME/Programs/rtems_5 \\
--rtems-bsps=arm/xilinx_zynq_zedboard \\
--buildset=buildset/default.ini
python3 ./waf
```

succeeds.

Author: Trac Migrate 2019-02-26T16:30:26.000Z

Original author: jbrandmeyer-piq

Reader beware: two forward slashes together are interpreted by Trac as an italic formatting request. The error text is `Could not create the directory ///h` with three forward slashes (backticks work for literally quoting the machine-output text).

Author: Chris Johns 2019-02-27T23:45:53.000Z

Original author: Shashvat Jain

whenever i commit in my rtems or rtems-docs git repository i get to see a Empty folder inside the repository . I am using MSYS2 shell on Windows 10 and the repo. is in the D: drive . Even

after i delete this folder , it returns back with the next commit.

Is this a genuine problem of the repository and a side effect of D: drive ?

```

Author: Chris Johns 2018-11-28T04:17:02.000Z

I am not sure how clean `rtems-ld` is for 64bit. Adding the machine type is easy but it could masking hidden issues.

The `libelf` code is built for 32bit and not 64bit as at the time there was only 32bit arch's. I am not sure how this code goes handling 32bit archs when built for 64bit. Also `libdl` and `rtems-ld` would need changes to make sure it is 64bit clean.

Original author: spindel

The native elf detection script of rtems-tools (rtems-tools/rtemstoolkit/elftoolchain/common/native-elf-format) does not recognize the host string "x86_64" as EM_X86_64. It expects the string x86-64.

The attached patch fixes this issue that causes the rtems-source-builder build process to abort.

The issue was observed on ubuntu 16.04.5 and ubuntu 18.04.1 (both x86_64) when trying to build the _5/**rtems-arm**_ target of **rtems-source-builder** (master). Manually adding the patch to _rtems-**tools-5-1.cfg**_ recipe fixed the issue.

```
%patch add rtems-tools file://rtems-tools_fix-native-elf-detection-on-x86_64-
↪machines.patch
```

3.9.1.95 3611 - qemu/glib fails to build with newer gcc

Id	3611
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-11-17T16:18:41.000Z

Original author: arand

The rsb qemu build fails on Debian Stretch with the following error:

CC libglib_2_0_la-gdate.lo ../../glib-2.39.3/glib/gdate.c: In function ‘g_date_strftime’: ../../glib-2.39.3/glib/gdate.c:2497:7: error: format not a string literal, format string not checked [-Werror=format-nonliteral] tmplen = strftime (tmpbuf, tmpbufsize, locale_format, &tm); ^~~~~~

I experimented around a bit and if glib is updated to version 2.48.2 this seems to be solved, but then it instead fails due to a missing libpcre dependency.

I tried forcing the internal version of pcre instead, and that seemed to at least make the build go through.

The experimentation I did is attached as a patch.

I tested the build result qemu-system-or32 briefly, and I’m not sure it works properly in the end:

$ ~/utv/rtems-build/5/bin/qemu-system-or32

(process:18292): GLib-WARNING **: ../../glib-2.48.2/glib/gmem.c:483: custom memory allocation vtable not supported qemu: fatal: Trying to execute code outside RAM or ROM at 0x08000000

changed the description

3.9.1.96 3608 - RISC-V Simulator Not in RSB Qemu Version

Id	3608
State	closed
Type	ISSUE
Author	Joel Sherrill
Assignee(s)	Trac Migrate
Created	2018-11-15T23:15:53.000Z
Updated	2025-09-19T01:06:44.263Z
Milestone	6.1
Labels	arch:riscv, old-indefinite, priority::normal, resolution::fixed, ticket-type::defect, tickettype::task, version::5
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3608
Merges	0

The Qemu version in the RSB does not have RISC-V support. Sebastian has been using a newer version from some project's git repository.

This is one of the two alternative simulators to run RISC-V executables. At the moment, neither Spike nor Qemu are usable for the RISC-V as present in the RSB.

Author: Trac Migrate 2018-11-16T06:27:22.000Z

- **Milestone** changed from %"5.1" to %"Indefinite"
- **Owner** set to Needs Funding

I would wait until the RISC-V is available in an upstream Qemu.

Author: Joel Sherrill 2022-02-17T14:06:13.000Z

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

I think this is OBE. We probably are always in need of a Qemu update in the RSB but not for this reason. At least not today.

Original author: Shashvat Jain

As per coverity scan at [https://scan.coverity.com/projects/rtems] ,CID 1437649 , line 103 in fifo.c is unreachable and the code is called to be structurally dead. You will need an Coverity Scan account and permission to view RTEMS to see more details. all the “goto” statements are present , the problem could have arised due to syntax issue like “indentation” or due to a problem in upstream files.the code in question is: 100 c = ‘a’; 101 return 0; 102

CID 1437649 (#1 of 1): Structurally dead code (UNREACHABLE) unreachable: This code cannot be reached: rtems_barrier_delete(pipe->.... 103 rtems_barrier_delete(pipe->writeBarrier); 104err_wbar: 105 rtems_barrier_delete(pipe->readBarrier); 106err_rbar: 107 free(pipe->Buffer); 108err_buf: 109 free(pipe); 110 return err; 111}

Author: Joel Sherrill 2018-11-03T15:20:28.000Z

Original author: Shashvat Jain

Line 103 does indeed appear to be dead. It is in between a return 0 and a label. There is no way to get there.

Original author: Sal

DHCP requests add the hostname option in dhcp_request_req() without checking its length, so the hostname can be of any length. This is a defect because the DHCP spec (https://tools.ietf.org/html/rfc2132) requires the hostname to have a minimum length of 1 char. This appears to trigger a bug in a specific Netgear router that causes it's DHCP process to lock up and could affect other things as well.

This bug can be solved applying the patch made by Aun-Ali Zaidi in the original ticket reporting this defect (https://devel.rtems.org/ticket/1405) that was never applied. I've been able to compile the code with the patch applied and it didn't raise any warnings.

We have permission from the author (Peter Magnusson) to convert this page:

https://web.archive.org/web/20120205014832/https://www.sics.se/~psm/sparcstack.html

to Rst and incorporate it into the SPARC CPU Supplement. The original website is no longer available and we have to reference archive.org. This information was quite useful to those who have dived into the details of the SPARC.

The conversion will need to be done by hand to ensure that the resulting Rst file is consistent with RTEMS Documentation Rst files. For the purposes of this ticket, assume the converted content will be placed as a new section at the end of the SPARC chapter in the CPU Supplement.

https://git.rtems.org/rtems-docs/tree/cpu-supplement/sparc.rst

For a first cut, the ASCII figures on the website can be ASCII figures in the Rst. As a second pass, they should be processed with DITAA into PNG files.

There is a starting point for the conversion in Joel's personal git repository on the sparcv8 branch. The content has had a very basic sanity check but there is more to do. Known issues with formatting are noted in the file. This repo can be browsed at https://git.rtems.org/joel/rtems-docs.git/. Please submit patches against the repo for the file cpu-supplement/sparc_v8_stacks_regwin.rst.

This ticket is to track that conversion.

or1k tools **COULD** be updated those from https://github.com/stffrdhrn?tab=repositories. Stafford Horne is working on addressing the last bits of code from the person who wouldn't sign the FSF assignment. I managed to build a toolchain from that using FSF binutils-gdb and his gcc. The downside is that it is tracking gcc master.

I am not convinced we should switch to this yet but when it is merged upstream to the FSF GCC, we should probably do it then.

Author: Amar Takhar 2018-10-22T15:22:22.000Z

The build is failing with the RSB it's not even attempting to build it. Same issue for Epiphany

https://devel.rtems.org/wiki/TBR/UserManual/Quick_Start seems to be redundant with https://docs.rtems.org/branches/master/user/start/index.html#quick-start

We need to review the Sphinx version for completeness versus the Wiki and eliminate the Wiki page including changing references to the Wiki page to point to the Users Guide.

That should allow the page to be deleted.

This may also apply to the 4.11 branch since we probably want to be consistent.

With RTEMS sometime after the bsp source reorganization, I now encounter errors when compiling RTEMS in a path that has a space in the name. This used to work. I will try to bisect to find the commit that makes it break. The current thought is that one of our custom automake scripts is not handling the path nicely.

make[4]: Entering directory '/media/gedare/Seagate Expansion Drive/work/rtems/builds/b-erc32-5/sparc-rtems5/c/erc32/lib/libbsp' Making all-am in . Making all-am in sparc make[5]: Entering directory '/media/gedare/Seagate Expansion Drive/work/rtems/builds/b-erc32-5/sparc-rtems5/c/erc32/lib/libbsp/sparc' make[5]: * **No rule to make target 'all-am'. Stop. make[5]: Leaving directory '/media/gedare/Seagate Expansion Drive/work/rtems/builds/b-erc32-5/sparc-rtems5/c/erc32/lib/libbsp/sparc' Makefile:656: recipe for target 'sparc' failed make[4]:** * [sparc] Error 2

Author: Joel Sherrill 2018-06-08T14:50:48.000Z

I duplicated this on Centos with the native filesystem.

sparc-rtems5-ranlib libscore.a gmake[5]: *** No rule to make target ``../../include/rtems/score/cpuopts.h', needed by ``all-am'. Stop.

My RTEMS source was under a directory with no spaces. But the build directory had a space in the final component. Based on Gedare's report, I think it doesn't matter where the space is in the path.

```
Build directory: /home/joel/rtems-work/test build
RTEMS Source:    /home/joel/rtems-work/rtems
```

Author: Joel Sherrill 2018-10-14T00:53:10.000Z

Author: Joel Sherrill 2018-11-14T15:25:08.000Z

This is the incredibly old GNU make issue https://savannah.gnu.org/bugs/?712 which was originally filed in 2002 and has **NOT** had an update since 2015.

I am recommending we mark this as Won't Fix and add a note to the Users Guide recommending that users not include a space (or other special characters) in their build or installation directories.

Author: Chris Johns 2018-11-14T22:58:41.000Z

Should we add a check to configure?

Author: Joel Sherrill 2018-11-14T23:16:58.000Z

Replying to Chris Johns:

> Should we add a check to configure?
>
> Which configure? There are so many places this could break. If we do anything, I would say add it to sb-check for work directory and sb-setbuilder for prefix. GCC, Binutils, GDB, Newlib, Qemu, etc. all use make to build. We can't change every configure on every program. RSB checking would probably catch users before they get too far down the path.

Author: Chris Johns 2018-11-14T23:53:05.000Z

From the ticket I assumed the break has happened with `rtems.git` so I am asking if the top level `configure` does a check?

3.9.1.112 3427 - Improvements to barectf

Id	3427
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2018-05-09T04:41:29.000Z
Updated	2025-09-19T01:06:40.588Z
Milestone	6.1
Labels	priority::normal, resolution::wontfix, tickettype::project, tickettype::task, tool
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/3427
Merges	0

Original author: VidushiVashishth

barectf is a command line generator of C tracers which outputs CTF packets natively. Barectf suffers through the following limitations:

1) Lacks support for compound data types such as array and structs
2) Depends on stdint.h header file which is in the new C99. If this is not supported by standard C library on the users machine then a new library defining all the relevant datatypes can be created.

This task involves overcoming the aforementioned drawbacks of barectf and is a part of the project

Author: Trac Migrate 2018-05-09T06:03:25.000Z

Original author: VidushiVashishth

I don't understand the problem with a stdint.h dependency.

Author: Trac Migrate 2018-05-09T06:10:44.000Z

Original author: VidushiVashishth

The barectf generated C code needs the stdint.h header file because of the use of datatypes int8_t, int16_t etc. This header file is supported by the new C99. If the standard C file on the user machine does not have this header then it needs to be created according to the architecture of the user machine.

Author: Trac Migrate 2018-05-09T06:15:30.000Z

Original author: VidushiVashishth

What is a user machine? Which user machines lack support for C99? If a user machine is an RTEMS target, then you can assume C11.

Author: Trac Migrate 2018-05-09T06:38:59.000Z

Original author: VidushiVashishth

Yes by user machine I mean RTEMS target. I will update the ticket description.

Author: Trac Migrate 2018-05-09T06:41:13.000Z

Original author: VidushiVashishth

The use of stdint.h is not a problem in RTEMS.

Author: Trac Migrate 2018-05-09T06:55:53.000Z

Original author: VidushiVashishth

I am not too sure if the host machine too should have support for stdint.h. I will try running a few barectf example codes and then update the ticket likewise.

Author: Trac Migrate 2018-05-09T07:00:08.000Z

Original author: VidushiVashishth

I don't think that a stdint.h dependency is a problem for a host machine.

Author: Trac Migrate 2019-02-20T10:10:30.000Z

Original author: VidushiVashishth

- **Resolution** set to ~"wontfix"
- **Status** changed from *assigned* to *closed*

According to the barectf documentation as of 2019-02-20 there is still no support for CTF compound types. At the moment this is not an RTEMS issue.

Author: Chris Johns 2025-09-19T01:06:40.652Z

Summary

`rmdir` should fail with either `ENOTEMPTY` or `EEXIST` (the first one is preferred) when the last component of the supplied path is dot-dot.

Author: Amar Takhar 2024-07-19T03:51:42.487Z

If you don't mind you can link these to your MRs by referring to the issue # .. I have done the other two for you previously you can also mention the mr using an exclamation point and number: !80 – this has now linked the issue so you can use this in your description, too.

Author: Loris Nardo 2024-07-19T04:09:19.181Z

mentioned in merge request !80

Author: Loris Nardo 2024-07-28T05:39:03.122Z

This issue has been created because the testcase fstest/fsrmdirparent fails.

I've checked better what happens: in the testcase the `rmdir` fails with `EBUSY`, this is because in the testcase it is trying to remove the current working directory; however if I change the testcase to remove a different dot-dot folder, the testcase passes.

The different error is just because the condition for `EBUSY` is checked before. The dot-dot path is treated as valid and then fails inside `rmnod_h` with the correct error code.

If it is fine I can fix the testcase

Author: Amar Takhar 2024-07-28T05:39:15.488Z

Sounds like the test is bad submit an MR and in the commit message put "Closes #5071" .. so that way this will be closed and referenced thank you! – without the quotes. :)

Merges	0

Summary

RFS file system does not honor `NAME_MAX`, in addition it does not check whether the file name is longer than the maximum allowed for its configuration causing the allocation of all remaining free blocks

Steps to reproduce

1. Configure a RFS mounted partition
2. Rename a file to a name longer than the block size, the rename operation fails with `ENOSPC`

Author: Amar Takhar 2024-07-18T18:47:43.053Z

mentioned in merge request !80

Author: Loris Nardo 2024-08-07T19:15:20.827Z

changed the description

Author: Chris Johns 2025-06-05T00:31:20.307Z

The Open Group rename call says about the `ENAMETOOLONG` :

> The length of a component of a pathname is longer than {NAME_MAX}.
>
> The `libio` rtems_filesystem_rename_t handler passes in to the file system only the component and it provides the length. The standard also says all components must be less than the `NAME_MAX` size and FreeBSD also adds the path length should be less than 1023 characters. The RFS cannot check the path as `libio` provides a LOC for the path.
>
> I will not fix this in the RFS and it is a `libio` bug. The `expected-fail` on the RFS is false and should be removed.

Author: Amar Takhar 2025-06-05T02:01:10.400Z

@chris The corresponding MR was merged are you saying it should be reverted? Partially reverted?

Author: Chris Johns 2025-06-05T02:01:10.400Z

No lets not bother. The ticket number in the `spec` points here and I have created #5257 to track the actual change needed. Reverting the change would make the test count again and it is still broken.

Author: Amar Takhar 2025-06-05T02:01:10.400Z

Okay thanks I linked the other issue as `Related to`.

Author: Amar Takhar 2025-06-05T02:00:23.315Z

Summary

The current implementation of the AIO interface does not use the `aio_sigevent` field in the `aiocb` struct to generate a notification upon request completion.

Summary

When working in editors like vi, vim, and neovim it is helpful to have compile_commands.json. WAF extras do have this, but it is not included in the library produced/fetched by the waf binary in .waf3-2.0.19xxxxx. Currently the json can be created by other external tools, but having this out of the box in waf seems more appropriate.

Steps to reproduce

create a hello project and use the instructions of the quick start. Add a line containing 'conf.load('clang_compilation_database')' in the def configure(conf) function.

Author: Amar Takhar 2024-07-06T22:09:31.480Z

I looked into this and with the way the build system is written for RTEMS I don't see how we'll be supporting this easily.

Honestly I'm not even sure if we'd ever want to support it there is a lot of complexity between architectures that can't be distilled down to a simple set of commandline arguments.

Having said that: waf is already incredibly fast and accurate. The advantages of taking the commands out of the build system into the IDE or editor are to speed up compiling single files but I don't think using waf you would get any perceptible speedup at all.

You're way better off running "waf" as your run command and "waf configure" if you edit `config.ini`.

Author: Amar Takhar 2024-07-06T22:10:45.292Z

For anyone else who has interest here are the two relevant pages you may want to read:

- https://clang.llvm.org/docs/JSONCompilationDatabase.html
- https://gitlab.com/ita1024/waf/-/blob/master/waflib/extras/clang_compilation_database.py

Author: Michael Frandsen 2024-07-07T06:46:21.532Z

I closed this since it will likely never be implemented and I am not creating the json for speed issues in compilation. I will use "bear – ./waf" to create the file.

Summary

Although the linker script places **.ctors** and **.dtors** inside **.init_array** and **.fini_array**, **CPU_USE_LIBC_INIT_FINI_ARRAY** is defined as FALSE which causes constructors and destructors to not get called.

x86_64 is actually never meant to use the _init and _fini generated by GCC as they will mess up stack alignment and potentially cause a General Protection Fault if any constructor utilizes SSE. Setting **CPU_USE_LIBC_INIT_FINI_ARRAY** to true fixes the issue.

3.9.1.122 5044 - FAT32 creating a file after a rename of a still opened file can yield back the same file

Merges	1

Summary

We have found that with FAT32 file system it is possible to end up in a situation in which creating a new file yields back a file whose name has been changed in the same folder.

Steps to reproduce

1. Open a file in a folder mounted with FAT32 file system (open call)
2. Rename the still opened file (rename call)

3. Create a file in the same folder (open call) At this point the newly created file aliases the file still open at point 1 if the FAT32 directory entry for the old name of the file at point 1 is used by the open call at point 3.

This happens because the fat_file_open constructs a key based on the directory entry position and uses it to perform a lookup, since the rename operation does not change the inode number nor does it update the hash table used for the lookup, it is possible for the fat_file_open called by point 3 to find in the lookup table the valid entry of the file opened at point 1.

A possible fix is to change the inode number of the file when it is renamed at point 2, this has the potentially undesired effect that the file opened at point 1 changes the inode number in between however.

@loris.nardo how hard would it be to update https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/testsuites/fstests/fsrename/test.c to test this issue?

Author: Loris Nardo 2024-06-22T06:10:46.211Z

I think that it is easy enough. In the next days I'll add to it, thanks to pointing to the correct test file. The idea is to write to the first file before the rename and then check with a read on the other file created after the rename, if there is no data read then the test is fine. I've finished writing it but first I need to test it.

3.9.1.123 5042 - amd64: console_initialize throws fatal error due to console device_file having the same path

Milestone	6.1
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5041
Merges	1

Summary

The **psxspin01** test fails on:

```
../../../testsuites/psxtests/psxspin01/test.c:102 _ISR_Get_level() != 0
```

Due to **_CPU_ISR_Disable** (located in **/cpukit/score/x86_64/include/rtems/score/cpu.h**) wrongfully calling **amd64_enable_interrupts** instead of **amd64_disable_interrupts**.

Even beyond this mistake the general implementation of **_CPU_ISR_Enable**, **_CPU_ISR_Disable** and **_CPU_ISR_Flash** do not follow the expected behavior as **_CPU_ISR_Disable** unconditionally sets level to disabled and both **_CPU_ISR_Enable** and **_CPU_ISR_Flash** enable interrupts independently of the level passed to them.

Merges	1

The `aio_fsync()` specification defines that the `op` parameter can be either `O_DSYNC` or `O_SYNC`. However, the current implementation of the method only accepts `O_SYNC`.

Author: Alessandro Nardin 2024-06-13T08:50:23.920Z

changed title from **{-``-}aio_fsync(){-``-} does not support {-``-}O_DSYNC{-``-}** to **aio_fsync() does not support O_DSYNC**

Author: Alessandro Nardin 2024-06-13T08:59:35.107Z

I found issue #1683 from the last GSoC project that worked on the AIO Interface. I attempted to locate `fcntl.h` to check if the definitions were still missing, but I couldn't find the file. Could someone help me locate it?

Also, according to the specifications, when a call to `aio_fsync()` is made with `op=O_DSYNC`, the request should be handled by a call to `fdatasync()`. I searched for this function to verify if it was correctly implemented. The function is present, but I am not sure if it performs as expected. Before diving too deep into the code, I wanted to ask if any of you already know whether the fdatasync() function is correctly implemented.

Author: Kinsey Moore 2024-06-13T12:28:57.013Z

Author: Joel Sherrill 2024-06-16T12:22:06.005Z

fdatasync() itself is implemented correctly. It depends on the file system to do the work.

I think setting this means that after every read/write/etc, fdatasync() should be called. It is adding conditional behavior.

Author: Alessandro Nardin 2024-06-16T12:22:28.426Z

After a first read of the documentation, I was left with the impression that it would be sufficient to call `fdatasync` instead of `fsync` if op was with `O_DSYNC`.

I'll need to read more and verify if that's actually a valid approach or if i missed something.

Author: Joel Sherrill 2024-06-16T17:03:16.059Z

I think that is correct. Be careful reading the POSIX specification to see if the synchronization call is once for the entire set or on each operation.

FWIW AIO should be in the RTEMS POSIx guide. As you complete each functionality improvement, you should check it see if the documentation needs updating also

Author: Alessandro Nardin 2024-06-16T18:27:55.849Z

Awesome, i'll double check the specification and start working.

Author: Alessandro Nardin 2024-06-26T13:41:09.804Z

I reviewed the documentation and it doesn't specify whether `aio_fsync()` should synchronize after every individual operation or just once after all enqueued operations are completed. The specification only states that all currently queued operations for the file should be synchronized.

From my understanding, the current implementation uses the latter approach, synchronizing once after all enqueued operations have completed. However, I have some concerns about the implementation details:

To ensure synchronization after all already enqueued operations, the sync request should be placed at the end of the queue. This is because we process the next operation from the top of the queue.

However, in our implementation, the insertion into the queue is not always at the bottom. It's based on the request priority, with requests having a low `aio_reqprio` value being placed earlier in the queue. I've noticed that there's no mechanism to guarantee that the sync request is placed at the bottom of the queue. Is this an error or am I misunderstanding the code?

Author: Joel Sherrill 2024-06-27T15:24:55.314Z

It looks like the aio enqueue process will insert requests on to the one associated with the thread for that file descriptor. But if I am reading this code right, the requests are placed in LIFO order.

```
while (
req->aiocbp->aio_reqprio > prio &&
!rtems_chain_is_tail( chain, node )
) {
```

I think that should be >= prio so the scan for the insertion point will put new requests at the same priority at the end of the same priority ones. If I am reading this right, changing to >= prio should address your concern.

I think all requested operations on a single fd should be processed in priority order and FIFO order when at the same priority.

Author: Alessandro Nardin 2024-06-29T13:38:50.145Z

I have noticed that O_DSYNC is not defined, as noted in issue #1683. I tried to locate file fcntl.h but could not find it. How should i proceed?

Author: Joel Sherrill 2024-06-29T20:14:17.181Z

fsync.h is from newlib and installed with your compiler. The definition of O_DSYNC and O_RSYNC are inside an ifdef(__CYGWIN__) but according to POSIX, two of the four items defined there are standard. Find them in _default_fsync.h.

For the short term, edit the installed file and let's see what works for you. Then I can take the lead to get this submitted to newlib and bump the RTEMS RSB. [Disclaimer: I have nothing against you doing the fix to newlib but it is a detour which could take time away from your real goal of AIO.]

Perhaps we are also fixing #1683 at the same time.

Merges	1

According to the POSIX specifications for *aio_return() <)*](https://pubs.opengroup.org/onlinepubs/9699919799/>`_:

The aio_return() function may be called exactly once to retrieve the return status of a given asynchronous operation; thereafter, if the same aiocb structure is used in a call to aio_return() or aio_error(), an error may be returned.

However, the current implementation of aio_return() simply returns a value in `aiocbp->return_value`. This allows `aio_return()` and `aio_error()` to be called again after the first call to `aio_return()` without generating an error, contrary to the specification.

Author: Alessandro Nardin 2024-06-13T08:22:32.473Z

Author: Alessandro Nardin 2024-06-13T08:26:25.156Z

changed the description

Author: Alessandro Nardin 2024-06-13T08:29:32.256Z

My idea for a possible solution is to add an additional private field to the `aiocb` structure to indicate whether `aio_return()` has already been called.

Let me know if this approach is viable.

Author: Joel Sherrill 2024-06-16T12:13:16.636Z

I think this may be the only approach. Reading https://pubs.opengroup.org/onlinepubs/009695399/functions/aio_return.html, it looks like the AIO implementation will have to track from when requested until the status is returned.

So yes. Looks like the approach to me. Just honor the POSIX specification.

Author: Alessandro Nardin 2024-06-16T12:13:16.610Z

perfect, i'll start working on that then.

Summary

Find a means to embed the `.debug_gdb_scripts` section in an executable.

The GDB manual provides a section The .debug_gdb_scripts section which details what the section looks like.

3.9.1.128.1.1 Solutions

This is an initial list of possible solutions. There may be more so please add to the list any other possible solutions.

1. Get the linker command file to embed the section directly into the executable
2. Create a object file the linker command file loaded into the executable

Author: Chris Johns 2024-06-11T06:14:02.891Z

Author: Chris Johns 2024-06-15T01:14:48.900Z

changed the description

Author: Suraj Kumar 2024-06-30T01:53:59.088Z

Using C to generate the object code for us seems to be the best way to go forward with this, to let us not worry about architecture specifics.

Currently, the idea is to add the code snippet containing the Python code to a C file which is universally accessed by the linker for all links. A starting point is: https://gitlab.rtems.org/rtems/rtos/rtems/-/blob/main/cpukit/sapi/src/exinit.c

The following modifications can be made to the file to reflect the desired changes:

1. Add macro definition

```
#define DEFINE_GDB_PY() \\
asm( \\
".pushsection \\".debug_gdb_scripts\\", \\"MS\\",@progbits,1\\n" \\
".byte 4\\n" \\
".ascii \\"gdb.inlined-script\\\\n\\"\\n" \\
".ascii \\"import sys\\\\n\\"\\n" \\
".ascii \\"import os.path\\\\n\\"\\n" \\
".ascii \\"sys.path.append(os.path.join(gdb.PYTHONDIR, 'rtems'))\\\\n\\
↪"\\n" \\
".ascii \\"print(sys.path)\\\\n\\"\\n" \\
".ascii \\"print(gdb.PYTHONDIR)\\\\n\\"\\n" \\
".ascii \\"import rtems.stdcxx as stdcxx\\\\n\\"\\n" \\
".byte 0\\n" \\
".popsection\\n" \\
)
```

2. Add macro call in function `rtems_initialize_data_structures()`

After these modifications, build the BSP again and build this application

```
int main() {
DEFINE_GDB_PY();
std::cout << "Hello World" << std::endl;
```

(continues on next page)

(continued from previous page)

```
4
5  auto v = std::vector<int>({1, 2, 3, 5, 7, 8});
6  for (auto i: v) {
7  std::cout << i << ' ';
8  }
9  std::cout << std::endl;
10
11 return 0;
12 }
```

After that, running this command shows us the existence of `.unexpected_sections` (which exists because we didn't tell the linker about the custom section).

```
1 arm-rtems6-readelf -S <path_to_exe>
```

We can dump the section with

```
1 arm-rtems6-objdump -s -j .unexpected_sections <path_to_exe>
```

to verify the existence of said script.

To make the section show up as a valid section to test in GDB, add this line to `linkcmds.base` present in `{prefix}/rtems/6/arm-rtems6/xilinx_zynq_a9_qemu/lib/linkcmds.base`:

```
1 .debug_gdb_scripts 0 : { *(.debug_gdb_scripts) }
```

And rebuild the file

Author: Chris Johns 2024-06-30T01:53:59.055Z

This looks good.

Is check the linker commands for all archs also a task to be included in this list?

Author: Suraj Kumar 2024-06-30T15:48:50.582Z

@chris Yes that is currently under testing.

Right now, I am building multiple architectures and BSPs to verify that this feature works across the board (and to identify Architectures where it fails). The section is embedding itself perfectly in the executable with just modifications to

1. linkcmds.base
2. exinit.c

The issue I am facing is setting up a debugger for each architecture, as there seems to be an issue (especially in `sparc`) in debugging with the `sis`.

Should I mention somewhere specifically that testing across multiple architectures is also part of this?

Author: Chris Johns 2024-07-01T03:58:46.993Z

You do not need to run and step the executable for each arch. Starting `gdb` with the executable should be enough to the trigger the auto-loading of the python support and our special section. It you see the prints then it is all that is needed. I think there is a print in the RTEMS C++ loader?

Note, when comfortable you can remove the path prints in the debug section. I only added those to show what was happening. The will not be needed in the version we commit to the repo.

Author: Suraj Kumar 2024-07-01T10:31:18.514Z

Ooh okay, that makes things way more easier then! I shall do that, thank you. In that case then, the feature has been working on every arch so far, with no hiccups.

And yes I will remove the path-printing statement from the fragment in my next commit to the MR.

Summary

The spec files for the amd64 and amd64efi contain a lot of duplicated links and sources which could be avoided using a common group and object file.

!43 !47

Author: Ning Yang 2024-05-31T12:44:42.461Z

Hi @gedare,

I recommit !47, and I created new pl011 structures for `aarch64/xilinx\ |md_0_8206|\ -versal\ |md_0_8206|\ ``, ``aarch64/raspberrypi` and `arm/raspberrypi`.

please give your comments.

Thanks!

Author: Ning Yang 2024-06-14T11:16:43.562Z

Author: Chris Johns 2024-09-19T03:59:22.356Z

@sebhub is reporting some BSPs are not building. The define is not present in the sources:

```
$ grep -r ARM_PL011_FIFO_DEPTH cpukit/ bsps/
bsps/shared/dev/serial/arm-pl011.c:  char buffer[ARM_PL011_FIFO_DEPTH];
$
```

It is defined in a spec option:

```
$ grep -r ARM_PL011_FIFO_DEPTH spec/
spec/build/bsps/optconsolefifo.yml:name: ARM_PL011_FIFO_DEPTH
$
```

Author: Ning Yang 2024-09-19T03:59:22.320Z

The following BSPs use the arm-pl011 driver, and they can all be built successfully.

```
[aarch64/raspberrypi4b]

[aarch64/a53_lp64_qemu]

[aarch64/a72_lp64_qemu]

[aarch64/xilinx_versal_qemu]

[arm/raspberrypi]

[arm/realview_pbx_a9_qemu]

[arm/xen_virtual]
```

Author: Chris Johns 2024-09-19T04:01:01.248Z

Where is `ARM_PL011_FIFO_DEPTH` defined in your successful builds?

Author: Sebastian Huber 2024-09-19T04:01:37.593Z

When you do changes in the shared BSP directory, you have to build all BSPs. The arm-pl011.c is built for all BSPs:

```
grep -r arm-pl011.c spec
spec/build/bsps/aarch64/raspberrypi/bspraspberrypi4.yml:- bsps/shared/
↪dev/serial/arm-pl011.c
spec/build/bsps/aarch64/xilinx-versal/obj.yml:- bsps/shared/dev/serial/
↪arm-pl011.c
spec/build/bsps/obj.yml:- bsps/shared/dev/serial/arm-pl011.c
```

Author: Sebastian Huber 2024-09-19T04:05:01.820Z

Please change the build support to use something similar to spec/build/bsps/objdevserialzynq.yml. For example:

- spec/build/bsps/objdevserialarmpl011.yml
- spec/build/bsps/optarmpl011fifodepth.yml

Author: Ning Yang 2024-09-19T05:16:00.960Z

Done. !228

I attempted to add a comment to !34 but it was already merged. The code around start.S:42 needs to consider the following:

- How do we know the _ISR_Stack_area_end address is properly aligned? Is that guaranteed by the linker script? At least add a comment.
- And will the ISR stack pointer be decremented before anything is written to it? The end addresses are often the same as the start of the next area in the linker script.

Double check these possible issues and at least add comments to clarify assumptions.

assigned to @mpec

Author: Matheus Pecoraro 2024-05-24T14:12:41.476Z

- I believe it's guaranteed to be aligned to 64 bits here
- The stack pointer will be decremented by the call instruction to save the return address

Would these comments be good?

Summary

3.9.1.136.1 Purpose

In some situations it can be useful to emulate an SPI using simple GPIO functions. An example for such an situation would be the one-time initialization of a chip on a system where all hardware SPI controllers are already used for other applications.

3.9.1.136.2 Result

A generic SPI driver which uses function pointers to pin get / set functions. Only basic SPI modes will be supported but it should be possible to extend more functionality later. Frequency is just as fast as possible. Additionally a driver for the arm/(imx|imxrt) family will be added.

Summary

scanf() is not blocking in UART interrupt mode. I think this might be a termios bug.

Steps to reproduce

I tried the `arm/xilinx_zynq_a9_qemu`.

It use interrupt driven mode for console devices (used by default).

My test app is:

```
#include <rtems.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <sys/types.h>
#include <errno.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <termios.h>
#include <rtems/error.h>
#include <string.h>

rtems_task Init(
rtems_task_argument ignored)
{
char s[10];
printf("scanf: ");
scanf("%s",s);
printf("printf: %s\\n",s);
exit(0);
}
#define CONFIGURE_APPLICATION_NEEDS_CLOCK_DRIVER
#define CONFIGURE_APPLICATION_NEEDS_CONSOLE_DRIVER

```

(continues on next page)

(continued from previous page)

```
#define CONFIGURE_UNLIMITED_OBJECTS
#define CONFIGURE_UNIFIED_WORK_AREAS

#define CONFIGURE_RTEMS_INIT_TASKS_TABLE

#define CONFIGURE_INIT

#define CONFIGURE_FILESYSTEM_IMFS

#include <rtems/confdefs.h>
```

output:

```
qemu-system-arm.exe -no-reboot -serial null -serial mon:stdio -net none -
↪nographic -M xilinx-zynq-a9 -m 256M -kernel test.exe
qemu-system-arm.exe: warning: nic cadence_gem.0 has no peer
qemu-system-arm.exe: warning: nic cadence_gem.1 has no peer
scanf: printf:

[ RTEMS shutdown ]
RTEMS version: 6.0.0.d3a0434a2c4759edac193b4f8b23224b8badbef5
RTEMS tools: 13.2.0 20230727 (RTEMS 6, RSB␣
↪07ba8d5f8f514b70ed6908c73d2dc5562f4723e1, Newlib 3cacedb)
executing thread ID: 0x0a010001
executing thread name: UI1
```

scanf() is not blocking.

but if I reapply existing settings without changes then it behaves as expected.

add the following code before scanf():

```
struct termios term;
tcgetattr(STDIN_FILENO, &term);
tcsetattr(STDIN_FILENO, TCSANOW, &term);
```

scanf() is blocking.

test app:

```
rtems_task Init(
rtems_task_argument ignored)
{
char s[10];
printf("scanf: ");

struct termios term;
tcgetattr(STDIN_FILENO, &term);
tcsetattr(STDIN_FILENO, TCSANOW, &term);

scanf("%s",s);
```

(continues on next page)

(continued from previous page)

```
printf("printf: %s\\n",s);
exit(0);
}
```

output:

```
qemu-system-arm.exe: warning: nic cadence_gem.0 has no peer
qemu-system-arm.exe: warning: nic cadence_gem.1 has no peer
scanf: testtest123
printf: testtest123

[ RTEMS shutdown ]
RTEMS version: 6.0.0.d3a0434a2c4759edac193b4f8b23224b8badbef5
RTEMS tools: 13.2.0 20230727 (RTEMS 6, RSB
↪07ba8d5f8f514b70ed6908c73d2dc5562f4723e1, Newlib 3cacedb)
executing thread ID: 0x0a010001
executing thread name: UI1
```

I found this issue while testing the UART interrupt mode of the pl011 driver using `aarch64/raspberrypi`. `aarch64/raspberrypi` also have this issue. I think this issue has nothing to do with UART driver.

Summary

In general, for test runs the system should reset once the test program terminated. The system reset implementation is BSP-specific. This makes _CPU_Fatal_halt() essentially a dead function since it is invoked after the BSP fatal extension which resets the system. To avoid this issue make the _CPU_Fatal_halt() implementation BSP-specific (similar to riscv and sparc).

Original author: mgsouth

sb-set-builder to build 7/rtems-arm fails with “C++17 needed” warnings and errors. If wscript is patched to include “-std=c++17” then the build is successful.

Attempted:

Build 7/arm on recentish Gentoo x86_64 build host.

```
git clone git://git.rtems.org/rtems-source-builder.git /XXX/rsb
git clone git://git.rtems.org/rtems.git /XXX/kernel
```

```
$ sb-set-builder --topdir=/XXX/rsb/rtems --prefix=/XXX/build/v7/tools 7/rtems-arm
```

Build log:

```
RTEMS Source Builder - Set Builder, 6 (633023de6517 modified)
Command Line: /XXX/rsb/source-builder/sb-set-builder --topdir=/XXX/rsb/rtems --
```

Fix:

Patched to replace "-std=c++14" with "-std=c++17". Build and install was successful. (I'll send the patch to the mailing list.)

↪line 74, in bsp_configure
if conf.options.rtems is None:
AttributeError: Values instance has no attribute 'rtems'
```

this is due to fact the conf.options variable does not have any `rtems` field e.g. the dictionary is missing `rtems` key.

Another issue is that when this is fixed, then following code sets libbsd path to None if RTEMS path was not submitted to configure step (and is None) instead of to the provided prefix one.

Original author: UtkarshVerma

I did a fresh installation of the `aarch64/raspberrypi4b` BSP on a fresh install of RTEMS 6. However, I got an error from `rtems_waf` while creating a new app (hello). The logs are attached below, but in summary, here is what happens.

In `$RTEMS_PREFIX/lib/pkgconfig/`, I have three files:

```
aarch64-rtems6-raspberrypi4b.pc
expat.pc
gmp.pc
```

The `_arch_from_arch_bsp()` function in `rtems_waf/rtems.py` tries to infer the arch name based on the file names, by splitting on hyphens. It works for BSP names, but not on the other files, therefore the `StopIteration` exception is thrown.

To remedy around that, I modified that function as follows:

```
def _arch_from_arch_bsp(arch_bsp):
rtems_index = arch_bsp.find("-rtems")
if rtems_index == -1:
return None
```

(continues on next page)

(continued from previous page)

```
5
6 end = arch_bsp.find("-", rtems_index + 1)
7 if end == -1:
8 return None
9
10 return arch_bsp[:end]
```

Fixing this function solves the issue resulting in successful compilation.

Building with LLVM 16 fails on all host platforms when compiling rtems-tools's record-main-lttng.cc.

The cause is `HAVE_LLVM_DEBUGINFO_SYMBOLIZE_SYMBOLIZE_H` being defined. If that is forced off, everything works fine.

This causes all versions of RTEMS I've tried, from 5.1 through git master, to fail, on every platform. Using an older version of LLVM is OK, or hacking to disable this.

I did a git bisect, and the failing commit is https://github.com/RTEMS/rtems-tools/commit/5d80d0b2e1de9decb24c2d7ef481e4b63525595e

I've attached the build failure.

- 0001-trace-wscript-Improve-C-standard-selection.patch

I was able to attach it but only after gzip'ing it. Sorry.

Author: Trac Migrate 2023-05-19T04:19:49.000Z

Original author: jhj

I should also add, this failure is being unable to build on any system that has LLVM 16 installed, not a failure building using Clang 16. Unfortunately every Linux system that I have has moved to Clang 16, except RHEL. I verified using RHEL 9, which ships Clang 15 that is works. Also verified using a container with any other distribution but without installing LLVM, also OK.

Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4907
Merges	1

There are several headers that are installed multiple times to the target include directories. Examples are (from both freebsd/include/rpc and freebsd/sys/rpc): include/rpc/rpc.h include/rpc/rpc_com.h include/rpc/rpc_msg.h include/rpc/rpcb_clnt.h include/rpc/svc_auth.h and several others.

This is due to the header installation being controlled by the header-paths key in the _defaults data structure including freebsd/include (and subdirectories including rpc) and freebsd/sys/rpc both being targeted at include/rpc. These installations should ideally be tied to the modules they're related to such that unused headers are not installed.

There is a separate issue with both rpc and rpc_user being active simultaneously in the default config that needs to be resolved once those headers are tied to modules properly.

Probably a result of recent hacking to support macOS well, but on Ubuntu 20.04 I see this:

```
config: tools/rtems-gdb-13.1.cfg
error: shell macro failed: /export/home/rtems/git/rtems/rtems-source-builder-ref/
↪source-builder/sb/rtems-build-dep -c gcc  -L /usr/lib/python3.8/config-3.8-x86_
```

(continues on next page)

(continued from previous page)

```
↪64-linux-gnu
/usr/lib -l libpython3.8\\*: 126: error: no header or library file to find found.
/bin/sh: 2: /usr/lib: Permission denied
Build FAILED
Build Set: Time 0:00:52.749192
error: shell macro failed: /export/home/rtems/git/rtems/rtems-source-builder-ref/

git revert 9919f1217c66dad5e721802a265cdbdcf6070069 – helps with this issue.

Author: Chris Johns 2023-04-11T05:38:54.000Z

Original author: kgardas

To debug this run the command with the options `--trace` and `--dry-run` as this is an RSB config issue. Running:

```
../source-builder/sb-set-builder --prefix=/opt/work/rtems/6 --log=a.txt␣
↪--trace --dry-run 6/rtems-aarch64
```

shows in the log:

```
exe: shell: /usr/bin/python3-config --ldflags --embed | awk 'BEGIN{FS="
↪"}/python/{for(i=1;i<NF;++i)if(match($i,".*lpython.*")) print "lib
↪"substr($i,3)"\\\\*";}'
exe: /usr/bin/python3-config --ldflags --embed | awk 'BEGIN{FS=" "}/
↪python/{for(i=1;i<NF;++i)if(match($i,".*lpython.*")) print "lib
↪"substr($i,3)"\\\\*";}'
shell-output: 0 libpython3.9\\*
config: source-builder/config/gdb-common-1.cfg: 121:>%define gdb-python-
↪config-libpath %(%{gdb-python-config} %{gdb-python-config-lib-check-
↪flags} | %{gdb-python-libpath-filter} | uniq) [True]
exe: shell: /usr/bin/python3-config --ldflags --embed | awk 'BEGIN{FS="
↪"}/python/{for(i=1;i<NF;++i)if(match($i,".*L.*")) print substr($i,3);}
↪' | uniq
exe: /usr/bin/python3-config --ldflags --embed | awk 'BEGIN{FS=" "}/
↪python/{for(i=1;i<NF;++i)if(match($i,".*L.*")) print substr($i,3);}'␣
↪| uniq
shell-output: 0 /usr/lib/python3.9/config-3.9-x86_64-linux-gnu
```

(continues on next page)

(continued from previous page)

```
/usr/lib/x86_64-linux-gnu
config: source-builder/config/gdb-common-1.cfg: 122:>%define gdb-python-lib-check %(%{_sbdir}/sb/rtems-build-dep -c %{__cc} %{gdb-host-libs} -L %{gdb-python-config-libpath} -l %{gdb-python-config-libs}) [True]
exe: shell: /opt/work/chris/rtems/kernel/rtems-source-builder.git/source-builder/sb/rtems-build-dep -c gcc  -L /usr/lib/python3.9/config-3.9-x86_64-linux-gnu
/usr/lib/x86_64-linux-gnu -l libpython3.9\\*
exe: /opt/work/chris/rtems/kernel/rtems-source-builder.git/source-builder/sb/rtems-build-dep -c gcc  -L /usr/lib/python3.9/config-3.9-x86_64-linux-gnu
/usr/lib/x86_64-linux-gnu -l libpython3.9\\*
shell-output: 126 error: no header or library file to find found.
/bin/sh: 2: /usr/lib/x86_64-linux-gnu: Permission denied
error: shell macro failed: /opt/work/chris/rtems/kernel/rtems-source-builder.git/source-builder/sb/rtems-build-dep -c gcc  -L /usr/lib/python3.9/config-3.9-x86_64-linux-gnu
/usr/lib/x86_64-linux-gnu -l libpython3.9\\*: 126: error: no header or library file to find found.
/bin/sh: 2: /usr/lib/x86_64-linux-gnu: Permission denied
```

The issue is the python config command outputting more than one library and the awk post processing turning this into more than one line:

```
/usr/bin/python3-config --ldflags --embed
-L/usr/lib/python3.9/config-3.9-x86_64-linux-gnu -L/usr/lib/x86_64-linux-gnu -lpython3.9 -lcrypt -ldl  -lm -lm
```

The breaks the library check script.

Original author: kgardas

It would be great if _CPU_Exception_frame_print would use a little bit more fault information provided on Cortex-Mx cores and prints them too. E.g. CSFR with its UFSR, BFSR and MMFSR looks like good to have there. Also perhaps HFSR content.

Original author: alancudmore

The Kendryte K210 is low cost 64-bit dual core RISC-V SoC with: * Built in 8 MiB SRAM (6 for RISC-V applications, and 2 for the AI NPU) * An AI NPU * A number of other peripherals including UARTS, SPI, I2C, etc

https://www.canaan.io/product/kendryteai https://www.seeedstudio.com/blog/2019/09/12/get-started-with-k210-hardware-and-programming-environment/

While it is unclear how long these CPUs will be available, there are still low cost boards available that can run RTEMS including: https://wiki.sipeed.com/soft/maixpy/en/develop_kit_board/maix_bit.html https://wiki.sipeed.com/soft/maixpy/en/develop_kit_board/maix_duino.html

In addition there is basic support for the SoC on the renode.io simulator: https://renode.io/ https://github.com/renode/renode/blob/master/scripts/single-node/kendryte_k210.resc

Caanan provides a standalone SDK with an Apache 2.0 license that has examples for using nearly all of the peripherals including the AI NPU. This could be used as a reference for future BSP support. https://github.com/kendryte/kendryte-standalone-sdk

Basic RTEMS support for the device is a riscv/riscv BSP variant with only a few code changes, so it should be easy to maintain.

The basic BSP variant is complete and supports a polled console that is shared with the frdme310arty variant, interrupt, and timer support. It uses a built in device tree blob similar to the Microchip polarfire variant.

Original author: dppinto

With respect to RTEMS 6 (ESA-promoted RTEMS SMP Qualification Data Pack release 3), the following issues are observed:

File	Lines	Discrepancy
bsps\inclu regs.h	84; 86; 88; 91; 96; 98; 101; 106; 109; 115; 120; 123	According to table 365 of page 294 of the GR740 User Manual (v.2.50), the register addresses are incorrectly defined.
bsps\inclu regs.h	225	According to table 406 of page 319 of the GR740 User Manual (v.2,50), the register address is incorrect;
bsps\inclu regs.h	435	According to table 538 of page 403 of the GR740 User Manual (v.2.5), the register address is incorrect according to the table but it is correct according to the table description.
bsps\inclu regs.h	609	According to table 327 of page 259 of the GR740 User Manual (v.2.50), the register address is incorrect according to the table but it is correct according to the table description.
bsps\inclu regs.h	151	According to table 213 of page 200 of the GR740 User Manual (v.2.5), the register address is incorrect according to the table but it is correct according to the table description.
bsps\inclu regs.h	575; 591; 715; 787; 809	According to tables 191, 192, 199, 201, 202, respectively (to each identified line) starting on page 192 of the GR740 User Manual (v.2.5), the register addresses are incorrect according to the table but are correct according to the table description.

It seems that the generation of these registers definitions leads to incorrect bit definitions whenever there are reserved bits specified in the Gaisler User Manual.

Can you please double-check these cases?

Additional Notes:

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-014.

It is stated in the comments that these functions are deprecated: * cpukitincludertemsfatal.h: RTEMS_NO_RETURN void rtems_fatal_error_occurred(uint32_t fatal_code); * cpukitincludertemsscorethread.h: void rtems_iterate_over_all_threads( );

Can these be removed now or are there still portability reasons to still keep these?

As we transition off of Trac we'll need a new wiki to replace https://devel.rtems.org/

https://js.wiki/ offers the best situation for us for several reasons:

- It uses Markdown as it's main language
- It can replicate itself to a Git repository making easy branching or local copies of the wiki. It can directly interface with GitLab.
- We can, in the future build a PDF using Sphinx from the Git repository.
- It supports OATH so we can log in using our local GitLab instance.
- Has instant search capabilities.

Moving to a purely Sphinx based system is too heavyweight for developer documentation as an open source project we need to have a strong focus on lowering the barrier to contributions. Documentation lags behind everything else as it we shouldn't be making it more difficult to contribute.

There is one downside to this as anyone who wants to modify the wiki will need to have their local GitLab account approved whereas Trac currently is automatic right after applying.

Original author: heshamelmatary

Currently **RISCV_ENABLE_HTIF_SUPPORT** [1] is required to be set to 1 for Spike platform. This adds more confusions to users and doubles the number of BSPs for testing on both QEMU and Spike.

I suggest removing the RISCV_ENABLE_HTIF_SUPPORT option and always prob for it in the FDT in the C code (only during init and shutdown), it shouldn't affect any critical paths.

This should get us a single BSP that runs on both QEMU and Spike.

Original author: cal

Hi,

I have followed the RTEMS Quick Start webpage and have successfully built the BSP for stm32h7 (STM32H745I_DISCO board) with the RTEMS source code that I git cloned 2 weeks ago. I have successfully compiled a hello world application and ran on the board.

This week, however, I repeated the steps to build the bsp but with the latest RTEMS git cloned. After successfully building the BSP and compiled the hello world application, I encountered an exception as shown below.

* **FATAL** * fatal source: 9 (RTEMS_FATAL_SOURCE_EXCEPTION)

R0 = 0x00000000 R8 = 0x00000000 R1 = 0x00000002 R9 = 0x00000000 R2 = 0x0000001c R10 = 0x00000000 R3 = 0x240063a8 R11 = 0x00000000 R4 = 0x00000001 R12 = 0xffffffff R5 = 0x00000000 SP = 0x24006398 R6 = 0x00000000 LR = 0x0800d503 R7 = 0x00000000 PC = 0x0800d512 XPSR = 0x210b0000 VEC = 0x00000004 RTEMS version: 6.0.0.df814344215b6ec29d46238be47e3bbd2a2e22e4 RTEMS tools: 12.2.1 20221104 (RTEMS 6, RSB f690701431fc88d0d79a56c41bc6a11d4641e60b, Newlib a8526cb) executing thread ID: 0x0a010001 executing thð

I did a comparison between the previous RTEMS code with the latest version. I replaced some of the codes in the latest code with the older codes. Below are the minimum changes that I did to make the board work.

1) cpukitincludertemsscoretls.h Added the lines of codes in the file:

static inline uintptr_t _TLS_Align_up(uintptr_t val) { uintptr_t alignment = CPU_STACK_ALIGNMENT;

return RTEMS_ALIGN_UP(val, alignment); } static inline void *_TLS_TCB_at_area_begin_initialize(void *tls_area) { void *tls_block = (char *) tls_area + _TLS_Get_thread_control_block_area_size(); TLS_Thread_control_block *tcb = (TLS_Thread_control_block *) tls_area; uintptr_t aligned_size = _TLS_Align_up((uintptr_t) _TLS_Size); TLS_Dynamic_thread_vector *dtv = (TLS_Dynamic_thread_vector *) ((char *) tls_block + aligned_size);

_TLS_Initialize_TCB_and_DTV(tls_block, tcb, dtv); _TLS_Copy_and_clear(tls_block); return tls_block; }

2) cpukitscorecpuarmarmv7m-context-initialize.c Replaces the last line in the code:

void _CPU_Context_Initialize(Context_Control *context, void *stack_area_begin, size_t stack_area_size, uint32_t new_level, void (*entry_point)(void), bool is_fp, void *tls_area) { char *stack_area_end = (char *) stack_area_begin + stack_area_size;

memset(context, 0, sizeof(*context));

context->register_lr = entry_point; context->register_sp = stack_area_end;

if (tls_area != NULL) { //_TLS_Initialize_area(tls_area); //replace the line with: ** _TLS_TCB_at_area_begin_initialize(tls_area);** } }

3) cpukitscorecpuarm__aeabi_read_tp.c replace the codes:

void __attribute__((naked)) __aeabi_read_tp(void) { __asm__ volatile (“ldr r0, =_Per_CPU_Informationn” “ldr r0, [r0, %[executingoff]]n”

if defined(__thumb__) && !defined(__thumb2__)

“add r0, %[tlsareaoff]n” “ldr r0, [r0]n”

else

“ldr r0, [r0, %[tlsareaoff]]n”

endif

“bx lrn” : : [executingoff] “I” (offsetof(Per_CPU_Control, executing)), [tlsareaoff] “I” (offsetof(Thread_Control, Start.tls_area))); }

May I know if I might have configured the bsp wrongly during the build, or it is an actual bug that is introduced in the new code release?

Thanks, Cal

3.9.1.156 4740 - Teach libdebugger to wait for GDB to connect and ask to continue

Id	4740
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Chris Johns
Created	2022-10-13T09:51:53.000Z
Updated	2025-09-19T01:03:55.302Z
Milestone	6.1
Labels	cpukit::debugger, priority::normal, resolution::fixed, ticket-type::enhancement
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4740

Original author: legouguec

In #4739, Chris noted this snippet in the reproducer:

```
/* Debugger lock, there is no way to ask the libdebugger to wait for a
* connection, that would block the kernel.  Instead use the following global
* variable and 'set release_debugger = 1' in GDB when ready.  */
volatile int release_debugger = 0;

static void start_gdb_server(void)
{
rtems_printer printer;
int r;

rtems_print_printer_fprintf(&printer, stdout);
r = rtems_debugger_register_tcp_remote();
if (r < 0) {
perror("TCP remote register");
abort();
}

r = rtems_debugger_start("tcp", "1122", 3, 1, &printer);
```

(continues on next page)

(continued from previous page)

```
if (r < 0) {
perror("can't start debugger");
abort();
}

/* Definitely not nice, but it doesn't seem like there is any other choice
* for libdebugger based debugging.  GDB just has to setup and only then
* set release_debugger variable.  */
while (!release_debugger) {
sleep(0.1);
}
}
```

Chris suggests adding an option to make libdebugger halt execution until GDB connects and sends a “continue”, which would make the debugging experience similar to targeting QEMU with the -S (uppercase S) switch:

https://www.qemu.org/docs/master/system/gdb.html#gdb-usage

We would appreciate that option very much, as it would make our testsuite support code for RTEMS more akin to other platforms by getting rid of that release_debugger variable.

The API has yet to be defined:

> Don’t know how that would translate in terms of API (adding an argument to rtems_debugger_start, if breaking the API is allowed; adding a function to request the wait after rtems_debugger_start has been called; ...);

I think breaking the API may be worth the short term pain. I tend to prefer a `const char* option` type argument that can be `NULL`. That argument can then be passed around and parsed by backends, transports etc and options can come and go without breaking the API.

I know some programmers feel strongly against so-called “stringly-typed” APIs (e.g. they subvert type-checking; they require “

(Woops, looks like part of my OP got bitten off. Here it is, without the weird Unicode characters that presumably caused it to be truncated?)

I know some programmers feel strongly against so-called “stringly-typed” APIs (e.g. they subvert type-checking; they require “parsing”), but I’ve seen reasonable cases for them; FWIW I do not have a clear preference for or against them in this context (C type-checking is a bit of a joke so not much is lost; parsing can be fraught but libdebugger probably does not belong in a critical stack anyway).

So I’ll trust your judgment on this!

Again, thanks for suggesting this.

> The statements are true and valid however given the context I see more value in a set of string options. The link you provide is great. I will add to the list of examples the NFS options to a kernel such as FreeBSD.
>
> Libdebugger will expand and grow in ways we might not appreciate today and I do not see value in maintaining C code to do this. The first example is `continue`. I would make waiting the default as GDB does when you connect to a running process. A continue option would be:

```
"cont"
```

> Now a setting for a transports such as serial (which does not exist):

```
cont;serial=tty0:115000,8,1,e
```

> and in time some adds support to load XML files so registers for a target SoC can be seen by GDB:

```
"cont;serial=tty0:115000,8,1,e;xml=/xx/soc-abc.xml"
```

> The options can be easily and cheaply passed around and then used as needed by different subsystems in `libdebugger`.

Author: Chris Johns 2022-10-17T20:30:38.000Z

Original author: legouguec

I took a closer look at the debug server code and saw a simpler solution. I have have added a new call:

```
/**
* Suspend all running threads including the caller if not
* excluded. Returns when the debugger has connected and continued.
*
* If wait is true and there is no remote connected wait then break.
*/
extern int rtems_debugger_break(bool wait);
```

I think this is simpler and cleaner to implement and use and it also lets users make the call anytime to break the target.

The patch can be found here https://lists.rtems.org/pipermail/devel/2022-October/073581.html

Author: Trac Migrate 2022-10-18T09:23:52.000Z

Original author: legouguec

I gave the patch a whirl, removing the `release_debugger` variable in our code and replacing the `while` loop with a call to `rtems_debugger_break(true)`, and as far as I can tell, it works pretty well.

Thanks for implementing this!

Original author: lsilistr

When running psxrwlock01, the NULL argument check from testsuites/psxtests/psxrwlock01/test.c:458 uses the uninitialized rwlock. Depending on memory content this lock may or may not be auto-initialized. The cases I can see are:

1. if memory is zeroed, it will auto a new lock and acquire without checking abstime value. Will return SUCCESS and test will fail.
2. if memory is random it will instantly return EINVAL from autoinitialization, again not checking abstime. Test will pass.
3. if memory somehow ends up over another older lock structure, it will try to take over that lock - not encountered this specific behaviour.

Author: Joel Sherrill 2022-10-06T16:15:15.000Z

Original author: lsilistr

The odds are that on the BSPs which get the most testing, the memory is zeroed. Can you see if initializing the id variable in question to 0 resolves the issue and the test still works?

Patch appreciated if so.

Original author: alancudmore

The riscv console configuration code uses a macro:

define RISCV_CONSOLE_IS_COMPATIBLE(actual, actual_len, desired) \

(actual_len == sizeof(desired) && memcmp(actual, desired, sizeof(desired) - 1) == 0)

And is used to find a compatible console device in the device tree like this: if (RISCV_CONSOLE_IS_COMPATIBLE(compat, compat_len, “ucb,htif0”)) { htif_console_context_init(&htif_console_instance.base, node);

An example device tree entry: compatible = “ns16550a”; works with the macro, but when the device tree entry has multiple items like: compatible = “canaan,k210-uarths”, “sifive,uart0”; the macro cannot parse the entry because the list is being treated like a single string. The compat_len variable ends up having the length of the entire list, causing the comparison to fail.

If the macro is replaced with a call to fdt_stringlist_contains like: if (fdt_stringlist_contains(compat, compat_len, “ucb,htif0”)) { htif_console_context_init(&htif_console_instance.base, node);

The substring can be found in the compatible list.

This works with my use case where there are multiple items in the compatible list.

Unless there is a reason why the macro is used, I can submit a patch that replaces the macros with fdt_stringlist_contains calls.

Note: I am not sure how to test all cases of this code, I can test the generic riscv-v/qemu based BSP, and the BSP I am working on, but I do not have access to a FE310/Arty system

Original author: PirovanoF

We are testing NFSv4 on a coldfire mcf5329 platform using rtems-6 (MASTER) and 6-freebsd-12 (downloaded September 9th). The tool chain is bould by rtems-source-builder last version.

The test program testsuite/nfs01 work correctly but if we try to copy a file in a subfolder of NFS disk we meet the issue that I try to describe below:

using telnetd01 example from the testsuite (adding NFS filesytem at configuration with #define CONFIGURE_FILESYSTEM_NFS) and opening a shell we are capable to mount a NFS disk with the command:

mount -t nfs -o nfsv4,minorversion=1 192.168.3.36:/rtems /nfs

(where “192.168.3.36/rtems” is a share from an ubuntu 20.1 machine).

Mount is fine and we receive the following reply

“nfs: mount: nfs -> 192.168.3.36:/rtems (nfsv4,minorversion=1) nfs: mount args: 8 16 addr=10 02 08 01 ffffffc0 fffffa8 03 24 00 00 00 00 00 00 00 00 0 nfsv4 7 dirpath=/rtems 4 fstype=nfs 4 fspath=nfs 20 hostname=192.168.3.36:/rtems 0 rw 2 minorversion=1 nfs: mount: (0) Success”

The issue happen when we try to copy a file in a /nfs subfolder. If we create subfolders

mkdir /nfs/1 mkdir /nfs/1/2 mkdir /nfs/1/2/3 folders are creted correctly but if we try to copy a file as:

cp xxx /nfs/1/2/3

unfortunately the file xxx is copied in /nfs/1/2 and NOT inside /nfs/1/2/3 folder. The same issue happen in other locations:

cp xxx /nfs/1/2 file is copied in /nfs/1 cp xxx /nfs/1 file is copied in /nfs

Author: Trac Migrate 2023-02-01T18:23:47.000Z

Original author: PirovanoF

Fabrizio,

let me ask, are you sure you are using NFSv4 and not plain old NFSv2 on the RTEMS side? I'm asking since all evidence I've seen so far point to only NFSv2 on the RTEMS and that is including wireshark debugging.

The idea: your -o options get silently ignored, your RTEMS is using NFSv2 which your server luckily supports although there are some issues...

By any chance, if you are using Linux as a NFS server, what does:

```
$ sudo cat /proc/fs/nfsd/versions
```

tells you?

Example: Ubuntu 20.04 LTS as a NFS server by default:

```
-2 +3 +4 +4.1 +4.2
```

and obviously RTEMS refuses to work with that. E.g. nfs01.exe:

```
NFS (proc 0) - RPC: Program/version mismatch
NFS Ping 169.254.1.1  failed: I/O error
```

but when I reconfigure and enforce NFSv2 to be supported, then cat tells correctly:

```
+2 +3 +4 +4.1 +4.2
```

and RTEMS nfs01.exe runs fine.

Now, back to your testcase as I'm able to test that too now. Actually with few days old RTEMS and libbsd repos, both `master` branches I'm not able to duplicate your issue. See:

```
SHLL [/nfs] # ls -la /nfs/1/2/3
total 2
drwxr-xr-x  2 1000  100  2 Feb  1  2023 .
drwxr-xr-x  3 1000  100  4 Feb  1  2023 ..
SHLL [/nfs] # cp rtems.txt /nfs/1/2/3
SHLL [/nfs] # ls -la /nfs/1/2/3
total 3
drwxr-xr-x  2 1000  100   3 Feb  1  2023 .
drwxr-xr-x  3 1000  100   4 Feb  1  2023 ..
-rw-r--r--  1 1000  100  38 Feb  1  2023 rtems.txt
```

perhaps the issue is already solved?

Author: Trac Migrate 2023-02-01T18:25:00.000Z

Original author: PirovanoF

- **Cc** added @karel@functional.vision

Author: Joel Sherrill 2023-02-01T19:24:25.000Z

Original author: PirovanoF

Which version of RTEMS are you using and which network stack?

NFS v4 is only in libbsd

Author: Trac Migrate 2023-02-01T19:28:17.000Z

Original author: PirovanoF

Oh. Today, as of February 1 2023, I followed README from libbsd: https://github.com/RTEMS/rtems-libbsd – concretely steps to make that working on zynq-a9-qemu bsp. When I did so, then compiled nsf01.exe was purely NFS v2 client application.

I just passed in custom network configuration to be more in-line with recommended qtap configuration:

```
NET_CFG_SELF_IP = 169.254.10.10
NET_CFG_NETMASK = 255.255.0.0
NET_CFG_PEER_IP = 169.254.1.1
NET_CFG_GATEWAY_IP = 169.254.1.1
```

Let me ask, where exactly is this NFS v4 implementation located? Thanks!

Author: Trac Migrate 2023-02-02T10:49:46.000Z

Original author: PirovanoF

Hi Karel, as I wrote in my opened ticket NFSv4 implementation is located in 6-freebsd-12 branch.

my Ubuntu server when I type sudo cat /proc/fs/nfsd/versions answer -2 +3 +4 +4.1 +4.2 so I am sure that I am not using NFSv2 also because I forced rtems side to use NFSV4.1 and wireshark dump confirm NFSv4.

Author: Trac Migrate 2023-02-02T11:03:48.000Z

Original author: PirovanoF

Hi Fabrizio,

cool! I stand corrected then and it looks like NFSv4 got into the 6-freebsd-12 and not to the master. What a confusion! I really would expect everything to be on the `master` as it is described as a:

master

_ This branch is intended for the RTEMS master which tracks the FreeBSD master branch. This branch must be used for libbsd development. Back ports to the 6-freebsd-12 are allowed._

sorry about my confusing message than, it was not done on purpose. I was confused myself. :-)

Original author: noor

I have built a new aarch64 raspberry pi 4 BSP and while trying out the minimum.exe on the target and the IDLE thread ID printing was 0x089010001. As per Joel, This is not limited to aarch64 BSPs but to sparc/leon3 too. Here's my output from Raspberry pi 4B aarch64 minimum.exe

```
*** FATAL ***
fatal source: 0 (INTERNAL_ERROR_CORE)
fatal code: 5 (INTERNAL_ERROR_THREAD_EXITTED)
RTEMS version: 6.0.0.ee92899632c823e19aa4f2e7048af3d910f59be2
RTEMS tools: 12.1.1 20220622 (RTEMS 6, RSB␣
↪eea379370116628dbe91f19e61ad6129aa1951ac, Newlib ea99f21)
executing thread ID: 0x089010001
executing thread name: IDLE
```

From the cpuuse command, this is the IDLE thread ID:

```
0x09010001 | IDLE                                 |     20.301428 |  96.344
Looks like a bug somewhere not related to the Pi4
```

For some reason, the MSB is set. Doesn't look like sign-extension. But could be a bug in printk() versus printf().

Original author: alancudmore

In the riscv/riscv fe310_uart_read function, the uart RX data/status register is read twice when reading a character: once for the status, then a second time when reading the data. Reading the RX data/status register twice discards the input data from the first read.

It can be fixed by first reading the RX data/status register into a local variable.

This was verified on a Kendryte K210 CPU which uses the same SiFive UART. I will submit a patch to fix it.

We support the various APIs to set tunable values but not the /etc/sysctl.conf file to set them during initialization. They cannot be set before the network stack is initialized as this leads to a fault.

Doing this brings us more in line with FreeBSD Configuration and Tuning. We already have the sysctl APIs and /etc/rc.conf. This would round out the support.

Original author: kgardas

Hello, patch for the defect was already provided here: https://lists.rtems.org/pipermail/devel/2022-May/071507.html

and here: https://lists.rtems.org/pipermail/devel/2022-May/071509.html

however especially second patch has met strong resistance from inclusion without a proper attempt to contact upstream projects and report, provide patch there.

So, here I clearly declare, that I've contacted all three projects by using mailing lists (in case of mfc and mfpr) and google group (in case of isl). Unfortunately neither archive to mailing lists neither google group is easily publicably accessible. I'll try my best to link replies here as much as possible.

Anyway, as discussed on devel@, I'm also attaching 3 required patches here.

I've tested building of 6/rtems-riscv 6/rtems-arm 6/rtems-i386 6/rtems-x86_64 6/rtems-aarch64 and all built fine on:

```
karel@mini ~ % sw_vers
ProductName:            macOS
ProductVersion:         13.4
BuildVersion:           22F66
```

thanks to Chris Johns for hacking on it. Closing as I'm original reporter.

Author: Kinsey Moore 2024-12-28T04:46:22.295Z

Uploading an updated ISL fix that resolves issues for FreeBSD since it also references arm64 instead of aarch64. fix-mac-arm64-isl-config-v2.patch

Author: Kinsey Moore 2024-12-28T04:46:22.256Z

This fixes compilation on FreeBSD14.2 running on both the Raspberry Pi 5 and Apple M-series hardware. The change to apply this patch is in rtems/tools/rtems-source-builder!101

Author: Kinsey Moore 2024-12-29T23:34:03.180Z

And now uploading the similarly expanded version of the MPC patch fix-mac-arm64-mpc-config-v2.patch

Setting `BUILD_TESTS=True` avoids this error and successfully builds (but also builds the whole test suite).

3.9.1.165 4642 - RSB: log.py tends to remove relevant error messages

Id	4642
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2022-04-12T14:03:02.000Z

Merges	0

Original author: frank_k

I sometime see (spontaneous) RSB build errors when building the tools. Fortunately, RSB provides error logs like this:

```
rtems/rsb-report-sparc-rtems6-gcc-0f001dd-newlib-64b2081-x86_64-linux-gnu-1.txt
```

Unfortunately, I can often not find the error message in the report. The reason is that the file `source-builder/sb/log.py` shortens the report to the last 400 lines in

```
148         if len(self.tail) > self.tail_size:
149             self.tail = self.tail[-self.tail_size:]
```

This is fine if the number of jobs is 1. If the number of jobs is greater one, the following tends to happen:

Assume the top level Makefile is called with `-j 2` and it makes one job to execute a sub-Makefile in `foo/Makefile` and concurrently the second job to execute another one: `bar/Makefile`. Now, assume the job in `foo/Makefile` runs into an error, prints the error and returns to the top Makefile. The top Makefile will then wait for the second job to finish `bar/Makefile`. This job will typically print thousands of lines into the log and succeed in its execution. The result is that the truncated log will not contain the error message but only final lines of the output of the successful job.

For example, I oft did see this log report:

```
make[8]: Entering directory '/home/minna/src/rtems-source-builder/rtems/build/

```

I would expect that the log/RSB report contains the actual error message by either somehow making sure the error containing piece is kept or the whole output is available. (I do not want to suggest a design decision on how this is solved the best way.)

For the records:

```
$ git -C rtems-source-builder/ rev-parse HEAD
49e3dac17765fa82ce2f754da839638ee352f95c
```

Build command:

```
$ cd rtems-source-builder/rtems && ../source-builder/sb-set-builder --rtems-
↪version 6 --prefix /usr/lib/rtems6/devtools-arm --with_ada --with_cxx --with_
↪fortran --with_objc --log /home/minna/src/sb-set-builder.log --trace --no-clean␣
↪--jobs=12 6/rtems-arm 6/rtems-sparc 6/rtems-powerpc 6/rtems-riscv
```

Build environment: _openSUSE Leap 15.3 **container_**

Author: Trac Migrate 2022-04-22T14:02:05.000Z

Original author: frank_k

There is an easy workaround:

When using the `--log <log-file>` option on the `sb-set-builder` command line, that log file contains all the output - including the lines not in the `rtems/`

`rsb-report-*.txt` file. What me confused is the message “See error report” below the error:

Error: building arm-rtems6-gcc-0f001dd-newlib-64b2081-x86_64-linux-gnu-1 Build FAILED See error report: rsb-report-arm-rtems6-gcc-0f001dd-newlib-64b2081-x86_64-linux-gnu-1.txt

This error report is shortened and may not contain the actual error message but it can be found in the log file mentioned above. Maybe changing the text to something link “See log or this error report” would prevent users like me from only looking into the error report.

Author: Chris Johns 2022-06-08T04:10:42.000Z

Original author: frank_k

It is not possible to teach the RSB all the error messages that exist so it can find them.

A few of solutions exist:

1. Increase the size of the log tail
2. Remove the log tail on error
3. Do nothing and close this ticket? (my preferred option)

Author: Trac Migrate 2022-06-08T09:24:15.000Z

Original author: frank_k

I opened this ticked because I wasted a lot of time looking into the error reports and not understanding that the real error is not shown there at all. With this ticket, I would like to prevent others to drop into the same pit I did fall in.

An error message like

`See error report: rsb-report-arm-rtems6-gcc-0f001dd-newlib-64b2081-x86_64-linux-gnu-1.txt`

strongly suggests that the error can be found in the report. This is the more confusing when the log close to the end contains something like `make: *** [Makefile:965: all] Error 2`. Yet, it turns out that when the number of jobs is greater than 1, the “real” error message appears so early that it is not in this report. (The real error message appears typically just before it says `make: [...] Error 1` - but this may depend on the used `make` tool).

1. “Increasing the log size” does not help as the errors appears a lot of lines before the output ends.
2. “Remove the log tail on error.” Keeping the whole log would help. Yet, these files are very very large and the current `log.py` implementation keeps everything in memory.
3. “Do nothing and close this ticket?” You can certainly close this ticks, as it is not a hard bug. Yet, many stupid users like me will end up looking uselessly

into the report, instead of identifying the error and providing a patch. But nonetheless, just closing this ticket is certainly valid.

As a forth solution I would suggest to print a different text or some text below (esp. when the “jobs > 1”), indicating that the error cause in some cases can only be spotted in the full log generated by the `-log <log-file>` option.

Author: Chris Johns 2022-06-09T01:21:16.000Z

Original author: frank_k

Yes the message can be wrong and it depends on the number of jobs and cores you have running and on the package being built. There are too many variables.

The log.py code does not keep the log in memory. Only the tail fragment is kept.

I think I will remove the log tail from the RSB and users can check the actual log. I can update the message to refer to the log.

Author: Trac Migrate 2023-01-20T11:00:41.000Z

Original author: frank_k

There was a discussion on the _devel at **rtems.org_** mailing list on this topic. The thread starts with _[PATCH 1/1] RSB: Mitigate too short error **reports_** Tue Dec 20 16:44:11 UTC 2022:

https://lists.rtems.org/pipermail/devel/2022-December/073973.html

and continues in January 2023:

https://lists.rtems.org/pipermail/devel/2023-January/074087.html

With the following results:

- It is not possible to change the error report so that it always contains the relevant error. The errors can come from too may different sources and tools.
- Nonetheless the error report should be kept as it proved often helpful.
- The message which is printed when an error report is produced should be changed in such a way that the reader is made aware of the problem that the relevant error can sometimes not be found in the error report but only in the full build log.

Author: Trac Migrate 2023-01-20T14:40:22.000Z

Merges	0

Original author: Christian Mauderer

Due to the ticket #3053 a lot of outdated headers have been pointed out:

(1) Thomas Doerfler is now using an embedded-brains.de mail address.

(2) A number of embedded brains copyright notices include ground addresses. That is a violation of the published recommendation for file headers and copyright blocks as shown here:

https://docs.rtems.org/branches/master/eng/coding-file-hdr.html#copyright-and-license-block

If headers are touched during the cleanup work for #3053 these two points should be cleaned up.

Original author: Christian Mauderer

By default, pfkey allocates a 2MB buffer that is used for SPD entries. This size is a good choice for a server system where a lot of clients should be handled. But on our embedded systems, an application with that much clients is unlikely and 2MB is a lot of space.

Author: Trac Migrate 2022-02-24T09:11:57.000Z

In [changeset:"0b30f38951d5f6291e9691ce8eb51a14242e26be/rtems-libbsd" 0b30f38/rtems-libbsd]:

```
ipsec-tools: Reduce allocated buffer size

By default, pfkey allocates a 2MB buffer that is used for SPD entries.
This size is a good choice for a server system where a lot of clients
should be handled. But on our embedded systems, an application with that
```

(continues on next page)

(continued from previous page)

```
much clients is unlikely and 2MB is a lot of space. So reduce that to
the default value of 128kB which should be enough for a small number of
ipsec connections.

See https://bugzilla.redhat.com/show_bug.cgi?id=607361 for more details
why the upstream project originally increased the size.

If someone really needs a bigger size, there is a option in the
configuration file of pfkey called `pfkey_buffer` that can overwrite
this value.

Closes #4621
```

3.9.1.168 4610 - BSP/atsam: UART driver sends data with a small gap

Id	4610
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2022-02-11T07:53:25.000Z
Updated	2025-09-19T01:03:47.608Z
Milestone	6.1

Original author: Christian Mauderer

The ATSAM UART waits for data to be completely send before queuing the next character. Due to that there is a small gap between two characters. This is only notable if the UART is 100% busy. For example if received data should be echoed back at maximum data rate the software buffer fills till it is full and then starts to loose characters.

Author: Trac Migrate 2022-02-15T13:39:53.000Z

Original author: Christian Mauderer

- **Resolution** set to ~"fixed"

In [changeset:"cff16379c9650324e1a320d0931892e220f8f55a/rtems" cff16379/rtems]:

```
bsp/atsam: Improve UART / USART tx performance

Put the next character into the send buffer if the buffer is empty and
not when the last character has been sent out to the line. This improves
the performance slightly.

Before that patch, the receive path was faster than the transmit path.
Therefore a simple echo could drop characters on a busy connection.
With this patch sending and receiving has about the same performance so
that no characters are lost.

Fixes #4610
```

```
bsp/atsam/i2c: Add error return and fix edge cases

The driver didn't return with an error on (for example) a NACK on the
bus. This adds the expected error return. Due to the new case that a
transfer can be interrupted on an error, there were some new edge cases.
This patch therefore also fixes these edge cases by removing the
transfer_state that more or less duplicated the interrupt states.

Fixes #4592
```

3.9.1.171 4580 - Update BSP for STM32H7

Id	4580
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2022-01-15T00:47:50.000Z
Updated	2025-09-19T01:03:45.597Z
Milestone	6.1
Labels	bsp, priority::normal, resolution::fixed, tickettype::defect
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/4580
Merges	0

Original author: kgardas

It looks like after STM32H7 BSP was added STM added few more members to the stm32h7 chip family. So code addition tracked by #3910 is now a bit incomplete and it would be great to grab what was grabbed in the past and merge again since both projects https://github.com/STMicroelectronics/stm32h7xx_hal_driver and https://github.com/STMicroelectronics/STM32CubeH7 are up to date with latest hardware offerings from STM. Anyway, when I tried to do merge myself I've found several things which may be considered difficult for merge: (1) both projects seems to switch t o Unix line endings while original bsp submission kept original (of that time) DOS line endings. (2) STM changed license note in the code itself:

```
-  @endverbatim
-  ******************************************************************************
-  * @attention
-  *
-  * <h2><center>&copy; Copyright (c) 2017 STMicroelectronics.
-  * All rights reserved.</center></h2>
-  *
-  * This software component is licensed by ST under BSD 3-Clause license,
-  * the "License"; You may not use this file except in compliance with the
-  * License. You may obtain a copy of the License at:
-  *                        opensource.org/licenses/BSD-3-Clause
-  *
-  ******************************************************************************
-  */
-
+  ******************************************************************************
+  * @attention
+  *
+  * Copyright (c) 2017 STMicroelectronics.
+  * All rights reserved.
+  *
+  * This software is licensed under terms that can be found in the LICENSE file
+  * in the root directory of this software component.
+  * If no LICENSE file comes with this software, it is provided AS-IS.
+  *
```

Anyway, the new code adds support for following chips:

```
bsps/arm/stm32h7/include/stm32h723xx.h
bsps/arm/stm32h7/include/stm32h725xx.h
bsps/arm/stm32h7/include/stm32h730xx.h
bsps/arm/stm32h7/include/stm32h730xxq.h
bsps/arm/stm32h7/include/stm32h733xx.h
bsps/arm/stm32h7/include/stm32h735xx.h
bsps/arm/stm32h7/include/stm32h745xg.h
bsps/arm/stm32h7/include/stm32h747xg.h
```

and also for Cordic and FMAC features whatever that means.

Author: Trac Migrate 2022-01-15T00:51:37.000Z

Original author: kgardas

I've found out that using `git diff -b` may help with (1) problem to review update changes ignoring line ends changes. Still the diff itself is about 117k lines of code so quite heavy to push thorough email I would guess.

Author: Trac Migrate 2022-02-06T22:13:47.000Z

Original author: kgardas

As per Sebastian request here: https://lists.rtems.org/pipermail/devel/2022-January/070320.html – I've updated HAL and reapplied necessary patches (those removed by files update) and fixed possible rejects by hand except the patch:

```
commit fe58f6ce4bf1ff5e92d64b9fee0cb46b6ac06e64

bsp/stm32h7: Add and use BSP Doxygen group

Update #3910.
```

on which I've started working on solving rejects just to notice after several files that even if I add all necessary groups, then still there are more added by HAL update and the tree will still not be complete with the change. Hence I left it without the patch completely in an idea that embedded-brains probably do have some script which updates those docygen directives.

Anyway, update hal project is here: https://github.com/kgardas/rtems – and the branch is `` stm32h7-hal-update ``

Sebastian, I hope you don't mind if I reassign to you now for review. Thanks!

Thanks for the update, I am very busy this week. Reviewing the patches needs a bit of time. Please ping me if you don't get feedback by mid of next week.

The license text in the in the ticket is an issue. Please make sure the LICENSE file is included in the branch in "the root directory of this software component". If the root directory is not clear, then this needs to be discussed on the mailing list. If it is a standard license, then an SPDX License Identifier should be added to the files.

Original author: Christian Mauderer

Cloned from #4577:

The UART/USART of the ATSAM doesn't have any FIFO buffer. Therefore every received character has to be processed before the next one arrives. In situations with a high interrupt load or during long interrupt locks, this might not work reliable and the UART/USART can loose characters.

Author: Trac Migrate	2022-01-18T08:10:47.000Z

Original author: Christian Mauderer

In [changeset:"fbd18c09af38eadb16c07e11d4aa84b74afc2142/rtems" fbd18c0/rtems]:

```
bsp/atsam: Merge USART and UART driver

If no extended features of the USART are used and if the comparison
feature of the UART is not used, the two modules are compatible. The
drivers were nearly identical except for some names of the defines.

This patch merges the two drivers into one.

Update #4578

In [changeset:"aa95122c17707d6eaadcbdae71aad33446fcf66c/rtems" aa95122/rtems]:

```
bsp/atsam: Optionally use DMA for UART Rx

If the system is busy with other interrupts and the UART is set to a
fast baud rate, it's possible to loose UART interrupts and therefore
characters. This allows to optionally enable a DMA for the UARTs so that
a number of lost interrupts can be tolerated.

The number of DMAs on this chip is limited and not not all applications
need that feature. Therefore the DMA is disabled by default.

Original author: Christian Mauderer

Cloned from #4552:

Our current implementation of untar in cpukit/libmisc/untar/untar.c has problems if a directory in the archive already exists. Note that this is no problem, if the archive contains only a file.

The problem exists on 5 and master.

Example: If I have a tar.gz file which contains a file and directories l1/l2/x.txt and call Untar_FromGzChunk_Print twice, the first attempt will print

```
untar: dir: l1
untar: dir: l1/l2
untar: file: l1/l2/x.txt (s:12,m:0644)
```

After that the directories l1 already exists. So if I re-try to extract the archive, I'll get the following:

```
untar: dir: l1
untar: mkdir: l1: (17) File exists
```

My expectation would have been that the files are just integrated into an existing directory structure. If a file exists, it should be overwritten.

We have multiple references for expected behavior. GNU or BSD `tar` or POSIX `pax`. In my experience `tar` is the better known tool so my suggestion would be to use the default behavior of `tar` as a reference.

GNU or BSD *tar*

I tested the default behavior of GNU `tar` and BSD `tar`. It seems to be the same for both:

- If a directory structure exists, the files from the archive will be integrated. Existing files are overwritten.
- If a file exists and the archive contains a directory with the same name, the file is removed and a directory is created. In the above example: if `l1/l2` is a file it will be overwritten with a new directory.
- If a directory exists and the archive contains a file with the same name, the directory will be replaced if it is empty. If it contains files, the result is an error.
- An archive also can contain only a file without the parent directories. If in that case one of the parent directories exists as a file extracting the archive results in an error. In the example: if `l1/l2` is a file and the archive doesn't contain the directories but only the file `l1/l2/x.txt` that would be an error.

In case of an error, it is possible that the archive has been partially extracted.

Note: GNU `tar` has options to change the behavior (like –recursive-unlink). I'm sure there are similar options in BSD `tar`. From my point of view we should adapt to the default behavior, so I ignored these options.

The POSIX *pax* utility

https://pubs.opengroup.org/onlinepubs/9699919799/utilities/pax.html

Default behavior is described as follows:

If an attempt is made to extract a directory when the directory already exists, this shall not be considered an error. If an attempt is made to extract a FIFO when the FIFO already exists, this shall not be considered an error.

From some quick tests pax has a similar behavior like `tar`. The only difference I noted is that empty directories are not overwritten with files from the archive.

Author: Trac Migrate 2021-12-09T07:19:46.000Z

Original author: Christian Mauderer

- **Resolution** set to ~"fixed"
- **Status** changed from *assigned* to *closed*

In [changeset:"ffc57e3cf33ec0e2cc51ce214cedc24f390a7ea5/rtems" ffc57e3/rtems]:

```
untar: Make behavior similar to GNU or BSD tar

RTEMS untar implementation had problems with overwriting or integrating
archives into existing directory structures. This patch adapts the
behavior to mimic that of a GNU tar or BSD tar and extends the tar01
test to check for the behavior. That is:

* If a directory structure exists, the files from the archive will be
integrated. Existing files are overwritten.

* If a file exists and the archive contains a directory with the same
name, the file is removed and a directory is created. In the above
example: if l1/l2 is a file it will be overwritten with a new
directory.

* If a directory exists and the archive contains a file with the same
name, the directory will be replaced if it is empty. If it contains
files, the result is an error.

* An archive also can contain only a file without the parent
directories. If in that case one of the parent directories exists as a
file extracting the archive results in an error. In the example: if
l1/l2 is a file and the archive doesn't contain the directories but
only the file l1/l2/x.txt that would be an error.

* In case of an error, it is possible that the archive has been
partially extracted.

Closes #4568

Original author: bernardi

Calling `pthread_cond_wait()` with a mutex using the priority ceiling protocol causes the kernel to terminate with an `INTERNAL_ERROR_BAD_THREAD_DISPATCH_DISABLE_LEVEL` fatal code.

The following C program reproduces the error with the latest Git master checkout (f6385b4edc5d0cc6626783c7920c521622796b4b) on AArch64:

```
#include <pthread.h>

void *
POSIX_Init (void *argument)
{
pthread_mutex_t mutex;
pthread_mutexattr_t mutex_attr;
pthread_cond_t cond;

pthread_mutexattr_init (&mutex_attr);
pthread_mutexattr_setprotocol (&mutex_attr, PTHREAD_PRIO_PROTECT);
pthread_mutex_init (&mutex, &mutex_attr);
pthread_cond_init (&cond, NULL);
pthread_mutex_lock (&mutex);
pthread_cond_wait (&cond, &mutex);

return 0;
}

/* configuration */

#define CONFIGURE_APPLICATION_NEEDS_CLOCK_DRIVER
#define CONFIGURE_POSIX_INIT_THREAD_TABLE
#define CONFIGURE_UNLIMITED_OBJECTS
#define CONFIGURE_UNIFIED_WORK_AREAS
#define CONFIGURE_INIT

```

(continues on next page)

(continued from previous page)

```
#include <rtems/confdefs.h>
```

A debugging session shows that _Thread_Dispatch_disable_critical is called twice within _Thread_queue_Enqueue:

```

Original author: rlong

This flag is needed to force the generation of AArch64 assembly from C sources instead of using the hand-optimized code in newlib. The existing hand-optimized code has bugs for ILP32. There are multiple technical options to address this and lots of discussion:

- Update newlib from upstream ARM source code
- Add -DPREFER_SIZE_OVER_SPEED and always use C versions on aarch64
- Fix existing code
- 0001-aarch64-Add-ILP32-ABI-support-in-assembly-v2.patch
- 0001-aarch64-Add-ILP32-ABI-support-in-assembly.patch

changed the description

Author: Amar Takhar 2024-05-17T02:03:35.708Z

assigned to @joel and @opticron and unassigned @tracmigrate

Author: Amar Takhar 2024-05-17T02:03:55.675Z

Can this be closed? If not can it be moved to %6.2?

Author: Kinsey Moore 2024-05-17T02:55:20.622Z

This can move to %Indefinite because it needs to be open until the patch actually gets pulled into newlib.

Author: Kinsey Moore 2025-03-02T01:52:05.962Z

The updated code has been pulled into newlib and this issue is no longer necessary with 6 or main branches.

3.9.1.178 4504 - RTEMS6 has incorrect code generation for stm32f4 bsp

Id	4504
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate
Created	2021-08-19T23:07:19.000Z

Original author: andreic

I'm working with the master head targeting arm/stm32f4 for RTEMS 6.

I built the tools and RTEMS using:

```
mkdir -p rtems/6
export PREFIX=`pwd`/rtems/6
mkdir external
cd external
git clone git://git.rtems.org/rtems.git
git clone git://git.rtems.org/rtems-source-builder.git
cd rtems-source-builder/rtems
../source-builder/sb-set-builder --prefix=${PREFIX} --log=../b-rsb-toolchain-arm.
↪log 6/rtems-arm
cd ../../rtems
./waf bsp_defaults --rtems-bsps=arm/stm32f4 > config.ini
./waf configure --prefix=${PREFIX}
./waf
```

This setup gives me code that faults when calling the memset() function from bsp_start_clear_bss(). The version of memset() being used in any of the compiled samples has the flags (from rtems-execinfo -O) of:

```
| memset.c                        : -mcpu=arm7tdmi -marm -march=armv4t
```

whereas other functions in the executable have:

```
| lseek.c                         : -mthumb -mcpu=cortex-m4 -march=armv7e-m
```

If I rebuild with

```
./waf bsp_defaults --rtems-bsps=arm/stm32f105rc > config.ini
```

then all of the functions are compiled with the correct architecture flags for a 105rc and the program can reach Init() when run on a 105rc chip.

```
Common flags: 3
| -mthumb -mcpu=cortex-m3 -march=armv7-m
```

If I configure for stm32f4 and change the config.ini file to use:

```
ABI_FLAGS = -mthumb -mcpu=cortex-m3
```

Then rtems-exeinfo shows that all functions are using the same common flags as the stm32f105rc bsp configuration. The generated code cannot be used on an stm32f407, but it does compile an executable with one consistent instruction set.

So, providing -mcpu=cortex-m4 in ABI_FLAGS triggers the use of the wrong version of functions from libgcc (I think).

Background

See https://man7.org/linux/man-pages/man3/malloc_usable_size.3.html https://www.freebsd.org/cgi/man.cgi?query=malloc_usable_size

Approach

RTEMS already has this functionality so it should not be hard to implement this.

The prototype may need to be added to the appropriate newlib header file with the same guard as Linux and FreeBSD.

Add implementation and test code to the malloc family in libcsupport/. The required functionality should already be in the underlying score/ capability used.

The method would need to be fully tested.

The method would need to be documented.

Knowledge/Skills

Original author: Christian Mauderer

The current implementation of ppp assumes (in ppp_tty.c:pppstart) that sending characters via the termios device write function will send buffers of any length. That is not true for most drivers.

Devices that can only send one character at a time won't work with that at all. Devices that have a big enough FIFO might work most of the time. Devices that use a DMA for transmitting might work without problems.

Author: Trac Migrate 2022-02-11T07:37:27.000Z

Original author: Christian Mauderer

In [changeset:"7b5948d4d220ad33864a7b60d8133809908b0d2e/rtems" 7b5948d4/rtems]:

```
termios: Pass number of sent chars to l_start

At the moment the line discipline start function (l_start) has no
possibility to get feedback about the number of characters that have
been sent. This patch passes that information via an additional
parameter.

The change might trigger a warning on existing code because of a pointer
mismatch but it shouldn't break it. An existing function with the old
API will just ignore the additional parameter.

Update #4493
```

Merges	0

Original author: sebastian.huber

Currently, all traps without special functions are handled by _ISR_Handler(). For traps which occur for example due to

- instruction access exception
- illegal instruction
- privileged instruction
- fp disabled
- memory address not aligned
- fp exception
- data access exception

errors the trap handling is unreliable since

1. the stack pointer of the context which caused the trap is used, and
2. writeable data structures are used (for example _ISR_Vector_table).

The trap table is initialized to “ta 0” which ends up in a system error mode. In this mode, the RTEMS fatal error handling is by passed and the initial fatal error handlers are not called.

The trap handling should be changed to invoke a statically initialized bad trap handler which performs the RTEMS fatal error procedure and uses a CPU-specific stack with minimum dependencies on the context which caused the trap.

Author: Trac Migrate 2021-06-24T10:30:30.000Z

Original author: sebastian.huber

Original author: thelunatic

The libbsd currently doesn't support configuring network task priorities that can be used with network services that are used by all network stacks, an example of such network service is telnetd.

Author: Trac Migrate 2021-05-21T06:04:39.000Z

Original author: thelunatic

We have two function in libbsd which may be provided by the application to customize threads created by libbsd:

```
/**
* @brief Returns the initial priority for a task specified by its name.
*
* Applications may provide their own implementation of this function. For
* example they can define their implementation in the same module which calls
```

(continues on next page)

(continued from previous page)

```
 * rtems_bsd_initialize().
 *
 * @param[in] name The task name.
 *
 * @return The desired initial task priority.
 */
rtems_task_priority rtems_bsd_get_task_priority(const char *name);

/**
 * @brief Returns the stack size for a task specified by its name.
 *
 * Applications may provide their own implementation of this function. For
 * example they can define their implementation in the same module which calls
 * rtems_bsd_initialize().
 *
 * @param[in] name The task name.
 *
 * @return The desired task stack size.
 */
size_t rtems_bsd_get_task_stack_size(const char *name);
```

3.9.1.188 5110 - Work around STM32 H7 errata unsupported read access with unaligned address

Id	5110
State	closed
Type	ISSUE
Author	Karel Gardas
Closed by	Amar Takhar

Merges	3

Summary

ST in its errata doc for H7 family (ES0445) in version 3 from 18-Jul-2023 adds errata record:

Citation:

3.9.1.188.1.1 2.8.4 Unsupported read access with unaligned address

3.9.1.188.1.2 Description

Read access with unaligned address, such as a half-word read access starting at odd address, is not supported.

3.9.1.188.1.3 Workaround

Compile the software that accesses the fmc region with a compiler option that ensures data alignment, such as –no_unaligned_access

Citation ends here.

Clearly the workaround for this errata is missing from RTEMS yet.

Author: Karel Gardas 2024-08-09T13:41:40.189Z

mentioned in merge request !180

Author: Kinsey Moore 2024-08-09T14:24:32.515Z

This is missing the context that this only applies to the FMC peripheral. As such, applying this flag to the entirety of RTEMS is not necessary and is likely detrimental to performance.

Author: Karel Gardas 2024-08-11T18:56:59.423Z

Indeed, this is classical and well expected argument. Practice however shows that there is a single testcase from ~600 tests from RTEMS testsuite I compiled with and without the option which resulted in different binary completely. All others have the same text/bss/data sizes so assumption is do not differ or differ much. One different was tftpfs.

Anyway. AFIAK there is a no way how to decide if code is using FMC or it is not, besides looking into RTEMS configuration itself. E.g. once user set linkcmds.*sdram, then this is clear FMC is in use. On the other hand this is probably not easily detectable in ini itself. . . .

So would you like to have configure option like: `STM32H7_ERRATA_ENABLE_FMC_282 = False/True` in ini file which would drive addition of -mno-unaligned-access option? Fine by me, but what would be default? Here I would really appreciate `True` as this is about stability and even ST itself recommends that! Once someone feels a need to be brave, then she/he can switch to `False` of course, but he/she will/should understand consequences well.

Author: Kinsey Moore 2024-08-11T18:56:59.423Z

This is fine. I agree that stability is critical and I misread the errata initially. Thanks for taking the time to explain things.

Author: Joel Sherrill 2024-08-09T20:16:36.340Z

I'd support that approach. Default to conservative and user beware to change the setting. Be sure the comments for the setting are clear and include a reference to

STM material. Or write what you want in the Users Guide for this BSP and reference that with less detail for the ini file

Author: Kinsey Moore 2024-08-09T20:20:01.513Z

Oh... the errata is non-specific. I had assumed it meant the device memory itself and not the mapped memory. That is very unfortunate errata.

3.9.1.189 5109 - open: Race condition when called with O_TRUNC

Id	5109
State	closed
Type	ISSUE
Author	Loris Nardo
Closed by	Kinsey Moore
Created	2024-08-08T05:13:51.200Z
Closed	2024-08-11T18:59:06.067Z
Updated	2025-09-19T01:02:12.033Z
Milestone	6.1
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5109
Merges	1

Summary

Checking the code of `open`, I noticed that when `O_TRUNC` is passed, the iop flag is updated to include `LIBIO_FLAGS_OPEN` and then ftruncate is called on the file descriptor of the iop. In doing so, there is a small time window in which the file descriptor can be accessed by other threads and can perform some operation on the file before the truncate has been completed or even started.

Steps to reproduce

Author: Loris Nardo 2024-08-08T05:23:14.323Z

mentioned in merge request !178

Author: Chris Johns 2024-08-11T01:43:18.176Z

Why would a thread have the descriptor if it has not been returned by open?

Author: Loris Nardo 2024-08-11T01:43:18.176Z

That is a good question..., currently the only way I can think of is because the fd number had been kept in some variable after a `close`, but it is questionable and also it seems like clutching at straws.

Feel also free to close the issue and the merge request

Author: Chris Johns 2024-08-11T01:43:18.176Z

There is a valid case you have shown but I am wondering if ithighlights the lack of locking around the `iop` references in `libio`?

The change in !178 looks OK. Which filesystems have you tested it on?

Author: Loris Nardo 2024-08-11T01:43:18.176Z

I usually run the testsuite of fstest and at work I use mostly the FAT32 file system.

About the first question, some issue with the way `iop` are currently handled exists, but they require far more changes and some discussion to fix them (at least is what I think). Example are the issue #2158 and #5045.

I'm not saying that these things needs to be addressed now, the code has been like that for many years and none has had any particular issue with it.

Author: Chris Johns 2024-08-11T01:43:18.176Z

Yes I agree there are issues and it is more work.

3.9.1.190 5082 - Change the default stack checker reporter to be a quiet reporter

Merges	0

Summary

3.9.1.190.1.1 Purpose

The current stack checker reporter provides a detailed description of stack usage. This proposed change aims to set the default reporter to a basic version that only performs one task: calling the fatal error handler. Users will have the option to configure the reporter to use the detailed version or even a custom, user-defined reporter through the application settings.

3.9.1.190.1.2 Result

This change will simplify the default reporting behavior, while also giving users the flexibility to choose a more detailed reporter if desired or to create their own custom reporter.

pwdgrp.c: Fix Unchecked return value from library (CID #1255518)

CID 1255518: Unchecked return value from library in pwdgrp_init().

Closes #4282
```

Author: Joel Sherrill 2021-03-23T13:45:55.000Z

Original author: rlong

- **Resolution** ~"fixed" deleted
- **Status** changed from *closed* to *reopened*

It turns out that at least /etc can be created in multiple places depending on the RTEMS application structure. It was discussed that a standard mechanism is needed to address additional base file system directories. Ticket #4354 has been created for that which allows this issue to be strictly about the Coverity issue.

Changing the _Assert which was used to (void) mkdir should be sufficient to close this ticket again. Improvements to the base file system directory create can occur under #4354

Original author: frank_k

When I use the 'shell' from the fileio sample with the command below:

```
env QEMU_AUDIO_DRV="none" \\
qemu-system-arm -no-reboot -net none -nographic -M realview-pbx-a9 -m 256M \\
-kernel build/arm/realview_pbx_a9_qemu/testsuites/samples/fileio.exe
```

The executable crashes with an "BLOWN STACK!!!" as soon as I try to login as 'root' with password. (The logins without password work fine.) Increasing the stack size of the affected thread a bit (to 5 times RTEMS_MINIMUM_STACK_SIZE) solves the issue.

How to reproduce:

1. Start the fileio sample in QEMU with the above command.
2. Type a key to stop the timer.
3. Type "s" <return> to enter the shell.
4. Login as "root" with the password printed to the terminal.
5. In the line with the first shell prompt, the text "BLOWN STACK!!!" appears unexpectedly followed by further crash information.

```
[...]
/dev/foobar login: root
Password:

RTEMS Shell on /dev/foobar. Use 'help' to list commands.
SHLL [/] # BLOWN STACK!!!
task control block: 0x00205278
[...]
```

In [changeset:"ec13365d770f41a3d7ecda661a8844a47b4e1fb9/rtems" ec13365/rtems]:

```
testsuites/samples/fileio - Increase of stack size

When I use the 'shell' from the fileio sample with the command below:

env QEMU_AUDIO_DRV="none" \\
qemu-system-arm -no-reboot -net none -nographic -M realview-pbx-a9 \\
-m 256M \\
-kernel build/arm/realview_pbx_a9_qemu/testsuites/samples/fileio.exe

The executable crashes with an "BLOWN STACK!!!" as soon as I try to
↪login
as 'root' with password. (The logins without password work fine.)
Increasing the stack size of the affected thread a bit solves the issue.
Hence, I suggest this patch.

My config.ini was

Current rtems-libbsd master branch fails to compile the e1000 driver for i386 based BSPs.

The corresponding patches from the 5-freebsd-12 branch need to be ported to master.

Original author: chenjin_zhong

Cloned from #4564:

Hi, I find when close editor in shell console.some errors will occur. I check and analyse the source code of medit.c. the code fragment is listed as follows.

if defined(__rtems__)

case ctrl('w'): ed = ed->env->current; close_editor(ed); break;

else

case ctrl('w'): close_editor(ed); ed = ed->env->current; break;

endif

static void close_editor(struct editor *ed) { struct env *env = ed->env; if (ed->dirty) { display_message(ed, "Close %s without saving changes (y/n)? ", ed->filename); if (!ask()) { ed->refresh = 1; return; } }

delete_editor(ed);

ed = env->current; if (!ed) { ed = create_editor(env); new_file(ed, ""); } ed->refresh = 1; }

static void delete_editor(struct editor *ed) { if (ed->next == ed) { ed->env->current = NULL; } else { ed->env->current = ed->prev; } ed->next->prev = ed->prev; ed->prev->next = ed->next; if (ed->start) free(ed->start); clear_undo(ed); * free(ed);** }

as seen above, if the macro **__rtems__** is defined. the delete_editor function will free **ed** pointer. Therefore, after the next loop, the **ed** is an invalid pointer.I have checked the code of https:

//github.com/ringgaard/sanos/blob/master/src/utils/edit/edit.c. the code is as follows. **case ctrl('w'): close_editor(ed); ed = ed->env->current; break;**

Original author: jkillelea

I have found two possible memory exceptions under `rtems_shell_init` when running on the raspberry pi 1 BSP.

First, a possible null pointer dereference from `getpwuid_r(0, &pwd, NULL, 0, &pwd_res);` in `rtems_shell_init_once`. The NULL pointer is never checked before it is used as a backing buffer for `pwd`.

Second, usage of `stdin`, `stdout`, and `stderr` cause memory exceptions in `rtems_shell_run` when used, for example `shell_env->parent_stdin = stdin;`.

- getpwuid_r_patch.txt

Author: Trac Migrate 2022-11-14T00:32:43.000Z

Original author: jkillelea

- **Attachment** getpwuid_r_patch.txt added

Author: Trac Migrate 2022-12-11T15:06:45.000Z

Original author: jkillelea

It appears that raspberry pi does not support _Thread_Local attributes. Rebuilding GCC with the flag `--without_newlib_tls` seems to fix most errors. The null pointer error in getpwuid_r is actually ok, it's the call to set errno later in the function that causes failures.

Author: Trac Migrate 2022-12-15T07:18:06.000Z

Original author: jkillelea

What happens if you run the sptls01, sptls02, and sptls03 tests on this BSP?

After a tool update, did you recompile everything?

Author: Trac Migrate 2022-12-18T18:03:05.000Z

Original author: jkillelea

I recompiled everything with the same `--without_newlib_tls` flag, yes. That seemed to fix most issues. Certain miscellaneous packages fail to compile, but the kernel, BSP, and libbsd all work. I can reach an interactive terminal inside qemu now, and can reach the terminal prompt over serial on real hardware (unclear why I can't type yet, but that feels unrelated).

Author: Trac Migrate 2022-12-19T06:43:45.000Z

Original author: jkillelea

Disabling the Newlib TLS configuration is really not a long term option. We should figure out why the TLS support is broken on this BSP. What happens if you run the sptls01, sptls02, and sptls03 tests on this BSP?

Cloned from #4558:

Hi, I find one problem in rtems_shell_main_chmod function. the usage of this instruction is descripted as “chmod 0777 n1 n2... #change filemode”, .the src code is listed as follows. the bold part should be replaced with **chmod(argv[n], mode)**?

```
static int rtems_shell_main_chmod(
int argc,
char *argv[]
)
{
int           n;
mode_t        mode;
unsigned long tmp;

```

(continues on next page)

(continued from previous page)

```
if (argc < 2) {
fprintf(stderr,"%s: too few arguments\\n", argv[0]);
return -1;
}

/*
*  Convert arguments into numbers
*/
if ( rtems_string_to_unsigned_long(argv[1], &tmp, NULL, 0) ) {
printf( "Mode argument (%s) is not a number\\n", argv[1] );
return -1;
}
mode = (mode_t) (tmp & 0777);

/*
*  Now change the files modes
*/
for (n=2 ; n < argc ; n++)
chmod(argv[n++], mode); /* <<<< here */

return 0;
}
```

Original author: sebastian.huber

The rtems_shell_init() passes the address of a stack variable (exit_code) to rtems_shell_run(). If wait == false, then the stack variable goes out of scope but may be accessed by the created shell thread.

```
shell: Avoid potential stack corruption

The rtems_shell_init() passed the address of a stack variable
(exit_code) to rtems_shell_run().  If wait == false, then the stack
variable goes out of scope but may be accessed by the created shell
thread.

The rtems_shell_script() was affected by the same problem.

Close #4629.

Add support to set the rows and columns in the shell. RTEMS does not have a full tty system and does not carry `terminfo` so implement a shell based approach to let some commands manage the terminal size.

Update the `edit` command to support the terminal size.

Fix the help lines.

Original author: ralf.corsepius

rtems_shell_main_monitor is a private function of cpukit/libmisc/shell/cmds.c

However, the way testsuites/libtests/monitor02/init.c uses it (as a public/exported function) to me reads as a strong indication that rtems_shell_main_monitor() should be “made public” by declaring/prototyping it in cpukit/libmisc/shell/shell.h

Author: Chris Johns 2010-05-15T06:42:03.000Z

- **Cc** added @vattam.santosh
- **Owner** set to @chrisj
- **Milestone** changed from %”4.10” to %”4.11”
- **Status** changed from *new* to *assigned*

Exporting this interface from the shell is a hack as well. The central issue is the purpose of the monitor now we have a shell. Should we consume the monitor into the shell and remove the duplicate code in RTEMS ? The monitor has stdin handling, terminal handling plus help formatting (which is much better than the shell’s). I think these can all be merged into the shell and the monitor goes away.

I think this should be moved to the 4.11 milestone, which I have done, and we live with the current code for 4.10.

Once issue this raises is the pressure on the shell with all the files that are starting to appear in it. Maybe the monitor command remain in its directory.

- **Milestone** changed from %”4.11” to %”5.0”
- **Summary** changed from *Add rtems_shell_main_monitor to cpukit/libmisc/shell/shell.h?* to *Make Monitor Commands first class citizens in shell,*

The monitor predates the shell. There is really no point in having two CLIs. The monitor commands are available in the shell but the integration is a hack. The monitor commands need to be made first class shell commands and the set for looking at objects enhanced to include more objects.

This may be a decent GSoC project.

Original author: frank_k

Cloned from #4096:

This patch fixes a tiny bug in the command line editing of the RTEMS shell. Typing CTRL-U in the shell should remove all characters left of the cursor. After pressing CTRL-U, the current implementation does wrongly place the cursor at the end of the line instead at its beginning.

To reproduce the bug, start the shell and type 'abc123' (no <RETURN>):

{{{ ~/src/rtems $ qemu-system-arm -net none -nographic -M realview-pbx-a9 -m 256M -kernel build/arm/realview_pbx_a9_qemu/testsuites/libtests/dl10.exe * **BEGIN OF TEST libdl (RTL) 10** * * **TEST VERSION: 6.0.0.d9bdf166644f612dd628fe4951c12c6f8e94ba5f** * TEST STATE: USER_INPUT * **TEST BUILD: RTEMS_DEBUG RTEMS_NETWORKING RTEMS_POSIX_API RTEMS_SMP** * TEST TOOLS: 10.2.1 20200904 (RTEMS 6, RSB 31f936a7b74d60bda609a9960c6e1a705ba54974, Newlib a0d7982) RTL (libdl) commands: dl, rtl

RTEMS Shell on /dev/foobar. Use 'help' to list commands. SHLL [/] # abc123 }}}

Then move the cursor onto the '1' by hitting three times the <ARROW-LEFT> key. Next type <CTRL>-U:

{{{ SHLL [/] # 123 }}}

Note that the cursor is at the end of the line (after '3') instead of correctly at the beginning (on the '1'), now.

Continuing typing 'echo ' incorrectly results in the output:

{{{ SHLL [/] # 123echo 123 }}}

The patch changes this behavior so that the cursor in the second last step will be on the '1' and typing 'echo ' will then correctly reflected as:

{{{ SHLL [/] # echo 123 }}}

Original author: chenjin_zhong

Hi, I find when open medit editor in shell console, and then input **CTRL+E/CTRL+X** instructions in medit.the selected text cannot be cut. I review the code in main_medit file. First, when I input **CTRL+E** instruction, the function **select_toggle** is executed and selects the text. Second, when I input **CTRL+X**, the function **cut_selection** copies the selected text to clipboard. but after copy, the selected text is non-selected. Therefore, the **erase_selection** in **cut_selection** cannot take effect. the src code is listed as follows. I suggest that remove **select_toggle** in **copy_selection** function. and add after **copy_selection**. the code frament is marked in bold.

static void select_toggle(struct editor *ed) { ed->selecting = ed->selecting ? 0 : 1; update_selection(ed, ed->selecting); adjust(ed); }

static void cut_selection(struct editor *ed) { copy_selection(ed); erase_selection(ed); select_toggle(ed); }

static void copy_selection(struct editor *ed) { int selstart, selend; if (!get_selection(ed, &selstart, &selend)) return; ed->env->clipsize = selend - selstart; ed->env->clipboard = (unsigned char *) realloc(ed->env->clipboard, ed->env->clipsize); if (!ed->env->clipboard) return; copy(ed, ed->env->clipboard, selstart, ed->env->clipsize); select_toggle(ed); }

case ctrl('c'): copy_selection(ed); select_toggle; break;

Original author: chenjin_zhong

First I think you mean main_edit.c ([https://github.com/RTEMS/rtems/blob/master/cpukit/libmisc/shell/main_edit.c])

Did you observe this on real hardware or a simulator? It is possible that the communications program (with hardware) or simulator is grabbing some characters.

It is also possible this is a bug. If this is the case, the code originated from https://github.com/ringgaard/sanos/tree/master/src/utils/edit. If it is a bug, we would like to work with the upstream to get it fixed and then update the code in RTEMS.

The code at the original repository can be compiled natively and you can check the behavior on that. The RTEMS derived version probably can be compiled similarly if that didn't get broken in the merge. Please try to follow up and let's see what is needed.

Author: Trac Migrate 2021-12-05T13:34:32.000Z

Original author: chenjin_zhong

Thank you! I have observed this on real hardware. then, I have checked https://github.com/ringgaard/sanos/tree/master/src/utils/edit. This Bug has been fixed. the code fragment is listed as follows. The erase_selection function is called by the cut_selection function and is able to delete selected characters.

void copy_selection(struct editor *ed) { int selstart, selend; if (!get_selection(ed, &selstart, &selend)) return; ed->env->clipsize = selend - selstart; ed->env->clipboard = (unsigned char *) realloc(ed->env->clipboard, ed->env->clipsize); if (!ed->env->clipboard) return; copy(ed, ed->env->clipboard, selstart, ed->env->clipsize); }

void cut_selection(struct editor *ed) { copy_selection(ed); erase_selection(ed); }

Summary

Provider calls to set a read and write handler for the `rd` and `wr` shell commands. The set calls will return the existing handler.

This change lets a user provide calls to access indirection devices with FDT blobs.

3.9.1.210 4131 - “fdisk DISK_NAME mount” in bdpart-mount.c uses non-existing file system type “msdos”

Id	4131
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Trac Migrate

Original author: frank_k

The function rtems_bdpart_mount() seems to be only used by the ‘fdisk’ shell command to mount all partitions of a disk with a single command:

```
fdisk DISK_NAME mount
mounts the file system of each partition of the disk

fdisk DISK_NAME unmount
unmounts the file system of each partition of the disk
```

The whole command does not work because in file cpukit/libblock/src/bdpart-mount.c line 103 specifies the file system type of each partition to be “msdos”. Yet, “msdos” does not exist. The name must be “dosfs”.

Beside of this fundamental problem, there are more issues with the code in bdpart-mount.c:

1) The function returns RTEMS_SUCCESSFUL despite the mount always fails.

2) The reason for errors is not written to the terminal.

3) The directory ‘/mnt’ is created but not deleted later on (failure or not).

3) There is no documentation about this special ‘fdisk’ feature in the RTEMS Shell Guide. (‘fdisk’ is mentioned but its documentation is a bit short).

4) Only “msdos” formatted partitions can be mounted and all partitions are mounted read only. This is hard coded and cannot be changed by options. Moreover, there is no information about this to the user of the shell (i.e. using ‘fdisk’ mount requires insider knowledge).

How to reproduce:

1) For testing I use the ‘testsuites/samples/fileio/init.c’ sample and since I do not know the ‘root’ password, the password must be removed from that file to login as ‘root’ without password:

```
index 86b34b99dd..51507f9a53 100644

↪-m 256M -kernel build/arm/realview_pbx_a9_qemu/testsuites/samples/fileio.exe
```

3) Type any key to stop the timer and enter the sample tool. Type ‘s’ to enter the shell, login as ‘root’ with empty password.

4) Type the following shell commands (they create a RAM disk, partition it, regsiter it, format it and try to mount it):

```
mkrd
fdisk /dev/rda fat32 16 write mbr
fdisk /dev/rda register
mkdos /dev/rda1
fdisk /dev/rda mount
```

5) The last line above is the command which fails - without an error message. There exists a ‘/mnt’ directory but no ‘/mnt/rda1’ directory as it shoud be:

```
ls -la /mnt
```

6) If you change line 103 of ‘cpukit/libblock/src/bdpart-mount.c’ from “msdos” to “dosfs”, compile and build the executable and re-run the above test, ‘/mnt/rda1’ exists (but the file system is mounted read-only).

In [changeset:”a479686c112144119866391ceb21c48be6a3eca9/rtems” a479686/rtems]:

```
shell: Remove not functioning fdisk mount/unmount

The shell has an 'fdisk' command which has sub-commands 'mount' and
↪'unmount'.
These two sub-commands have a bug which causes them to be not able
to mount anything. This proposed patch removes the buggy file
cpukit/libblock/src/bdpart-mount.c and the mount/unmount commands
from 'fdisk' as bug fix. The 'fdisk' command itself is not removed.
The reasons for removing the sub-commands (instead of fixing the issue)␣
↪are:

1) The bug has been introduced on 2010-May-31 with commit
29e92b090c8bc35745aa5c89231ce806bcb11e57. Since ten years no one
can use this feature, nor has anybody complained about it.

2) Besides of the 'fdisk' 'mount' sub-command, the shell has the
usual 'mount' and 'unmount' commands which can serve as
substitutes.

3) There are additional minor issues (see further down) which needed to
be addressed when the file will be kept.

What follows below is the precise bug description.

The bug is in function rtems_bdpart_mount() which is only be used
by the 'fdisk' shell command to mount all partitions of a disk with a
single command:

  fdisk DISK_NAME mount
  mounts the file system of each partition of the disk
  fdisk DISK_NAME unmount
  unmounts the file system of each partition of the disk

  The whole command does not work because in file
  cpukit/libblock/src/bdpart-mount.c line 103 specifies the file system␣
↪type
  of each partition to be "msdos". Yet, "msdos" does not exist. The name
  must be "dosfs".

  Beside of this fundamental problem, there are more issues with the␣
↪code
  in bdpart-mount.c:

  1) The function returns RTEMS_SUCCESSFUL despite the mount always␣
↪fails.

  2) The reason for errors is not written to the terminal.

```

(continues on next page)

(continued from previous page)

```
  3) The directory '/mnt' is created but not deleted later on (failure
↪or not).

  3) There is no documentation about this special 'fdisk' feature in the
  RTEMS Shell Guide ('fdisk' is mentioned but its documentation is a
  bit short):
  https://docs.rtems.org/branches/master/shell/
  file_and_directory.html#fdisk-format-disk

  4) Only "msdos" formatted partitions can be mounted and all partitions
  are mounted read-only. This is hard coded and cannot be changed by
  options. Moreover, there is no information about this to the user of
  the shell (i.e. using 'fdisk' mount requires insider knowledge).

  How to reproduce:

  1) For testing, I use the 'testsuites/samples/fileio.exe' sample with
↪qemu:

    cd rtems
    env QEMU_AUDIO_DRV="none" qemu-system-arm -net none -nographic \\
    -M realview-pbx-a9 -m 256M -kernel \\
    build/arm/realview_pbx_a9_qemu/testsuites/samples/fileio.exe

    2) Type any key to stop the timer and enter the sample tool.
    Type 's' to enter the shell, login as 'root' with the password
    shown in the terminal.

    3) Type the following shell commands (they create a RAM disk,
    partition it, register it, format it and try to mount it):

      mkrd
      fdisk /dev/rda fat32 16 write mbr
      fdisk /dev/rda register
      mkdos /dev/rda1
      fdisk /dev/rda mount

      4) The last line above is the command which fails - without an
↪error
      message. There exists a '/mnt' directory but no '/mnt/rda1'
↪directory
      as it should be:

```

(continues on next page)

(continued from previous page)

```
91          ls -la /mnt
92
93          5) If you change line 103 of 'cpukit/libblock/src/bdpart-mount.c
    ↪'
94          from "msdos" to "dosfs", compile and build the executable and
95          re-run the above test, '/mnt/rda1' exists (but the file system
96          is mounted read-only).
97
98          Close #4131
```

3.9.1.211 5159 - SMP: Race condition in thread priority changes

Id	5159
State	closed
Type	ISSUE
Author	Sebastian Huber
Assignee(s)	Sebastian Huber
Closed by	Chris Johns

Merges	5

Summary

In SMP configurations, explicit thread priority changes (for example rtems_task_set_priority()) and thread priority changes carried out by thread queues (locking protocols such as priority inheritance) are not properly serialized. This leads to a data corruption of the thread control blocks and unpredictable system behaviour.

Explicit thread priority changes are issued by the following operations:

- rtems_task_set_priority()
- rtems_task_restart()
- EDF job deadlines
- Obtaining or releasing a priority ceiling mutex
- pthread_setschedparam()
- pthread_setschedprio()

If one of these operations is carried out while the thread priority is changed in parallel through priority inheritance the error may get triggered. Applications setting the thread priorities only during thread initialization are not affected by the bug.

Steps to reproduce

Applications using the POSIX sporadic server and priority inheritance mutexes have a higher probability to observe the faulty system behaviour.

Merges	5

Summary

The rtime decompressor appears to have a bug when handling corrupted/bad compressed data. The repeat while loop doesn't verify it has space to write out data when handling repeats.

This was observed to cause memory corruption when using multiple JFFS2 partitions set to use the same compression buffer (which is itself a bug/incorrect configuration).

Steps to reproduce

Configure a system with multiple JFFS2 filesystems configured to use the same rtime compression buffer and access them from multiple threads. RAM and flash corruption occur quickly.

Summary

On our new projects website needs a review we need to either close issue or remove the project:: tag from it so it doesn't show up for instance we have one for the x86_64 BSP which already exists.

We should have this for %6.1 because when we have the new release we'll get more attention and it will be an easy way for them to contribute if they wish.

Steps to reproduce

https://projects.rtems.org

3.9.1.216.2.1 Pre-set options

Author: Amar Takhar 2024-11-09T19:15:51.068Z

@chris @gedare @joel .. can we go through the list and figure it out? I'm going to add the project:: tags now and we will use those the gsoc ones will remain.

Author: Gedare Bloom 2024-11-09T18:40:03.092Z

I usually go through this list as part of preparing the GSoC Application. I don't see a need to align this activity with a release milestone.

A different problem is more important to me on the Projects page, which is that it has somehow merged what used to be small GCI-like tasks in with small GSoC tasks, e.g., https://gitlab.rtems.org/rtems/rtos/rtems/-/issues/3913

I guess I'll have to go through all those project ideas and filter them so we have a clean set of GSoC-appropriate tasks and sizes with correct labels, and also have additional project ideas that may not be ready or eligible for GSoC.

Author: Gedare Bloom 2024-11-09T18:42:16.402Z

I think I know what happened. We used to have separate tags for project size, and for gsoc. It looks like they got merged together in a single label during the gitlab transition. It should mostly only be affecting the small sizes.

Author: Amar Takhar 2024-11-09T18:52:08.104Z

Yeah I just looked and this is what most likely happened. I think I recall we merged a bunch of labels together.

We can have a project::simple or something for those tasks? No reason to not identify them for being completed.

Author: Gedare Bloom 2024-11-09T18:53:33.052Z

I'm not sure what you mean by `package::` tags. We had ticket keywords before to help us sort the projects. They were in the set of `BSP`, `testing`, `ecosystem`, `kernel`, `API`, `statistics`, `libbsd`

We should just remove the `gsoc` labels and keep the size?

Author: Amar Takhar 2024-11-09T19:17:14.700Z

That's a typo on my parent meant to type project:: it was late.

We can remove the gsoc labels yes. I can re-add missing labels to issues if they were in trac.

Do we want a project::tiny tag to move the GCI tasks there or identify any other tiny projects?

Author: Gedare Bloom 2024-11-09T19:24:59.077Z

I would for now stick with having small/medium/large sizes, and a GSoC identifier. if we need to add a size below small for non-GSoC projects we can come up with that later.

Author: Amar Takhar 2024-11-09T19:50:57.973Z

I think that's a bad idea if we kick them out of project::small then they will go into the wind of all the other tickets we have to go though we've already identified it as something needing to be done so we should identify it it somehow. We can always delete the project::tiny label later if we don't think it's worthwhile but I don't want to just have random open tickets floating we have 600 of those already.

Author: Gedare Bloom 2024-11-09T20:03:36.966Z

Maybe I wasn't clear. Keep them as `project::small` but remove any `gsoc` or `gsoc::` labels. I should be able to do this, if the decision isn't clear to you.

Author: Amar Takhar 2024-11-09T20:05:35.776Z

Ohh I see it's a different issue nevermind I thought you were talking about getting rid of the ``project::small`` tag so they don't show up on the website.

Author: Amar Takhar 2024-11-09T20:06:37.566Z

If your intention is to not have the two labels overlap then the code can just be made to work on multiple pages and you can have list on the /gsoc/ page as well.

Author: Gedare Bloom 2024-11-09T21:57:52.790Z

My thought is to organize all projects by size, but then have other ways to filter, such as by GSoC, or by project tags (bsp, kernel, etc). Whether we do that filtering by making pages, or by making separate sections, or by presenting the label information in the web site, is something still to be determined.

Author: Amar Takhar 2024-11-09T22:41:51.607Z

Okay well we can have any permutation we want on the website but we must organise them using labels on the issues. We decided that issues were defacto in their respective repositories but we can make the webpage pull off the issues using the labels that way both always match. Happy to create whatever labels are required.

Author: Gedare Bloom 2024-11-10T00:51:32.740Z

ok. i think I want project::{size} and then gsoc::{tag} for tag in the list above (bsp, testing, ecosystem, ...) as those are gsoc-specific filters we created. This way, we can pull those tags and sort them by size for GSoC, while we can have an overall open projects page with all sizes listed?

Author: Amar Takhar 2024-11-10T01:03:47.520Z

Okay so can you give me a list of gsoc tags you want? Do you put more than 1 on an issue? If they are scoped you can only use 1.

Summary

The build of my template rtems-omk-template fails when libdl test aplication is enabled for riscv-beaglevfire and riscv-mpfs64imafdc and I expect that problem is related to all RISC-V targets.

The include file is not installed

The build end with error message:

```
fatal error: rtems/rtl/dlfcn-shell.h: No such file or directory
```

The problem seems to be cause by missing build spec file

```
spec/build/cpukit/objdlriscv.yml
```

The related RISC-V relocation support seems to be present in the CPU kit libdl sources

```
cpukit/libdl/rtl-mdreloc-riscv.c
```

But it is not referenced by any `.yml` files at all.

Steps to reproduce

Configure RTEMS for any of RISC-V targets, i.e.:

```
!/bin/sh

MY_DIR="$(cd "$(dirname "$0")" ; pwd -L )"

RTEMS_DIR=../../../git/rtems

$RTEMS_DIR/waf bspdefaults --rtems-bsps=riscv/beaglevfire -t "$RTEMS_DIR" -o "$MY_
↪DIR" --prefix "/opt/rtems/6" >config.ini || exit 1

mv config.ini config.ini.default
sed <config.ini.default >config.ini \\
```

(continues on next page)

(continued from previous page)

```
-e 's/^RTEMS_POSIX_API .*$/RTEMS_POSIX_API = True/' \\
-e 's/^RTEMS_SMP .*$/RTEMS_SMP = True/' \\

$RTEMS_DIR/waf configure -t "$RTEMS_DIR" -o "$MY_DIR" --rtems-config "$MY_DIR/
↪config.ini" --prefix "/opt/rtems/6" || exit 1
$RTEMS_DIR/waf || exit 1
$RTEMS_DIR/waf install || exit 1
```

and file

```
riscv-rtems6/beaglevfire/lib/include/rtems/rtl/dlfcn-shell.h
```

is missing in the `/opt/rtems/6`

It can be found there for other architectures

```
arm-rtems6/csb336/lib/include/rtems/rtl/dlfcn-shell.h
arm-rtems6/lpc40xx_ea_ram/lib/include/rtems/rtl/dlfcn-shell.h
arm-rtems6/tms570ls3137_hdk_intram/lib/include/rtems/rtl/dlfcn-shell.h
arm-rtems6/tms570ls3137_hdk_sdram/lib/include/rtems/rtl/dlfcn-shell.h
arm-rtems6/xilinx_zynq_a9_qemu/lib/include/rtems/rtl/dlfcn-shell.h
arm-rtems6/xilinx_zynq_zedboard/lib/include/rtems/rtl/dlfcn-shell.h
i386-rtems6/pc686/lib/include/rtems/rtl/dlfcn-shell.h
```

3.9.1.219.2.1 Pre-set options

|                                                              |
|                                                              long int
|                                                            %d
../../../../../git/rtems/cpukit/libdl/rtl-mdreloc-riscv.c:166:12: warning: variable 'local' set but not used [-Wunused-but-set-variable]
166 |   Elf_Word local = 0;
|            ^~~~~
../../../../../git/rtems/cpukit/libdl/rtl-mdreloc-riscv.c:165:12: warning: unused variable 'addend' [-Wunused-variable]
165 |   Elf_Word addend = (Elf_Word) rela->r_addend;
|            ^~~~~~
../../../../../git/rtems/cpukit/libdl/rtl-mdreloc-riscv.c:164:13: warning: unused variable 'tmp' [-Wunused-variable]
164 |   Elf_Word  tmp;
|             ^~~
```

I try to analyze what is right, but it would need real testing to be sure that there is not something missed.

I am curious even about `libdl` for x86_64, because that architecture is missing in `cpukit/libdl/rtl-elf.h` to select 64-bit `ELFSIZE`

```
#if defined(__powerpc64__) || defined(__aarch64__) || (__riscv_xlen == 64)
#define ELFSIZE 64
#else
#define ELFSIZE 32
#endif
```

Author: Chris Johns 2024-11-14T09:37:48.710Z

The `libdl` support for RISCV does not build as the following symbols are missing:

- `rtems_rtl_elf_arch_parse_section`

- `rtems_rtl_elf_arch_section_alloc`
- `rtems_rtl_elf_arch_section_free`
- `rtems_rtl_elf_rel_resolve_sym`
- `rtems_rtl_elf_relocate_rel`
- `rtems_rtl_elf_relocate_rel_tramp`
- `rtems_rtl_elf_relocate_rela`
- `rtems_rtl_elf_relocate_rela_tramp`
- `rtems_rtl_elf_relocate_tramp_max_size`
- `rtems_rtl_elf_section_flags`
- `rtems_rtl_elf_unwind_deregister`
- `rtems_rtl_elf_unwind_parse`
- `rtems_rtl_elf_unwind_register`
- `rtems_rtl_obj_tramp_alignment`

These calls will need to be provided for RISCV for it to be added to the build.

Author: Chris Johns 2024-11-14T09:40:09.995Z

It could be my spec foo is rubbish. Checking some more.

Author: Chris Johns 2024-11-14T09:44:52.426Z

Yeap my spec changes were broken. Back on track.

Author: Chris Johns 2024-11-14T10:05:50.435Z

mentioned in merge request !312

Author: Pavel Pisa 2024-11-14T20:09:42.197Z

My test code with my libdl-riscv.diff builds completely but I have stuck on some sane setup of BeagleV-Fire for testing. May it be, I try QEMU the first. As for the code, there are warnings and I do not like how `Elf_Word *where;` is assigned `where = (Elf_Addr *)(sect->base + rela->r_offset);` and used in the function `rtems_rtl_elf_reloc_rela()`. It would wort to check all relocation cases what should be the length of modified address in the binary image. I expect that it should be sometimes 32-bit Elf_Word for 32-bit targets but 64-bit for 64-bit targets. It should be of native endianning for constants acessed by LW but it should be little-endian when code is modified, because even big-endian RISC-V reads code in little-endian to allow variable length instructions. There rules seems to be mostly followed by the `rtl-mdreloc-riscv.c` code but I am not 100% confident and warnings make me even more unsure. So it should be check against spec.

Author: Chris Johns 2024-11-14T20:10:38.728Z

Can you please try the MR I have posted? It is !312. Thanks

3.9.1.220 5120 - Refactor xilinx_zynqmp_lp64_cfc400x BSP watchdog disable

Id	5120
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Kinsey Moore

Merges	1

The `xilinx_zynqmp_lp64_cfc400x` BSP requires a special console sequence sent over the NS1550 UART driver in the PL to the board hardware to disable the board watchdog. This is needed to run the tests in the testsuite or they watchdog.

This issue to move the sequence send into a BSP specific C file that SYSINITs after the console driver has been registered to send the disable sequence. This removes the code from a shared driver placing it into a BSP specific source file linked only into that BSP.

Author: Chris Johns 2024-08-18T01:29:25.642Z

assigned to @opticron

Author: Chris Johns 2024-08-27T03:50:20.081Z

The refactor should move the MMU LPD HP AXI entry to the BSP and remove it from the general table. Some systems have requirements to not have unmapped addresses open. I do not know what happens to an access not mapped? It may lock up a system as there tends to be no bus error timers running.

Author: Kinsey Moore 2024-08-27T15:13:09.950Z

Thanks for creating this issue. I'll remove the entry from the general table. Currently, accesses not mapped at the MMU level will generate a data abort and accesses that don't have a real AXI target will hang the system.

The header rtems/confdefs/libio.h includes `librtemsNfs.h` which no longer exists in `rtems.git`. The define `CONFIGURE_FILESYSTEM_NFS` is defined if `CONFIGURE_FILESYSTEM_ALL` is defined.

Should references to NFS be removed from `confdefs` since NFS depends on a networking stack which is a separate package?

At the moment defining `CONFIGURE_FILESYSTEM_ALL` is broken and I suppose not used so should it also be removed?

Author: Joel Sherrill 2024-10-24T22:32:06.271Z

I can remove the include but I do not know how to properly replace this with an alternative.

It may make sense to have something like networking/confdefs.h which the USER can include before rtems/confdefs.h. The networking/confdefs.h could then define some macros used by the main confdefs.h but unavailable unless the user does the right thing. FWIW this is the pattern used with the Deos+RTEMS BSPs

Author: Chris Johns 2024-10-24T22:32:06.271Z

Should this be punted off to 7?

Author: Gedare Bloom 2024-11-16T21:54:29.606Z

Should we just remove `CONFIGURE_FILESYSTEM_NFS` from the `CONFIGURE_FILESYSTEM_ALL` and add documentation that configuring network filesystems requires separate/explicit configuration by the user application?

Author: Chris Johns 2024-11-16T21:54:29.572Z

Sounds good and add a note to the v6 release notes that users may need to add it?

Author: Gedare Bloom 2024-11-17T00:13:31.455Z

Yes. It seems to be the least intrusive solution at the moment.

Original author: dppinto

Within bspssparcleon3startbspidle.S there is the attached code snapshot, on which line 26 seems to contradict GR712RC board User Manual section 1.7.8 (Errata # 8 - LEON3FT Cache Controller: Incorrect Bus Access After Power-Down):

“1.7.8 LEON3FT Cache Controller: Incorrect Bus Access After Power-Down

A LEON with support for clock gating has one clock that is kept running and one clock that is gated off in power-down mode. Due to a design error, the gated clock was used for logic that keeps track of the state of the AMBA bus. Due to this error, the first instruction or data (whichever is first) access to the bus after leaving power-down might be performed incorrectly.

. . .

Note that the stack pointer or other cachable memory should never be used as the source operand, even if using ASI 1, since this may lead to faulty data being loaded into the data cache.“

One has asked Gaisler’s opinion and this has been the response: _“The errata is perhaps a bit too strongly worded. There is a risk that the load instruction used in the workaround will lead to fetching in incorrect data that gets cached if the address is in a cacheable area but that in itself is not a problem. In order for that to propagate into a real problem there has to be a subsequent load from that address that hits in the Dcache and uses the invalid data before that cache line is either flushed or the data is overwritten by stores. If you know that the address (and the same cache line) will not be loaded from this does not happen. In this case it is reading from the stack of the idle task which is never read from once the idle task is running. So I do not see that this can create a real issue.”_

Either way, we wanted the RTEMS community to double-check that indeed there is not a real problem and eventually place additional comments on the code to better contextualize it w.r.t. the GR712RC User Manual errata # 8.

(Image attached)

Additional Notes:

This ticket was raised as an outcome of the Independent SW Verification and Validation (ISVV) for ESA-promoted RTEMS SMP Qualification Data Packs (https://rtems-qual.io.esa.int). The original ISVV reference for this issue is RTEMS-SMP-CODE-VER-073.

Summary

The `rtems_record_server()` may attempt to `close()` an unsuccessful `socket()` or it may attempt to close an invalid descriptor (initialized to `-1`) in case the `rtems_timer_create()` failed. The `error` handling section needs to be refactored.

```

Original author: sebastian.huber

Assign each code file (header, C source, assembler) to a Doxygen group. Exclude the legacy network stack and test suites. For third-party code decide case by case. Use this template and place it at the top of the file:

```
/**
* @file
*
* @ingroup RTEMSClassicTasks
*/
```

Do not use @brief and a file description.

3.9.1.228 5149 - arm/xilinx_zynq_microzed: Microzed timer is running 3 times the required frequency

Id	5149
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Chris Johns
Closed by	Gedare Bloom
Created	2024-11-12T05:00:36.578Z
Closed	2024-11-12T16:16:35.600Z
Updated	2024-11-12T16:16:35.815Z
Milestone	6.1
Labels	arch:arm, bsp
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5149
Merges	1

The BSP default for the Micorzed BSP is:

```
$ ./waf bspdefaults --rtems-bsps=arm/xilinx_zynq_microzed | grep BSP_ARM_A9MPCORE_
↪PERIPHCLK
BSP_ARM_A9MPCORE_PERIPHCLK = 100000000
```

Building a FSBL with Linux using Vivado 2019-2 and the Avnet BSP then using it to boot RTEMS results in 3 times the requested frequency.

The following code gets the correct frequency:

```
uint32_t a9mpcore_clock_periphclk(void) {
return 333333333;
}
```

The BSP should default to the settings provided by the Avnet BSP for Viviado.

The following discussion from !282 should be addressed:

- [] @gedare started a discussion: (+2 comments)

  The API changes I noticed: * new function `rtems_record_fetch_recommended_item_count()` * new function `rtems_record_fetch_initialize()` * new function `rtems_record_fetch()` * new structure `rtems_record_fetch_control` * new type (enum) `rtems_record_fetch_status` * structure name change `uptime` to `rtems_record_client_uptime` (this is an improvement to avoid polluting the global namespace) * return type change for `rtems_record_client_init` * increment the `RTEMS_RECORD_THE_VERSION` with associated restructuring of the `rtems_record_event` structure And the deprecated and obsoleted call: * `rtems_record_drain` * `rtems_record_writev` It is unusual to directly deprecate and obsolete an API call, but, it seems this function was not documented and was not being used by the external tooling, so I’m willing to let that slide. It should still be noted and treated as a deprecation, even if it was a “hidden interface” just on the chance someone happened to be using it for something.

Summary

Releases add a `VERSION` file that defines the release. This is not working

Steps to reproduce

Add a suitable `VERSION` file then check the version.

Author: Chris Johns 2024-06-13T04:20:39.803Z

assigned to @chris

Author: Chris Johns 2024-06-13T04:20:52.457Z

changed the description

Author: Sebastian Huber 2024-10-11T04:19:17.418Z

The wscript of RTEMS uses a VERSION file. For example:

```
[RTEMS_VERSION]
__RTEMS_MAJOR__ = 1
__RTEMS_MINOR__ = 2
__RTEMS_REVISION__ = 3
RTEMS_VERSION_CONTROL_KEY = 4
```

Author: Chris Johns 2024-10-11T04:19:17.418Z

Yes and thanks. I have a patch to fix this in my queue and I need to find the time to finish testing it.

Author: Chris Johns 2024-10-11T04:22:41.298Z

mentioned in merge request !257

Author: Chris Johns 2024-10-21T00:44:42.187Z

I have updated !257 to resolve the issues raised in the that MR and bring together the various pieces. Once merged I will update the engineering manual with the documentation added to the `wscript`.

The current VC key interface can remain for RTEMS 6 and be removed in RTEMS 7 as we are close to the 6 release. I have provided the replacement interface to aid migration for those who may depend on the interface. Internally some parts have moved to release label from VC key.

Author: Sebastian Huber 2024-10-28T21:04:41.970Z

Why don't we discuss and document the procedure and API changes first? Once this is settled, the implementation can be adjusted.

It seems you want to deprecate `rtems_version_control_key()` and `rtems_version_control_key_is_valid()`. What is the reason for this?

What is a release label?

Author: Chris Johns 2024-10-28T21:04:41.970Z

I have provided updated documentation for review that defines this.

Original author: frank_k

Short Problem Description

RTEMS Classic API Guide says:

> RTEMS can represent time points of this clock in nanoseconds ranging from 1988-01-01T00:00:00.000000000Z to 2514-05-31T01:53:03.999999999Z.
>
> - Yet, years larger than roughly 2105 to 2110 cannot be set
>
> (or at least the date should be wrong but this never occured in my tests).
>
> The possible RETURN VALUES are RTEMS_SUCCESSFUL, RTEMS_INVALID_ADDRESS, RTEMS_INVALID_CLOCK
>
> - Yet, rtems_clock_set() can return status RTEMS_INVALID_NUMBER, too.
>
> (Only for such dates in the far future.)
>
> Call rtems_clock_set() with this time_of-day: { year = 2514, month = 5, day = 31, hour = 1, minute = 53, second = 3, ticks = 995 } The return value will be RTEMS_INVALID_NUMBER.
>
> cpukit/rtems/src/clockset.c: rtems_clock_set() calls
>
> - cpukit/rtems/src/clocktodvalidate.c: _TOD_Validate() and
> - cpukit/rtems/src/clocktodtoseconds.c: _TOD_To_seconds() and
> - cpukit/score/src/coretodset.c: _TOD_Set()
>
> First issue:
>
> _TOD_To_seconds() converts the time_of_day structure into seconds using a variable `time` of type `uint32_t`. This simply overflows when in comes close to year 2110.
>
> Debugger output at the end of _TOD_To_seconds():

```
(gdb) print the_tod->year
$16 = 2104
(gdb) print time
$17 = 4233686400
```

with a higher year:

```
(gdb) print the_tod->year
$28 = 2514
(gdb) print *the_tod
$31 = {
year = 2514,
month = 5,
day = 31,
hour = 1,
minute = 53,
second = 3,
ticks = 995
}
(gdb) print time
$29 = 192272
```

Second issue:

_TOD_To_seconds() can (most likely) not handle the leap year issues of the years 2200, 2300, 2400, 2500 because it has dedicated code for the 2100 case only:

```
  /* The year 2100 is not a leap year */
  if ( time

    = (TOD_SECONDS_AT_2100_03_01_00_00 - TOD_SECONDS_1970_
↪THROUGH_1988)) {
    time -= TOD_SECONDS_PER_DAY;
    }

_TOD_Check_time_of_day_and_run_hooks() causes STATUS_INVALID_
↪NUMBER
.....
↪.....

cpukit/score/src/coretodset.c: _TOD_Set() calls

* cpukit/score/src/coretodset.c:
_TOD_Check_time_of_day_and_run_hooks()

```

(continues on next page)

(continued from previous page)

```
in this code snippet (note ``return status``):

.. code-block::

    status = _TOD_Check_time_of_day_and_run_hooks( tod );
    if ( status != STATUS_SUCCESSFUL ) {
    _TOD_Release( lock_context );
    return status;
    }

_TOD_Check_time_of_day_and_run_hooks( tod ) can return status␣
↪STATUS_INVALID_NUMBER which is not documented for rtems_
↪clock_set(). The small time in seconds value 192272 from␣
↪the integer overrun discussed above triggers the middle␣
↪``if`` clause:

.. code-block::

    static Status_Control _TOD_Check_time_of_day_and_run_
↪hooks(
    const struct timespec *tod
    )
    {
    if ( !_Watchdog_Is_valid_timespec( tod ) ) {
    return STATUS_INVALID_NUMBER;
    }

    if ( tod->tv_sec < TOD_SECONDS_1970_THROUGH_1988 ) {
    return STATUS_INVALID_NUMBER;
    }

    if ( _Watchdog_Is_far_future_timespec( tod ) ) {
    return STATUS_INVALID_NUMBER;
    }

    return _TOD_Hook_Run( TOD_ACTION_SET_CLOCK, tod );
    }

Final Notes
...........

* I found `#2665 <https://gitlab.rtems.org/rtems/rtos/rtems/-/
↪issues/2665>`_ and #2548 but I do not say these are␣
```

(continues on next page)

(continued from previous page)

```
↪relevant here.
64 * ``#define WATCHDOG_MAX_SECONDS 0x3fffffff`` in cpukit/
↪include/rtems/score/watchdogimpl.h covers 17179869183␣
↪seconds which are some 544 years
65 * _TOD_Check_time_of_day_and_run_hooks() seems to be only␣
↪used by _TOD_Set() but _TOD_Set() has three users.
66 * I did not check whether the invers conversation (rtems_
↪clock_get_tod()) works for dates which are centuries in the␣
↪future.
```

Will switching to time_t instead of uint32_t largely resolve this?

I think you might have missed some Classic API methods which might overflow. I think anything using uint32_t or rtems_interval related to seconds or ticks over long intervals is suspect. I spotted these:

- rtems_clock_get_seconds_since_epoch() uses rtems_interval.
- rtems_clock_get_ticks_since_boot() also uses rtems_interval but I think this overflows sooner than we'd like

I think the Classic API time of day structure is OK.

Author: Trac Migrate 2021-03-12T15:30:38.000Z

Original author: frank_k

- `time_t` - I presume 64 bit - will avoid the overflow in _TOD_To_seconds() but
- ... there are still the not correctly handled far away leap years.
- ... there is STATUS_INVALID_NUMBER (Should not occur when the overflow is fixed. Yet, I do not like such incorrect code even if it should not trigger.)
- Overruns in rtems_clock_get_ticks_since_boot() are OK because the Classic API Guide says:

  With a 1ms clock tick, this counter overflows after 50 days since boot. This is the historical measure of uptime in an RTEMS system. The newer service rtems_clock_get_uptime() is another and potentially more accurate way of obtaining similar information.

  – At other functions like rtems_clock_get_seconds_since_epoch() I had not have a look, yet.

Author: Joel Sherrill 2021-03-12T15:51:58.000Z

Original author: frank_k

OK. I was unclear but I was asking if it is time to move rtems_interval to 64-bits. This would address the historical ticks since boot and other intervals being 32 bits. The limit also applied to rtems_task_wake_after() and other APIs using rtems_interval for number of ticks.

Author: Trac Migrate 2021-03-12T16:25:14.000Z

Original author: frank_k

Could we please separate the 32-bit rtems_interval issues from this ticket.

If we need a 64-bit division we should think about limiting the time of day to the year 2104. If it is just a multiplication and a couple of leap year fixes, then we should keep the full watchdog range.

Author: Trac Migrate 2021-04-21T05:19:03.000Z

Original author: frank_k

In [changeset:"7bbbe4225c92b646faa14e5f5800ed2feba09899/rtems" 7bbbe42/rtems]:

```
clock:_TOD_To_seconds(): Fix year 2514 overflow

This patch fixes issue #4338 by changing _TOD_Validate()
to only accept years till 2105. This requires another patch
to change the documentation of rtems_clock_set() and other
affected API functions (indicating the end date is 2105 not 2514).

I tried to support till year 2514 but it turned out that
this needs changing the Timer Manager too. That in turn
would mean to change _TOD_Seconds_since_epoch( void )
from 32 to 64 bit. Sebastian pointed out that a naive extension
leads to trouble with 32 bit processors. He deemed a safe
re-implementation too costly performance wise considering
that year 2106 is far away and current binaries using RTEMS
Classic API are unlikely to be in use by 2106.

The constant TOD_SECONDS_AT_2100_03_01_00_00 in
cpukit/rtems/src/clocktodtoseconds.c happens to be wrong by
1 hour. When setting the date 2100-Feb-28 23:59:59 and then
reading the date again you will find yourself in 2100-Feb-27.

Update #4338
```

Author: Trac Migrate 2021-05-06T13:20:56.000Z

Original author: frank_k

Update on status:

This is fixed in code. What is missing is to update the documentation (i.e. removing the 2514-05-31T01:53:03.999999999Z in favor of 2104-12-31T23:59:59.999999999Z in Classic API and may be explaining that the internal clock will run beyond this limit and POSIX API can work with dates beyond 2105). A colleague of mine promised to do that.

Summary

We have a CI job which executes the exact instructions from the rtems user manual: Bare Metal Rust with RTEMS and therefore runs `hello.exe` from the RTEMS samples. This executable crashes when executed. The Ticker sample crashes too.

This is **not** a Rust bug! This is just RTEMS without any Rust involved!

Basically, it does:

1. Run RSB for Risc-V to install Tools.
2. Build for Risc-V

3. Run the `hello.exe` sample

The output looks like:

```
+ qemu-system-riscv64 -M virt -nographic -bios build/riscv/rv64imafdc/testsuites/samples/hello.exe

RTEMS version: 6.0.0.eaaeebedda43a9e9886078389b3af05d0c267a7a
RTEMS tools: 13.3.0 20240521 (RTEMS 6, RSB 78680c889c2458f26170fe6e4a05c37791aacc87, Newlib 1b3dcfd)
executing thread is NULL
```

The first known buggy build was:

Date:	2024-10-26T02:33:07+02:00
rtems-docs:	a3cfaea265cb6b5af8f0eb6cb5f4ace32873ecf3
rtems-source-builder:	78680c889c2458f26170fe6e4a05c37791aacc87
rtems:	eaaeebedda43a9e9886078389b3af05d0c267a7a

The last known good build was:

Date:	2024-10-25T02:33:14+02:00
rtems-docs:	2cafea3f43db17f7f0355078449acd77527e2dd3
rtems-source-builder:	d7870131e4de88f35ed137e62c83874597ccee82
rtems:	e0f1c8fe0b20ae486f5b99c3a9155686bc3a11f2

By the way, the build of `hello.exe` for SPARC (which is also part of the RTEMS user manual instructions) is not affected and works fine.

Steps to reproduce

Follow the instructions in Bare Metal Rust with RTEMS

3.9.1.232.2.1 Pre-set options

Author: Frank Kuehndel 2024-10-28T13:22:55.971Z

Re-testing shows the problem is in the RTEMS repo beween commits `e0f1c8fe` and `eaaeebed`. Therefore, one of these commits is responsible:

There is no easy means to add the current version number to the documentation using the Sphinx. The supported directives and variables are fine in the documentation however they are no applied in the code blocks.

Provide a means to support a version number that can be used in the documentation and code blocks.

We should also review the documentation code blocks and find ways to include content that does not vary from version to version.

This issue captures review comments by @gedare in !283. The MR is the patches posted by Patrick to the `devel@rtems` list in 2017.

1. Change the mutex resources to be self-contained
2. Make debug printing conditional code and guard including `stdtio.h` on debug output being enabled
3. Use `printk` for debug output
4. Add SPDX tags to the start of the sources

Author: Gedare Bloom 2024-10-30T22:16:15.877Z

mentioned in merge request !283

Author: Chris Johns 2024-10-31T02:21:54.373Z

The use of `malloc` and `free` is to handle the case of a supplied bit image not aligned at a 64 byte boundary which the PCAP DMA engine requires. If an aligned buffer is written or read there are no heap allocations. The use of `malloc` and `free` could be removed and an alignment error return or we leave the code as is?

I think the SMC call used for loading the PL on a ZynqMP and Versal require alignment. I also notice the DMA alignment value is in the registers header file which is not installed. I will move it to the installed header.

Author: Chris Johns 2024-10-31T03:00:59.633Z

The `WARN()` macros means there are always print statements present so the warnings should not be made conditional on debug.

I will change the `printf` statements to `printk`.

The README test has `master` are now using `main`. The URLs need to be reviewed and updated.

Author: Chris Johns 2024-10-05T23:36:04.688Z

assigned to @joel

Author: Amar Takhar 2024-10-06T01:14:08.064Z

The only two references to `master` I see in the readme point to the docs which need to be fixed so an issue should be opened there, too.

Author: Amar Takhar 2024-10-28T21:17:32.816Z

Which I opened 3 months back btw: https://gitlab.rtems.org/rtems/docs/rtems-docs/-/issues/17

Author: Chris Johns 2024-10-28T21:17:32.816Z

The issue you linked is not on the 6.1 milestone. Should be on that milestone and this issue closed as a duplicate?

Author: Amar Takhar 2024-10-28T21:17:32.816Z

I just did that thanks

This ticket is to track all the documentation changes for the RTEMS 6 releases.

Author: Chris Johns 2022-05-08T11:18:31.000Z

Update the build system to support substitution in areas of the text with:

- `@rtems-version@`
- `@rtems-ver-major@`
- `@rtems-ver-minor@`
- `@rtems-ver-revision@`

The support allows the source to contain in any area:

```
$ sparc-rtems@rtems-ver-major@-gdb app.exe
```

Author: Chris Johns 2022-05-08T11:20:39.000Z

Update to `waf` configure

Author: Chris Johns 2022-05-09T11:45:45.000Z

The use of `.. include::` in the nested `index.rst` files breaks the parsing of Sphinx. I have discovered the read in source that passes through the `source-read` hook is not in the some of the generated HTML pages. I cannot tell if this is a bug in Sphinx, the theme or something else but using the `.. toctree::` works.

We need to change the use includes and update the `README.txt`.

Author: Joel Sherrill 2023-06-22T21:01:23.000Z

- **Summary** changed from *User manual documentation updates* to *User manual documentation updates for RTEMS 6 release*

Author: Joel Sherrill 2023-06-22T21:56:19.000Z

We need to use this extension:

https://github.com/adamtheturtle/sphinx-substitution-extensions

And then a documentation working session to switch the hard-coded versions and lengthy version specific output. Also remove the current hacked [per Chris :)] solution.

3.9.1.237 5067 - Remove essentially dead code from _Terminate()

Id	5067
State	closed
Type	ISSUE
Author	Sebastian Huber
Assignee(s)	Sebastian Huber
Closed by	Sebastian Huber
Created	2024-07-15T14:00:31.234Z
Closed	2024-08-24T08:45:34.991Z

Milestone	6.1
Labels	rtems::testing
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5067
Merges	0

Summary

The system termination procedure is implemented like this:

```
void _Terminate(
Internal_errors_Source the_source,
Internal_errors_t      the_error
)
{
_User_extensions_Fatal( the_source, the_error );
_System_state_Set( SYSTEM_STATE_TERMINATED );
_SMP_Request_shutdown();
_CPU_Fatal_halt( the_source, the_error );
}
```

However, the `_User_extensions_Fatal()` should not return for properly configured applications. The `_Terminate()` implementation should be simplified to ease testing and code coverage.

```
void _Terminate(
Internal_errors_Source the_source,
Internal_errors_t      the_error
)
{
_User_extensions_Fatal( the_source, the_error );

/*
* Everything after invoking the fatal extensions is essentially dead code.
* At least one fatal extension of the initial extension sets should not
* return and for example reset the system.  See section "System Termination
* Procedure" in the RTEMS Classic API Guide.
*
* The following code is only executed in badly applications.
*/
_CPU_Thread_Idle_body( 0 );
}
```

3.9.1.238 5119 - AMD (Xilinx) ZymqMP BSP Review

Id	5119
State	closed
Type	ISSUE
Author	Chris Johns
Assignee(s)	Gedare Bloom
Closed by	Amar Takhar
Created	2024-08-18T01:17:45.873Z
Closed	2024-10-21T02:26:22.977Z
Updated	2024-10-21T02:26:23.064Z
Milestone	6.1
Labels	arch:aarch64, bsp
Link	https://gitlab.rtems.org/rtems/rtos/rtems/-/work_items/5119
Merges	1

Summary

The `rtems-bsps` command for the Xilinx ZymqMP shows:

```
$ ./rtems-bsps --family xilinx-zynqmp
RTEMS 6 Board Support Packages

Architectures: 18
BSP Families: 93
BSPs: 220

aarch64: (families:5 bsps:14)
xilinx_zynqmp_ilp32_qemu     xilinx-zynqmp
xilinx_zynqmp_ilp32_zu3eg    xilinx-zynqmp
xilinx_zynqmp_lp64_a53       xilinx-zynqmp
xilinx_zynqmp_lp64_cfc400x   xilinx-zynqmp
xilinx_zynqmp_lp64_qemu      xilinx-zynqmp
xilinx_zynqmp_lp64_zu3eg     xilinx-zynqmp

arm: (families:25 bsps:76)
xilinx_zynqmp_ultra96        xilinx-zynqmp
```

AMD documents the processing elements on the ZynqMP as APU MP Cores and RPU. The names we have for the BSP do not reflect this. We should use follow the labels AMDs documentation uses.

Duplicate BSPs

The BSP `xilinx_zynqmp_lp64_zu3eg` and `xilinx_zynqmp_lp64_a53` only differ by the console driver from my analysis. We should not have two very similar BSPs that only different with a console driver. It is confusing to users and also makes fixing console driver issues more complex.

The `xilinx_zynqmp_lp64_cfc400x` BSP is special as it has a DTB and a specific sequence to disable a board specific watchdog in the console driver.

The console driver for `xilinx_zynqmp_lp64_zu3eg` is the `xilinx_zynqmp` driver and all BSPs in this family should either use this BSP given the name of the console or all BSPs in this family should use the shared driver. There is no need for a difference and we should resolve this before we release.

The use of A53 in the naming is an implementation detail for the SoC family. If the R5 BSP is named RPU it would be consistent with the documentation. If this path is taken we should add issues to the Zynq and Versal BSPs to bring them in line with this change.

Proposals

1. Rename `xilinx_zynqmp_lp64_zu3eg` to `xilinx_zynqmp_lp64_apu` and remove `xilinx_zynqmp_lp64_a53`
2. Rename `xilinx_zynqmp_lp64_a53` to `xilinx_zynqmp_lp64_apu` and change the console driver in `xilinx_zynqmp` to be `xilinx_zynqmp_lp64_cfc400x` specific.

assigned to @gedare

Author: Amar Takhar 2024-10-18T03:24:34.672Z

This sounds old a good change to me it follows POLA - Principle of least astonishment.

Author: Kinsey Moore 2024-10-18T02:32:16.095Z

I think as part of this we also want to strip the **xilinx_** from the BSP names as was done for the RPU BSPs to shorten them a bit.

Author: Kinsey Moore 2024-10-18T02:32:16.061Z

I would also say that xilinx_zynqmp_mercuryxu5_rpu is ready to be retired since the other explicit options now exist.

Author: Sebastian Huber 2024-10-18T10:27:50.116Z

I would also strip the **xilinx_** to be in line with the new RPU BSPs.

Do we really need the _lp64_ for the aarch64 BSPs? I would assume that this is the default for a 64-bit architecture.

Author: Sebastian Huber 2024-10-18T10:29:50.789Z

Do we need the Qemu variants? I simply use the xilinx_zynqmp_lp64_a53 BSP for my test runs on Qemu and the ZCU104 evaluation board.

Author: Kinsey Moore 2024-10-18T12:25:51.054Z

We need the QEMU variants because QEMU doesn't support all the hardware that is available and things that aren't supported in QEMU are only compiled in for hardware BSPs. The A53 BSP you reference actually uses the generic grp.yml instead of grp_zu3eg.yml which I'm renaming to grp_hardware.yml shortly. I'll switch that to grp_hardware.yml when I do the renaming.

Author: Kinsey Moore 2024-10-18T13:17:23.329Z

```
In regard to the lp64 specifiers, I'd agree that it is the default for␣
↪AArch64 and that we can dispense with it. I'll handle that when I␣
↪strip off

@chris Do you have opinions on removal of
```

```
 from the versal BSPs as well?
xilinx_
```

A single character is output then nothing further. Tests output using the `printk` but `spconsole01` fails.

It seems there is a problem with the UART driver interrupts.

Author: Chris Johns 2021-02-06T23:07:27.000Z

The issue is the wrong `BSP_PCI_ISA_BRIDGE_IRQ` value was being passed to the `openpic_enable_irq()` call in `bsps/powerpc/shared/irq/openpic_i8259_irq.c`. The define is offset by the max ISA bus IRQ value and the `openpic` call expects IRQ values relative to its signals, ie 0.

Author: Trac Migrate 2021-02-07T23:26:16.000Z

- **Resolution** set to ~"fixed"

- **Status** changed from *assigned* to *closed*

In [changeset:"450e238bc6dde7caa221fad1a8339b3cf0dbd0c2/rtems" 450e238/rtems]:

```
powerpc/shared: ISA bus bridge fails to enable the openpic irq

- The call to enable the openpic irq for the ISA bridge fails
because the IRQ used is offset by the ISA bus signals and
the openpic call expects an IRQ relative to its signals.

- Add the MVME 2600/2700 to the list of boards with an ISA bridge.

Closes #4231
```

Merges	0

Currently many of the individual tools in the development toolchain are using versions specified in the RSB using git hashes and not release versions. This is an issue for stable tool versions (e.g. 6) and release branches. Using git hashes is necessary for picking up bug fixes in some cases and should likely be the preference for the forward leaning tools (e.g. 7) but released versions with patches should be given preference.

Note: Newlib is acknowledged as likely always being a hash.

Author: Chris Johns 2022-11-30T21:02:25.000Z

I agree with this. Should the Eng doco be updated to reflect this as a policy?

Author: Joel Sherrill 2023-02-20T20:43:23.000Z

- **Resolution** set to ~"worksforme"
- **Status** changed from *new* to *closed*

Confirming that the RSB lists all tools as released versions except rtems-tools and newlib. See https://git.rtems.org/rtems-source-builder/tree/rtems/config/6/rtems-default.bset for details.

Author: Chris Johns 2024-06-14T18:30:31.151Z

- **Resolution** ~"worksforme" deleted
- **Status** changed from *closed* to *reopened*

I am reopening this ticket. The severity is blocker and if a release is not to use upstream released tarball files we need a clear reason why.

The RSB is not using GCC released sources and the current rtems/config/tools/rtems-gcc-10-newlib-head.cfg shows this.

If you look at the 5.3 sources you will see gcc tarballs are used, eg `gcc-9.3.0.tar.xz`. As things are an RTEMS 6 release will end up with a file called

`gnu-mirror-gcc-92b44cf,tar.gz`.

Where is the repo this comes from?

The name `gnu-mirror-gcc` is confusing unless you understand what is going on?

How do you track the integrity of the repo used once you manage to find it?

I think we should be using a GCC release tarball of code in releases.

We have moved to released tar files.

3.9.1.242 4982 - Add support for TMS570LC4357 for the arm/tms570 BSP

Id	4982
State	closed
Type	ISSUE
Author	Trac Migrate
Assignee(s)	Sebastian Huber
Closed by	Amar Takhar
Created	2024-01-15T09:31:59.000Z
Closed	2024-10-16T04:34:15.289Z
Updated	2024-10-16T04:34:15.339Z
Milestone	6.1
Labels	arch:arm, priority::normal, tickettype::enhancement, version::6

Merges	1

Original author: sebastian.huber

Add support for TMS570LC4357 chip variant using the TMS570LS43x Hercules Development Kit from TI.

In [changeset:"b1fdf753387189afe720d3fa1ac13af5fb9943c2/rtems" b1fdf75/rtems]:

```
bsp/tms570: Fix console receive interrupts

`tms570_sci_interrupt_handler()` is called when an RX interrupt fires. It checks
in the register `FLR`, the `RXRDY` bit (Receiver ready flag - indicate that the
SCIRD contains new data). If it is set, it calls
`tms570_sci_read_received_chars()`.

`tms570_sci_read_received_chars()` checks the register `RD` against 0. If it is
non zero, it returns 1 to indicate that one byte was read.

In the old behavior, if it is zero, the function returns 0 to indicate that no
data was read.

The new behavior is to not silently drop 0x00 bytes. Ignoring 0x00 bytes is fine
when working with printable text (which, I assume, is how this driver was
tested), but as soon as the UART is used in non canonical (raw) mode, with
potentially 0x00 bytes, these bytes will be silently dropped, causing issues in
the data/protocol layer above.

Update #4982.
```

mentioned in merge request !16

Author: Chris Johns 2024-10-07T00:54:45.869Z

@sebhub what is the status of this issue?

Author: Sebastian Huber 2024-10-07T00:54:45.869Z

This is still work in progress, see !16. Once this patch set is merged, there are two issues left:

1. The PBIST checks need to move before the SRAM initialization.
2. The MPU initialization should to move to shared code.

Author: Sebastian Huber 2024-10-07T00:54:45.869Z

Moved to #5134.
